INDEX TO VOLUME XI.

ORIGINAL ARTICLES.

A Review of Telegraphic Progress for 1874. Are Rules Made for Managers to Observe or only for Subordinates. A Case of Epileptic Telegraphy. A Remarkable Coincidence. A Sharper Felled by a Telegrapher. Anglo-American Automatic Telegraph, The. A Pair of Stairs. A Telegraph Operator's Lark Twenty-five Years Ago. A July Storm. Albany, N. Y., New Western Union Office. Adventures of a Military Telegraph Operator in South Carolina. American District Telegraph Company, The. A New Agency Discovered.—Ethers-Gumelastic Force. Bits of Reminiscences. Burmah. Condensers as Automatic Repeaters. Conductivity and Insulation in Telegraph Lines, The. Chemistry of the Automatic Telegraph, The. Centenary Insulator, The. Catching a Tartar. Central American Telegraph, The. Chicago Poetical Squibs. Destruction of Albany, New York, Western Union Telegraph Office. Duffer De C. D'Infeville's Duplex Telegraph. Experience of a Bashful Operator, The. Friendly Notices and Reminiscences of the Operators on the A. & P. California Lines. Fifteen Years Telegraphic Progress. Gold and Stock Telegraph Company, The. Haskins' Duplex Telegraph. Insulation of Lightning Rods, The. Jimmy S.—A Reminiscence. Jovial Spirits in Hoboken, The. Kenosha Carbon Insulators, The. Love and Lightning. Lovely Woman.—An Operator's Matrimonial Experience. Morse vs. The Automatic, The. Meanest Man, The. Momentous Discussion. New Western Union Telegraph Building, The. Notes from the Western Union. New York and New England Telegraph Company, The. New Offices of the Atlantic and Pacific Telegraph Company, The. Occult Forces of Nature Utilized, The. Oh, That Ale! On Quadruplex Telegraphy. Perils of Telegraphing in the Far West, The. Quadruplex Telegraph, The. Saved by Telegraph. Synopsis of a Paper on Lightning Rods. Success the Result of Failure.—A Telegraphic Review. Smith's System of Duplex Telegraphy. Telegraphic Competition—Past, Present and Future. The Telegraph in the West Twenty-five Years Ago. The Telegraph.—What it has Accomplished, etc. The Tendencies of the Times. We Should Not Judge from Appearances.

EDITORIAL.

American Electrical Society, The. After the Holidays. An Excellent Appointment.—Henry Holland. Automatic Telegraph System, The. All Quiet Along the Lines. An Art Criticism. Activity of Telegraphic Invention. American Fire Alarm Telegraph, The. Appointment of D. H. Bates, General Manager A. & P. Telegraph Co. Atlantic and Pacific Report, The. Appointment of Electrician to the Centennial Exhibition. American Dist. Telegraph Co.—Fourth of July Parade and Review of Messengers. Almost Another Panic. Annual Exhibition of the American Institute. An Ex-Telegrapher Becomes a Successful Artist. Atlantic Telegraphs.—Competition Established. Atlantic Cable Competition, The. American District Telegraph Company, The. Atlantic Telegraph, Anglo-American, The—Advance of Tariff. Atlantic Cable Tariffs.—Why the Advance was Unavoidable. Atlantic and Pacific Telegraph Company, The. Appreciation of and Interest in THE TELEGRAPHER. A. & P. Telegraph Co.—New Headquarters. Annual Meeting of the Telegraphers M. B. Association. Atlantic Cable Tariffs. Appointment of H. H. Ward, Cashier of the Western Union Office. Another Great Discovery of the Professor of Duplicity and Quadruplicity. Appointment of J. D. Reid, Treasurer of the Gold and Stock Telegraph Co. Busy Time Ahead. Brooks' Patent Insulators. Business Prospects and the Telegraphs. Boston and Providence, A Trip to. Compound Telegraph Wire in England. Canadian Telegraphers Mutual Insurance Association. Congress and the Telegraphic Competition. Candidate for the Big Leather Medal, A. Contest, The, for the Title to the Edison Quad. Patents. Completion of the Direct United States Cable. Consolidation of Insulated Wire Works. Cincinnati Industrial Exposition, The Sixth. Competition in Telegraphy. Centennial Celebration and the Telegraph, The.

Characteristics of a Genius. California Correspondent of THE TELEGRAPHER. Centennial Telegraph Tournament Proposed, A. Caution to Operators.—Don't go to California. Close of the Volume, The. Discussion of Past Telegraphy, The. Direct United States Cable, The, 24, 89, 118, 137, 161, 167, 257, 311. Death of Harrison Gray Dyar. Dominion Telegraph Company, The. Duplexed Telegraph Printers, The. Duplex and Quad. Telegraphy in America. Dominion Telegraph Legislation. Direct Cable, The, Again in Operation.—Reduction of Tariff. Duplex and Quad. Telegraphy. Duplex and Quad. Telegraphy.—Mr Framer's Inventions. Direct Cable, The, Again Broken. Eleventh Volume of THE TELEGRAPHER, The. Election of E. D. L. Sweet, Trustee and V. Prest. of the A. & P. Telegraph Co. Electric, The. Express Messages. Electrical and Telegraphic Disturbances.—An Exceptional Case. Faraday, The, and the New Cable. Foundation of Telegraphic Success, The. Floods, The, and the Telegraphs. Female Telegraph Operator, The. Fire Alarm Contest, The. French Telegraph Service, The. Fatal Accident to Mr. Frederick Hudson. Fertility of Inventions and Inventors. Great Western Telegraph Company, The. Gaugain's, M., Experiments on the Brooks' Insulator. Gold and Stock Telegraph Company, The. High Toned Journalism. Hinchman, J. C., Promoted. How to Dispose of a Newspaper and Still Retain It. Harmonic Electric Telegraph, The. Haskin's Duplex Telegraph Invention. Impending Telegraph Contest, The. Important Patent Decision of the U. S. Supreme Court. Interest of Operators in a Proper Qualification for their Duties. Improvements in Telegraphic Apparatus.—Their Bearing Upon Telegraphic Interest. Is a Government Telegraph System to be Surreptitiously Established? Illness of President Eckert. Improvements Proposed and Possible in the System of Transacting Telegraph Business. Insular Egotism. Illness of Mr. David Brooks. Lease of a Western Union Wire by the N. Y. Ass. Press. Literature. Late Storm, A.—Prospects for New Telegraph Construction. Letter from Mark Twain, A. Latest Phase of the Telegraphic Situation. Marine Telegraph Bill of the Dominion of Canada. Merihew, James, Deserved Promotion of. Memorial of the late Vice-Prest Mumford. New District Telegraph System, A. "Nondescript" Edison Organ, The. New York Telegraphers Club, The. New Telegraph Alphabet, A. Nihil's Grave. New Washington, D. C., Fire Alarm Telegraph, The. National Board of Trade, The, and Postal Telegraph Schemes. New Western Union Loan, A. New Telegraph Company, A. New Blanks of the A. & P. Telegraph Co., The. THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, JANUARY 2, 1875.

VOL. XI.

WHOLE No. 442.

Original Article.

A Review of Telegraphic Progress for 1874.

THE year which has just closed has been remarkable for an almost unprecedented dulness in telegraphic work, so far at least as this country is concerned, which is principally if not wholly due to the prevailing financial stringency. It may not, however, be uninteresting at this time to review the telegraphic field, not only at home but abroad, and at a single glance gain a connected idea of the progress of events during the year 1874.

The Western Union Company signalized the commencement of the year by taking in the lines of the Pacific and Atlantic Company, comprising about 5,000 miles of poles and 10,000 miles of wire. Very few extensions have been made to points not hitherto covered by the Western Union system. Probably about 20,000 miles of new wire, all told, have been strung during the year, but nearly all of this has consisted of additions to the facilities on routes already existing. The mileage of new poles erected will hardly exceed 1,000 miles, as against between 3,000 and 4,000 miles the preceding year. The magnificent new building of this company at Broadway and Dey street has made steady progress during the year, and will probably be ready for occupancy before spring.

The Atlantic and Pacific Company have also extended their lines, improved their facilities and strengthened themselves in various directions and are now in a very satisfactory condition. During the past year they have built a new line from Chicago to Omaha, and extended their lines from Boston to Rye, N. H., and from New York to Long Branch. In October they effected a lease of the Franklin lines between New York and Washington, and are making preparations for still further extensions and improvements during the coming year.

The lines of the Southern and Atlantic Company have reached Mobile, Alabama, on their way to New Orleans. The Automatic Company have made no extensions during the year, but have been working their single wire successfully between New York and Washington, and, we understand, doing a good business.

We have seen no statement of the progress of the Montreal Telegraph Company, but believe that considerable work has been done by them during the year. The Dominion Company have added about 800 miles of poles and 1,000 miles of wire to their system, and are believed to be in a prosperous condition.

The record of submarine cable work for 1874 is quite an extensive one. The Lisbon and Maderia section of the Brazilian cable, laid last year and subsequently broken, was picked up from two and a half miles depth of water and repaired early in the season. The remaining sections were also laid, and the whole line completed on the 22d of June, giving a telegraphic connection from London to Rio de Janeiro via Lisbon, Maderia, the Cape de Verde Islands and Pernambuco. The fourth cable of the Anglo-American company has been laid from Valentia to Heart's Content without accident, the work having been successfully completed on the 6th of September. The cable of 1865, which failed on the 11th of March, 1873, at a point about 568 miles from Valentia, in deep water, has not as yet been repaired. A break also occurred in the 1866 cable on the 14th of April, at a point about twenty-five miles from Valentia, which was repaired, and the cable put in working order on the 14th of July. At the present time the cables of 1866, 1873 and 1874, and the French cable are all in working order.

The Direct United States Cable Company have not, at last accounts, succeeded in completing their line. The cables from Rye Beach, N. H., to Nova Scotia, and Nova Scotia to Newfoundland were successfully submerged, and the Faraday afterwards proceeded to lay the deep sea line from Ireland to Newfoundland, but was obliged to cut the cable in a storm on the 8th of November at a point less than 200 miles from Newfoundland, and owing to the unfavorable weather usually prevailing at this season of the year it is scarcely probable that the work will be completed before another season.

Soundings have been made during the season by the

U. S. steamship Tusearora on the route of a proposed cable across the Pacific ocean from the western coast of America to Japan and China.

The organization of the American Electrical Society during the past year is a circumstance upon which all our telegraphers and electricians have reason to congratulate themselves. The matter was brought up in THE TELEGRAPHER of May 2, 1874, by Mr. I. N. Miller, and the discussion which ensued led to the organization of the society, which held its first annual meeting at Chicago on the third Wednesday of October. The attendance was quite large, and a commendable degree of interest was manifested. If this interest is sustained, as it ought to be, the society will be of great and constantly increasing benefit to the electrical and telegraphic profession in this country.

We have been obliged to record during the past year the deaths of three persons who have been prominent in telegraphic interest, almost from the time of the first establishment of the system in this country—Edward Creighton, Isaac Butts and Ezra Cornell. One by one the early pioneers of the wonderful system of telegraphic communication, which now well nigh encircles the globe, are passing away. Of the few that remain scarcely any are at present actively engaged in telegraphic enterprises.

All things considered, the past year has been a dull one for those whose business is connected with the extension or enlargement of telegraphic facilities in our own country, but it is hardly possible that the coming year should not be an improvement in this respect upon its predecessors.

Southern and Atlantic Telegraph Company.

THE monopoly which has for so long a time been enjoyed by the Western Union Telegraph Company appears now to be at an end. The establishment of a competing line is an assured fact. The new competing line is the Southern and Atlantic Telegraph Company. Mr. Charles W. Blossom, of New York, is the President, and Mr. Henry Hentz, President of the New York Cotton Exchange, Vice-President, and Mr. George H. Grace, of Macon, Georgia, the General Superintendent.

Knowing that any information on the subject of cheap telegraph rates possesses great interest for the people of this city and State, and, in fact, the whole South, a reporter of the *Republican* called yesterday upon Mr. Grace to obtain from him some facts concerning the new company. Mr. Grace is here on business for the company, and, though much occupied, gave frank replies to the questions asked.

The company is organized, he states, under the laws of New York, Mississippi and Louisiana. The business men and bankers in the various cities and towns on the route are, many of them, owners of stock, and all of them support the enterprise, as it is to their interest to obtain cheap telegraphing. The work now being performed here is under the control of a local company, of which Mr. J. B. Lafitte is president, and Mr. J. M. Siexas, secretary.

Up to February, 1873, the company was operating but about 1,600 miles of line, with about twenty-five offices. To-day it is working over 4,000 miles, with 100 offices, including nearly every important city and town between New York and Mobile, as well as the cities and towns along the Atlantic and gulf coasts.

All opposition has come from those interested in maintaining a monopoly, and every device, it is alleged, has been resorted to whereby the progress of the company might be retarded. It has been frequently tied up for weeks at a time by injunctions. It has also had to contend with evil reports which were circulated concerning it. The suit which was decided on Monday in the Superior District Court will give some idea of how the company has had to fight its way. But for these legal detentions it would have been established here long ago. The suit in the Superior District Court was against the Mobile Railroad Company for condemnation of right of way, and a verdict of \$1 damages was rendered. This was merely to establish the right of the telegraph company along the line of the road.

The Company will now go ahead as fast as possible, and the Superintendent hopes to have the line between New Orleans and Mobile working in a few days. The line is already completed from Mobile to Pearl river, and work has now been resumed between there and this city. Great importance is attached to the connection between this place and Mobile, but it is the purpose of the company to establish a duplicate line to New York, and should the people of New Orleans encourage it, as no doubt they will, routes to the West will be the object of the company's immediate efforts.

This company now connects at New York with other independent companies, whose lines extend to San Francisco, and also to the Dominion of Canada. It has, also, close and exclusive connection with the new Direct United States cable now being laid by the cable

steamship Faraday, which, when completed, will give us connection with all parts of Europe.

The objection that the company, as soon as in complete working order, will consolidate with one of the rival lines and leave its patrons again at the mercy of a monopoly, is promptly met by the Superintendent. He asserts that it has no foundation. While, of course, he cannot say what may happen, he asserts that nothing has been done by the company looking to any consolidation with any of the rival lines. Nor can it possibly be done except with the consent of the holders of three fourths of the capital stock, and he has yet to see the first stockholder who would sanction it.

On closing the interview, Mr. Grace, after thanking our reporter, remarked: "We fully understand and appreciate the wants of the press and its claims on the telegraph, for which it has done so much, and so far as has been in our power we have recognized it to the fullest extent. This has been frequently acknowledged in a public manner by the different newspapers which we have served and are still serving."—*New Orleans Bulletin*.

What Can a Woman Do?

SHE can do very much outside of what some people choose to call a woman's sphere. We have an instance in point. Two daughters of Mr. W. H. Wheeler, station agent for the B., C. R. and M. R. R. at this place, have become successful telegraph operators. Miss Fannie M. Wheeler commenced operating at Blairstown, on the Northwestern road, before Vinton had a telegraph office. Subsequently she operated in other places—as Waterloo, Chicago, Omaha; being now in an office in the city of San Francisco, holding a responsible position at a good salary. Miss Fannie is regarded as one of the best operators in the country. While in Chicago Western Union (Main) office she worked the Union Stock Yard wire. And on one occasion received 140 messages, *without a single break*—a feat which, probably, not one operator in a hundred could perform.

Miss Julia Wheeler, a younger sister of Miss Fannie's has for several months, and until recently, had full charge of the telegraph office at this place, performing her duties with tact and skill. For the present she has retired from the office for the purpose of attending school. Who shall say *such accomplishments* are unladylike and unrefined.—*Vinton (Iowa) Eagle, Dec. 2d, 1874.*

Cupid and Telegraphs.

SOME two years ago Conductor Morris Goodwin, of the I. and St. L. road, became enamored of a young lady at Malta, a station on the line. She reciprocated the emotion, but the young man didn't suit Mr. Campbell, the father of the damsel, and he would not listen to any matrimonial propositions. The two, at last becoming weary in their pleadings, planned an elopement. Yesterday Anna wanted to go to Filmore, on the Vandalia road. Shortly after she had left with a friend in a buggy, it popped into the old man's head that she had matrimonial intentions, and he mounted a horse and pursued her. The young man, who had planned the elopement, was watching his manœuvres, and despatched a messenger on a swift horse, who informed her of what was going on. She then hired a buggy at Filmore and made for Greencastle, her lover, who had been informed by telegraph, taking an Indianapolis and St. Louis train and met her there, where the two were made one flesh. Yesterday afternoon they passed through this city *en route* for Cincinnati. The old gentleman is reported to have returned, disgusted with telegraphy, railroads and young American bloods generally.—*Indianapolis Journal*.

Rubber Thermometers.

M. KOHLRAUSCH having several times noticed that glass flasks, closed by stoppers of hard rubber, burst, concluded that this substance must be very dilatible. This hypothesis was fully verified by experiment, for the expansion of this body was found to be about three times that of zinc. From his measures, the coefficient of dilatation for 1° between 16.7° and 25.3° = 0.0000770, and between 25.3° and 35.4° = 0.0000842. Thus, not only has hard rubber a very great coefficient of dilatation, but the latter increases very rapidly with the temperature.

This remarkable property can be applied to the construction of very delicate thermometers. Thus, with a small instrument, consisting of two strips of rubber and ivory eight inches long glued together and fastened at one end, we obtain at the other extremity a considerable movement for a change of temperature of one degree. The coefficient of hard rubber is equal at zero to that of mercury; above, it is greater. We can, then, as a curiosity, construct a mercury thermometer with a reservoir of this substance, whose changes will be the opposite of those of a common thermometer, and which will fall with an increase of temperature.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

"Morse," "Quadruplex," and "Automatic" Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR long editorial, in your interesting journal of last week, upon the subject of the three leading systems of telegraphing, and in reply to your "Morseite" correspondent, was characterized with your usual sound practical common sense, and there were but few ideas advanced by you that the friends of either side could take reasonable exception to.

It is known to you and to all your readers that, from first to last, I have in my advocacy of Automatic telegraphy, insisted that one of its chief elements of strength consisted in the fact that a very large proportion of the labor incident to the proper working of the system could be of a much cheaper grade than can possibly be used in working Morse, or any other system equal to it.

My real argument has been, from the day I undertook to develop and make practical Automatic telegraphy, in 1869, to the present moment, that the perforating of the messages could be done by the cheapest of intelligent unskilled labor.

Now, what are the facts in regard to the business of operating my perforating machine? In the first place, it can be worked accurately with one tenth part of the mental labor required to operate, reliably, the Morse key.

As a practical printer, I say that the mental and physical ability required to learn and successfully practice, to the extent of \$10 per week, the business of type setting upon plain book work, are vastly greater than are necessary to become good average operators upon our improved perforating machines.

But, practically, the real footing would be thus: 60 Morse operators.....\$250 00 41 Automatic operators..... 170 00 19 In favor of Automatic.....\$80 00

of the service. But even applying your remarks to the so-called Edison machine, in use by the Automatic Co., they are little less than caricatures. If you had written one quarter the "intelligence," and one hundredth part the "skill," you would have been very near the truth.

But it was reserved to your correspondent "Morseite," to out do all other opponents of Automatic Telegraphy, except, possibly, President Orton and his electrician, in the following monstrous statements.

"To counterbalance this, the Automatic system must more than double the number of employes of the Morse system in order to accomplish the same work in a given time, as every practical operator is aware that more words can be copied from an instrument in a specified time (all things being equal) than can be translated from strips and written out.

Your correspondent appears to have a soul above details, and therefore contents himself by making bold assertions which are directly the opposite of truth, and this I hold myself bound to prove from indisputable facts.

Estimate of the cost and of the number of operators required to telegraph 300,000 words between New York and Washington, by the "Morse" and by the "Automatic" systems.

The President of the Western Union Co. has publicly stated that 600 words per hour is a "large average" of the speed of telegraphing by the Morse system, but as there may be operators who think they can do 10,000 in ten hours, we will assume that as a maximum speed of a class of operators who command a salary of \$25 per week.

Each Perforator is capable, after a moderate degree of practice, to average 2,000 words per hour with great ease, therefore, fifteen operators would be required to perforate 300,000 words in ten hours.

In copying, each type-writing machine, manipulated by girls' labor, after three to six weeks' practice, will average, with the assistance of an expert reader of the Morse characters, 2,500 words per hour, with great ease and absolute accuracy.

There will also be required one operator to transmit and one to receive.

Thus we have for the Automatic system: 15 Perforators, 12 Copyists, 12 Readers, 2 Transmitters and Receivers.

41 Total Automatic, against 60 Morse. If it be admitted, for the sake of argument, that we must pay for our labor the same as the Morse people pay, the account will stand thus:

60 Morse operators.....\$250 00 41 Automatic operators..... 170 00 19 In favor of Automatic.....\$80 00

But, practically, the real footing would be thus: 60 Morse operators.....\$250 00 41 Automatic operators..... 82 00 19 In favor of Automatic.....\$168 00

Thus, in the matter of labor alone, showing a difference of more than 75-100ths against the simple Morse system, which, in the matter of labor is decidedly more advantageous than the "Duplex" or "Quadruplex."

When we leave the question of labor and come to the cost of maintaining the wires, on the basis of the official figures of the Western Union Co., we find in that item alone over \$70,000 per year against the Morse system—and if we divide this sum into 300 working days, we shall have over \$230 to add to the above balance of \$168—thus making the enormous difference of

\$368 in favor of the Automatic system, in telegraphing between Washington and New York 300,000 words. D. H. CRAIG.

The "Automatic Side."

BALTIMORE, Dec. 22d.

TO THE EDITOR OF THE TELEGRAPHER.

I WOULD like to say a few words in reply to the communication of "Morseite," in THE TELEGRAPHER of the 19th inst. I wish to notice that part of his communication in which the following occurs: "The work of preparing a strip for the Automatic system requires a certain amount of time, etc."

The Automatic Company are now doing about seven hundred messages a day between Washington and New York, which is a large amount of work for one "circuit," considering the length of the messages. Now, if we suppose a Morse "circuit" doing the same amount of work between the points above named, and sixty messages were to be given the Morse in Washington and the same number in New York, and the Automatic to be given the same number at both points at the same time, I would like here to ask "Morseite" which, the Automatic or the Morse, would have to wait the longest for the "circuit."

A first class puncher will prepare sixty messages an hour (perhaps "Morseite" may doubt this fact, if he does it can be proved to his entire satisfaction). A first class operator will send sixty messages an hour, (I don't say this amount of work is done, but believe it can be under favorable circumstances). The Morse operator will be two hours sending and receiving his business. The Automatic operator will receive and transmit his business in one hour, and have it copied in one hour and five minutes. We are supposing the Automatic and the Morse are starting simultaneously. If everything was favorable one first class copyist would do at each end of the line.

The force would be six employes for the Automatic, viz: two transmitting operators, two copyists and two punchers. The Morse would make a better showing in force, but give the Morse two "circuits," doing a heavy business, and the Automatic will get through as quick, if not quicker. The force will then stand four to six in favor of the Morse, but the one wire of the Automatic ought to balance the increase in force.

I saw an article some time ago in THE TELEGRAPHER, in which the writer charges certain parties connected with the Automatic Company of keeping up a continual fight to determine who shall run the machine, which appears to be true.

But if the system is worthless as "Morseite" seems to think, perhaps there would not have been so much fighting over it.

In conclusion, I believe the day is not far distant when Automatic telegraphy will be used throughout the United States—not to supersede the Morse, but in conjunction with it.

I have the honor to be an employe of and one who believes in the ultimate success of the

AUTOMATIC.

Automatic Telegraphy, and Things not generally Known in connection therewith.

TO THE EDITOR OF THE TELEGRAPHER.

PERMIT me to call the attention of your readers to another of the many valuable desiderata in connection with the American Electro-Chemical rapid Automatic Telegraph system. Thus, during the existence of a swinging cross, our expert automatic operators have frequently transmitted a long despatch during the interval of divergence. Is not this also progress?

GEORGE LITTLE, C. E.

Passaic City, New Jersey, U. S. A., December 19, 1874.

Success of the A. and P. Co.—Bad Policy.—Bulls.—The American Electrical Society.—Scurrilous Journalism, etc.

CHICAGO, Dec. 21.

TO THE EDITOR OF THE TELEGRAPHER.

WE are having one of the finest winters known in this region for a number of years, and, as a natural consequence business is quite brisk. The Atlantic and Pacific Company are doing a splendid business. They made excellent time on the President's message, receiving it on both their first class wires from the East. Their new Omaha wire is the model wire of the West. There are twenty way offices on it, all of which are doing a good business, and as Omaha and San Francisco business is done over that wire now, it makes it "red hot" all the while. It is to be regretted that the management have seen fit to reduce force and salaries as a means of curtailing expenses, as similar proceedings in this direction heretofore have demonstrated the fact that it is a bad policy, as they cannot

expect to retain skilful employes by this means. Overwork and poor pay won't pay in the long run.

Mr. Minor C. Gross has been promoted from the "mixed trick" to the regular day force in the A. and P. office.

This is a merited promotion to a deserving young man. After an unsuccessful search by an Eastern office for Col. B. patent Fire-arm Company, one of our Western offices suggested the message be delivered to Colt's patent Fire-arm Co.

Indianapolis insisted that it was "cow cars" that an office east of him telegraphed to an office west of here to be returned, but it wasn't, it was coal cars.

A written explanation will be in order and probably the receiving operator requested to "improve on his copy," ha! ha!

Speaking of bulls, here's one which, although a little old, ain't spoiled yet:

A young minister with a sweetheart, and a pastorate with a good salary, waiting for him here in the West, was expecting a certain Synod in the east to ordain him before proceeding to his western home.

The Synod met and lacking sufficient members for a quorum, adjourned over till next day. Our young divine telegraphed as follows: "Synod lacked a quorum to ordain." Imagine the surprise of the sweetheart when the Deacon out here showed her the following: "Synod tacked a worm to Adam," then imagine the consternation of the minister on his arrival in his western home to find a house furnished all but the wife, instead of finding his sweetheart with open arms to receive him.

The mistake was soon tacked on to a plug, and the worm to Adam.

The Quadruplex, I understand, still meets with good success, working between Chicago and Buffalo on all four sides perfectly. Some trouble of course has arisen from time to time, in fact such is to be expected from such a complicated mechanical arrangement, but the W. U. electricians here have shown themselves able to cope with every difficulty that has arisen so far, and declare they will make it work here or "bust."

Mr. Henry, a rising young electrician in the W. U. office at Buffalo, has shown that he understands his business, and knows what a Quadruplex is for. There has been some trouble at various times east of Buffalo, which disarranged matters so that New York could not get Chicago on both sides when sending to them, but Chicago has been able to get New York on both sides and send to him at the same time nearly all last week, thus doing the work of three wires on one.

The regular monthly meeting of the American Electrical Society was held last Wednesday evening at Gen. Stager's room. There were very few members present, but it was demonstrated at this meeting that the affairs of the Society are in a very flattering condition, that all the committees and sub-committees, except one, were working assiduously, and good progress was being made.

Blank applications for membership had been sent out to a large number of well known gentlemen, and they were being received almost daily signed and accompanied with the initiation fee and yearly dues.

The exception mentioned above was the committee on room, Col. J. J. S. Wilson, who had been confined to his house for several weeks, but it is hoped he will soon be able to be around again, when he will succeed in getting a suitable room, after which the society will rapidly grow in interest, and there will then be no lack of members present at every monthly meeting, as the society will begin to collect books, apparatus, etc. It must be remembered it takes time to get such a society as this in fair working order. The English society were nearly a year in getting fairly started, and I am very much mistaken if the society in this country is not in fair working order in a few months. The Committee on Printing made a good report.

Mr. Chas. W. Thayer of the W. U. night force has been promoted to the day report wire, made vacant by Mr. Stone's resignation.

Mr. Snyder, formerly of the P. and A., St. Louis, night force, who has been in poor health until quite recently, is now subbing in the W. U. days, while Mr. Swift is east on account of sickness in his family. Mr. Olin W. Hamilton of the W. U., who has been taking a vacation, has returned looking refreshed.

telegrapher, whether for quadruplex or automatic work.

Those of us who take all the telegraphic journals (and many do in the West) are sick of the slang and libellous abuse which has characterized a certain New York paper in its treatment of THE TELEGRAPHER and its publisher. Such scurrility as characterized its last issue may be appreciated by New York telegraphers, but the responsible publishers and editors may be assured that they are regarded elsewhere as anything but creditable to them. Their animus is so apparent, and the foul source from which they emanate is so well known, that they are having a contrary effect from that intended. The contrast between the spirit exhibited and the editorial on the next page, wherein we are enjoined to "cast off hatreds created in moments of past anger," is striking.

These slanderous effusions display neither "wit" nor "wisdom," but may perhaps come under the other designation of "folly." The friends of THE TELEGRAPHER admire your good sense in refraining from replying to such attacks, and the high ground that you have taken, but they are not going to stand by speechless any longer. Let us be done with such work, and exhibit a manly, or at least a reputable spirit, and not that of a cowardly calumniator or a snivelling child.

Suggested Simplification of Telegraph Rates and Prepayment by Stamps.

CINCINNATI, O., December 24.

TO THE EDITOR OF THE TELEGRAPHER.

PRESIDENT ORTON, in his Annual Report, says, that eventually he may be able to establish but four rates, viz: 25c., 50c., 75c. and \$1 00. Now, if this can be done, why not have a system of stamps for the payment of tolls, enabling Telegraph Companies to dispense with the expense of bookkeepers and a large portion of an auditor's office?

Table with 5 columns: Class (1st to 5th), To Chicago, To Cleveland, To Hamilton, To N. York. Rates range from 65c to \$1 00.

The 1st class (counting every word) to consist of all messages of twenty words or less; 2d class, over twenty and under thirty-one, etc., as follows:

Table with 6 columns: Class (1st to 6th), Description of message length (e.g., not exceeding 20 words, more than 20 and not exceeding 30 words, etc.).

Stamps of the denomination of the rates for 1st class only as above, would be required.

Some one in the Auditor's office will ask how to prevent stealing by dishonest managers and clerks, ways can be devised, but until I discover evidence that my suggestions so far are of value I will not occupy space in your columns with further discussions of the matter.

The Attack on the "Merry Meeting Club."

CHICAGO, Dec. 19th.

TO THE EDITOR OF THE TELEGRAPHER.

AS YOU always seem to be willing to do justice where there is a chance to do so, I hope you will give this a place in your columns.

Your correspondent "Doctor" in a recent number of your valuable paper referred casually to the unjust criticism of one "Cameo," in a sheet called The Operator, in regard to the social club of this city known as the "Merry Meeting Club." It is unfortunate that the "Doctor" did not give a detailed account of this criticism and of the club, as it would have saved my "rushing into print," and at the same time, have given your numerous readers from the Atlantic to the Pacific a better idea of the uncalled for attack.

The reply of "Pawnee," in the same paper, of the issue of the 15th inst., is a scathing rebuke, and meets with the hearty endorsement of the ladies and gentlemen of the fraternity in this section, outside of the Merry Meeting Society, as well as those connected with it.

The Merry Meeting Club was not organized among members of the fraternity, but by ladies and gentlemen outside of the telegraphic ranks, and was not intended as a telegraphic Club. As well might the churches, which some of the better class of the telegraphic fraternity attend and are members of, be called telegraph churches, as this club be attacked and looked upon as a telegraphic affair. A few of the mem-

bers had friends who were in the telegraph ranks, and naturally enough they were solicited to join, and did so. Did this make it a telegraph club?

After the society was formed, one of our first class lady operators was elected Vice-President, and a retired gentleman operator was elected President, but did this make it a telegraph club?

True the Secretary and Treasurer of the club is a telegrapher, but the members of the executive committee are not telegraphers, neither is the backbone of the club, nor a majority of the members telegraphers, but ladies and gentlemen who move in the best society on the west side. Now, if it is not a telegraph club, what business had "Cameo" to write it up in a so-called telegraph operators' paper? He had better write flowery notices of telegraph operators' marriages, as that is about all he has done for the paper so far, except this unwarrantable attack on a social club. Why didn't he write it up in the Kansas papers? 'Twould been just as fitting.

JUSTICE.

Advice to Telegraphers.—Don't Go West.

SAN FRANCISCO, Dec. 15th.

TO THE EDITOR OF THE TELEGRAPHER.

HAVING a few minutes' leisure, I think I cannot employ them to better advantage than by advising the many knights of the key in the East of that ever overflowing evil of going west. I will give you an idea of how the market for telegraphers in this State is overcrowded. I know of three good operators in this city who have been out of employment for three months, and one of which has just started to work on a farm at fifteen dollars a month. The man I speak of is a first class operator, and six months ago worked at 145 Broadway. Another I knew, who remained here until he hadn't five cents, and had to leave his clothes for his board, with the exception of a change of underwear, which, done up in a handkerchief, he threw over his back and started for the mines to work as a laborer. Such is now the state of things in California, and those that now persist in coming out here may rest assured that if they have not a stock of coin ahead it were better that they remain among their friends in the East.

W.

Correction.

OSAGE CITY, Mo., Dec. 22.

TO THE EDITOR OF THE TELEGRAPHER.

IN MY communication of Nov. 24th, in THE TELEGRAPHER of December 12th, there occurred a slight mistake. The illustration should be in a perpendicular position instead of horizontal.

R. J. HEWETT.

Answer to Correspondent.

W. S., Iowa.—The electric light is produced by the passage of a powerful electric current between two pointed pieces of carbon attached to the poles of a large battery; fifty or sixty carbon or Grove cells being necessary to produce a satisfactory effect. Instead of a battery a large magneto-electric machine, driven by steam or other power is sometimes used. The light thus produced is more powerful and intense than any other yet known, but is costly and difficult to manage. Professor Tyndall employed it with great success during his lecturing tour in this country for the purpose of illumination of the diagrams, etc., projected upon the screen, in illustrating the lectures. A full description will be found in Deschanel's Physics and other standard works.

A Merry Christmas for the Gold and Stock Boys.

AFTER the great storm of Dec. 20th, which made such havoc among the telegraph lines in this city and vicinity, the inspectors of the Gold and Stock Telegraph Co., who are mostly old operators, and good ones, turned out and spent a good share of their time during the following week in climbing over house tops, at the risk of their necks, carrying coils of wire, and doing linemen's work generally.

As a slight token of consideration of the extra labor performed, the regular meals missed and the good clothes torn in this volunteer service, General Lefferts generously ordered a distribution of turkeys to take place on the day before Christmas, which was duly carried into effect, and on Christmas eve the various employes of the Gold and Stock might have been seen on the uptown horse cars, the Brooklyn and especially the Jersey ferries, each laden with a large bird, in addition to the usual stock of dolls, hobby horses and toy wheelbarrows, which form a prominent feature of such occasions. There has always existed a very kindly feeling between the officers and employes of the Gold and Stock Company, which incidents like these have a tendency to preserve and strengthen, and it has had the excellent result of retaining permanently in the service of the company about the most efficient and intelligent corps of employes to be found in this country, a fact it is nothing more than simple justice to chronicle.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

ELEVENTH VOLUME.

The Publisher, in announcing the **Eleventh Volume** of
THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year.

All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER

is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to or in the interests of NO TELEGRAPH COMPANY, CLIQUE or COMBINATION, but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE

AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore:

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The Title Page and Index for Volume X.

We had hoped to have got the Title Page and Index for Volume X ready to send out with this number of THE TELEGRAPHER, but shall not be able to do so until next week.

We shall send this number of the paper to those whose subscriptions expired last week, whether their renewals have been received or not, but shall discontinue after this week, those for which renewals are not received before the second number of the present volume is issued.

It is not necessary for those who do not desire the paper continued to send any notice to that effect as the non-receipt of the money for renewal is sufficient notice.

If any of those who are entitled to a title page and index to Volume X should fail to receive it, they can get them on application.

The Eleventh Volume of "The Telegrapher."

WITH this number commences the *Eleventh Volume* of THE TELEGRAPHER. For nearly twelve years a first class telegraphic journal has been sustained in this country by the telegraphic fraternity, and the present volume commences under favorable auspices, and with every prospect of being as successful, if not more so, than any which has preceded it. In no other country in the world has a journal, specially devoted to the interests and welfare of the telegraphic laborers, been possible, and in no other country do these occupy the position they do here. They have a larger choice of employment, and, all things considered, are better compensated than elsewhere, and can with more ease engage in other business if telegraphy does not prove satisfactory and remunerative. For this reason is witnessed that constant abandonment of the telegraph service for other employments, which is going on. This has its disadvantages as well as its advantages, as those who leave the business, as a rule, are the more intelligent and enterprising of its members, whose services are or would become of much value in a business where skilled labor is of so much importance.

In inaugurating a new volume of THE TELEGRAPHER we have no special promises to make. For the past five years this journal has been under its present management, and we think we may justly refer with some pride to its character and the position which it has occupied during that time. That it has met with the approbation of the better and more intelligent class of telegraphers and those interested in telegraphy, we think its continued support by them sufficiently indicates. It has endeavored honestly to represent them, and to present them creditably to the world. It has not pandered to the lower passions and prejudices, but by presenting fairly and justly their claims to recognition of their rights in a candid spirit, has sought to secure for them the best possible treatment from their employers, and the respect of the public generally. It has been its aim to afford instruction and information which should render its weekly issues not only instructing but of real practical value to its readers.

We have not, and shall not favor what may be termed the slap dash style of telegraphic journalism. This may for a time cause the unthinking and inconsiderate temporary amusement and gratification, but it is not beneficial or reputable.

The columns of THE TELEGRAPHER have been in the past enriched by the contributions of the best and most intelligent telegraphers and electricians in the country, and in the future will continue to receive similar favors. Its columns will, as heretofore, be freely opened to the discussion of all telegraphic and electrical questions and matters without regard to persons. Every effort will be made to present each week a complete record of telegraphic news and progress, not only in this country but throughout the world. Whatever shall seem to be of value and importance in telegraphic invention and discovery will be a rly treated. We shall, as heretofore, commend whenever and wherever commendation shall

be deserved, and criticise and condemn when that shall appear to be necessary or proper.

Since THE TELEGRAPHER was first established, and especially during the time it has been under its present management, repeated attempts have been made to destroy or supplant it, but these have always failed hitherto, as they will now and in the future. We propose to attend strictly to our own business, and in our own way, and shall not descend to abuse, libel or blackguardism in response to any attacks which may be made upon us. We shall leave such weapons to those who may see fit to use them. They cannot permanently injure anything or anybody, and the motives which prompt them are usually too transparent for them to have the desired effect.

In conclusion, we would say that the present volume of THE TELEGRAPHER will in no respect be inferior, and in some we hope to make it an improvement upon any which have preceded it. With heartfelt thanks to those who have stood by the paper in the past and given it their countenance and support, we ask all who desire to have maintained a first class independent telegraphic journal to aid us in our task, and by increasing and extending its circulation, and by contributions to its columns, to make THE TELEGRAPHER more useful and successful even than heretofore. Confident from our experience heretofore that we shall receive such aid and support we will, without trespassing further, close, wishing our readers a Happy New Year, and as many of them as may reasonably be desired.

The Telegraphic Prospects for the New Year.

THE year 1875 promises to be one of much greater activity and interest in telegraphic matters in this country than the one which has just closed. The completion of the line of the Southern and Atlantic Telegraph Company to New Orleans is an event of much importance, and enables that company to compete for Southern business with the Western Union Company more effectually than it has hitherto done. It will, undoubtedly, having reached its objective point, proceed to strengthen its system and develop its facilities to a greater extent than it could do until this had been accomplished. It has met with every impediment that could be put in its way to delay, and if possible, prevent its extension, but has finally triumphed over them all, and we expect to be able to announce in our next paper the opening of its communication with New Orleans.

The Atlantic and Pacific Telegraph Company is making arrangements to add largely to its lines and facilities during the coming year. The company is displaying much energy, and is meeting with good success in obtaining business. What the Automatic may do is not yet known, but it is probable that there will be a vigorous effort made to still further develop and extend the system during the present year.

The Western Union Telegraph Company cannot, of course, stand still while its competitors are thus advancing toward a nearer approach to equality in the means for competition in the telegraph business of the country. During the year which has just closed, that company has done but little comparatively in the construction of new lines, but will no doubt resume the work of extension at an early day. The company, notwithstanding the depression in business during the past year, has done very well, in a business point of view. To maintain its present advantage over its competitors, it must necessarily guard as effectually as possible every point, and strengthen those in which it is weak or liable to be assailed.

Upon a review of the field the prospects now seem good for a very lively and active telegraphic business. This will, no doubt, be to the advantage of the telegraphic fraternity by increasing the demand for their services. The struggle between the several systems for rapid telegraphy has become very earnest, as it is apparent that the party which possesses the most practical and economical system of telegraphy will possess a decided advantage in the contest. If the

quadruplex shall prove on thorough trial to possess all the advantages and good qualities which are claimed for it, it will be of great value to the Western Union Company. The figures worked out by Mr. F. L. POPE in the excellent and practical article prepared by him and printed in THE TELEGRAPHER last week do not make as good a showing for the quadruplex as is claimed for it by Mr. ORTON in his official reports. If these figures are incorrect the columns of the THE TELEGRAPHER are open to any one who may desire to demonstrate that fact.

The revival of telegraphic activity will add to the interest and value of THE TELEGRAPHER during the current year. We shall keep our readers fully informed of everything of interest in connection therewith, and shall give to all parties and the different systems which are being experimented with or developed the credit and prominence which they shall be found to deserve.

The Discussion of Fast Telegraphy.

AS WILL be seen from the columns of THE TELEGRAPHER, the discussion of the automatic, duplex and quadruplex inventions and systems is exciting much interest. We are pleased to open the columns of THE TELEGRAPHER to this discussion, as nothing can more interest the telegraphic fraternity, and, in fact, every person connected with telegraph interests, than the development of the best telegraphic system, and that which shall be for the best interest and advantage of all concerned. It will be seen that Mr. CRAIG takes exception to our statement that to operate the "punchers" to the best advantage in practical business will require as much, or nearly as much skill and ability as is required in a good Morse operator, and that such will have to be paid at about the same rates. We do not think that cheap labor, as Mr. CRAIG understands it, can be advantageously employed in Automatic or any other telegraph system, nor do we believe that the success of the Automatic system is to result in driving from telegraphic employment all but a limited number of good Morse operators. However, we do not propose to discuss any of the principles or questions involved but merely to allude to the interest which has evidently been awakened.

We have received another communication from our correspondent, "Morseite," but in consequence of going to press a day earlier than usual, on account of Friday being a holiday, it did not come to hand in season to appear in the present number. We shall print it next week, and have no doubt it will be looked for with interest by our readers.

The American Electrical Society.

OUR Chicago correspondent keeps the readers of THE TELEGRAPHER informed of the proceedings and progress of the American Electrical Society. It gives us pleasure to know that the work of organization is progressing satisfactorily. Much time and labor is necessarily involved in getting such an association into good and complete working order, but we believe that this work is being very thoroughly done, and the society will bring forth good fruit in due season.

Blank applications for membership may be had of the officers of the society, and it is hoped that the society will have enrolled upon its books a large proportion of the intelligent electricians and telegraphers of the country.

Compound Telegraph Wire in England.

MESSRS. SIEMENS BROTHERS have made arrangements with the inventors of compound telegraph line wire to manufacture it at their extensive works in London. This firm have extensive works for the manufacture of telegraph apparatus, cables, wires, etc., at Woolwich, England, and at Berlin, St. Petersburg, and Tiflis. They have used the compound wire extensively in carrying out contracts for construction of lines in European countries, and recommend it to their custom-

ers and the public generally as the best for telegraphic purposes, and find it necessary to establish its manufacture at their own works to supply the European demand.

Tillotson & Co.'s Christmas Distribution.

MESSRS. L. G. TILLOTSON & Co. did not omit their usual distribution of turkeys, etc., to their numerous employes this year. For a day or two before Christmas a visit to the subterranean regions of their establishment at No. 8 Dey Street, would have given the visitor the impression that he had dropped into a poultry shop. It takes a large quantity to supply all their employes with the materials for a good Christmas dinner, but there was this year, as heretofore, abundance thoughtfully provided for this purpose.

The business of this leading firm deservedly increases from year to year and the good will of their employes (as well as of their customers) is secured by just and liberal treatment from their employers.

The Western Union Office in the Cotton Exchange.

WE are informed that there were some errors in the account of the Western Union Telegraph office which is located in the Cotton Exchange Building.

MR. EDWARD A. JOHNSON is the Manager of the office, and has been since it was first opened. There are seven operators, fifteen instruments, and twenty four wires in the office.

Personals.

MR. W. W. WELLS, late of the Louisville, Cincinnati and Lexington, has been appointed train despatcher to the Mississippi Division of the New Orleans, St. Louis and Chicago R. R.

MR. J. E. REEVES has been appointed master of trains and superintendent of telegraph on the Louisville, Cincinnati and Lexington R. R., and will have charge of the telegraph lines, and of the movement of motive power and rolling stock on the road. He succeeds Mr. W. W. WELLS, resigned.

MR. WM. R. McDONALD has resigned his position with the Western Union Company, at Little Rock, Arkansas, to accept a position with the same company at St. Louis, Mo.

MR. C. E. SMALLS, ex-manager of the Western Union office at Atchison, Kansas, has been appointed manager of the Denison, Texas, office of the same company, in place of Mr. H. C. MAHONY, who returns to St. Louis, Mo.

MR. F. W. GRIFFIN, of Topeka, Kansas, has been appointed manager of the Atchison, Kansas, Western Union office.

MR. LUTHER L. SMITH, of St. Louis, Mo., has accepted a position with the Western Union Company at Omaha, Neb.

CHARLEY DAY, of the Western Union office, at St. Louis, Mo., was the recipient of a very handsome "air gun," on the evening of the 26th December, presented by his friends in St. Louis, Mo. Mr. JOHN L. CASSIDY made the presentation speech, to which CHARLEY responded in a very eloquent manner.

MR. WM. FLITCROFT, formerly messenger at Paterson, N. J., for Midland Telegraph Company, has been promoted to the position of night operator at Wortendyke, N. J., station of the same company.

MR. J. J. WORTENDYKE has been appointed agent and operator, Midland Park, N. J., office of the Midland Telegraph Company, vice Mr. E. A. THOMPSON.

The Telegraph.

The American District Telegraph Company.

IN obedience to the orders of the President, all employes of this company will appear in full uniform on and after January 1st. The uniform of superintendents and managers will consist of a blue suit—Prince Albert coat; vest and pants, the rank being indicated by the color and arrangement of buttons.

The day and night office police will wear a blue sack coat, vest and pants; while the uniform of the night patrol will be similar to that of the city police. All line men will wear a uniform cap, each cap being properly numbered in front and the figures surrounded by a silver wreath. Shields will be worn outside. The but-

tons used on the uniforms are ornamented with a design in relief, representing one of the company's messenger boys. The uniforms were designed by the superintendent, and manufactured by Messrs. Jessup & Co.

All of the circuits of the American District Co., with but two exceptions, between Central Park and the battery, were prostrated by the storm of Dec. 21st. The whole line force, consisting of some 15 men, were ordered to report Sunday night and hold themselves in readiness to commence the work of reconstruction. By the following Wednesday night all the circuits were in working order.

Over 700 calls were answered in the 31st district office, at 946 Broadway, during the 24 hours ending at 8 A. M. Dec. 25th. The whole force of messengers, 425 in number, were kept constantly on duty in all the offices, and yet the facilities were inadequate to properly perform the great amount of work so suddenly thrown upon the company in consequence of the holiday season.

A Heavy Rental.

THE Western Union Company have for many years leased an office in the Fifth Avenue Hotel, in this city, at a rental of \$1,200 per year. The lease expired in August last, when a proposition was made to the proprietor of the hotel, by Mr. J. W. Burnham, who was for many years manager of the Western Union office, to open an office in the hotel in connection with the Atlantic and Pacific lines. Negotiations to this effect were carried on for some time, but were finally terminated by the Western Union Company agreeing to pay \$5,000 per annum for the exclusive right to maintain an office in the hotel. The payment of this large sum to keep the Atlantic and Pacific Company out of this excellent business stand would seem to indicate that they are beginning to be regarded as a dangerous rival. If the precedent thus established should be followed by the other first class hotels in the city demanding a proportionate increase in the rental of the telegraph offices located therein, it would be likely to prove rather an expensive operation for the Western Union.

Foreign Telegraphic Notes.

IN consequence of the loss of the La Plata, the cable steamer Sydney Hall, under charter by the Montevideo Brazilian Telegraph Company to proceed to the River Plate to complete the communication in concert with the La Plata, is detained in the Thames until another steamer can be despatched by the Platino-Braziliera Company.

As showing the extensive use to which the electric telegraph is now applied in the transmission of news for the daily and other papers, it may be stated that one of the Scottish papers—the *North British Daily Mail*—received by wire eight columns of extracts from the Life of the Prince Consort, and which appeared in its columns the morning after the publication of the work.

The number of messages transmitted by the Cuba Submarine Telegraph Co. for the month of October, 1874, was 1,794, estimated to produce £2,000, against 859 messages which produced £896 in the corresponding month of 1873.

The directors of the Anglo-American Telegraph Co. have resolved to pay the usual *interim* dividend of 1½ per cent., free of income tax, for the quarter ended Dec. 31, 1874.

The traffic receipts of the Submarine Telegraph Company for the month of November, 1874, amounted to £8,563; for the corresponding month last year £9,012.

The directors of the Brazilian Submarine Telegraph Company (Limited) have declared an *interim* dividend for the quarter ending September last, of 2s. 6d. per share, or 5 per cent. per annum, free of income tax, and payable on Thursday, the 24th inst.

The Eastern Telegraph Company announce the usual *interim* dividend of 2s. 6d. per share for the quarter ending Sept. 30, 1874.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ending Dec. 5th, 1874, was 354,418, an increase on the corresponding week of 1873 of 15,319.

The Eastern Telegraph Company announce that agreements have been completed with the French Government, her Majesty's Postmaster General, and the Submarine Telegraph Company, by which they will be immediately placed in possession of a special wire between London and Marseilles, to be worked by the company's own clerks. The new line is designed expressly for the traffic between Great Britain and Egypt, and the transit of messages will now be greatly accelerated.

The traffic receipts of the Great Northern Telegraph

Company for the month of November last amounted to 63,152 fr., and for the month of September, 1873, to 316,616fr.; increase, 46,536fr. The total traffic receipts from Jan¹ to Nov. 30, amounted to 4,133,552fr. (£165,342), and for the corresponding period of last year to 3,065,184fr. (£122,607), showing an increase of 1,068,368fr. (£42,735.)

Western and Brazilian Telegraph.

THE report states that the several sections of the company's cables were completed as follows: Para to Pernambuco, 6th September, 1873; Pernambuco to Bahia, 11th December, 1873; Bahia to Rio de Janeiro, 24th December, 1873. These cables are all in thoroughly satisfactory working order. Owing to the unfortunate loss of the Steamship Gomos in May last, and the lamentable wreck of the Plata, lately reported, communication has only been extended to Rio Grande do Sul southwards by the Platino-Braziliera Company. Arrangements are, however, in progress for the speedy completion of the short section still unlaidd, which, when finished, will complete cable communication with the River Plate. The shareholders are aware of this company's agreement with the Platino-Braziliera Company, by which all the cables between Rio de Janeiro and Montevideo, when laid, become our property. Upon completion of their line as above the agreement of the 23d of May, 1873, will come into force. The cables of the Central American Telegraph Company (Limited), between Para and Demerara, have been laid to Cayenne, and the necessary cable to complete the communication has left England. The extension of cable communication to the River Plate and the opening of the lines between North and South America will undoubtedly prove additional sources of revenue to this company. Working agreements have been completed with the Brazilian Submarine Company, the West India and Panama Company, and the River Plate Company, by which all the traffic passing over the lines of these companies for South America is secured to this company. Although for some months only one section of the cable, was laid and at work, and communication with Europe was not opened until the 22d June, 1874, from the opening of the line in September, 1873, to the 30th of September last, the total amount of receipts was £70,473, of which £43,917 belong to this company. From that date the receipts continue very satisfactory, being £23,298 up to the 4th inst.

The First Social Union of the Telegraphers of Cincinnati, Ohio.

THE first social union of the telegraphers of Cincinnati, Ohio, was held in Telegraphers' Hall, in the Western Union Telegraph Company's building, corner of Fourth and Vine streets, on the evening of Monday, Dec. 21st, last. This was intended to be the first of a series of annual or semi-annual social telegraphic reunions, and was a very successful affair.

Messrs. C. Selden, W. J. Lawler, J. C. Matton and J. C. Hall were the Committee of Arrangements. Mr. E. Baker was chief Master of Ceremonies, and Mr. A. M. Paddock, assistant chief. The Floor Managers were Messrs. W. Fellows, C. E. Higden, J. Evenman, E. T. Applegate, W. G. Peudeny, J. J. Grant.

A select party of ladies and gentlemen, most of whom are connected with telegraph interests in the city, were present, and all seemed to enjoy the occasion fully.

The social reunions of telegraphers should be more frequent, and, if properly and liberally managed, may be made not only pleasant but useful in cultivating a closer fraternal feeling.

THE telegraph line over the new section of the Flint and Pere Marquette Railroad, from Reed City to Ludington, Mich., is nearly completed.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: Dec., WESTERN UNION, ATL. AND PAC., AMER. DIST., GOLD AND STOCK. Rows show dates from Dec 23 to 29 with bid/asked prices.

THERE is a great tendency to ridicule that which we do not understand. Fortunately the scientific man has the laugh on his side. He gains much more amusement from the ignorance of the unscientific than the unscientific, though in the majority, do from the hard names, queer subjects and petty minutiae which apparently monopolize the time of the physicist.—W. H. Preece.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended Nov. 17, 1874, and bearing that date. 157,002.—ELECTRIC FIRE ALARM SIGNAL BOXES. Zeroy P. Hotchkiss, Richmond, Ind. Filed Aug. 14, 1874.

Circuit wheel held stationary by a lug on bolt if locked; key applied to this lock releases wheel, but is itself held in the lock till a second lock is operated by a key held by an officer of Fire Department. The manipulation of second key releases first key, and rewinds the spring. A trigger on a sliding plate may be brought into path of pins on side of circuit wheel to give a second set of signals.

- 1. A combination of locks, one permitting, by the application of a suitable key, the turning in of an alarm, the said key being thereby fastened until released by the application of a key to the other lock. 2. The combination of the door lock M and spring H with an arbor, I, common to both, and adapted to cause the rewinding of the spring in the act of locking or unlocking the door. 3. The sliding guard N, in combination with the spring O, for elevating it, and the cap plate connection O2 P2, for retracting the said spring. 4. The combination of spring catch N2 and projection N3, for securing the guard plate N in its uppermost position, substantially as set forth. 5. The slide R2 and trigger R, in combination with a secondary series of pins or projections upon the section wheel for the purpose set forth. 6. In combination with the door lock M, spring H, and arbor I, the double ratchet plates K K2, connected to impart a winding movement to the spring in one direction, and to permit the free movement of the key in the other direction.

157,003.—ELECTRIC BELL STRIKING APPARATUS. Zeroy P. Hotchkiss, Richmond, Ind. Filed Aug. 17, 1874.

Momentary breaking of circuit releases an armature from a magnet in main circuit. The initial movement of this armature closes a local circuit to a magnet acting on rear end of lever, causing its full movement, and consequent release of the detent arm of the striking machinery.

- 1. The combination of the governing arm 3, spiral shaft 2 drum 5, and the worm wheel 1, with ratchet wheel or teeth 8, spaced at double the distance of the threads of the endless screw 2, so as to retract the bell hammer in two revolutions of the said screw. 2. The combination of the armature lever 19, and governing arm 3 with a suitable battery, electro-magnet 16, and connections 20 21, to cause the tripping of the governing arm by the continued movement of the lever under the influence of a local circuit, which is closed by the initial movement of said lever. 3. The combination of the governing arm 3 with suitable mechanism for driving it, and a tripping mechanism causing it to break the electrical circuit by which it is tripped. 4. The combination of the armature lever 19, the two magnets 16 16c, the back spring 22, and electrical connections 20 21 23 24 25 32 with the battery B and main and local circuits, to effect an intermittent or alternate movement of the armature lever, in manner substantially as set forth. 5. The combination of main and local circuits with a battery, B, armature lever 19, and magnet 16, to cause an initial movement of the said lever by the current in the main line, and a further movement in the same direction by a current in a local circuit closed by the said initial movement. 6. The combination of the spring 4, guides 14, stop 15, and pins 20 21 with the revolving arm 3 and armature lever 19, operating to trip the said revolving arm and bring it to rest at the same point after each revolution. 7. The stop 13, in combination with the lever 9 and ratchet-wheel 8, for the purpose set forth.

For the week ended December 1, 1874, and bearing that date.

157,299.—ELECTRO-MAGNETS FOR MOTORS. Winfield S. Simms, Newark, N. J. [Filed Dec. 20, 1873.]

An electro-magnet for an electro-magnetic motor, provided with a supplemental core or mass of iron connected therewith opposite to the pole used to generate motion, as and for the purpose specified.

Born.

HUNTINGTON.—To Mr. GEO. E. HUNTINGTON, of Saginaw City, Michigan, at seven o'clock A. M., December 22d, 1874, a daughter. The first issue. We hope he will continue to do as well in the future.

Died.

MYERS.—At Brooklyn, N. Y., December 23d, 1874, CHARLES K. MYERS, of the New Sandy Hook Telegraph Line, after a short illness.

Obituary.

CHARLES K. MYERS.

CHARLES K. MYERS, one of the oldest telegraphers in the country, died at his residence after a very short illness, in Brooklyn, on the morning of December 23d, 1874, aged fifty years. Mr. MYERS commenced his telegraphic career as operator on the Semaphore Marine Telegraphic Line, between New York and Sandy Hook, about 1848.

In 1851 the present magnetic line, worked by the Western Union Telegraph Company, was constructed, and a lively opposition continued until 1857, with which Mr. MYERS' great popularity with the merchants enabled the semaphore to hold out much longer than it otherwise could against the superior magnetic system. When the lines were consolidated and the management passed into the hands of the American, now Western Union Company, the semaphore was abandoned, but Mr. MYERS

soon mastered the magnetic system, and continued his connection with the Western Union Company until the new line to Sandy Hook, by the Merchants' Exchange, was projected, when he became connected with that enterprise, but death overtook him before he had really entered upon his new duties. Under the various managements of the Marine Telegraph business he enjoyed the full confidence and esteem of his employers, and his universal urbanity of manner endeared him to all who came in contact with him in business or otherwise. No one in his sphere will be more missed. Until the evening before his death his physician did not consider him in the least dangerous, and when informed that he had but a few hours to live, and in answer to an interrogatory by his minister, his reply was, "I am ready."

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS

of every description, at

No. 64 SOUTH FOURTH STREET,

(Corner Chestnut street,)

PHILADELPHIA.

They solicit the patronage of their friends and the telegraphic fraternity generally.

ECONOMIZE!

Procure the best and cheapest Telegraph and Electrical Instruments and supplies of all kinds from,

LANNERT & DECKER, 31 1/2 Prospect St., Cleveland, O. Send for circular.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET; or to L. G. TILLOTSON & CO., 8 Dey street, sole Agents.

CHAMPION BURGLAR ALARM AND ANNUNCIATOR COMPANY,

40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skilful mechanics to estimate upon work, or will give any information in writing that may be required. Liberal commissions will be paid upon any orders that may be secured for us. Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

L. G. TILLOTSON, President. CORNELIUS ROOSEVELT, Secretary and Treasurer, 40 West 18th Street, New York.

GEOURGE H. BLISS & CO.,
41 Third Avenue, Chicago, Ill.
CINCINNATI, O., ST. LOUIS, MO.,
Elm St., cor. 5th. 409 North Third St.

TELEGRAPH INSTRUMENTS AND SUPPLIES.

- RELAYS, unequalled for beauty and strength;
- COMBINATION SETS; BOX and POKET RELAYS.
- CHALLENGE, PONY and REPEATING SOUNDERS.
- KEYS, various styles, including the SCHNEIDER KEY, just out, no legs, wire connections above the table.
- REGISTERS, with SPRINGS OF WEIGHT.
- CUT CUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.
- REPEATERS—HASKIN'S AUTOMATIC, and others,
- SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.
- ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.
- ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.
- ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.
- MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.
- BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.
- WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.
- INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.
- BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.
- TELEGRAPH STATIONERY—REFOURER, MESSAGE and MANIFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

SOMETHING NEW!

[PATENTED SEPT. 29, 1874.]

THE FAIRY ELECTRIC ENGINE.

A perfect working model of an engine
Run by Electricity!
It will work well with an ordinary local battery.

Price, with two cells' Eagles' Metallic Battery..... \$5 00
" without Battery..... 4 00

May be seen working at the office of the THE TELEGRAPHER.
For sale by

The Electro-Magnetic Manufacturing Company,
36 BROAD STREET, NEW YORK.

P. O. Box 1804.
Also for sale by
L. G. TILLOTSON & CO., 8 Dey street.
F. L. POPE & CO., 38 Vesey street.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Original Article.

Friendly Notices and Reminiscences of Operators
Now or Formerly on the Atlantic and
Pacific (California) Line.

THE peculiarities of telegraph operators have furnished many interesting paragraphs for THE TELEGRAPHER heretofore, and the following in regard to operators now or heretofore on the Atlantic and Pacific (California) lines will be recognized by, and perhaps prove of interest to many of your California readers.

There was, for instance, Laven, "old Jim Laven," as he was familiarly known among his fellows. When taking report he would draw his chair up so close to the table that it would squeeze a person not used to it uncomfortably. Then he would have from three to half a dozen pencils lying around handy, all nicely sharpened ready for use. When working on the line he was all business, rarely making any conversation over the wire, "yes" or "no" being the extent of his remarks. He was a good fellow, withal, and a first rate operator. When he left to engage in more remunerative business the telegraphic profession lost an honored member, and one who was an honor to it.

Mr. Thos. R. Knox, better known, perhaps, on the line as "Tom Knox," deserves mention among those who were once familiar to California telegraphers. He was a good report operator. When working nights he usually wore a huge pair of goggles, which imparted to him a weird and unearthly appearance. He was loquacious, and would tell amusing and laughable stories and copy report right along by the hour. Knox and Harry Bennett used to have some terrible scoring up when they got started. Knox will verify this for any of his eastern friends who may have the curiosity to inquire about its correctness. He left us a long time since, regretted by all.

The Thomases are not yet exhausted, and I will next devote a few lines to Tom Lee. It is almost an impossibility to rush Tom, for he won't be rushed. He will scratch it down in his own peculiar manner, no matter how fast you may send to him. He is not much of a talker, but what he does say is to the point, and he has a way of crooking his fingers when writing till they resemble the famous "Grecian Bend," but makes a good copy nevertheless.

An old war operator, "Art. Jonesy," takes report in San Francisco office. As "Art. Jonesy" is rather an uncommon appellation, even for a telegrapher, I will endeavor to elucidate. "Art." as the readers who are telegraph operators will know, is the abbreviation for "all right." Not long ago Jones was made the victim of a "goak." Sometimes in sending, Ogden would open his key while waiting for copy, and Sacramento, improving these chances, would tap on the amateur of the relay on the east side of the button, "Art. Jonesy." As a wire couldn't very well be all right and dead open at the same time, Jonesy came to the conclusion it was some plug breaking in to interrupt report, and he determined to discover the culprit or perish in the attempt. Accordingly, he called up Winnemucca, which is between Sacramento and Ogden, and asked which side of him it was. Of course, Ogden hadn't heard it at all, but not wishing to appear inattentive to business, promptly replied "east." Jones was more than ever convinced that it was a "fritc gersc's" doings, and was quite wrathly until Sacramento explained.

A stranger would never suspect that "V. C." was taking report, for Ed. Pearson hangs out there, and he never breaks on report. He answers his call, and that is the last that is heard of him that night. It is sometimes amusing to listen to the rapid senders spreading themselves in endeavors to make him break, but their attempts usually prove futile.

Mr. Samuel Kimber sends report from Ogden, and makes good time. "S" is a queer one in some respects; seldom talks much, and whiles away the time between early and late reports with a game of "draw" with the boys, in which he generally comes out ahead. The only drawback to Sam's chance of promotion is a story that has been put upon him that he "froze out" a division superintendent one night on a little game.

On the day force in Sacramento office may still be found Harp Prays, one of the old timers. Harp has an

eye open for discipline, and if any of the boys on the line fail to come up to the mark, the offender will be very likely to hear from P.

The position of chief operator at Sacramento is held by Billy Wilder. He makes a beautiful copy and can write with almost lightning rapidity, and at the same time his copy is perfectly legible. As he has settled down to his position like an old stager in harness, we don't expect to hear of a vacancy there unless through promotion, till grim death steps in and claims him for his victim, which we all hope will be a long time hence.

In the same office may be found Marks. He is a cool, self-possessed individual, and nothing disturbs his equanimity. He never gets out of his regular jog trot style of sending. "Stox" have no enlivening influence for him. He turns out a good clean copy, and is not much of a talker.

Bennett sends quotations from "S. B.," while the Stock Board is in session, and then takes his trick at No. 2 wire in San Francisco. It pleases Harry greatly to get hold of some poor fellow and rush him half to death, and frighten him the other half if he breaks. He is a very rapid sender, and gives all the boys a hurrying up once in a while. Benny works No. 3 stock wire to Virginia with Newt Boydston. He is a good operator and a perfect gentleman.

Boydston is also a first class operator. He will sit with his legs crossed, fight circuit and smile complacently, while some man who imagines the circuit belongs to him is vainly battling for his rights—vainly, because Newt never gives it up.

On the whole Mr. Vandenberg has good cause to be proud of the *personnel* of the lines under his superintendence. K. O. T. K.

Recent Legal Telegraphic Decisions.—Rights,
Obligations and Responsibilities of Tele-
graph Companies—Telegraph Laws of
Ohio.

A DECISION has been given by Judge Marsh, at Zanesville, Ohio, in regard to the right of a chartered company to set telegraph poles on a street. The points are as follows:

First.—The Legislature has the power to authorize the companies to occupy the highways of the State with their telegraph lines erected on poles.

Second.—The dedication of a street must be held to include a use of all such improved methods of transportation and transmitting intelligence as future improvements may require, subject to the rule that no one method of travel or transit shall exclude any other, or interfere with its free exercise.

Third.—The original dedication contemplates all needed improvements, and a special injury must be shown before an injunction in any case can be granted.

The right of an individual to erect wires along a highway was disposed of, the Court saying that without a special act of the Legislature he could not do so. Several Supreme Court decisions were cited bearing upon the case, all of which justified the court in its decision.

In the Supreme Court of Minnesota, in the case of *Beaupure & Kelly vs. The Pacific and Atlantic Telegraph Company*, appellant. Syllabus of decision filed. The plaintiffs, merchants in St. Paul, wrote to R., a wholesale dealer in pork in Dubuque, Iowa: "Have you any more northwestern pork or prime mess, also extra mess; telegraph price on receipt of this." R. telegraphed in reply: "Letter received. No light mess here. Extra mess twenty-eight, seventy-five." On the 15th of July the plaintiffs, having received R's dispatch, delivered to the defendant at St. Paul, at about six o'clock P. M., the following message, addressed to R., with the request to forward it without delay: "Dispatch received. Will take two hundred extra mess, price named." The defendant undertook to forward the message, having no other information of its nature or object than was afforded by the message itself, but negligently delayed sending it until the 19th of July, and did not inform the plaintiffs of the delay. Between the 16th and 19th of July the market price of pork advanced, and the plaintiffs were compelled to supply at the advanced price. Held that the plaintiffs were entitled to recover the price paid for the message but not for any loss resulting from the advance in price of pork, the damages claimed on this account not arising naturally from the defendant's breach of contract, and not being such as may reasonably be supposed to have been contemplated by the parties when making the contract, as the probable result of the breach. Judgment of the court below modified so as to conform to the report of the referee. Opinion by Justice Young.

In the Supreme Court of Louisiana, in the case of the *Bank of New Orleans vs. Western Union Telegraph Company*.—From Fourth District Court. The defendant was employed to furnish plaintiff with daily reports indicating fluctuations of the New York money market. On the second of November, 1869, they delivered a

telegram reporting gold at 12 M. at 128½, whereas, the true rate was in New York at that hour 127½.

Plaintiffs allege that they lost by the telegrams \$1,733.16 in buying foreign exchange, \$173,816.15, for which they sued and obtained judgment for the amount prayed. The allegations of plaintiff were fully proven. The defendants, however, contend that the error in the telegram was no fault of theirs; that the information conveyed was taken from the indicator of the Gold Exchange of New York, and that the error occurred in the working of the indicator. It is true that the error so occurred in the instrument placed for defendant's convenience in their office at New York, but this does not exonerate them from liability, because by contract they were bound to convey correct information, which they could have obtained without relying on the indicator; this they failed to do. Judgment affirmed.

The Society of Telegraph Engineers.

The annual meeting of this Society was held on Wednesday evening last, the 9th inst.

Mr. Latimer Clark, Vice President, took the Chair.

The annual report of the Council was read by the Secretary, Mr. G. E. Preece. It stated that an accession of 131 members of all classes had taken place during the year, and showed the Society to be in a most satisfactory and prosperous condition. The council had to record the loss of Mr. Ricketts, one of the first members of the Society, who had met with an untimely end through the foundering of the steamship *La Plata*.

The Chairman expressed the sympathy of the Society with the families of those electricians who had perished in the *La Plata*. One of them (as stated in the report), was a member of the Society, and another was a relative of the President, Sir William Thomson. He hoped that all the members would subscribe to the fund which was being raised to help the bereaved families.

On the motion of the Chairman it was resolved that the report be adopted and printed.

A ballot was taken for the officers and council for the ensuing year. Mr. Langdon and Mr. Von Truenfeld acted as scrutineers. The following is the result as far as regards the officers of the Society:—President, Mr. Latimer Clark; Vice Presidents, Prof. Abel, Mr. Culley, Prof. Foster and Mr. Walker; Treasurer, Major Webber; Hon. Sec., Major Bolton.

Mr. Walter Hancock moved "that the best thanks of this Society be accorded to Prof. Sir William Thomson, F. R. S., for the manner in which he has filled the chair during the past year, and for the assistance that he has afforded the Society in furthering its proceedings." He said that he was sure that the motion would meet with the most cordial acceptance on the part of every member. The name of Sir William Thomson was a household word amongst electricians and other scientific men. He had conducted laborious investigations into the speed of the transmission of messages, and devised the most marvellous and beautiful instrument, the reflecting galvanometer, and also that very wonderful and simple instrument, the quadrant electrometer; and these three achievements were such as would stamp him for all time as a man who had left his mark on electrical science, and a most useful and indelible mark on telegraphy.

Mr. Sievwright seconded the motion, and spoke in the highest terms of the help and advantage which the Society had derived from Sir William Thomson during his presidency.

The motion was carried by acclamation. Colonel Stotherd moved "that the thanks of the Society of Telegraph Engineers be accorded to the President and Council of the Institute of Civil Engineers, for their continued liberality and kindness in affording this Society the free use of this magnificent hall, and the other apartments of the building."

Major Webber seconded the motion. He said that he hoped that the day, which was shadowed forth in the report, when they would have a hall of their own, was very far distant, for he felt sure that they would never get such a comfortable place as that in which they were now assembled. As treasurer, he thought that he could say that that day was really a distant one. (Laughter.)

The motion was carried unanimously. This concluded the business of the annual meeting.—*The Telegraphic Journal*.

At the meeting on Thursday, December 17, 1874, of the Western and Brazilian Telegraph Company, the directors' report, which is of an encouraging nature, was adopted. The chairman, Mr. John Hengh, was enabled to make the welcome announcement that, in the short time which has elapsed since the making up of the accounts, the receipts have been so satisfactory as to enable the directors to declare an interim dividend at the rate of 5 per cent. per annum for the three months ending the 31st of December instant, payable on and after the 15th instant.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

The "Other Side" Again.

TO THE EDITOR OF THE TELEGRAPHER.

If you will again allow me, I would like to review Mr. Pope's communication in THE TELEGRAPHER of the 26th instant. First, let me say that whatever criticisms I have made upon THE TELEGRAPHER'S course in this matter, have been entirely of a friendly character. I have no criticism to make upon the editorial comments touching my former article, except to say in regard to the statement, that, "In case of the interruption of a wire from crosses or breakages, that the accumulation of business can be worked off in a short time, etc.," and (in substance) "that the strips can be prepared during the interruption; that were this granted, the employes, at the receiving office would be, relatively, as badly swamped as under any other system. Suppose a force of ten copyists had enough business to keep them constantly employed, the wires are interrupted, for, say two hours, would not the entire day's business be delayed two hours, as well as by other modes of telegraphy, no matter how soon it passed over the wire?"

It matters little to us who invents quadruplex telegraphy. It is with the system itself that the interest of telegraphers lie—not the inventor.

With all due deference to Mr. Pope, I must say that, evidently, his figures in regard to Morse work are in confusion. He takes the transmission of the President's message as a fair specimen of what a Morse wire can do. Does he consider the fact that those wires were distributing the message to at least two intermediate offices? and that some of those offices were hard pushed to get men of fair ability to man those wires? Consequently the 1,368 average is not so poor as it might at first appear.

Again, Mr. Pope puts the average of messages at twenty words and only concedes fifty of those per hour upon a single wire, making a total of 1,000 words, or less than 17 words per minute over a through circuit, with first class operators! I, myself, have worked an average of nearly double that amount, therefore, I speak from experience.

I claim that messages will average over 30 words each, counting 1 for number of message, 3 for date, 4 for signal, "20;" and name, 3 for number and street, 2 for destination and State, 3 for signal "sig," and name, and 2 for check, making 18 words not paid for (longer names than I have allowed, in estimate, will compensate for messages without street in address). Every practical operator is well aware that, in regular business, the words counted and paid for will average over ten.

With a 20 word average, 90 messages, or with 30 words allowed, 60 messages per hour upon a single wire is practicable, thus making a total of but 1,800 words or 30 words per minute. About two years since Messrs. Dwight and Catlin, of the Western Union New York office, working with Boston upon a duplexed wire (while doing regular business), handled 151 messages, of a regular average, in a single hour; making an average for each of over 2,200 words.

Over 2,500 words have been transmitted (by Morse) and copied within an hour, on test occasions; but, of course, such speed is not practicable, and few could accomplish it.

We will take Mr. Pope's figures as to the cost of a single wire, viz. \$21.29 per day, allowing 90 messages per hour, of a 20 word average (equaling 60 messages of regular length), we have for

8 hours 720 messages, costing.....	\$21 29
Cost per message, single circuit.....	.0296
" " duplex ".....	.021
" " quadruplex ".....	.016

(I use the 20 word average to compare with Mr. Pope's 20 word average in automatic estimate.)

According to the above, a message can be transmitted at a cost of .016 by quadruplex, against a cost of .0101 by automatic, as Mr. Pope figures it.

The pay of the employes of the automatic system as stated by him, appears to be fair, excepting that of the copyists. If girls are to learn to read strips and copy on type writers, they will certainly come under the head of skilled labor and will have to be compensated accordingly. It strikes me that it will require as much skill to handle the type writer and read from strips, as is necessary for the ladies of the Gold and Stock Telegraph Co. to have, and they are paid (at the lowest, I think), about \$2.30 per day.

I am inclined to doubt the attainable speed of a copyist being as high as 1,500 words per hour. The characters are never as quickly read as manuscript or

print. Mr. Pope only concedes 1,738 words per hour to a printing circuit, with skilled operators, reading from manuscripts; but he thinks girls at \$1.50 per day can read the characters and finger each letter upon a type writer at the rate of 1,500 words per hour!

Again, suppose it is necessary to work a wire that "swings" occasionally, what is to become of the automatic copy then? Certainly the receiving operator cannot read and follow the instrument at the rate of 20,000 words per hour. A swing might spoil a word or two, and the error not be detected until it reached the hands of the copyist, how much time would be lost hunting up and retransmitting the portion lost? An occasional swing would, apparently, almost annihilate automatic working. With the duplex or quadruplex, when a word drops out, from a swing or other causes, it only requires a break (at the time) to correct it.

In long circuits repeaters can be used for the duplex and quadruplex, and they work much better than repeaters on single wires. I am not informed as to the distance the automatic will work successfully.

Another valuable feature of the quadruplex is the fact that three or more independent double circuits can be worked on the same wire. On a test, New York and Chicago worked a double circuit, New York and Buffalo another, and Buffalo and Chicago a third, only one wire from New York to Chicago being used for all three.

If, as Mr. Pope says, "the number of routes carrying business enough for the quadruplex is not very great," why will not this assertion apply to the automatic as well?

Summing up the whole matter, I find that the quadruplex will transmit messages at a cost barely exceeding that of the automatic upon its best showing, and day by day I think it will be found cheaper, everything being considered.

I am aware that all we can say will not hinder the ultimate adoption of the most simple and economical system of telegraphy, but I think that the automatic fails to fill the requirements more completely than the quadruplex, that requires no change in the methods of doing the business as already established. Then, if it costs no more, it is worth something to keep the business entirely in the hands of skilled labor rather than put part of it into the hands of those so near childhood that they can only command \$1.50 per day, on the ground of accuracy, if nothing more.

If the automatic system will tend to diminish rates for the service, so, equally, will the quadruplex, if it will, as I think, perform the work as cheaply considering the entire average day by day.

MORSEITE.

The Actual Performance of Phelps' Combination Printer.

NEW YORK, January 2.

TO THE EDITOR OF THE TELEGRAPHER.

In Mr. Pope's communication of last week, by giving 20.1 as the average number of words per message, I fear he commits an error which materially injures the character of his calculations.

My object, however, is only to refer to the error where it involves the performance of the Phelps combination Printing instrument.

The peculiar principle of that instrument is such that there can be no significant deviation in the speed of operating it from hour to hour. Its operation is something after the fashion of the treadmill, where, if the animal stops, its legs pay forfeit; so, if the operator stops, the instrument "runs out," and as it runs at a uniform rate of speed throughout the day, a uniform rate of transmission is necessarily maintained. Mr. Pope's observation that "the rate of speed at which wires are actually worked is a matter of endless dispute," cannot, therefore apply to the instrument in question.

The facts in regard to the Phelps Combination Printing Machine are, that in its daily working the year round, it transmits at the rate of not less than 86 messages, or 2,752 words (in messages) per hour. It will be seen that I give 32 as the average number of words per message. This average is arrived at by an actual count of the messages themselves, which must be admitted a more accurate method than taking the result of an unusual exertion over a single wire as the divisor, and an average made over eight wires as the dividend.

In the transmission of press matter a still higher rate is obtained, and a person visiting the W. U. office at night may witness the receiving of press at all the way from 50 to 58 words per minute, or at the rate of over 3,000 words per hour.

The Automatic perforating machine cannot, therefore, as Mr. P. claims, "certainly be fingered much faster than the Phelps Printer," unless it exceeds "50 words per minute" and "2,000 words per hour."

The Phelps instruments are now, and have been for years, run at an average speed of 190 revolutions per minute, 1½ letters being the average obtained per revolution. gives 285 letters, or (5 letters to the word) 57

words per minute, and 3,420 per hour as the full capacity of the instrument at 190 revolutions as above stated.

In sending press matter, where but few stoppages are necessary, if we make the liberal allowance of ten minutes, or 570 words for loss of time per hour, we still have 2,850 as the number of words actually transmitted.

In the controversy becoming so general in your columns, if, where the printing system is brought into comparison the above are adhered to, justice will be accorded it, and accuracy (an element greatly ignored by some of your correspondents) lend stability to the argument. Statistics might be found which would also recommend the consideration of accurate transmission or the comparative non-liability to errors.

JOS. L. EDWARDS.

How Interesting Communications may be Written.—Bad Policy of the Atlantic and Pacific.—Arrangements for Christmas Holidays, etc.

CHICAGO, ILL., Dec. 31.

TO THE EDITOR OF THE TELEGRAPHER.

DID you ever try to write without a subject, preach an extempore sermon without notes, deliver a lecture on a subject you knew nothing about, or make a political speech when you were on the wrong side of the question?

I have often heard persons when requested to write for THE TELEGRAPHER, say "Oh, I don't know what to write about that would be interesting." Now, probably, if all who contemplated writing would do as I am in the habit of doing, they *might* get up something interesting. I carry a little note book with me in my travels through the City when about my business, and when a thought strikes me, or I see anything worth recording, I note it down; so that by the time I am ready to send you my weekly batch of news, I usually find plenty to write about, generally more than you have room for. Try my plan, boys, but don't drop or leave your note book at some place just the day previous to writing your letter. This is exactly the position I am placed in.

The day force of the Atlantic and Pacific office were all on duty Christmas till 9 o'clock A. M., and the other hours were divided equally among the day men. The night men were on duty as usual.

My prediction that the policy the Atlantic and Pacific Company had inaugurated in cutting down salaries, etc., would prove a poor one is fast proving to be correct. One of the best operators in their office here (Mr. McRobey) resigned on short notice, and has accepted a situation on the W. U. day staff of this city.

As the holidays come and go business decreases, and the boys naturally take the benefit of holiday recreations. Messrs. Fortier, of the W. U. day, and Ball of the W. U. night force of this city, are spending the holidays among their friends in Canada.

On account of short force during part of the day on last Thanksgiving, the regular mode of working the W. U. force in this city was changed on Christmas, half force being on from 8 till 1 and the other half from 1 till 6 o'clock, when the whole night force relieved the day men. At 8 o'clock the night men drew each a card from an envelope marked "off Christmas," "off New Year's;" there being a card for half the force marked for the one night, and for the other half marked the other night. Those marked "off Christmas night," were promptly relieved, and those marked "off New Year's" are expecting the same pleasure when that night arrives.

A noticeable feature among the fraternity these holidays is an absence of any intoxication. This is very commendable, and is a great source of pleasure to the friends of those who have heretofore been in the habit of giving way to their appetites in this direction, and fixing themselves so they were fit subjects to be carried home on a shutter about 3 A. M.

There was a good deal of "kicking" (as the boys put it), among the W. U. lady operators, on account of having to work half the day these holidays. It has not been customary heretofore to require them to perform any service holidays, and they had rather began to look upon the "courtesy" hitherto extended them, as a "right" rather than a "courtesy." The management however decided to place all on an equal footing, and although a great many of the male operators no doubt felt that they would be willing to work harder to give "the girls" a whole holiday, the management probably, did not feel like discriminating, and could not see how one person could do the work of two, let him work ever so hard. Outside of this dissatisfaction among the ladies, the holiday hours this year are much more satisfactory than any previous arrangement for working them. Those of the day force I understand who were on early Christmas will be on late New Year's, and *vice versa* those late on Christmas night will be early New Year's.

I notice the Mercurial Fire Alarm, or Indicator, is

meeting with great favor here. The Western Electric Manufacturing Company are putting them in the more important buildings as fast as they can be manufactured. Especially is this the case in the vicinity of Lake and South Water Streets, where the fire made such sad havoc during the great conflagration. The name of the inventor is not shown upon any of the Indicators I examined. The box containing the Indicators proper are placed in a conspicuous place on the side or front of the building, whichever is most convenient, about five feet above the side walk. A glass door covers the box, and inside are Indicators showing each floor first, and underneath each floor every room on the floor. The Indicator pointers or fingers when everything is all right, point horizontally, all in the same direction and position. When any disturbance occurs the Indicator points drop down, showing what floor and what room on the floor are heated to a dangerous degree, and remain in that position until the trouble (*the heat*) is removed. A sufficient force of police and watchmen pass these boxes often enough to arrest any fire before it could gain sufficient headway to do any great damage.

It is not necessary to stop and examine the Indicator, a glance across the street is sufficient even when passing at a brisk pace, to determine the condition of every floor and room connected therewith. The insulated wires pass from the Indicator through a metal tube to the nearest window in the first story of the building, through which all the wires are passed into the building, and thence distributed to the different floors and rooms, connecting there with a mercurial apparatus, somewhat similar to that which has heretofore been explained in your columns editorially and by advertisements. Even the basement floors of the buildings are connected. Great and destructive fires will, when these Indicators are extensively used, be numbered with "the things that were."

Verily we live in a progressive age. I had the good fortune during one of my rambles recently to call at the Western Electric Manufacturing Co.'s works on Kinzie street, between State and Dearborn, and was shown over the immense building by Secretary Barton, who takes great pains to make visitors feel at home and show them the wonders of telegraph instrument making in all its various branches. The lateness of the hour at which I called (being near closing time) prevented my making a critical examination of all there is to be seen in this manufactory, and consequently you will have to be content with this passing notice, and wait till I call again (as I was kindly invited to do) for a detailed description. Mr. Barton is an old Eastern telegrapher, and can keep a fellow convulsed with laughter relating some of his early experiences, and at the same time explain the working of the different parts of the machinery.

Mr. Kellogg, the electrician of the concern, showed us a model of a French battery for medical use, about as large as a five cent cake of soap, which gives such powerful shocks that I had to "squeal" before I got half of the force of it. He is a well read gentleman, reading all the foreign works, as well as the English, on electricity, and is withal seemingly very friendly, and there is an absence of anything "airy," that was very acceptable to a common fellow like myself. I saw Mr. Warner, the inventor of the "Warner Relay," with his little apron on, hard at work with the other mechanics; a number of whom I was introduced to, and found seemingly very intelligent gentlemen, but cannot recall names. The "grip" of their stout hands was quite a contrast to the "littile squeeze" the "boys" give us, and we must confess rather pleasing and "impressive." Some of the boys, who complain of having so much spare time they hardly know how to kill it, might pass many an hour pleasantly and to their profit visiting the different manufactories of our city, not only the telegraphic and electrical, but others, and make the acquaintance of some of the mechanics employed therein. They would be agreeably surprised at the intelligence among the better class of them, and would be obliged to post up if they intended to carry conversation very far. The firm of George H. Bliss & Co., as is their usual custom at this season of the year, have given their employes a week's vacation, including Christmas and New Year's day, and are not turning out any work at present. After the holiday season is over they will start up again, and continue to turn out first class work as heretofore. They are prepared to fill any kind of an order on short notice, even during the holidays.

The quadruplex still continues to work satisfactorily in the Western Union office here, and unless something yet in the future transpires to interfere with the successful working of it to such an extent as to baffle the electricians here, it will prove to be a decided success and a great invention.

The showing up "northwest" gives the Valentine Bros. and their "telegraph school" at Janesville, Wis., in your issue of the 19th, is very much commended by the fraternity in this section.

The communication of "Morseite," in the same issue, on "The Other Side," expresses the sentiments

of the majority of the operators with whom it has been my good fortune to converse on the subject, and all are unanimous in commending your well written editorial on the subject. How any sane person can, after the publication of such an editorial, and after such prominence being given "*the other side*," accuse THE TELEGRAPHER of being "*an automatic organ*," is beyond the comprehension of conservative thinkers in the profession here. That part of the editorial referring to Mr. Prescott is especially commended, as a number of operators here who know Mr. Prescott personally (some of whom worked under him when he was superintendent) feel rather antagonistic to THE TELEGRAPHER on account of what they deemed uncalled for criticism of Mr. Prescott. I am happy to say the editorial in question is fast abating that antipathy. Let us quit treading on each other's corns.

In a recent communication, in speaking of the rising young telegraphers of this city, I mentioned Patsey Tracy as one of the most prominent. I should have said Patsey Tierney, which is the name of the young gentleman referred to.

OCCASIONAL.

Will the Coming Operator be a Woman?

CINCINNATI, O., Dec. 21.

TO THE EDITOR OF THE TELEGRAPHER.

WITHIN the last few years many changes have occurred in the old modes of doing and thinking! "Old things are passed away" and many things are become new. Many of these changes are doubtless for the better. Many others are certainly for the worse. There is also an intermediate class of changes which are doubtful in their tendencies. Change does not always mean improvement any more than revolution mea is purification. Our lathes had many straight-laced notions certainly, which have been wisely dropped by their children; but they also had many other earnest opinions which would be with equal wisdom adhered to by the knowing ones of the present generation. I might mention many, but I will only speak of one. Our fathers thought that women had a high and holy mission to fill, which, narrow though it might be, made home cheerful, children happy, men good. This is stating it briefly, perhaps too briefly to do justice. I suppose the average reader will understand what I have said and know all that I have not said; I shall, therefore, proceed to the body of my subject.

A few years since no one would have dreamed of a woman occupying a pulpit as a regularly ordained and installed minister. Now a large number of our clergymen are WOMEN. Harvey, and Greene, and Brown, and Bullion have made no provision in their grammars for this anomaly. As for Lindlay Murray, he would have choked with etymological wrath had any one hinted at the bare probability of any such inconsistency. Hence, I hope to be forgiven the syntactical error in view of the anomalous character of the fact. Forty years ago our "old fogies" would have held up their hands in unutterable astonishment at the thought (had it been suggested to them), of their daughters studying medicine; now their grand-daughters are practicing physicians. We have female lecturers, female aeronauts, female physicians, female clergymen and lastly, female operators, surely the day of female justices of the peace, female police judges and female lawyers cannot be far in the future. Female operators are everywhere. They are rapidly absorbing the business as they have already done in other walks in life. Now, I do not wish to hedge her in the least; I know how limited already are her opportunities for earning an independent, honorable livelihood, and I do not wish to cast a straw in her path, but I also feel keenly the nature and magnitude of the obstacles which are thrown in the way of her *real* prosperity in *this* business. She must, in the first place, utterly exclude herself from every social pleasure and privilege, and confine herself rigidly to the heated, unwholesome air of the office from eight to ten hours out of every twenty-four. This, it is true, she would have to do in nearly any other business now open to her. But here she has also to throw away much womanly modesty and mingle with men (and as yet the men are largely in the majority), hear all the profanity to which they may choose to give utterance, the covert innuendo, the foul remarks irresponsibly made by operators who "break in," breathe the tobacco smoke, sit and work by spittoons reeking with the accumulated foulness of a score of filthy tobacco chewers. Can the influence of such scenes do otherwise than dull those finer qualities of mind and heart, those gentler, purer sensibilities of soul, which go to make up the character which we all have learned to look for and desire in woman? I do not wish to be so plain as to be unkind. I certainly do not wish to say a word which would imply the slightest lack of respect on my part for any lady who may have chosen this profession as a means of livelihood, I do admire the pluck and independence of spirit which sustains a woman while she works under so many difficulties. I do respect her for her pride and the faithfulness which she exhibits in going through sunshine and storm, in sickness and health,

submitting patiently to the rude shocks her modesty must endure among so many of the uncouth sex to which I belong, but I very much regret the circumstances which surround her efforts, I deplore the result to her mind and heart. Let me point out briefly some of the probabilities in store for ladies who enter the profession.

First, and in addition to those at which I have hinted. When Miss A— has learned the business, she must get a situation (I take it for granted that those whose wealth places them above the need of pecuniary assistance will not be likely to try to learn it). She cannot afford to wait until one is offered, acceptable in every way. She must take such as she can get. Suppose that happened to be at the stock yards, or at a railroad repairing shop, such as I have seen, her office will be surrounded, perhaps thronged with men of the rudest, most uncultured type, glaring on her through her window, asking her impertinent or insulting questions and giving utterance to the most shocking profanity. She must bear it; she cannot protect herself, nor punish the offenders. Her bread and clothes are the price of these oaths and mocking taunts; she can do nought but bear it uncomplainingly. Second, an accident occurs out on the railroad over which her line runs, she must go in the night and the storm, perhaps, and attach the instrument to the wires, and sitting there alone and unprotected, among blasphemous men, work while chilling rain drenches her, freezing as it falls. But it is her bread and she must submit. To complain would be to lose her situation. To lose her situation is to shake hands with hunger and want. Third, as the female operators increase in numbers the isolated country offices which must still be filled, will be taken up, must be taken up by ladies who must stay alone, subject to every danger. Night work must still be done then as now, and when the women shall have absorbed all the work they must do this, too. Imagine the new difficulties they will encounter here. I am enlarging upon this third point, having in view the probability held out by some, that the day is rapidly coming in the which ALL telegraph operating will be done by women. This may be too strong, I hope it is.

In what I have said I have not hoped to influence any one already in the business to quit it. That would be too much. Such could not afford to lose time and money enough to learn a new business. But if I have said what shall deter any lady who now contemplates learning, from entering a profession which I consider eminently unfitted for her delicate organization and pure character, I shall accomplish all I intended, and I may almost add, more than I hoped.

NHIL NAMELESS.

Presentation to Manager Gough of Union Stock Yards, Illinois Western Union Telegraph Office.

UNION STOCK YARDS, CHICAGO, ILL., Dec. 30.

TO THE EDITOR OF THE TELEGRAPHER.

CHRISTMAS Eve, as Manager Gough was sitting at his desk, he was confronted by his operators, and Mr. T— who having been appointed spokesman for the occasion, addressed him as follows:

"Mr. GOUGH.—Allow me on behalf of the employes of this office and its patrons, to present you with this slight token of our esteem for you as a manager, friend and associate; hoping it may more firmly cement the ties of kindly feeling and fellowship. With it we wish you a Merry Christmas."

The present consisted of a splendid gold watch and chain. On the case of the watch was the following inscription:

"Presented to R. S. Gough, Manager W. U. Telegraph Office, by his patrons and employes, Dec. 25th, 1874."

Mr. Gough was so completely taken by surprise that it was some little time before he could recover himself sufficiently to return his thanks!

The *Chicago Tribune* in speaking of the affair, says: "Mr. Gough is a genial gentleman with whom it is a pleasure to come in contact."

He is very popular with all whom his business relations bring him in contact with, and has the kindest wishes from a host of friends that Christmas will always find him merry.

BLANK.

Says J. to X.—"Why is this *string* like you and I?"
X. "Give it up."
J. "Because it is always *busted*."

Curtain falls.

"Been after you all day, why couldn't I get you?"
"I hate to tell
But then I must,
It was because
You couldn't adjust,

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JANUARY 9, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.
ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.
INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,
AT

No. 38 VESEY STREET, New York.

ELEVENTH VOLUME.

The Publisher, in announcing the Eleventh Volume of

THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year.

All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER

is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to or in the interests of no TELEGRAPH COMPANY, CLIQUE or COMBINATION, but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL UPON THE AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore:

ONE COPY, ONE YEAR.....\$2 00
SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

After the Holidays.

The holidays are over, and the business of the new year may be considered as having commenced. During the two weeks which have just passed which may be fairly considered the festal season of the year, there has been to a considerable extent a practical suspension of business and a devotion to recuperation, and a general settling up of old affairs preparatory to making a fresh start. Naturally telegraph business is unusually dull while this season lasts, but now that it is over we may reasonably look for a revival, which, it is to be hoped, will be more encouraging than that of the year which has just passed.

We receive complaints of depression in business in all parts of the country but more especially in the West, exceeding anything which has been experienced for many years. That this can be much longer continued we do not believe. The resources of the country and the energy and enterprise of the American people are so great that financial reverses cannot for any length of time exercise the depressing influence which has been felt for the last year and a half.

It is undoubtedly true as regards the telegraphic service that there has been and still is, an over supply of telegraphic labor. The very general suspension of telegraphic extension has lessened the usual increase of demand for such labor, while until recently, there has been little if any decrease in the number of those who are entering the telegraphic ranks. In fact, the depression in other lines of business for a time induced many to regard a resort to telegraphy as a means of obtaining a livelihood, as offering the desired opportunity for securing employment. Besides this, there being but little demand for the higher class of talent in other employments, there has not been the usual depletion of the telegraphic ranks from the transfer of telegraphers to other vocations, which are expected to be more remunerative. Those who occupy positions in the telegraphic service naturally and sensibly hold on to them in the absence of the usual inducements to make a change.

As we have before stated, the indications are that during the year upon which we have just entered the extension of telegraph lines and the increase of telegraphic facilities will be resumed.

It cannot be said of the telegraphs as of railroads that they have been extended and increased in advance of the demand of the country for them. With a revival of business, such as we are confident will be witnessed during the present year, additional telegraphic facilities will be required, and intelligent and enterprising capitalists and telegraph managers are preparing in time to supply this demand. The telegraph companies generally are in a healthy and prosperous condition, and with economical practical management telegraphs cannot fail to prove remunerative investments.

While the prospects for the future are encouraging, the fact that there is at present an over supply of telegraphic labor must not be overlooked. It will take some time to absorb such labor now seeking employment, and there is not, therefore, likely to be for some time to come the necessity for enlisting a large number of raw recruits in the service. Telegraphers should make it a point to impress this fact upon those who contemplate engaging in telegraphy. With the large number of telegraph offices now in existence, there will necessarily and unavoidably be many every year who will, from their connection with such offices in clerical or subordinate capacities, become telegraph operators. This will be sufficient, and it is to be feared more than sufficient, to supply any probable demand. It is not a good time for telegraph schools, and it would be a blessing if all such establishments could be at once closed up. As this cannot be done, however, the next best thing is, as far as possible, to restrict the number of their patrons by giving to those who would be likely to patronize them, reliable information as to the result likely to attend the expenditure of time and money in seeking to obtain a practical knowledge of the telegraphic art.

The holidays are over, and we must now come down to another year of toil and labor. That it may be satisfactory and remunerative is to be sincerely desired. For most of us life is no season of idleness or mere pleasure, and this is eminently the case with telegraphers. Success that is worth obtaining is seldom to be had except by earnest and persevering labor. Happy are they who can by such even secure it. The year, like those which have preceded it, will doubtless have the usual quota of successes and failures. Many will, despite their best and most faithful exertions, fail to secure that which they commenced the year with hopes of attaining. At the best, it is not for us to command success, but we may one and all deserve it.

It is not our wish or purpose to discourage any telegrapher. We but state the case plainly, and put on record what we believe to be the facts—that the prospects for the new year are better than for that which has just passed, we think is evident. That we may be mistaken in this is possible. At the best, however, economy and prudence will be requisite, and with these telegraphers as well as others, will be enabled to overcome the difficulties which must be met whether we will or not.

The Canadian Telegraphers' Mutual Insurance Association.

In November last a notice was issued for a general meeting of telegraphers to be held at Mechanics' Hall, in Montreal, Canada, December 7th, for the purpose of considering the advisability of organizing a Canadian Telegraphers' Mutual Insurance Association. The meeting was held accordingly, and it was decided to organize such an association under the above name. The organization was effected at this meeting and officers elected for the first year.

The following circular has been issued and distributed generally among Canadian telegraphers:

MONTREAL, December 8, 1874.

DEAR SIR: Pursuant to a notice dated November 11, a general meeting of telegraphers was held in the Mechanics' Hall, Montreal, on Monday, December 7. The response made to the circular above referred to was so general, and the desire to have an organization of the kind in operation in the Dominion being so heartily expressed, it was decided at the meeting to organize the "Canadian Telegraphers' Mutual Insurance Association." The following gentlemen were elected office bearers for the years 1874-75:

President, J. Stephenson, Superintendent G. T. R., Montreal; Vice-President, Hugh Neilson, Superintendent Western District, D. T. Co., Toronto; Secretary, B. J. Hickey, train despatcher, G. T. R., Montreal; Treasurer, J. S. McConnell, treasurer's department, M. T. Co., Montreal; Executive Committee, C. R. Hosmer, Superintendent Eastern District, D. T. Co.; J. S. McKenzie, chief operator, head office, M. T. Co.; A. T. Nurse, operator, M. T. Co.; D. McCarthy, train despatcher, G. T. R.; P. McPhee, operator, general offices, G. T. R., Montreal.

The constitution and by-laws were submitted, approved and ordered to be printed for distribution.

The president, officers and executive committee respectfully solicit the support of every member of the telegraphic fraternity in the Dominion.

The annual subscription to this association is one dollar from each member, payable in advance, the funds arising from which to go toward the formation of a reserve fund, after the payment of necessary expenses. When the death or total disability of any member takes place, an assessment of two dollars per member will be made, and the amount so collected paid over to the person in whose favor the deceased or totally disabled member had made his policy payable.

All persons who are employed in telegraph service in any capacity may become members of this association, provided they are acceptable to the executive committee.

With this circular is enclosed a blank form of application for membership to be filled up and returned with the amount of subscription (by registered letter) to the secretary.

District secretaries will be appointed as soon as possible, of which due notice will be given.

B. J. HICKEY, Secretary.

It will be noticed that this differs in some respects from the Telegraphers' Mutual Benefit Association, which has proved so successful here in that a yearly membership of one dollar is required, and that the assessment is two dollars in case of the death or total

disability of any member, the entire amount of such assessment to be applied to the benefit of the person in whose favor the policy is payable.

It is to be hoped that the Canadian telegraphers will respond liberally to the appeal which is made to them to give this association their personal and active support. It is comparatively an inexpensive kind of insurance, and one which has proved of the most beneficial and satisfactory character wherever it has been tried. There are now a large number of persons engaged in the telegraph business in Canada, and if these generally enroll themselves as members of the Association the benefits dispensed will be very liberal.

Our Correspondence.

ONE of the most valuable and interesting features of THE TELEGRAPHER, is its correspondence department, the contributions to which are mainly from practical telegraphers engaged in telegraphic service. The discussion of fast telegraph systems is bringing out some excellent and well written communications which enrich our columns. In this department THE TELEGRAPHER is by all odds greatly superior to any other telegraphic journal published, and the importance of this fact is greatly enhanced in that it demonstrates the talent and ability which is engaged in the practical every day work of the telegraph in this country.

We would avail ourselves of this opportunity to renew our urgent invitation to telegraphers to contribute to this department of the paper generally, and to keep our readers informed of all telegraphic matters of interest that may come to their knowledge or notice. There are but few of those who read THE TELEGRAPHER, who cannot occasionally communicate something of interest for its columns. We desire to make the paper a complete record of everything of interest or value in connection with telegraphic matters, or electrical science in its relations to the telegraphic art, and to do this we must depend largely upon the voluntary communications of those who are engaged in the telegraphic service. Such contributions are always received with pleasure and appreciation, and add greatly to the interest of the paper.

An Excellent Appointment.

We learn that Mr. HENRY HOLLAND has resigned his position as manager of the marine office of the Western Union Telegraph Co. at pier 1 East river, and has been appointed Superintendent of the new Marine Line to Sandy Hook, owned by the Merchants' Exchange and News Room, with his headquarters at the Exchange, Nos. 66 Beaver and 113 Pearl streets.

Mr. HOLLAND carries with him the good will and fraternal feeling of all his late brother managers and operators on the line, and a host of friends connected with the Custom House, whose friendship and good will he has won by his untiring efforts in anticipating all their wants in the intricacies of the customs duties. His long experience in marine telegraphy will enable him to work up the new line in such a manner as to give perfect satisfaction to its patrons, and secure, with his own exertions and the vigorous energies which the Western Union will make to hold supremacy over that business, a more thorough working of the lines than has ever been done before, so that the merchants and underwriters will be the gainers in being served with earlier and more detailed marine reports. The war between the lines will be earnest, and will be protracted so long as the Merchants' Exchange and News Room line can hold out. In fact their banners might be inscribed Western Union, MONOPOLY—Merchants' Exchange, EXISTENCE. No doubt the Western Union will carry the war into Africa by establishing eventually a large, commodious news room, and bring to bear all the resources of that company for news from all parts of the world, and it is claimed that it is only a question of time before the old News Room will be

obliged to succumb. On the other hand, the underwriters and merchants are fully identified with the Merchants' Exchange and News Room and its new line, and it becomes a question whether they will abandon their own organization and become subjects of the "great monopoly." On Mr. HOLLAND in a great measure lays the responsibility of success or defeat. If he displays energy and promptness to the satisfaction of the patrons of the line he will be sustained, if not, not.

New Year's Presentation to Mr. Joseph E. Fenn, General Superintendent of the Automatic Signal Telegraph Company.

THE Automatic Signal Telegraph is probably the most successful telegraphic enterprise recently inaugurated. It met a necessity, and furnished a safeguard against damage by fire which was immediately recognized and appreciated. Much of the marked success which has attended this enterprise is undoubtedly due to the ability and excellent management of Mr. JOSEPH E. FENN, who has been the General Supt. of the Company from the start.

Mr. FENN is deservedly popular, not only with the public, but also with the numerous employes of the Company, for his considerate treatment of the latter, combining strict discipline with a due regard for the interests and welfare of all associated with him in the business.

On the afternoon before New Year's, Mr. FENN, on going to the shop where the apparatus used is manufactured, was surprised to find a large number of the employes assembled, and still more surprised on being invited to remain for a few moments as they had something to say to him. His perplexity was soon terminated, however, by Mr. COYLE, one of the line constructors, informing him briefly that his associates in the employ of the Company, desired to extend the compliments of the season to their superintendent, and to emphasize their appreciation and good will toward him had procured a handsome china tea set, the best that could be obtained, of which they desired his acceptance.

He was so completely surprised at this that for a few moments he was nonplussed, but finally rallied sufficiently to appropriately acknowledge their kindness and assure them of his intentions heretofore, now and always to treat them justly, and his gratification at this manifestation of their approbation of his course, and the good feeling existing between them, which they might rest assured was mutual.

Send in Subscriptions Promptly.

Those who desire to secure full files of the present volume of THE TELEGRAPHER will do well to send in their subscriptions as soon as possible. We endeavor to print a sufficient number of copies to enable us to furnish back numbers from the commencement of the volume to all who desire them, but as it is not always possible to anticipate the extra demand for some issues of the paper, the supply of such numbers is liable to be exhausted.

Subscriptions can commence with any number of the paper desired, or may begin with the volume so long as the supply of back numbers is not exhausted.

The Title Page and Index for Volume X.

WITH this number of THE TELEGRAPHER, we send to our subscribers the title page, and usual very full index for Volume X, which closed with the number for December 26th. Possibly some who are entitled to, and desire to obtain this may fail to receive it. Such persons will be supplied on application to the publisher.

The number of messages sent during the month of November, 1874, over the Cuba Submarine Telegraph, was 1,621, estimated to produce about £1,500, as against 817 messages, which produced £927 in the corresponding month of 1873.

Personals.

Mr. J. W. WOODS, formerly of the Western Union Company's Canal street office in this city, has been appointed manager of the Marine office of the same company, on the Government pier, foot of Whitehall street, in place of Mr. HENRY HOLLAND, resigned, to accept the superintendency of the Merchants' Exchange and News Room Marine line to Sandy Hook.

Mr. J. M. FISH, formerly at the depot office, Salem, Oregon, O. & C. R. R. telegraph, has been promoted to chief operator on the lines of the road, during the absence of Mr. J. J. KENNY, who has taken a trip to San Francisco.

Mr. JAMES C. DELONG has resigned his position with the Western Union Telegraph Co., at Kansas City, Mo., and accepted a position with the same Company at Little Rock, Arkansas.

Mr. R. LIVINGSTON, formerly of New York, has been appointed on the Western Union day force at Kansas City, Mo.

Mr. T. J. HERBEL, of the Kansas City, Mo., Western Union office, has resigned and accepted a position on the Kansas Pacific R. R., at Brookfield, Kansas.

Mr. S. W. HILL, of Kansas City, Mo., has been appointed agent and operator at Buffalo, Kansas.

The Telegraph.

The New Marine Line to Sandy Hook.

THE new line to Sandy Hook, constructed for the Merchants' Exchange, News and Maritime Association of this city, to compete with the Western Union line for marine news on that route was completed some time since and is now in regular operation. This line is about ninety miles in length, and is constructed with compound wire and Brooks' patent insulators. Five cables manufactured at the Bishop Gutta Percha Works, some of them very heavy, are required. These are located as follows: that across the North River at the foot of Seventieth street, another at Kill Von Kull to Staten Island, from Tottenville to Perth Amboy, across the Raritan River from Perth Amboy to South Amboy, and across Shrewsbury River to the Highlands.

The following offices are now open for business, and others are to be opened soon: New York, at the Merchants' Exchange News Room, 66 Beaver and 113 Pearl street; Bergen Heights, N. J., Quarantine and Richmond Court House, Staten Island, Perth Amboy, Matteawan, Highlands, and Sandy Hook, N. Jersey.

Mr. Ohas. K. Myers, whose death was announced in THE TELEGRAPHER last week, was originally appointed superintendent, and was completing the organization of the line for business when he died. Mr. Henry Holland has succeeded him, and is actively engaged in perfecting the arrangements for working the line and the marine news stations in connection with it, effectively.

The competition in Marine news reporting between the Association and the Western Union and Gold and Stock Telegraph Companies is now fairly inaugurated and is likely to prove very bitter and protracted.

A Good Appointment.

The Pacific Division of the Atlantic and Pacific Telegraph Company will hereafter be under the control of Major R. P. Hammond, who has been appointed Executive Manager. The selection of Major Hammond for this important position is a very judicious one. He was for many years Superintendent of the Southern Pacific Railroad Company, and his business energy and executive ability are well known. During the year now closing the Atlantic and Pacific Telegraph Company has greatly increased its facilities for commercial business, and has grown steadily in favor with the public. It is but a few weeks since the lines were extended to the principal cities of distant Idaho, and now the Company find it necessary to run two additional wires from San Francisco to Ogden, Utah. Meanwhile the numerous wires throughout our own State are being constantly extended in every direction. Before assuming his new position, Major Hammond visited the chief cities of the Atlantic States and Europe, in order to familiarize himself with the newest improvements in telegraphy. He made a special study of the postal telegraph system in Great Britain, and highly indorses its efficiency and great economy. For twenty-five cents a message of twenty words can be sent between any two points in the United Kingdom.—*San Francisco Chronicle.*

Foreign Telegraphic Notes.

The directors of the Brazilian Submarine Telegraph Company have declared an interim dividend for the quarter ending 30th September last of 2s. 6d. per share,

or 5 per cent. per annum, free of income tax, and payable on Thursday, the 24th instant.

The Black Sea Telegraph Company state that telegraph communication has now been established between Constantinople and Odessa, and the Odessa offices are connected by wires with the Russian land lines.

The cable between Singapore and Batavia has been repaired, so that telegraphic communication with Australia is restored.

The traffic receipts of the Direct Spanish Telegraph Company for November, 1874, were £1,224 10s. against £1,386 11s. 8d. in October.

The traffic receipts of the Eastern Extension, Australia and China Telegraph Company for the month of November, 1874, amounted to £17,728 against £17,454 for the corresponding period of 1873.

The Eastern Telegraph Company's traffic receipts for the month of November, 1874, were £33,060 against £35,096 in the corresponding month of 1873.

The Eastern Extension, Australasia and China Telegraph Company have declared an interim dividend for the quarter ending September 30th of 3s. per share, or 6 per cent. per annum.

Subscription for the Widows and Orphans of the "La Plata" Disaster.

THE following is the list of the names of the electric and cable staff who were on the steamship La Plata when she was lost, every one of whom perished: F. H. Ricketts, chief engineer in charge of the expedition; C. A. Cramer, assistant engineer; A. Culham, assistant engineer; King, Platino-Brazilian Telegraph Company; Gockelen, electrician; Blake, electrician; Voullaire, fitter; Gericka, fitter; Richardson, joiner; Owen, joiner; Franks, foreman; Kelly, cable foreman; Mitchell, storekeeper; Telbury, engine driver; Newman, cabin boy; Charles Lowe, diver.

Subscriptions have been opened in London for the "La Plata Widows and Orphans Aid Fund."

Subscriptions are received by the Lord Mayor of London; Mr. W. T. Henley, 110 Fenchurch street, E. C.; the London and Westminster Bank, St. James's Square, S. W.; Messrs. Graut Brothers & Co., 24 Lombard street, and by Messrs. Siemens Brothers, 12 Queen Anne's Gate, S. W.

Presentation to Mr. W. W. Marks.

On New Year's Day the employes of the Bishop Gntta Percha Works proceeded in a body to the residence of Mr. W. W. Marks, the superintendent of the establishment, and succeeded in thoroughly surprising that worthy gentleman, by presenting him with a silver bouquet holder, valued at nearly \$100.

Christmas Presentations to Mr. L. E. C. Moore, Manager Southern and Atlantic Telegraph, Charleston, S. C.

THE employes of the Southern and Atlantic Telegraph Company, at Charleston, S. C., as a manifestation of their appreciation of the manager of the Company at that place, Mr. L. E. C. Moore, presented him with a handsome writing desk on Christmas, with the following kind and complimentary note:

Mr. L. E. C. MOORE, Manager In behalf of the employes of the S. and A. Telegraph Co., at Charleston, in appreciation of your uniform kindness and gentlemanly management, I have the pleasure of presenting you with this "writing desk," as a slight token of respect and a memento in remembrance of our second Christmas in the office together.

A. V. GREEN, in behalf of S. and A. Boys.

This manifestation of good feeling on the part of his associates was highly gratifying to Mr. Moore, who responded appropriately in accepting the same.

Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS—NEW YORK, DEC. 24, 1874.

ASSESSMENT NO. 71.

- 23, 29, 31, 52, 54, 59, 60, 64, 67, 72, 75, 82, 88, 89, 95, 99, 103, 108, 114, 129, 140, 141, 142, 144, 148, 153, 189, 190, 191, 193, 197, 198, 220, 254, 269, 278, 279, 281, 282, 283, 285, 312, 342, 344, 346, 351, 352, 361, 367, 372, 378, 379, 391, 394, 405, 426, 430, 431, 466, 468, 469, 470, 471, 475, 514, 533, 542, 546, 554, 555, 560, 579, 586, 603, 661, 672, 678, 680, 685, 714, 729, 734, 740, 742, 750, 751, 756, 764, 769, 787, 791, 799, 812, 831, 855, 859, 873, 874, 875, 883, 886, 906, 917, 929, 932, 943, 952, 977, 978, 1023, 1038, 1040, 1047, 1072, 1088, 1090, 1093, 1102, 1143, 1147, 1169, 1198, 1200, 1226, 1227, 1232, 1233, 1267, 1288, 1325, 1329, 1364, 1365, 1398, 1407, 1417, 1426, 1444, 1449, 1451, 1454, 1455, 1456, 1482, 1484, 1488, 1489, 1498, 1505, 1506, 1507, 1508, 1517, 1522, 1532, 1554, 1555, 1569, 1582, 1589, 1601, 1615, 1620, 1625, 1634, 1652, 1656, 1658, 1676, 1681, 1692, 1697, 1699, 1707, 1721, 1723, 1732, 1733, 1736, 1745, 1775, 1791, 1809, 1810, 1811, 1812, 1847, 1869, 1906, 2919, 1938, 1942, 1957, 1965, 1991, 1999, 2000, 2001, 2025, 2026, 2028, 2029, 2040, 2057, 2061, 2065, 2069, 2084, 2086, 2094, 2097, 2113, 2114, 2138, 2147, 2159, 2162, 2165, 2169, 2170, 2172, 2180, 2181, 2192, 2196, 2197, 2199, 2201, 2203, 2204, 2205, 2206, 2212, 2213, 2216, 2233, 2240, 2242, 2256, 2257, 2263, 2273, 2285, 2283, 2294, 2295, 2296, 2297, 2298, 2299, 2309, 2310, 2313, 2314, 2315, 2316, 2317, 2319, 2321, 2331, 2332, 2339.

ASSESSMENT NO. 69.

- 6, 175, 273, 294, 347, 597, 692, 766, 1134, 1135, 1136, 1556, 1557, 1570, 1650, 1678, 1722, 1727, 1742, 1778, 1916, 1945, 1946, 1947, 1987, 2063, 2066, 2182, 2190, 2236, 2279.

MISCELLANEOUS.

- 68.—1854. 70.—398.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice, that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each.

For the week ended December 8, 1874, and bearing that date.

157,469.—DUPLIX TELEGRAPHS. Georges D'Infeville, New York, N. Y. Filed July 13, 1874.

1. The combination, with opposing terminal batteries, of a rheostatic balance, connected to the line on both sides of a receiving instrument and to the ground, substantially as set forth.

2. In a duplex or multiple telegraph, the method of causing the relay at the sending station to be unaffected by the operations at that station, by using certain amounts of the currents of terminal opposing batteries to neutralize each other, such amounts being controlled by a rheostatic balance, substantially as and for the purpose set forth.

3. The method of operating a duplex or multiple telegraph by arranging terminal batteries opposed to each other, and localizing the battery at the sending station partly through the instrument at that station, and partly through a circuit outside of such instrument, the portion through the instrument being neutralized, when necessary, by a portion of the current of the distant battery, the relations of these portions of one or both currents being determined by a rheostatic balance, and the signals at either terminal station being given by the withdrawal from such station of the current of the battery of the other station, substantially as described.

4. In a duplex or multiple telegraph, as described, the combination, with the main battery, receiving instruments and key, of the series of resistance coils, for the purpose set forth.

5. The combination, with the rheostatic balance of the sounder, for the purpose of recording the sounder's own messages, and of counteracting the effect of the momentary current

in the receiving instrument due to the static charge and discharge in long or buried lines at each movement of the key, substantially as described.

Born.

VAN TYNE.—To Mr. A. E. VAN TYNE, assistant chief operator, Western Union office, St. Louis, Mo., December 31st, 1874, a daughter, eleven pounder.

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS of every description, at

No. 54 SOUTH FOURTH STREET,

(Corner Chestnut street.)

PHILADELPHIA.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY, No. 40 WEST EIGHTEENTH STREET; or to L. G. TILLOTSON & CO., 8 Dey street, sole Agents.

CHAMPION BURGLAR ALARM AND ANNUNCIATOR COMPANY,

40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skilful mechanics to estimate upon work, or will give any information in writing that may be required, Liberal commissions will be paid upon any orders that may be secured for us. Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

CORNELIUS ROOSEVELT, Secretary and Treasurer, L. G. TILLOTSON, President, 40 West 18th Street, New York.

GEOURGE H. BLISS & CO.,
41 Third Avenue, Chicago, Ill.
CINCINNATI, O., ST. LOUIS, MO.,

Manufacturers and Dealers in
TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS, unequalled for beauty and strength;
COMBINATION SETS; BOX and POCKET RELAYS.
CHALLENGE, PONY and REPEATING SOUNDERS.
KEYS, various styles, including the SCHNEIDER KEY, just out, no legs, wire connections above the table.
REGISTERS, with SPRINGS or WEIGHT.
CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.
REPEATERS—HASKIN'S AUTOMATIC, and others,
SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.
ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.
ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.
ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.
MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.
BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.
WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.
INSULATORS—BROOKS, SORREW GLASS and KENOSHA CARBON.
BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.
TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANIFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
PRICE LISTS FURNISHED FREE ON APPLICATION.
Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

SOMETHING NEW!

[PATENTED SEPT. 29, 1874.]

THE FAIRY ELECTRIC ENGINE.

A perfect working model of an engine
Run by Electricity!
It will work well with an ordinary local battery.
Price, with two cells Eagles' Metallic Battery.....\$6 00
" without Battery..... 4 00
May be seen working at the office of the THE TELEGRAPHER.
For sale by
The Electro-Magnetic Manufacturing Company,
36 BROAD STREET, NEW YORK.
P. O. Box 1804.
Also for sale by
L. G. TILLOTSON & CO., 8 Dey street.
F. L. POPE & CO., 38 Vesey street.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.
The undersigned having secured the exclusive Agency for manufacture and sale of the
EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.
The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.
These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.
Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.
No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon application to
F. L. POPE & CO.,
(P. O. Box 5503.) **38 VESSEY STREET, N. Y.**

Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Ocean Cables.*

ALTHOUGH submarine telegraphy has only been established about twenty years, few of those daily availing themselves of it have any idea of the successive steps by which it has been developed into its present enormous proportions; and, in the cases more particularly of the Atlantic cables, of the anxieties, disappointments and disasters attendant upon the early attempts to bring the eastern and western hemispheres into instant communication with each other.

It will be our task in this article to endeavor to show how, within the last quarter of a century, the world has seen the wonderful strides that have been made in submarine telegraphy, so that now, with the exception of the islands of the Pacific and New Zealand, the Cape of Good Hope in Southern Africa, and a few other points, the whole civilized world is able to interchange, almost with the rapidity of lightning, commercial, social and political intelligence, thus becoming, so to speak, one vast community of different races, but drawn together by a bond of brotherhood which each successive year will only the more firmly strengthen.

The first attempt to lay a submarine cable was made in the year 1850, when it was proposed to connect England and France by a line of telegraph between Dover and Calais. The length of the cable submerged was twenty-seven miles, and although accomplished without much difficulty, it worked only one day. The following year, however, another, and the first iron covered cable, was laid and successfully worked. It having thus been proved that the sea was no barrier to electric communication, cables between England and Belgium, and England and Holland, were soon after submerged, and were followed in rapid succession by others between various points, which are more particularly specified in the following table. Those marked thus * are not working at the present time.

Table with columns: Date, From, Length in Miles, Greatest depth in fathoms. Lists various cable routes from 1850 to 1868, including Dover to Calais, Keyhaven to Hurst Castle, and others.

Table with columns: Date, From, Length in Miles, Greatest depth in fathoms. Lists various cable routes from 1859 to 1874, including Crete to Alexandria, Singapore to Batavia, and others.

Table with columns: Date, From, Length in Miles, Greatest depth in fathoms. Lists various cable routes from 1871 to 1874, including Khania to Retimo, Retimo to Khandia, and others.

It will be seen from the foregoing list that no cable longer than 350 miles had been successfully submerged before the year 1858, when the first Atlantic cable of 2,174 nautical miles, was laid, which, however, only worked, and that with great difficulty, about one month, and then became useless.

The practicability of laying ocean cables having thus been proved, a line was projected from Malta to Alexandria, Egypt, touching at Tripoli and Benghazi, the longest section being 593 miles, and the length of the three sections 1,331 miles. This line was successfully submerged and worked.

The honor of being the original projector of ocean cables belongs to our country, in the person of Cyrus W. Field, to whom Congress, in December, 1866, voted their thanks, and authorized a gold medal to be struck and presented to him in the name of the people of the United States. The grand prize of the International Exposition at Paris in 1867 was also awarded to him as "the promoter of the system of ocean telegraphy."

The history of the world produces but few instances of greater energy, of more untiring exertions, and of more unbounded faith in the feasibility of the scheme for connecting telegraphy in the Old and New World, than were exhibited by Mr. Field through the long period of thirteen years, during which, in spite of every obstacle and discouragement, he kept on his course, unflinching, each successive disappointment only serving to infuse into him fresh energy and a determination to surmount every obstruction that lay in his path.

We have not space in this article to recite the successive steps that were taken by Mr. Field to accomplish the object eventually attained by the final laying and successful working of the two Atlantic cables in 1866, and the results that followed. Suffice it to say that from the year 1858, when the first ocean cable

- a Worked one day only.
b Remained perfect for eight years.
c Failed after five years.
d Failed after ten years.
e Broke in laying; part recovered.
f Worked eleven months.
g Failed.
h Failed.
i Too light; abandoned.
j Worked less than a month.
k Abandoned.
l Abandoned.
m Never worked.
n Red Sea Telegraph; some sections worked eighteen months and two years, others only a very short time.
o First long cable which proved successful. Finally abandoned in 1872, after repeated breakages.
p Failed in laying.
q Failed in a few days.
r Part laid in 1865; completed in 1866.
s Broken in laying.
t Two cables laid.
u Touching at Santos and St. Catherine.

* Philip P. Harris, in the American Iron Trade.

united for a short time the two hemispheres, the attention of capitalists was directed to the subject, and schemes were introduced with the view of connecting the British Isles with their outlying dependencies in Europe and Asia, although it was not until the year 1870 that the different sections were completed, and direct telegraphic communication was established between England, India, Singapore and Batavia, and during 1871 extended to China, Japan and Australia. Other projects had in view the laying of lines between England and her immediate Continental neighbors.

To complete the "girdle round the earth" a cable must be laid across the Pacific Ocean, and when this is accomplished the dream of Mr. Field's life will be realized.

The first step towards forming a company for this purpose was taken by that gentleman in the presentation of a memorial to Congress on the 31st of March, 1870, praying it to incorporate a company, possessing a capital of ten millions of dollars in gold, "with power to construct an oceanic cable between California and Japan and China," and soliciting a grant of land in aid of the undertaking. A bill to that effect was introduced into the Senate on the 31st of May of that year, but failed of passage before Congress adjourned. Certain obstacles afterwards intervening, it was thought advisable to delay the scheme till the proper course of the cable could be finally determined; and, on the application of Mr. Field, an act was passed authorizing the Secretary of the Navy to employ the vessels of the United States to take soundings. This service has just been completed, and the project will now be pressed forward as soon as funds can be obtained.

When this line of telegraph is laid, its length between the terminal points, namely, San Francisco and Yokohama, will be 5,573 nautical miles. The cable will, however, be divided into three sections—from San Francisco to Honolulu, 2,093 miles; from Honolulu to Midway Island, 1,220; and from Midway Island to Yokohama, 2,260 miles.

Several other cables are projected, but not yet contracted for; amongst them the following:

Table listing cable projects: Panama to Payta, Ecuador... about 960 miles. Pisco, Peru, to Valparaiso, Chili... 1,400. Sydney, Australia, to Wellington, New Zealand... 1,600. Aden, Arabia, to the Island of Mauritius... 2,800. Mauritius to Natal and Algoa Bay, South Africa... 2,300. Honolulu to the Fiji Islands... 2,950. Fiji Islands to Brisbane, Australia... 1,610.

The following are under contract, but not yet laid: Porto Rico to Trinidad... about 680 miles. Demerara to Cayenne, South America... 460. Rio Grand do Sul to Castillo, South America... 180. Ireland to Nova Scotia... 2,200.

The latter cable, while being laid from Ireland, in September last, broke after 574 nautical miles had been paid out. The fleet is now on its way to endeavor to pick up the cable, and, if successful, will proceed to lay the remainder, so as to unite it with that portion which was laid from Nova Scotia and buoyed off the coast of Newfoundland.

When the above projected lines are completed it will be seen that almost the whole civilized world will be connected by this wonderful invisible agent, the electric spark.

The cost of submarine telegraph cables depends altogether on the depth of water in which they are laid, and the nature of the bottom of the sea. If the latter is rocky and uneven in depth, and there are swift submarine currents, the cable must be much heavier and stronger than if laid on an even and soft bottom. The average cost of the Anglo-American Company's cables was about £300 per mile for the deep sea portion, and £1,000 per mile for the shore ends.

The cables from England to Holland are throughout nearly the size of the shore ends of the Atlantic cables, in consequence of the shallowness of the water, the deepest part not exceeding thirty fathoms. Their average cost per mile would, therefore, be considerably greater.

The following list shows the principal submarine telegraph companies, with the amount of their capital:

Table listing submarine telegraph companies and their capital: Anglo-American Telegraph Company—Ireland to Newfoundland; Newfoundland to Cape Breton; Brest to St. Pierre; St. Pierre to Duxbury, U. S. (five cables)... £7,000,000. Brazilian Submarine Telegraph Company—Portugal to Brazil... 1,300,000. Cuba Submarine Telegraph Company—Santiago to Havana... 160,000. Direct Spanish Submarine Telegraph Company—England to Bilbao, Spain... 130,000. Direct United States Submarine Telegraph Company—Ireland to Nova Scotia; Nova Scotia to United States... 1,300,000. Eastern Submarine Telegraph Company—England to Bombay via Mediterranean and Red Seas... 3,000,000. Eastern Extension, Australian and China Submarine Telegraph Company—Madras to China and Japan; Java to Australia... 1,663,100. Great Northern of Copenhagen Telegraph Company—England to Denmark, Norway, Sweden and Russia... 400,000. Great Northern China and Japan Extension—Siberia to Hong Kong and Japan... 600,000. International Ocean Telegraph Company—Florida to Havana... 1,500,000. Mediterranean Extension Telegraph Company—Sicily to Malta and Corfu... 152,000.

Table listing telegraph companies and their capital: Montevideo and Brazilian Telegraph Company—Montevideo to Brazilian Frontier... 135,000. Platino Brazilian Telegraph Company—Rio Janeiro to Uruguay... 400,000. Submarine Telegraph Company—England to France, to Belgium and to Holland... 418,640. Western and Brazilian Telegraph Company—Coast of Brazil... 1,350,000. West India and Panama Telegraph Company—Cuba to West India Islands and South America... 1,900,000.

Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS—NEW YORK, JAN. 11, 1875.

ASSESSMENT NO. 71.

Large table of assessment numbers from 8 to 2326, arranged in columns.

MISCELLANEOUS.

- 70.—1626, 2253, 2273, 2275, 2276, 2277. 69.—232, 1915, 1921.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice, that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion. No notice will be taken of anonymous communications.

Congress and the Telegraph.

WASHINGTON, D. C., Jan. 13th.

TO THE EDITOR OF THE TELEGRAPHER.

SINCE Congress reassembled after the holiday vacations, telegraph matters have been very quiet. On Monday last, however, three bills were introduced in the House under the regular call, which are of some interest to telegraphers. As only six weeks of the present Congress remain, it is not likely with the other

pressing and exciting matters which require attention, that anything will be done with them.

The bill introduced by Mr. McCrary, of Iowa, proposes to amend the telegraph law of 1866, so as to require that all telegraph companies who have or may accept the conditions of that act shall mutually interchange messages and transmit and deliver them at the regular tariff rates of each company between the points of transmission, without any additional charge for words indicating the route or manner of transmission, and punishes by fine not exceeding \$2,000, or imprisonment not exceeding two years, and by liability for damages to the party injured, any officer or employe of any telegraph company who shall refuse to receive or who shall fail promptly to transmit and deliver messages at the rates and in all respects in the manner above provided.

Another bill, introduced by Mr. White, of Alabama, for cheapening and regulating telegraphic communication, etc., provides, that the rate for telegraphing upon every telegraph line in the United States shall be, for 20 words or less, under 200 miles, 30 cents; under 500 miles, 50 cents; under 750 miles, 75 cents; under 1,000 miles, \$1, and for all greater distances, \$1 25. For night telegrams, under 1,000 miles, 30 cents; for all greater distances, 50 cents; for transmitting special telegrams to newspapers and commercial news associations, for each 100 words, for each circuit of 250 miles, not exceeding 75 cents at night and \$1 during the day; for copies of the same telegram dropped off at one or more offices, not exceeding 50 cents at night or 75 cents during the day; for special telegrams for two or more newspapers, 10 cents additional for each 100 words for manifolding; no charge for telegrams for press associations or special telegrams to exceed those now paid by the New York Associated Press or similar associations. The bill also provides that where the lines of the competing telegraph companies extend over the same territory and afford equal facilities, all government business shall be equally divided between them.

Both bills were referred to the House Judiciary Committee, which has in turn referred them to a subcommittee consisting of Messrs. Butler, of Massachusetts; Wilson, of Indiana, and Finck, of Ohio.

Another bill was introduced by Mr. Sypker, representative from Louisiana, for the construction of a government telegraph line from Washington, D. C., to Boston, Mass. This is identically the same bill as that previously introduced in the Senate by Mr. West, of Louisiana. CAPITOL.

Telegraphic News.—The "Chicago Times" on Telegraph Colleges.—Performances of the Quadruplex.

CHICAGO, ILL., Jan. 4th.

TO THE EDITOR OF THE TELEGRAPHER.

WISH you a happy New Year. The members of the fraternity in this section have done their best towards starting the New Year right. I did not hear of a single case of drunkenness. The Baltimore and Ohio R. R. have opened a telegraph office in the passenger depot, in the north wing of the opposite building.

The Illinois Central are increasing the capacity of their round house to six or eight more engine stalls, near the 16th street station, at the shops. It is rumored a new office will be opened on the line there.

Miss Lillie Smethells, of the W. U., Chicago, day force, has resigned, and accepted a situation on the Michigan Central R. R. line, as operator at the home of her parents, Michigan City, Ind. As the management of the Michigan Central have heretofore strenuously opposed the employment of female operators, this new departure must be considered quite a compliment to Miss S. We opine the M. C. R. R. will have no cause to regret its departure, as Miss Smethells has shown by her deportment here that she understood her business and knew her place. She has left lots of friends and no enemies behind her.

Mr. Aden Hatch, formerly clerk in Supt. Wilson's office, but more recently night check boy, W. U. main office, has been promoted to the vacancy caused by the resignation of Miss Smethells. Mr. Hatch is a worthy young man.

The following pertinent remarks upon the lying advertisements of so-called telegraph colleges, clipped from the columns of the Times of this city, of January 2d, will, no doubt, be read with interest by the fraternity elsewhere. The Times remarks as follows:

"There is a good deal of what seems to be well founded complaint against the advertisements and claims of so-called telegraph colleges. It is stated in the circulars of these institutions that men and women learning the business are sure of a position at once, and that salaries of operators range from sixty to one hundred and twenty dollars a month. They are also informed by these same circulars that the telegraphers have not infrequently the opportunity afforded them of travelling to distant parts of the world; that they not infrequently enjoy the privileges of railroads

steaboats, expresses, and of hotel living and public entertainments; that various companies 'offer a premium, by way of large salaries, for the services of telegraphers, both ladies and gentlemen, to act as agents, book keepers, and fill other responsible positions; and that 'enterprising young men and ladies can obtain a good salary in a shorter space of time than in most any other business.'

There is just sufficient truth in these statements to save them from being a total falsehood and not enough to save them from being a most discreditable misrepresentation—one hording on a barefaced swindle. The facts are that salaries range from \$30 to \$100 a month; and the further fact is worthy of notice that a telegraph company vastly prefers to employ an operator who has learned his business in a regular office, where he acquires all the routine duties, in addition to the management of an instrument, and which is really but a small part of an operator's duties. The operator who accepts passes at hotels, or on railways, secures them by virtue of his 'cheek' and not by virtue of his position. Again, these telegraph colleges require a considerable sum to be paid; whereas, any young man or woman desiring to learn practical telegraphy can obtain a position in almost any office; they can commence to receive pay at once, and can thoroughly learn the duties of the profession, their compensation increasing constantly as they are promoted.

A majority of the telegraph colleges in the country are started by discharged or broken down operatives, and who do no more than to 'beat' pupils out of half a hundred dollars, without affording them any adequate return. There may be one or two reliable telegraphic schools in Chicago and the northwest, but the majority are simply swindles. Young persons who wish to become practical telegraphers should seek to enter, at the start, a regular telegraph office. Telegraphy, like journalism, cannot be learned outside the regular organization."

The quadruplex continues to work successfully. When there is business enough to call for four men on each end, between here and New York, the quadruplex is always ready. At other times it is worked as a duplex, the receiving operator using one side, the sending operator the other. There is an advantage gained when working it this way over any other system, as the receiving operator at either end can break on his own side, without interfering with the sending operator, as on the duplex circuits as ordinarily worked. Sometimes Buffalo works with New York on one side, and Chicago with New York on the other.

Does not this seem wonderful, three offices working on the same wire at once? On December 21st, during the big sleet storm which prevailed from Buffalo east to New York, the quadruplex was worked in the manner spoken of above, Buffalo and New York doing 450 messages on one side, between 8 A. M. and 5 P. M., and Chicago and New York doing 523 on the other side, during the same hours. The line worked very hard east of Buffalo, or a better showing could have been made. That the quadruplex was almost a god-send to the Western Union Co. this day is demonstrated by the fact that out of the 40 wires Philadelphia had to New York, only four were working, and only two were working from Buffalo to New York; Cincinnati, St. Louis and Indianapolis, had none to New York, and Pittsburg had but one; so it was impossible to distribute the business by the different routes as is generally done at such times.

OCCASIONAL.

Subscriptions to "The Telegrapher.—The Canadian Telegraphers' Mutual Insurance Association.—Bulls.—Not to be Fooled.

HAMILTON, CANADA, Jan'y, 8.

TO THE EDITOR OF THE TELEGRAPHER.

ENCLOSED please find currency to pay for subscriptions to THE TELEGRAPHER, commencing with the first number of the current volume. Telegraphers in the Dominion feel the pressure of the hard times, but I expect to send you some additional subscriptions very soon.

The Canadian Telegraphers' Mutual Insurance Association, which was organized at Montreal on the 7th of December last, is understood to have already a very considerable membership, and is favorably regarded by the Canadian telegraphers. The Association is worthy of the support of the telegraphers in the Dominion, and cannot injure the Telegraphers' Mutual Benefit Association of our brethren in the United States, as it will not, in all probability, withdraw from it a dozen supporters, whereas a home institution will obtain more general recognition and be regarded with more interest. It is intended to appoint district secretaries for each company at convenient points.

Telegraph bulls are always appreciated—they serve a double purpose—to amuse, and as a warning to go and do otherwise.

A Wisconsin correspondent of THE TELEGRAPHER lately sent you a bull about "coat sleeves" for "coal stoves." The error was perpetrated in a lady's department not a hundred miles from here, and we caught it on the fly—the message being addressed to a large iron foundry here. I send you a few others which may interest the readers of THE TELEGRAPHER.

One operator at a branch office who works fast and slow, regardless of time, and throws dots in promiscuously, sent us a message addressed James S. Paw. When the original turned up it read James Shaw. Fortunately the street and number accompanied the address, and Mr. Shaw will no doubt be somewhat surprised at the new way of spelling his name.

Another message passed through this office signed "S. A. Mueleox." When the message was delivered the gentleman to whom it was addressed was absent, and his wife replying to the signature, the answer came back to us in the same shape. The singularity of the name attracted attention, and we asked "M" if he sent a message signed S. A. Mueleox? He replied "yes." We then asked for a repetition of the signature, and it turned out by a redistribution of the dots and time to be Samuel Cox.

Another message passing through asked for a certain "casbnator," which turned out to be a "cultivator." Walsingham via St. W—was sent by a telegraphic expert "Walsing Hall." Another to K— G—, care of H. and Peter, turned out to be intended for "Hespeler."

The last two bulls originated on the Western Union lines.

The last "bull" in this drove was received through a repeating office. "Meet her will leave at—Meet her." The receiver suggested that the first two words should be "mother," and so it turned out.

Will close this communication with a little anecdote, which I believe has not yet been in print.

Some years ago an office was opened at Vienna, Ontario, and a junior operator was sent to take charge and instruct the new agent. The telegraph was now in that section of the country, and the office was visited by sight seers from the locality for some distance around. One old gentleman visited the office daily, departing after each visit with a knowing look. At last he could hold in no longer, and as he watched the paper unrolling and passing through the table exclaimed: "No use, young man, you can't fool me—there ain't paper enough on that roll to go around the world!" After this he was seen no more inside the office, having probably satisfied himself that the telegraph was a fraud. Fancy a strip of telegraph paper passing inside the wire and going "around the world," and each office writing his message on it. I may suggest in concluding that there's a wide field for the inventive genius in this idea. Patent not yet applied for.

Cold Weather.—Lease of the Great Western Lines to the Western Union Co.—Telegraphic News and Personals.

CHICAGO, ILL., Jan. 10th.

TO THE EDITOR OF THE TELEGRAPHER.

NO LETTER is so easily begun, no conversation so easily opened, no acquaintance so quickly formed after an introduction as by reverting to that universal topic the weather, and "shure we're havin' a deal up it now," as the Irishman remarked, from 20 to 25 below zero, and the wind from the northwest driving it right through a fellow is enough to impress it upon one's mind quite forcibly. The Electrical storm of the 8th was pretty general. It had been snowing west of us for several days previous, and very few overland routes were working on that day.

Hon. Wm. Orton, Pres. of the Western Union Telegraph Co. was in town last week. He came here, I understand, in connection with the lease of the Great Western Lines to the W. U. Co. Just about a year ago now, the W. U. Co. celebrated the new year by taking in the Pacific and Atlantic Company. This year they say Happy New Year to the Western folks, and wrap their corporative arms about them. An order was entered on the 7th by Judge Williams, of the circuit court, approving and confirming the lease. The terms of the lease were not stated, but it is understood to be very favorable to the W. U. Co. This Company (the Great Western) owned and operated about 1,000 miles of line. It is claimed by parties who seem to be posted, that the Milwaukee lines of the G. W. Co. are not covered by this lease to the W. U. Company, but that they are to be operated by a private corporation. I understand some of the wires have already been run into the W. U. office.

This quiet transfer to the W. U. is a matter of great surprise in telegraph circles here, as it was generally thought the A. and P. Co. would lease the lines of the G. W. Co.; and a rumor was afloat that the terms had recently all been agreed upon, but it is said that the A. and P. kicked over the traces on account of having

to advance money to pay the taxes, and other liens against the G. W. Co. The W. U. being willing to do this have outgeneralled the A. and P.

George Fuller, a well known fire alarm operator, recently resigned his position in the office here on account of his health, and accepted the position of Pipeman on Engine No. 6, of the City Fire Department. On the evening of the 6th as the engine was going to a fire, running at full speed, one of the whiffletrees broke at the corner of Canal and Eighteenth street, and turned the engine over on its side. Mr. Fuller, who was in his seat beside the driver, was thrown directly under the engine, and instantly killed.

Mr. F. W. Jones, electrician, W. U. office, this city, has just finished setting up one of the finest sets of quadruplex instruments I have ever seen. There is not a single splice in any of the wires, they being continuous from pole to pole. The wire that was used to make these connections being first tested as to insulation, etc. before being used, and no naked splices under the table to make crosses. There is no doubt this will be one of the finest working quads in the business. This one is intended for the Cincinnati wire. That makes two sets of quadruplex now in successful working in the W. U. office here.

Mrs. O'Connor, for a number of years on the day force in the W. U. office here, has taken a vacation, and will visit the Emerald Isle, the place of her birth, across the big pond, before she takes her place in the office here again. Wish we could go too.

OCCASIONAL.

The Toronto, Canada, Dominion Telegraph Office.

TORONTO, ONT., CANADA, Jan. 7.

TO THE EDITOR OF THE TELEGRAPHER.

AS THERE has been nothing said through your columns as regards the Toronto Dominion office for some time, I thought I would show the boys that we are alive.

We have five four sectioned tables and a duplex in operation between here and Montreal, and have just set one up for the Buffalo circuit, which will be put in operation in a few days.

Our present force consists of Mr. S. E. Gibbs, chief operator, a gentleman well worthy of his position. Mr. P. W. Snider, asst. chief, who is an old time operator in this country. Mr. N. Enrke, is our night manager, and is well liked by the boys.

Miss Josie Schofield, our only lady operator, manipulates the Barrie line. Mr. A. J. Pattison (Pat) is sushing things on the Buffalo wire. Messrs. G. M. Merryfield (swelly) and F. W. Farley (Kid), are running the Montreal Duplex. Mr. Thomas Kehoe sleeps on the Hamilton and St. Catharines wire. Mr. Mick Burke (the wild Irishman), runs the Ottawa line. Mr. George Carlisle, the infant that's never on time, runs Detroit wire. Mr. R. M. Ratbray presides at the Brantford wire. Mr. Alexis Bennet, the man that never breaks, is playing on the Peterboro' wire. Mr. E. Whiteside works with the girls on the city loop. Mr. Channey Knapp takes a good many chances on the Goderich wire. Mr. Homer Pingle, the short haired man, is rusticiating in a branch office. Mr. W. H. Stratton is on the Kingston wire; and last, but by no means least, is Mr. James Wilson, at present acting as Supt. Neilson's private secretary.

Business at present is very dull, consequently the force is not so large as usual, but the Canadian Parliament opening in Feb. will probably call for an increase in the staff, owing to large amount of reports, etc.

DOMINION.

Telegraphs and Telegraphers in Minnesota and Wisconsin.]

WINONA, MINN., Dec. 30.

TO THE EDITOR OF THE TELEGRAPHER.

TELEGRAPHING is rather slow in this part of the country at present. But few changes are taking place among the operators, as those who have situations hold on to them, as there are plenty of operators seeking employment and few vacancies occurring at this season of the year.

The Fountain City Telegraph Company, during the fall, extended its line from Winona, Minn., to Alma, Wisconsin. This is an independent line, and extends now from this place to Alma, with offices also at Fountain City and Buffalo City, Wis. It is owned by Mr. B. C. Slade, of this place.

The Grangers purpose to push their line through to Chicago early in the Spring and promise to reduce the rates about fifty per cent. when the line is completed

A BILL is to be introduced into the Legislature of New Jersey to incorporate the New Jersey and New England Telegraph Company.

The Publisher, in announcing the **Eleventh Volume** of

THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year.

All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER

is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to or in the interests of no TELEGRAPH COMPANY, CLIQUE or COMBINATION, but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, no LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL
UPON THE
AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore:

ONE COPY, ONE YEAR.....\$2 00
SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The Impending Telegraph Contest.

ALL the signs indicate a very active and vigorous contest between the Western Union Telegraph Company and the Atlantic and Pacific Company and the other companies connected with the latter in competing for the telegraph business of the country. A strong party is now evidently backing up the Atlantic and Pacific combination, and the result thus far is shown in the advance of the quotation for the latter stock to 23, a figure which it has not reached for years before, or when it was originally issued at 40 on the par value of 100. As against this advance the quotation for Western Union has declined 3 or 4 per cent., though it will probably be advanced again when it shall suit the purpose of the leading operators in it to do so.

The managers of the two companies are making every effort to strengthen their respective organizations for the contest which is impending, and to weaken their opponent as much as possible. The last move of the Western Union Company has been to sequestrate the lines of the Great Western Telegraph Company, which have for some time past been in the hands of a receiver, and which it was generally supposed would eventually be absorbed by the Atlantic and Pacific Company. It is understood that the stockholders of the Great Western Company lose their investment, and the Western Union Company undertakes to pay the debts of the company as the consideration of the lines. We presume that, as has been the case with the Pacific and Atlantic lines, a considerable portion of them will be taken down.

It is now some years since there has been a really active and energetic telegraphic competition, and a renewal of such competition will no doubt add to the interest and excitement attending the business. Whether it will be carried to such an extent as to become regardless of the interests of the stockholders and employes remains to be seen. It is to be hoped by those who are interested, either as stockholders or employes, that it may not.

The advantages possessed by the Western Union Company in such a contest are undoubtedly very great, and are so realized to be by its competitors. On the other hand, the companies competing with the Western Union are in better condition than ever heretofore to compete for telegraphic business, and the funds will be forthcoming to add to the lines and facilities in such directions as may be needed to complete the system, and to strengthen the lines on routes already covered, where that may be required. What is needed now to put the so-called opposition companies in good shape is a practical consolidation of the whole, as has been persistently urged in the columns of THE TELEGRAPHER. The reasons for, and arguments in favor of such a consolidation have been too often stated by us to require repetition at this time. We honestly believe that such a consolidation would be for the best interests, not only of the companies, but also of the employes. It would seem as though, if rightly undertaken, and by the proper parties, the present is a favorable time to effect it.

We know that the real managers of these great enterprises, the men who are behind the scenes, and move the actors who represent them to the public, do not take into very deep or earnest consideration the effect that their movements and operations may have upon the interests of the employes. The latter, especially those in subordinate capacities, have little voice or influence in what is to be done or left undone in such contests. Consequently, they cannot be expected to feel any very partisan interest on either side. Their duty is to discharge faithfully the business which they are employed and paid to do, and their sympathies will naturally be with the company which pays best for their services. Active telegraphic competition will, we think, benefit telegraphic employes. It has done so in the past, and the result will be the same in the future.

The question of fast telegraphy, or automatic, duplex and quadruplex, derives much of its interest and

importance from the advantage which it may afford to the competing parties. It is reasonable to suppose, therefore, that neither party will neglect any opportunity to strengthen itself in this respect.

The fear of Government interference in telegraphic matters for some time to come is practically removed, and the public have therefore to look only to competition for any advantage to be gained. It is for the interest of the public to support telegraphic competition, and it must be acknowledged that the public heretofore have shown a very decided recognition of this fact. Consolidating and absorbing lines with a view to the establishment of a telegraphic monopoly have proved futile, for the means have always been provided for the construction of new lines in place of those thus absorbed. As we have often asserted, only a Government telegraphic monopoly, maintained by law is possible in this country.

The policy and course of THE TELEGRAPHER in regard to such a competition will be the same in the future as in the past—entire independence. As the representative of the telegraphic fraternity, who are employed by all parties to such a competition, we shall not take sides with either, but shall give them all a fair chance to be heard. We are nobody's "organ," and don't intend to be, and we are not, therefore, under the necessity of misrepresenting anything or anybody, or suppressing anything for fear of the effect it may have upon one side or the other. THE TELEGRAPHER, in the interests, as it believed, of the fraternity and the public, has always favored telegraphic competition, and opposed telegraphic monopoly, and will continue to do so, whoever the proposed monopolists may be. We have no telegraphic interests to be affected either way, and are therefore in a condition to render impartial justice to all concerned. While we favor telegraphic competition within reasonable bounds, we do not desire to see it carried to such an extreme as to make the business unremunerative. That is not a consummation to be wished, either devoutly or otherwise, and such an excessive competition is not eventually in the interest of the patrons of the lines even. The great risk which has to be encountered in such cases is that the contestants may lose their temper, and be more intent on damaging their opponents than on making the business remunerative. However, we hope it may not proceed to such an extreme in the present case.

Important Decision of the U. S. Supreme Court in Regard to Patents.

In another column we publish the syllabus of a recent decision of the Supreme Court of the United States, which is of the utmost importance to all inventors, patentees and owners of patents. Although the magnitude of the interests involved in this decision will, doubtless, lead to its being extensively commented upon by far abler pens than ours, still we think no apology is needed for calling the attention of such of our readers as may be interested pecuniarily or otherwise in patents and patented inventions to some of the more prominent points involved therein.

According to this decision, it seems that if any person makes use of all the elements of a patented combination excepting one, and, instead of that element, he employs what was known at the date of the patent to be a proper substitute for that element, he is liable for infringement; but if he uses any other substitute, even one which was already known, but which performs a new function, he is not liable.

The importance of this decision will at once be apparent when it is borne in mind that nearly every patent issued from the Office is what is technically known as a "combination patent," that is, a new combination of old and well known devices, which is capable of producing a useful effect. We believe it has been almost uniformly laid down heretofore, not only by writers on patent law, but in the decisions of the Courts both in this country and in England, that the evasion of such a patent by the introduction of an obvious equivalent in place of one member of a patented

combination, constituted an infringement of the patent. Curtis, one of the leading authorities on the subject, says, that if the change introduced constitutes a mechanical equivalent, "and besides being such equivalent it accomplishes some other advantage beyond the effect or purpose accomplished by the patentee, it will still be an infringement, *as respects what is covered by the patent*, although the further advantage may be a patentable subject as an improvement upon the former invention." A good illustration of this doctrine is the English case of the Electric Telegraph Co. *vs.* Brett. The patentee's invention was described as an invention of "improvements in giving signals and sounding alarms in distant places, by means of electric currents transmitted through metallic circuits." The defendant used the earth as a return circuit, a discovery made subsequent to the grant of plaintiff's patent. It was held, in this case, that the earth was merely an equivalent for the return wire, which might in itself constitute an improvement which would warrant a separate patent, but, nevertheless, when used in connection with the signal and alarm apparatus, constituted an infringement. Under this last decision of the Supreme Court, on the contrary, it would not be an infringement. This question is one of the most common of any that arise in patent litigation, and the decision will be likely to render many patents hitherto considered of immense value comparatively worthless, and to correspondingly enhance the value of a great number of patents hitherto considered to be infringements upon earlier inventions. Of equal, and perhaps greater importance, is the decision in reference to reissued patents. The patent law provides that a patent may be reissued and amended under certain specified conditions, and under this law the office has been accustomed to grant any claim for a combination of elements, which was new, and was shown in the original drawing or model, whether specifically described in the original specification or not. According to this decision it seems that if a patentee of a patented combination subsequently discovers that he can accomplish a new and useful result by a combination which omits one or more members of his previously patented combination, he cannot reissue and obtain a valid claim on a combination of less than the original number of elements, the ground taken by the Court being that such a patent would not be for the same invention as the original patent, and that any description of such combination would constitute "new matter," the introduction of which into the specification of a reissued patent is expressly forbidden by the fifty-third section of the patent law of 1870.

In view of this decision it would be well for the holders of reissued patents to have them carefully examined by competent counsel, as in many cases their value may be most materially affected thereby.

The Faraday and the New Cable.

A DESPATCH to the Associated Press, from St. Johns, N. F., of the 11th inst., states that nothing had been heard of the cable steamer Faraday, since she put to sea, twenty-four days previously, to try to pick up the cable and finish laying it to the shore. It is supposed that after unsuccessful attempts to accomplish the object she has abandoned further efforts for the present season, and has returned to England. Her arrival has not, up to the time this is written, been reported at any English port, but this is not cause for alarm, and she will probably be heard from in a few days.

The persistent but unsuccessful attempts to complete the laying of the new cable, after the usual time regarded as practicable for such work, has fully demonstrated the fact, which has been generally recognized and heretofore acted upon by those who have had experience in laying cables across the Atlantic, that there are but a few weeks in the year when suitable weather can be relied upon for a sufficient length of time to warrant undertaking the work of laying a cable of the length required to establish telegraphic

communication between North America and England or Ireland.

The contractors for putting down the new cable have made most extraordinary exertions and incurred very large expense to carry out their contract, but it has been in vain, and the completion of the work, of which only about 200 miles remained to be done, must be postponed until another season. All the steamers from English and Irish ports arriving here for the last two or three weeks report unusually tempestuous weather and very heavy gales on the Atlantic, which have protracted their voyages to from two to three weeks. Under such climatic conditions it is of course useless to hope for the success of the Faraday.

It has seemed to us, although we do not claim to be an expert in telegraphic cable laying, that the great mistake which has been made in this matter was in laying the short sections of the cable from Nova Scotia to Rye Beach, and from Nova Scotia to the Newfoundland coast first. It would seem to have been more essential to have first laid the long section between Ireland and the Newfoundland coast while at least reasonably good weather could be counted on, and that having been done, it would not have been a difficult matter to put down the shorter sections. Why the other course was pursued we are not informed, but there must undoubtedly have been some reason which was considered of force sufficient to warrant a disregard of the experience of former similar enterprises. At any rate the damage is done, and the possibility of competition with the Anglo-American Company is postponed for several months.

There were undoubtedly very important reasons why the cable should be completed the past season, if possible, which will account for the persistent and costly efforts to accomplish it. The pecuniary loss falls upon the contractors, MESSRS. SIEMENS BROTHERS, but the company and its allies in this country are disappointed and damaged by the unanticipated delay in establishing communication. It is especially annoying to be unable to finish the work, when it had so nearly reached completion that two days more of decent weather would have sufficed for the purpose.

A Correction.

IN the account of the presentation to Mr. JOSEPH E. FENN, by the employés of the Automatic Signal Telegraph Company, which appeared in the last number of THE TELEGRAPHER, it was stated that Mr. COYLE made the presentation on behalf of his associates.

This was an error. Mr. EDWARD KYLE, who is a native American, and not an adopted citizen as the name first given would indicate, having been delegated for that agreeable duty.

A Telegraphic Change.

MR. L. N. JACOBS, who is generally known either personally or through his prominent connection with the "strike" in California in 1869, has resigned the position of Manager of the San Francisco, California, office of the Atlantic and Pacific Telegraph Company, the duties of which he has discharged for some time to the satisfaction of the company and the public, to engage in other business. The estimation in which Mr. JACOBS is held by the public in San Francisco is shown by the following notice of his retirement from telegraphic service, which appeared in the *San Francisco Chronicle* of January 1st:

"L. N. Jacobs, Manager of the Atlantic and Pacific Telegraph Company's office in this city, yesterday resigned his position to engage in a more lucrative business. His successor is J. G. Bloomer. Mr. Jacobs has been identified with the Atlantic and Pacific Telegraph Company since the establishment of their office in this city, and his uniform courtesy and attention to business have won for him hosts of friends, who will regret to learn of his retirement. In the retirement of Mr. Jacobs the company has lost a most efficient and capable officer."

Mr. JACOBS has been an earnest and practical friend

of THE TELEGRAPHER for several years past, and has contributed by his exertions very materially to the liberal support which it has received from the telegraphers on the Pacific Coast, and, while, in common with his late associates and numerous telegraphic friends, we regret the discontinuance of his connection with the telegraphic interests, we heartily congratulate him on his excellent prospects for the future, and trust that he may realize the success and prosperity which he has now every reason to anticipate.

A Telegraphic Ball.

SOME time since an Association of telegraphers was organized in this city for the purpose of giving an annual invitation ball. The first annual ball of this Association will be held at FERRERO'S Assembly Rooms, Tammany Hall, on Thursday evening, Feb. 4th. This will, no doubt, prove a successful and enjoyable entertainment.

A general meeting of the Association to complete the arrangements, was held at 86 Liberty Street, on Friday evening of this week.

Personals.

MR. THOS. FORSYTHE has been reappointed Superintendent of Fire Alarm Telegraph at Elizabeth, N. J.

MR. JOHN H. WERBLE has been appointed Superintendent of Fire Alarm Telegraph at Newark, N. J.

MR. L. N. JACOBS has resigned the position of Manager of the Atlantic and Pacific Telegraph Company at San Francisco, Cal.

MR. J. G. BLOOMER has been appointed Manager of the Atlantic and Pacific Telegraph Company, at San Francisco, Cal., *vice* Mr. L. N. JACOBS resigned.

The Telegraph.

Lively Times in Telegraphic Circles.—Resignation of Gen. Eckert, Superintendent of the Eastern Division of the Western Union Telegraph Co.—Facts, Rumors and Fancies.

QUITE a sensation was occasioned in telegraphic circles and among the brokers and speculators at the Stock Exchange, on Tuesday last, by the resignation of Gen. Thomas T. Eckert, who has, since the present organization of the Western Union Company, been General Superintendent of the Eastern Division of that Company's lines. This resignation took the public generally by surprise, although it was not unanticipated by those acquainted with recent telegraphic combinations.

It was also reported that Mr. Eckert's retirement was preliminary to his election to the Presidency of the Atlantic and Pacific Telegraph Co., which, it will be recollected, has been vacant since the withdrawal of Mr. Duff from the Company. There is no doubt but that Mr. Eckert is to occupy a prominent position in the management of the Companies competing with the Western Union combination, but just what that position will be is not as yet made public.

General Marshal Lefferts is prominently spoken of as the successor of Gen. Eckert in the position of General Supt. of the Eastern Division. As manager of the American Telegraph Company, previous to its consolidation with the Western Union, Gen. Lefferts was very popular. His present position as the President and Executive Manager of the Gold and Stock Telegraph Company is a very important one, and whether he would consent to the transfer, if proposed, we are not informed.

There are unpleasant whisperings in regard to the hold which the Western Union Company has upon the quadruplex, which it has puffed so industriously and spent so much to develop. The presumptive inventor of that arrangement is a slippery customer, and it would be the usual thing for him, after the instrument had been developed at the expense of the Western Union Company, and had been so unqualifiedly endorsed by its officials, to trick them out of it, if possible.

It is also rumored that negotiations are nearly completed with the Automatic Telegraph Company to afford the advantage to be derived from its system to the opposition to the Western Union. We shall probably be in a position to give our readers more certain and definite information in regard to these matters before long.

All sorts of rumors are afloat in regard to matters

connected with the telegraphic contest which is about to be inaugurated, but it is hardly worth while for us to repeat them at this time.

It is evident that the competition between the Western Union combination and the companies competing with them is to be very active and bitter, and not improbably a protracted one. Further developments will no doubt be awaited with much interest, and the readers of THE TELEGRAPHER may rely upon being kept fully informed of all matters in connection therewith.

Lease of the Great Western Telegraph Co's. Lines to the W. U. Telegraph Co.

THE lines of the Great Western Telegraph Company have been leased to the Western Union Co., the Atlantic and Pacific Telegraph Co. having declined to accede to the terms proposed for a lease to that Company.

It is understood that the Western Union Company leases the lines on condition that it advances the money required to pay off the floating indebtedness of the Great Western Company, which is to be reimbursed out of the earnings of the property if there should be any. It is known that the Great Western Company has been for some time in the hands of a receiver, and it was necessary to make some disposition of the property to meet the pressing demands of the creditors.

Gen. Eckert elected Trustee and President of the Atlantic and Pacific Telegraph Company.

At a meeting of the Board of Trustees of the Atlantic and Pacific Telegraph Company, Thursday, P. M., January 14th, Gen. Eckert was elected a Trustee, and subsequently President of the Company, to fill the vacancy caused by the retirement of Mr. John Duff.

Western Union stock sold down to 73½ on Thursday, and Atlantic and Pacific advanced to 29, closing at 29¾.

Effect of False Financial Quotations.

CONSIDERABLE indignation prevailed on the Gold Exchange on Saturday, growing out of the receipt of false financial intelligence affecting the price of gold. It appears that early in the day the following despatch was sent over the tape of the Manhattan Quotation Company:

LONDON, 3 P. M.—Discounts open market, 4¼; bank rate, 5. Bullion withdrawn from Bank of England, £268,000. American securities weak. Erie, 25½.

This caused an advance of from ¼ to ⅓ per cent., and a large number of transactions were made. The regular press despatches were soon received, stating that the Bank of England had gained £20,000 of bullion, that American securities were unchanged, and the street rate of discount was ½ below the regular Bank rate. This was soon followed by the following from the Manhattan Quotation Company:

CORRECTION.—LONDON, 4 P. M.—Bank of England gained on balance to-day £20,000; '90s, 4¼. Frankfurt—U. S. '62s, 98¾.

Gold reacted, and the indignation of the brokers found vent in the appointment of an investigating committee, who ascertained that the first despatch was not authentic, and recommended that the indicator of the Manhattan Company be removed from the floor. The Executive Committee was authorized to offer a reward of \$500 for the discovery of the perpetrator of the fraud.—*New York Daily Tribune.*

Important Patent Decision.

SUPREME COURT OF THE UNITED STATES.

Ira Gill, Plaintiff in Error, vs. Eliza Wells, Administratrix of Henry A. Wells, deceased. (In error to the Circuit Court of the United States for the Southern District of New York.) If any one uses all the elements of a patented combination except one, and instead of that, employs what was known at the date of the patent to be a proper substitute for the omitted element, he is liable for an infringement of the patent. But he is not liable if he uses any other substitute, or even an old one, which performs a new function.

A combination of four elements is not the same invention as a combination of three of them without the fourth.

A patent for a combination of four elements cannot be reissued for a combination of three of the original elements with a substitute for a fourth, unless it was known at the date of the patent to be a proper substitute; and it should be explained, it seems, that the substitute is an equivalent for the omitted element, and why the change is made.

A patent for a combination of four elements, which does not suggest any other improvement, cannot be reissued with a claim for a combination of three of those elements, omitting all reference to the fourth. A suit

for the infringement of such a reissued patent cannot be maintained against any one who uses a combination of the three elements embraced in it, even though he uses with them a substitute for the omitted element.

Conviction of a Railroad Telegraph Operator of Manslaughter.

IN the Court of Quarter Sessions, at Jersey City, N. J., on Tuesday last, Mr. John S. McClelland, a telegraph operator on the Pennsylvania Railroad, at Bergen Cut, was placed on trial on an indictment for manslaughter. The indictment set forth that the defendant, on the 28th of March last, neglected to warn the conductor of a train to remain at one of the cuts until another had passed. Owing to this negligence two trains collided, and Robert Keyes, conductor of train 941, William Day, a fireman, and Charles Stockton, a brakeman, were killed.

The prisoner, McClelland, was sworn in his own behalf, and testified that when he discovered his mistake he rushed out and tried to attract the attention of those on one of the trains, but did not succeed. He stated that the brakeman, Stockton, was intoxicated, and he tried to rouse him up while he was in the telegraph office. He cast the blame on McGuire, the conductor of one of the trains, for repeatedly disregarding the notifications of the telegraph operator. Gibbon Morris, the night telegraph operator at the same place, corroborated the testimony of the prisoner with regard to McGuire's repeated violation of instructions. He said he knew McGuire to run his train frequently on the main line without orders. When the defence was closed McGuire was called to give rebutting testimony, and he stated that McClelland gave him no orders whatever to remain for another train. His train was ready to proceed to Jersey City before he went to McClelland for orders. He did not hear the latter call or whistle or motion for the train to stop. James Smathers, the engineer, testified that he heard McClelland tell McGuire that all was right, and McGuire turned the switch to let the train on the main track. The case was summed up, and the jury, after a long deliberation, found the prisoner guilty. McClelland is still out on bail.

New Patents.

For the week ended December 8, 1874, and bearing that date.

6,167.—ELECTRICAL TORCHES. J. K. Simpson, Newark, N. J., assignor, by mesne assignments, to H. Mandeville. Patent No. 69,715, dated October 8, 1867. Filed October 16, 1874.

A portable electrical gas lighting torch, consisting of an electrophorus near the handle, and a gas director and spark points at the upper end, the lower spark point and gas director being insulated from the upper spark point and stem.

1. The electrical torch made by the combination, in one implement, of a gas director, spark point, and an electrophorus, or other portable electrical device, substantially as set forth.

2. The portable torch provided with an electrophorus contiguous to the handle, and operated by a thumb or finger piece, substantially as set forth.

3. The herein described electrophorus, consisting of the hard rubber tube *c*, the metallic plate *f* and the metallic tube *b*, connected, through the plate *d* and rod *2*, with the outer surface of the rubber tube *c*, and through the rod *3* and ring *e*, or its equivalent, with the outer surface of the handle *a*, substantially as set forth.

4. The torch with a gas director insulated from the point *s*, substantially as and for the purposes described.

5. The combination of an electrophorus, situated near the lower end of a torch, the gas director *z*, at the upper end of said torch, and a conductor between the electrophorus and the gas director so arranged as to convey the electricity from the electrophorus to the insulated point *s*, contiguous to the opening of the gas director, substantially in the manner and for the purposes set forth.

WANTED.

TELEGRAPH INSTRUMENTS AND SUPPLIES.

- RELAYS, unequalled for beauty and strength;
 - COMBINATION SETS; Box and Pocket Relays.
 - CHALLENGE, PONY and REPEATING SOUNDERS.
 - KEYS, various styles, including the SCHNEIDER KEY, just out, no legs, wire connections above the table.
 - REGISTERS, with SPRINGS or WEIGHT.
 - CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.
 - REPEATERS—HASKIN'S AUTOMATIC, and others,
 - SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.
 - ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.
 - ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.
 - ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.
 - MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.
 - BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.
 - WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA SERENA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.
 - INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.
 - BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.
 - TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
- PRICE LISTS FURNISHED FREE ON APPLICATION.

OUR TELEGRAPH INSTRUMENTS and ELECTRIC APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

CHAMPION BURGLAR ALARM AND ANNUNCIATOR COMPANY,
 40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS and OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skilful mechanics to estimate upon work, or will give any information in writing that may be required. *Liberal commissions will be paid upon any orders that may be secured for us.* Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

L. G. TILLOTSON, *President.*
 CORNELIUS ROOSEVELT, *Secretary and Treasurer,*

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.
 The undersigned having secured the exclusive Agency for manufacture and sale of the
EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.
 The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.
 These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.
 Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.
 On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.
 No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon application to

| Milwaukee, Wis., | |

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

**FIRE ALARM
AND
POLICE TELEGRAPHS,**

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by **MORE THAN TWENTY PATENTS.**

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SULLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Telegraphic Competition, Past, Present and Future.

BY OLD TELEGRAPHER.

COMPETITION in telegraphy commenced very soon after the practicability and importance of the telegraph was established, and, notwithstanding all attempts to establish telegraphic monopoly, has continued, with more or less vigor, to the present time. That it will continue in the future is inevitable, unless the Government in this, as it has in other countries, assumes the exclusive ownership and management of the telegraphs. Only by such ownership and management, and legal prohibition of private telegraph enterprises can competition in telegraphy be prevented. That such competition is essential to the interests of the public and telegraphic employes all experience has shown.

It is not intended at this time to go into a detailed history of the competition between different companies heretofore. It would occupy too much space, and require more time than can well be devoted to it at present. It would not, however, be either unprofitable or uninteresting to write up a complete history of the competition which has existed in the past, and the rise and fall of competing telegraph companies and systems, and it is to be hoped that some properly qualified person will soon undertake the task. For the present it is only intended to refer briefly to the subject and the lesson which may be learned from the experience of the past twenty-five years.

The Morse system and patents having been originally under one ownership and control, it was necessary, for the purpose of establishing competing lines, to develop some new system. This was done by Prof. Royal E. House in the House Printing Telegraph, and by Mr. Bain in the Bain Chemical Telegraph. There were at one time these three systems in operation, and competing for telegraph business in this country. The Chemical system first succumbed to and was absorbed by the Morse, and was practically abandoned until it was revived in the Automatic system. The House made a more prolonged contest, but it was finally consolidated into the Morse companies, and printing telegraph instruments are used to but a very limited extent now by the Western Union Company, which, in absorbing the American Company, took the only printing lines then in operation. In the meantime the House instrument had been succeeded on the American lines by the combination printer of Mr. Geo. M. Phelps, and this is the instrument which is now used, as above stated, by the Western Union Company.

For obvious reasons, no reference is made here to the printing telegraph instruments which have been invented and are extensively used on what are known as reporting lines, and for private telegraph lines. A large number of these are in operation, but they are designed for special use, and not for general telegraphic service.

After several years' experience with telegraph companies and lines covering limited extents of territory respectively, it became evident that, to work efficiently and advantageously, it was necessary that there should be fewer companies, and that these should cover large sections of the country at least. Accordingly the process of consolidation of companies and aggregation of lines was commenced and carried on vigorously, and has continued to the present time.

During this time the vital Morse patents had expired and this opened the field for a more active competition, which was not slow to be availed of. The American Telegraph Company and the Western Union Telegraph Company covered a large extent of territory, and by their connection with smaller companies and lines practically afforded a compact telegraphic system, covering a large part of United States and Canada. These companies were not always harmonious, it is true, but they managed to get along together bound by mutual interests. Various companies and lines competing with these were organized and built, most of which were finally consolidated into the United States Telegraph Company.

For two or three years an active competition was kept up between the United States and the American and Western Union Companies, which was at times very exciting and bitter. Through mismanagement and fraud the United States Company finally proved unprofitable to its stockholders, and soon after the election of Mr. Orton to the Presidency it was consolidated with the Western Union. A portion of the lines acquired by the Western Union from the United States Company, covered territory of the American Company, and by means of this and the menace of entering into direct competition with the latter company and building lines on other portions of its territory, the American Company was reluctantly induced to consolidate with the former company. Mr. Amos Kendall strenuously opposed this consolidation to the last, and to effect it it was necessary to purchase all his stock in the American Company, which was done, and the consolidation finally accomplished. The managers of the Western Union Company believed that telegraphic competition was practically ended, and that it would be practicable for that company, through its great resources and power, to prevent any effective competition in the future, and establish a practical telegraph monopoly. They soon found, however, that this was impossible.

The means were provided for building new lines in place of those which had been taken in. Not discouraged, however, the process of consolidation was continued, and the Bankers and Brokers, and subsequently the Pacific and Atlantic, and recently the Great Western Telegraph lines (not to mention other smaller concerns) have been absorbed. Still the millennium of telegraph monopoly seems as distant as ever.

The Atlantic and Pacific Company, under the vigorous manipulation of its present controlling influence, comes prominently forward, and just at the time when the pockets of the Western Union stockholders are beginning to be plethoric with dividends (so long suspended), a competition more extensive and energetic than ever is entered upon.

The lesson to be learnt from all this is obvious—it is that telegraph monopoly is repugnant to the public who patronize telegraph lines, and that however often bad management and consolidation may ruin telegraphic enterprises, and inter them in the Western Union telegraphic cemetery, the means will be forthcoming to construct new competing lines. The public do not intend that any telegraph company, no matter who may control it, shall be in a condition to "dictate terms."

Telegraphic Progress on the Pacific Coast.

THE SAN FRANCISCO, Cal., correspondent of the San Diego *Union* communicates to that journal the following interesting statement of telegraphic progress on the Pacific Coast last year:

"To a certain extent the business life of a community can be quite accurately gauged by the amount of telegraphing from and to that point. In this day of cheap telegraphing no business of any importance is carried on without more or less assistance from the telegraph, and the regular monthly reports to any telegraph headquarters from the different cities and towns are good thermometers, showing the rise or decline of business activity in the different localities.

The telegraph in its workings is no respecter of persons—"first come first served" is the standing order—Uncle Sam of course excepted. Peter Short's telegram to his grocer for a sack of potatoes goes according to its number, notwithstanding the impatient elbowing of the message behind it ordering the purchase of a railroad or line of steamships.

With the unprecedented increase of telegraphic facilities on the Pacific coast during the now closing year, the patrons of the telegraph can certainly be accommodated with speed—the second desideratum in the business—and with such pioneers as Col. James Gamble and Frank Jaynes, of the Western Union, in charge of the principal lines, there is but little to fear of the first requisite, *i. e.* accuracy, suffering.

The Western Union's line construction and reconstruction this year has only been limited by the number of competent foremen to take charge of the work. Early in the season all the District Superintendents were drafted to the front, and most of them are still there, working all day and praying all night that the agricultural gentlemen who asked for these early rains may never realize what *damp bad* work telegraph building in the rain is.

The following is a brief statement of the most important work this year:

A one wire line from Salinas to Santa Barbara, 241 miles. This extension was described at length in the *Union* some months since.

The line from Downville through Sierra City, Jamieson and Quincy to Greenville, 85 miles. This fills a long needed want in Plumas County.

The Cloverdale line was extended to Ukiah, 31 miles.

Construction of three new wires and reinsulating four old ones from Reno to Virginia. Rebuilding the Overland lines from Emigrant Gap to Summit, 22 miles—everything new except the post holes. The wires used on this work is No. 6 galvanized, 525 lbs. to the mile, the heaviest ever used on this coast. These two last jobs were under the personal supervision of Supt. Frank Bell, and reflect great credit on the builder.

The Overland lines have been further reconstructed by putting in new poles, cross arms and insulators between Promontory and Ogden, 53 miles.

The line along the North Pacific Coast Narrow Gauge Railroad is completed from Sandedito to Tomales, 50 miles.

The Northern line has been entirely rebuilt from Yreka, Cal., to Roseburg, Oregon, 160 miles. Four thousand new poles and thirty-two tons No. 7½ wire formed part of the material used.

From Shasta to French Gulch, 16 miles, new poles and other extensive repairs.

From Sacramento to Roseville Junction, 18 miles, seven wires were reinsulated upon new cross arms.

Roseville Junction to Marysville, 34 miles, thoroughly reinsulated.

Marysville to Colusa, 28 miles, and Nevada to Camp-tonville, 19 miles, overhauled and put in good shape.

Portland, O., to Kalama, W. T., 47 miles; Tenino, W. T., to Victoria, B. C., 200 miles. The lines were entirely reconstructed at heavy expense.

Several proposed extensions are postponed until next year, for reasons above given.

The Colusa Lake and Mendocino Telegraph Co. have extended their lines and opened a number of new offices.

The Western Union will, this winter, construct entirely new lines through the cities of San Francisco and Sacramento; extra heavy forty foot poles will be used, and no expense spared to make a neat and substantial job.

Mr. Jas. Gamble, Gen'l Supt. Pacific Division W. U. Tel. Co., who has just returned from New York, brought, among other electrical apparatus, a number of samples of cable proposed to be used in the Pacific Ocean submerged line, and Mr. Gamble speaks hopefully of an early start on this work.

The Duplex system, by which two messages are sent over one wire at the same time, has been lately introduced by Supt. Gamble upon the Overland, the Virginia, Nev., and the Sacramento circuits, with great success. This, practically, doubles the Company's facilities on these routes. As soon as a supply of the quadruplex (four messages over one wire at once) instruments can be made in New York, the Pacific Division will be stocked on the "heavy" lines.

Further and extensive improvements are to be made during the coming season, of which you will be duly advised.

Colusa Lake and Mendocino Telegraph Company.

AS THIS is strictly a local company, and as the enterprise originated and has been carried to a successful completion by prominent residents of Colusa county, we propose to give the particulars of its organization and extensions of the line.

P. I. Washburn, Manager of the Western Union Telegraph Company at Colusa, after exhausting every effort to persuade that company to extend their lines to Princeton and Grand Island, organized a local company, consisting of E. W. Jones, J. K. Giles, Joseph H. Jones and himself, for that purpose. In the latter part of May, 1873, they completed the new line from Princeton to Grand Island, embracing six offices, and connecting with the Western Union Telegraph Company at Colusa. This company was known as the Princeton, Colusa and Grand Island Telegraph Company. In December, 1873, J. B. Cooke and J. B. Stanton purchased the interests of E. W. and J. H. Jones, when the company reorganized under the name of the Colusa, Lake and Mendocino Telegraph Company, and resolved at once to extend their lines through Lake and Mendocino counties. As this enterprise contemplated a heavy expense, and as the plan proposed by the new line would be a huge lever in the development of the three counties, an effort was made to get an enabling Act passed by the last Legislature, which would authorize the different counties to loan their bonds in aid of the work, but as the bill was killed in committee, the company resolved at once to build the main trunk line, and delay the completion of the side lines until material assistance could be had. They commenced work on the fifteenth of May, and completed the line to Middletown, in Lake County, on the 25th of August. They opened offices at Colusa, Boggs', Princeton, Sycamore, Chapin's Landing, Grand Island Mills, Grimes' Landing, Grand Island, Williams' Ranch, Mountain House, Turner's Station, Munchville and Leesville, in Colusa County, and at Allen Springs, Bartlett Springs, Upper Lake, Lakeport, Kelseyville and Middletown, in Lake County.

The cost of the line and properties of the company was in round numbers twenty-four thousand dollars. We learn the company intend to complete their line to Calistoga within the next two months, and that the line will be extended to Jacinto, St. Johns, Olimpo and Newville, as soon as inducements are held out to the company by the citizens and property owners along the route. We are also informed they will extend their line north from Upper Lake, via Witer Springs and Potter Valley to Round Valley, in Mendocino County, early in the spring. Their present line covers about one hundred and eighty miles, which will be extended the coming season some two hundred miles more. This company, composed of only four men, by their energy and enterprise in showing this work along, have set an example worthy of imitation by some of our wealthy citizens, who at first were disposed to burlesque the enterprise, and throw cold water on the measure in its infancy. We can now boast of more telegraph offices in the county than any county in the State, and six months from this time we expect to see offices opened at Spring Valley, Newville, Olimpo, Kanawha, St. John's and Jacinto.

The principal or head office of this company is located at Colusa. J. B. Cooke, General Superintendent; J. B. DeJarnatt, Secretary, and W. P. Harrington, Jr., Treasurer.—*The Weekly Calusa (Cal.) Sun.*

Pleasant Surprise Party and Presentation to Miss Kittie Marriott.

On Friday evening, Jan. 15th, a large party of ladies and gentlemen assembled at the residence of Mrs. Marriott, 484 Herkimer street, Brooklyn, N. Y., for the purpose of surprising Miss Kittie Marriott, and presenting her with a large and beautiful black walnut, gold finished, photographic frame, containing the photographs of the several operators employed upon the Western Union wire between New York and New Brunswick, N. J., which Miss M. formerly operated.

Miss Marriott was greatly surprised, as she had been invited by one of the party to attend the theatre, and was waiting for the escort; which invitation was fully understood by her when her friends made the object of their visit known.

After the presentation had been made and suitably responded to by Miss Marriott, the party were invited to the large dining hall, where a sumptuous repast had been provided, which was enjoyed and appreciated by all present.

After supper dancing was indulged in, and continued for some time, and afterwards the talented and accomplished Miss Clara Utley, of Rahway favored the company with music.

Among those present were Messrs. W. T. H. Barr, of Elizabeth, N. J.; L. B. Foley, of New York; R. H. Zublar, of Hoboken; J. W. Downing, of New Brunswick; W. T. Harned, Fred. Atwood, Miss Madge McConnell, Miss Utley, Miss Tillie V. Marriott, Miss Van Schoonoven. The party dispersed at an early hour, greatly pleased with their evening's entertainment.

Miss Marriott has for the past three years been in the service of the Western Union Telegraph Co. in New York, and now retires, taking with her the esteem and good will of her superiors and that of her friends and late associates, who showed their appreciation of her past services in presenting her with so handsome and appropriate a testimonial.

A Woman Operator's Response to "Nihil Nameless."

CHICAGO, Jan. 15th.

TO THE EDITOR OF THE TELEGRAPHER.

"Will the Coming Operator be a Woman?"

THE above is the caption of an article in your issue of January 9th. The writer takes a doubtful affirmative view of affairs in general being better in these latter days, while that many things are worse he seems positive. It is always sad to my mind, when any one, be he friend or foe, is more inclined to look on the dark side of life than on the bright.

As "N. N.'s" side of the question unfolded itself to my mind at a first perusal, I mentally promised to answer paragraph by paragraph. But, just at present, lack the time, and must be content to fill less space.

Passing, therefore, directly to the very head of "the body of his subject," I would ask "N. N." if he considers it always necessary to use the term "clergyman?" I think not one of the scholars he calls forth would object to the noun clergy. I fancy even the

venerable Lindley would allow the lexicographers of the present day to be his equals.

Immediately after this little flirtation with grammar, the writer most fittingly uses the term "Old Fogies." An old foggy is always behind the time, even of his own age—let alone "forty years" in advance. Soon we hope to celebrate the Centennial of our Republic, and, methinks, he is an old foggy indeed who shall doubt that in the coming century woman will accomplish much which during the past years she has passively permitted her brother's brain and hand to will and do.

And again (I will quote one sentence, which I think must have got into "N. N.'s" article by mistake, surely) he says, "They," women, "are rapidly absorbing the business, as they have already done in other walks in life." If he thinks that, how can he say "he knows her opportunities are limited?"

Is it a conundrum?

All "N. N." says of men operators may be true. He knows such, I presume; but, after working long where there are scores of operators of his sex, I can say I am ignorant.

"Honi soit qui mal y pense."

If woman's mission is to elevate the human race, "make men good," does it argue against their working as operators, that in all large offices where there are a number of employes the introduction of ladies has tended directly to raise the tone of the office to a higher level? or this fact, that on a railroad line where the manager was troubled by slang and profane language he introduced three or four lady operators and quickly there was a marked change for the better in this respect? There is still enough of the old chivalry left to render men more gentlemanly in the presence of women. Does "N. N." think this will grow less as women go more and more into active business life? I think not. One who is naturally refined will not lose her identity by coming in contact with others. And one who respects herself, will always be respected.

A word as to my own experience. I have had charge of an office in a lumbering district in this city, where, perhaps, I was the only lady in the vicinity, but, not for that reason, did I meet with less kindness or consideration from the business men with whom I came in contact.

In an office with many employes a woman need have but little to do with male employes of coarse minds, if such there be; but men are not likely to show any but their most manly and gentlemanly characteristics to a true lady.

In a railroad office I suppose a woman does have to do with a rougher class of men, but she can certainly prevent profanity in her presence. And is it any worse to hand orders, etc., to a few workmen, than to give orders to the butcher, the baker, etc., at home? A woman cannot stay forever penned up at home, and only go out into the world hemmed in by a father or a brother on one side and a husband on the other. Many have not these "natural protectors," and as they go through life will probably meet all classes of men, the vulgar as well as gentlemen, and it rests with themselves to maintain their dignity under any and all circumstances.

I do not think that telegraphy will ever be in the hands of women alone.

I truly believe that in the coming days, men and women will ever join hands in all good works.

ALUQUAR.

Severe Weather.—Telegraph Colleges.

TO THE EDITOR OF THE TELEGRAPHER.

WE have been having some remarkable weather here in the northwest since my last communication. The thermometer at St. Paul changed in three hours to-day from 9 degrees above to 19 degrees below zero. It has been below 20 several times this winter, but the change was not so sudden. At Oshkosh to-day it was down to 22, at Greenbay 25, at Janesville 21, and about on the same proportion all through the upper lake region. At Pembina, Dakota, it was 45 below, and Fort Garry, Manitoba, 40 below. The electrical storm made sad havoc in this section with railroads, telegraph lines, etc. The snow blocked up the roads, and the extreme cold snapped the wires where they were drawn too taut like pipe stems. There was not so much snow as has fallen at other times, but the high winds drifted it in huge piles in enough convenient places to block trains. The Sioux City R. R. line was broken in several places north of St. Paul, and no trains got nearer Sioux City on that road than Mankato, Minn. Several interesting phenomena have been reported. Among the most notable was one at St. Paul, on the above mentioned Sioux City R. R. line. When Mr. Hughes, the chief operator, began testing this morning, this line seemed to be heavily grounded, and upon opening the key a stream of fire followed the circuit breaker about three inches long, and, seemingly, an inch thick. It was of nearly a minute's duration. A great many of

the boys complained of sticky writing to-day, and it was only remedied by opening the key a good deal wider when sending. The charge formed by the electrical storm was so heavy as to completely stop communication on some of the wires for several minutes at a time.

The Northwestern Telegraph Company began Jan. 1st using the word "collect," which is written after the signature on each collect message, and counted in the check as an extra word, but not charged for; this will no doubt prove to be an excellent idea to prevent error in paid and collect business, and save a great many check error sheets and vexation to clerks. No trouble originated in the adoption of the rule, as it was so simple. It looks very much like the work of Gen. Supt. C. H. Haskins.

In my last letter I referred incidentally to the Messrs. Valentines' Telegraph College, at Janesville, Wis., and expressed a wish that some of the fraternity would get the daily papers of some of our large cities to show up these swindles. This earnest desire, originated out here in the woods, has been gratified, as the following communication, clipped from the *Chicago Times*, January 4th, will show. I suppose some one of the fraternity has carried my former communication to Mr. Storey and shown him one of their circulars. Mr. Storey generally handles swindlers and humbugs without gloves, and, judging from the spirit of this letter, his editorial must have given it to them hot and heavy. The following is his letter, *verbatim*. The attention of the public is called to it by its being placed in a very conspicuous place and the following heading lines:

"TELEGRAPH COLLEGES.

An Old Operator Pronounces them Frauds of the First Water.

To the Editor.

CHICAGO, Jan. 4.—Your truthful editorial in your issue of the 2d inst., in regard to so-called telegraph colleges, is highly commended by the fraternity here and elsewhere. Heretofore these despicable frauds and humbugs have only been exposed in the telegraph papers, 'class journals,' whose circulation is limited entirely to members of the telegraphic fraternity. As a matter of course, 'outsiders,' young ladies and gentlemen who are constantly being made the victims of these would-be professors, never see these journals, as they rarely know of their existence, and it is only through the medium of a paper like the *Times*, whose columns are read by all classes, that they can ascertain the truth in regard to these colleges. You can consider yourself the pioneer in this respect here in the northwest, as no daily paper has ever published anything on the subject before. By your kind permission I should like to more fully enlighten the public in regard to these colleges.

You have forcibly pointed out the falsity of the elaborate statements made by the principals of these institutions, in regard to the 'certainty of position,' 'munificent salaries,' free transportation privileges, free tickets to entertainments, etc., and of premiums being offered telegraphers in the way of 'good salaries' as 'book-keepers,' 'agents,' etc., all of which is worse than bosh, as those who send out circulars containing such information know as well as we telegraphers; and their victims find it out when too late, after being fleeced out of the amount charged for tuition. These statements, however, do not seem sufficient to entrap the unsuspecting by some of these colleges, but downright falsehood and bribery has been used to accomplish their ends. A case recently came to the notice of the fraternity here, in which a college in Wisconsin undertook to bribe a young operator who had learned the business in a regular telegraph office near the location of this college, by offering to give him \$5 per head for every scholar he would induce to buy a scholarship in their institution. He was to inform the greenies that he learned there in six months. As he is as fine a young operator as there is in the business in the northwest, of course such an argument would have been sufficient to induce the most doubting greeny that in a short space of time he could be a first class operator, and enjoy all the benefits so blatantly advertised in their circulars.

Let us look for a moment at what constitutes a good operator. He must have a splendid English education, understand Algebra, be a rapid penman, a good grammarian, and be able to read all kinds of writing. In the earlier days of telegraphy, men who were not remarkably good scholars took up the business and schooled themselves. As the business grew they grew with it; but that time has passed, and an operator who lacks any of the requirements named, especially rapid penmanship, need never expect to advance in the profession. The railroad operators, who are a class by themselves, 'enjoy the privileges of railroads,' in so far that the railroad employing them transport them from one station to another, not as a pleasure to the operator but to suit the convenience of the railroad service. Their salaries range all the way from \$25 to \$75 per month, rarely exceeding the highest figures named even

for train dispatchers. The railroad operator is subject to the whims and caprices (called orders) of the 'division operator,' 'train dispatcher,' 'superintendent of telegraph,' 'division superintendent of the railroad,' etc. If the duties of agent are combined with those of telegraphing, his responsibilities are increased without a corresponding increase of salary. The commercial operators, those who handle the matter that appears in your telegraphic columns, are under a chief operator, manager and superintendent. Their hours of duty are from 8 A. M. until 6 P. M., with half an hour for lunch, and from 6 P. M. until the business is all cleared up, generally about 2 A. M. The day duty (8 A. M. to 6 P. M.) is considered preferable, and there are always applications on file for promotion from night to day duty. The commercial operators' hours are not so long as those of the railroad operators, except at way offices, they having to be on duty (except in offices where more than one is employed) from 7 A. M. until 9 and 10 P. M., with time allowed for dinner and supper. The commercial operators' work is more confining, however.

These remarks are not intended to discourage any who think they are fitted for this profession, but only to show them what fitness they require. Those intending to enter the profession should apply to some well known manager or superintendent, and if they can recommend a telegraph college they will be safe in entering it; otherwise they will save time and money and prevent disappointment to wait until they can get into a telegraph office to learn.

TELEGRAPH OPERATOR.

It is a pity this correspondent did not enlarge on his subject more, and show how that by as many years study in any other profession as it takes to make a real first class operator, a man could become rich and honored instead of being a mere machine subject to the whims of ignorant superiors devoid of any reason or judgment, to say nothing about justice, for it is a well known fact that if an operator, no matter how long he has been in the business, dares to assert his manhood he is quickly made to understand that he must divest himself of such foolish notions or find other quarters. It is also a matter of regret among the fraternity here that he did not come out boldly and give the principals in the case in Wisconsin mentioned, where the proprietors undertook to bribe a young operator to assist them in the roping in business as the principals were none other than the Valentine Brothers of that model college at Janesville. No doubt this correspondent knew all this, but did not wish to commit himself as it is well known here in the northwest. The young operator in question making no secret of the matter, but telling it boldly to his fellow laborers in the office where he is employed, and laughing over it as a good joke on the "Greenies." If the Messrs. Valentine want to follow up this matter they can have the facts, figures, etc., but they dare not do it.

If I mistake not we had editorial advice from you in a recent issue of your valuable paper showing that this method of ventilating these nuisances in the daily papers was the proper way. At least one of the students of this college will trouble the proprietors no more to procure him a situation. His real name was Odella B. Carpenter, but he went under the assumed name of T. H. Clifford. He spent three months at this college, and, of course, came out little better fitted for a first class telegraph situation than when he went in. His money was all gone, and he applied to the Northwestern Railroad Company, who gave him a clerkship at Sharon, Wisconsin, where he could barely earn enough to eke out an existence. There he was permitted to practice in the telegraph office when he had leisure time. Seeing no prospects of bettering his condition, and laboring under the idea that for something he had done, which caused him to assume another name, he would dishonor himself and family, he took morphine a few evenings ago and died from the effects of it. It has not as yet transpired what he had done to cause him to go by an assumed name. He was a single man, and I understand has a brother in the business at Belleflower, Ohio, and his parents reside at Painsville, Ohio. They have the heartfelt sympathy of the fraternity in this section in their bereavement. It is reported that some of the officials of the Northwestern Railroad are getting a bonus from the Valentines for giving these students situations on that road as fast as any of them are turned out competent to take a situation. I cannot say how true this is, and until I ascertain you will probably hear no more on this vexed question from

NORTHWEST.

The Relative Strength of Iron and Compound Telegraph Wire.

TO THE EDITOR OF THE TELEGRAPHER.

MENTION is made in the *Journal of the Telegraph*, for January 1st inst., of the serious interruptions caused to the Fire Alarm and Police telegraph lines o

New York city, by the sleet storm of December 20th 1874; and as the article appears to bear unfavorably upon compound telegraph wires, the following explanation of the facts is given that those who are interested in telegraphs may be enabled to judge fairly and intelligently whether the fault be inherent in compound wire or otherwise.

The compound wire used for the construction of the New York Fire Alarm and Police telegraph lines in 1869, was, in the first place, of very small size and the steel core of a smaller proportion to the whole weight, than is now manufactured, unless by special order. If this fact alone had been the cause of its inferior strength to galvanized iron wire, it remains simply a question of how much steel shall be added to make it superior to iron—but the wire was not constructed in accordance with the advice of the Wire Co., as regards the length of stretches (some of which are enormous), and was badly damaged before stringing by lying in the streets with teams passing over it, kinking in handling, etc; and the copper was also badly torn in making twist joints with plyers, such as are used for iron wire construction, whereas, patent joints are now used, entirely preventing such damage. We admit that the wire from its nature will not bear the rough usage in construction usually given to iron wire, and if the copper be torn, so as to admit moisture, it is only a question of time when the steel will rust away. Also, if kinked (for which there is no necessity), the steel is weaker at that point—but we claim that, being properly strung, copper will remain intact, and after a series of years the steel will be found bright with the tin originally put there. The superiority in strength of compound wire, properly strung, has been fully proven in many instances of long stretches in use by the Western Union and other telegraph companies.

CHESTER SNOW,

President Am. Compound Teleg. Wire Co.

N. Y. & O. M. R. R. Southern Division Operators.

IN THE WILDS OF JERSEY, January 12.

TO THE EDITOR OF THE TELEGRAPHER.

THE operators on this division of the New York and Oswego Midland Railroad are a very nice set of fellows. If some are a little slighted they must excuse me on the ground that I am not so very well acquainted with them. The first on our list is Mr. C. W. Cresson, ticket agent and operator at Wickham Avenue Depot, Middletown, N. Y., who is a fair, sound man, but I would like to suggest to him that when he breaks in on one, to at least give them some warning, as it would look more gentlemanly. No harm is meant, "X."

Mr. G. H. Smith, "S," officiates at Crawford Junction.

At "B," we find Mr. R. G. Kirkpatrick, "K," who does the double duty of agent and operator. He comes from some place on the Auburn branch, but we never could find out what part he took in the drama of "The Drover and the Lady Operator" at Truxton; perhaps Silas can.

At "Su," Mr. A. M. Chase, "C," takes care of both main line and the branch. The Ellenville branch starts from this place, following the D. & H. Canal to Ellenville, where Mr. C. E. Crum, "C," runs the station, while Mr. W. C. Whitner, "W," runs the "string."

At "C. E." Mr. W. E. Shippy, "S," officiates. While at Liberty Falls and Liberty, Messrs. E. Schoemaker, "E. D.," and W. H. Freer, "F," make things lively on the wires. We find Mr. A. D. Murray, "D," at Parkville; and at Morriston is Mr. W. L. Darbee, "A."

At Westfield Flats Mr. F. T. Wheeler, "F. T.," is agent and operator. At Cook's Falls we find a young man of our acquaintance, one of the most eccentric boys I ever had the fortune to come across, Silas D. Blanchard. I never hear his name but what I think of his "ball race and horse play at Truxton," and it makes one laugh heartily to hear of his exploits at school, in De Ruyter, N. Y. *Yale boys are nowhere.* Silas changes his sig, so often that we can hardly keep track of him. I must leave Silas to his fate, and pass on to East Branch, where Mr. W. E. Sloat, "S," is agent and operator. At Hancock, Mr. J. E. Hamilton, "X," is operator. At this point the Midland runs within half a mile of Hancock Station, on the Erie Railway. At Walton, Messrs. W. Nichols, "N," and W. Hawkins, "H," run the office. At Airville, Mr. H. H. Walton, "W," is agent and operator. At Sidney Centre Mr. C. W. Burnside, "B," is agent and operator. At Sidney Plains is the testing office, and here we find as agent, Mr. C. H. Hopkins, "N," a retired operator.

Mr. W. E. Dante, "X," officiates as day operator to the perfect satisfaction of the company. In Mr. C. W. Sherwood, "C. S.," the night man, I think I recognize as being once the night man at Franklin Furnace, N. J., who was at that time just commencing to *frite gerse*. At New Berlin Junction, Mr. M. D. Olds, "Q," is agent and operator. At this point the New Berlin branch leaves the main line. On this branch are few

stations. At Holmesville, Mr. Edw. White, "X," is operator. At Mt. Upton, Mr. Howard North, "W," and at New Berlin, Mr. Jas. Broadfoot, "F," brings up the rear with his *broad foot*. Again, on the main line, at Guilford, Mr. C. A. Winsor, "W," is agent and operator. At Summit, Mr. J. M. Welsh, "C," is operator; and at Oxford, Mr. J. E. Rogers, "J," is agent and operator. I will now stop for the present.

P's AND Q's.

Successful Working of the D'Infreville Duplex.—Unfounded Rumor.

TORONTO, CANADA, Jan. 12th.

TO THE EDITOR OF THE TELEGRAPHER.

DURING the past week a practical test of D'Infreville's duplex invention was made by the Dominion Telg. Co., working a circuit of six hundred miles—from Buffalo to Montreal, through repeaters at Toronto. The duplex between this city and Montreal has been for months working very successfully. Last week Mr. Hugh Neilson, Supt. and Electrician for the Dominion Co. proceeded to Buffalo, and after having put up the duplex, the trial was made, which proved quite satisfactory. One great advantage is that this duplex can be and is now working between this city and Buffalo on a battery by which a number of other wires are also worked.

The rumor that a paper is about to be started in the interests of Canadian telegraphists is evidently quite unfounded, nothing having been heard here of the undertaking.

P.

Personals.

Mr. DAVID T. ACKERSON has been appointed agent and operator N. J. M. Ry., at New Durham, N. J., vice E. Greenleaf, Jr., transferred.

Mr. ENOCH GREENLEAF, Jr., formerly agent and operator N. J. M. Ry., at New Durham, N. J., has been transferred to Newfoundland, N. J., same road, same position, vice Mr. E. B. CLAY.

Mr. A. H. KNAPP has been promoted from relief operator N. J. M. Ry., to the position of operator, same road, at Pompton, N. J., vice Mr. McELROY, transferred.

Mr. F. PETIT, operator Pompton Junction, N. J., succeeds Mr. McELROY, at Pompton, as agent.

Mr. J. H. McELROY has been transferred from Pompton, N. J., as agent and operator N. J. M. Ry. to Middleton, N. J., same road, as agent. This is quite a responsible position, but Mac is capable of holding his own.

Mr. SAMUEL E. GARVEY, "Sq," has been appointed manager of the Montreal, Canada, office, of the Dominion Telg. Co.

Mr. CHARLES R. RICHARDS has been discharged from the service of the Automatic Signal Telegraph Co. for intoxication and inattention to duty.

Mr. T. D. LOCKWOOD has resigned his position at Morristown, N. J., on the Delaware, Lackawanna and Western Railway, and has been appointed inspector of the Automatic Signal Telegraph Company in this city.

MESSRS. P. V. DEGRAW and E. C. BOILEAU, have resigned their positions in the New York Western Union office, and accepted positions in the New York office of the Associated Press line.

MESSRS. F. N. BASSETT, of the New York Western Union office, and WILLIAM G. JONES, of the Western Union, Philadelphia, office, have resigned, and accepted positions in the Washington office of the Associated Press line.

MESSRS. THOS. J. BISHOP, of the New York Western Union office, and HARRY A. WELLS, of the Western Union, Philadelphia, office, have accepted positions in the Baltimore office of the Associated Press line.

MESSRS. WM. H. HARGRAVE, of the New York Western Union office, and WM. N. GROVE, of the Philadelphia Western Union Office, have resigned and accepted positions in the Philadelphia office of the Associated Press line.

Mr. WM. S. LEWIS, who resigned his position in the New York Western Union Office in July last to go to St. Louis, returns and accepts a position on the night force at 145 Broadway.

Mr. GEORGE P. MATTHEWS, ticket agent and telegraph operator at the South street depot of the Penn. R. R., at Elizabeth, N. J., has been promoted to the principal depot in the same city, as passenger agent of the road, to date from Feb. 1.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

ELEVENTH VOLUME.

The Publisher, in announcing the **Eleventh Volume** of

THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year.

All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER

is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to or in the interests of no TELEGRAPH COMPANY, CLIQUE or COMBINATION, but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, no LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL
UPON THE
AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore:

ONE COPY, ONE YEAR.....\$2 00
SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The Telegraphic Contest.—A Commotion in Telegraphic Circles.

THE situation in telegraphic matters for the last ten days has been decidedly exciting and interesting. We gave briefly in the last number of THE TELEGRAPHER an account of the events that had transpired in the development of the active contest which was impending between the Western Union and the Atlantic and Pacific Telegraph Companies, the most notable and that which attracted the most general public attention being the resignation by General THOMAS T. ECKERT of the Superintendency of the Eastern Division of the former, and his election as President of the latter company.

This event, which was not altogether unanticipated by the initiated, took the public entirely by surprise, and was universally accepted as showing that the competition was to be a protracted, vigorous and bitter one. The officials of the Western Union Company were disposed at first to regard this transfer of General ECKERT from one side to the other as a matter of very little moment, and they were evidently in ignorance of other defections, and the arrangements which the manager of the Atlantic and Pacific Company has been making to secure advantages which should be effective in the contest that has been so vigorously inaugurated.

The adherents of the opposition company and the public were, however, disposed to regard it as a more momentous affair, and as indicative of strength in the opponents of the Western Union Company, and the consequence was a considerable decline in the market quotations for Western Union, and a more than corresponding advance in Atlantic and Pacific shares.

On Friday the following correspondence between General ECKERT and President ORTON was made public by the latter:

NEW YORK, Jan. 9, 1875.

DEAR SIR.—I hereby respectfully resign the position of General Superintendent of the Eastern Division of the Western Union Telegraph Company, and of Director and Traffic Manager of the International Ocean Telegraph Company, which resignation I prefer should take effect at once. Very respectfully,

THOS. T. ECKERT.

Hon. WILLIAM ORTON, President.

NEW YORK, Jan. 12, 1875.

Gen. THOMAS T. ECKERT—Dear Sir: At a personal interview solicited by you yesterday you tendered me your written resignation as General Superintendent of the Eastern Division of the Western Union Telegraph Company. The resignation, which was dated the 9th inst., and which you desired should take effect at once, was the first intimation of your purpose that I had received. In view of the fact, now clearly ascertained, that, while holding a confidential position with this company, you have been, for some time past, secretly carrying on negotiations with its enemies, and, before tendering your resignation, had made arrangements to accept employment in the service of the opposition, I promptly comply with your request, and your resignation is accepted hereby. Vice-President Mumford has been instructed to take charge of your office and assume its duties for the time being. Very respectfully,

WILLIAM ORTON, Pres't.

As Mr. ORTON had not seen fit to publish the whole correspondence, Gen'l ECKERT, on Saturday, in a card to the *New York Tribune* made public his reply to the sharp and acrimonious letter accepting his resignation, which first appeared in that paper.

To the Editor of The Tribune.

SIR: Will you have the kindness, as you have today published the first part of the correspondence which has passed between Mr. Orton and myself, to give publicity to the following letter, which is the latter portion of that correspondence, and which has been omitted, for reasons best known to Mr. Orton, although it was in his possession on Thursday, at 1 o'clock.

NEW YORK, Jan. 14, 1875.

The Hon. WM. ORTON, President Western Union Telegraph Company, 145 Broadway, New York.

DEAR SIR: Your letter of 12th inst., accepting my resignation, is before me. In it you mention that my letter of the 9th inst. was the first intimation of my purpose that you had received. That letter was withheld until your return on Monday, the 11th inst., that I might hand it to you personally.

The wide difference of opinion occurring between us as to the practical management of my division, and

recently exhibited with regard to the New Building on Broadway, has resulted in relations which were anything but agreeable, and which might have prepared you for the reception of my resignation at any moment. You cannot have forgotten the acrimonious correspondence which passed between us in May, 1873; and again last spring our relations assumed such a character that, as several of my friends are aware, I intended to resign, and should have done so but for your ill health and absence. My letter of resignation simply expressed a preference that it should take effect at once, but in presenting it to you I stated, as you must remember, that I was prepared to continue my duties for any reasonable time, and especially in connection with the completion of the work of my department in the new building, if you should so desire. Notwithstanding the imputation in your letter I to-day, at the request of Vice-President Mumford, my successor, accompanied him through the new building, and explained to him in detail all my plans that have been adopted for its arrangement. The assumption in your letter that a subordinate officer, not a director of a company, nor having any voice in determining its general policy, shall be debarred from entertaining a proposition for a more advantageous or agreeable position elsewhere, is one which I do not for a moment admit.

I regret that your exception to my resignation conveys a reflection upon me which will entirely prevent me from taking any further interest in the affairs of the Western Union Telegraph Company.

Very respectfully, THOMAS T. ECKERT.

As the public probably feel no particular interest in this subject, I do not propose to inflict any further discussion of it upon them. But both the public and the press are interested in possessing cheap telegraphic facilities, and these I hope to give them before long.

Very respectfully, THOMAS T. ECKERT.

NEW YORK, Jan. 15, 1875.

It is generally considered that in this epistolary warfare Gen. ECKERT had rather the best of it. It has been known that his relations with the Executive of the Company have for some time past, and as it now appears from the above letter, for nearly two years, not been very pleasant and agreeable to either party. However, that is a matter with which the public have but little concern, but it serves to explain, in some degree, his readiness to accept an antagonistic position to the Company with which he had been so long connected in a leading position.

Gen. ECKERT's ability as an executive officer and as a disciplinarian are generally conceded, and he certainly has no lack of the positive element in his character. In his new position as President of the Atlantic and Pacific Company, in the bitter competition which is to ensue, he will have ample opportunity to demonstrate the ability which it is claimed he possesses to efficiently manage a great telegraphic enterprise.

Mr. A. B. CHANDLER, Superintendent of the Sixth District, and Assistant General Superintendent under Gen. ECKERT, also resigned and followed his chief to the Atlantic and Pacific Company, of which he has since been appointed Assistant General Manager, Mr. E. D. L. SWERT retaining the position of General Manager of the Company.

We stated last week that there were unpleasant whisperings as to the hold which the Western Union Company had on the much lauded quadruplex. This was as definitely as we were at liberty to state the case, but it is now well known to the public, as it was previously to us, that EDISON had given the Western Union Company and his former admirers and ardent friends, President ORTON and Electrician, G. B. PRESCOTT, a "cold shake," and disposed of whatever title he had to the quadruplex to Mr. JAY GOULD for the service of the opposition. It was very difficult to convince our Western Union friends of this fact, and they retained, or pretended to retain their faith in EDISON up to the last possible moment, notwithstanding they had been unable to obtain an interview with him for some two weeks previously. They were at last compelled to succumb, however, to the cumulative evidence, and now they lament for him, and abandon further hope of being charmed by his presence and cooperation in effecting a reduction of tariffs which was officially announced as likely to follow upon the complete development of the quadruplex.

The retirement of Messrs. ECKERT and CHANDLER necessitated some changes in the personnel of the offi-

cial. To Vice-President MUMFORD was temporarily assigned the duties formerly discharged by Gen. ECKERT. Up to the time this is written no permanent appointment to fill the vacancy has been made, but it may be done in time to enable us to give the name of the fortunate individual before we go to press. We learn that Mr. J. C. HINGHAM has been appointed Assistant General Superintendent of the Eastern Division.

Mr. A. S. BROWN, who has for many years efficiently and ably discharged the duties of Manager of the New York office, has been appointed Superintendent of the Metropolitan and Sixth Districts in place of Messrs. HINGHAM and CHANDLER, and at once entered upon his new duties, retaining temporarily the management of the office until his successor could be appointed. Mr. BROWN is an excellent Manager and electrician and his appointment is a most fit and proper one. If the Western Union Company are successful in securing as well qualified persons to fill other vacancies they will be fortunate indeed. Although quiet and undemonstrative in his character and disposition, his ability and zeal in the service of the company ought to have secured promotion long since. We congratulate him and the company most heartily on their mutual good fortune.

The Central Grand Division (Gen'l STAGER'S) is to be extended so as to include GIFFORDS', HOLMES' and CHANDLER'S districts, which comprise the greater part of the lines and offices in New York State, and a portion of Northern New Jersey and Western Vermont, while BATES' New York and Washington district, including Eastern Pennsylvania, and DAVIS' (Baltimore and Ohio) district are to be annexed to the Southern Division under General Superintendent VAN HORN, which will leave the Eastern Division entirely east of the Hudson River.

Vice-President MUMFORD will, for the present, continue to act as General Superintendent of the Eastern Division, aided by Assistant General Superintendent J. C. HINGHAM.

Mr. A. S. DOWNER, who has for a long time been Assistant Manager of the New York office, has been appointed Acting Manager.

General Superintendent VAN HORN, under the new arrangement, will transfer his headquarters from Louisville to New York.

It will be noticed that Mr. ECKERT very plainly intimates in his card to *The Tribune* that it is his expectation to be able in his new position to give the public cheap telegraphy. With the quadruplex and the automatic systems, both of which are to be adopted and used by the Atlantic and Pacific Company, if necessary or advantageous, it is expected to so greatly increase the capacity of the lines for business as to make feasible low rates for telegraphic service. As from present indications the competition between the Western Union and the Atlantic and Pacific Companies is to be embittered by acrimonious personal feeling, as well as actuated by a desire to divide the telegraph business of the country, it is not improbable that rates may come down very materially at a not distant day.

As yet there have been no very important or radical changes of the Atlantic and Pacific lines. At present matters are in rather an unsettled state, and there is a disposition to marshal the forces and get things in order for the conflict which is to be waged. We have rumors of what is to be done by or for that company, but it would be premature to state them until matters are more definitely settled.

It is understood that there is behind all these movements a strong railroad combination, which has been provoked in the first place by the attempt of the Western Union Company to enforce the odious PAGE patent, and thus bring the railroad as well as other telegraphic interests into subjection to that company.

It is reported that the Atlantic and Pacific Company are negotiating for a lease of the Astor House for their executive and main offices in this city, but we are not in a position this week to either confirm or deny the report.

We have endeavored in the above to state as briefly as possible the facts and the situation, so far as they can be known, fairly and candidly. It is a subject which interests every telegrapher, and we do not think that we could occupy our columns with anything which would be more acceptable to our readers, and will not, therefore, offer other apology for the space which is devoted to it.

The telegraphic situation for some time to come is to be one of absorbing interest, and our means of obtaining information is such as to enable us to keep our readers fully and authentically informed of everything of importance on either side in connection with it. This we propose to do, not in the interest of either party especially, but as a matter of duty as a telegraphic journal to which the fraternity and the public are entitled and accustomed to look for the latest and most reliable information.

The Foundation of Telegraphic Success.

THERE has been, especially of late, great activity in the invention and development of apparatus for increasing the capacity of telegraph lines for business. They are all very well in their way, but to make them available to the fullest extent there is a necessity for a radical and decided improvement in the construction of the telegraph lines themselves. Too little attention has been given to this branch of the subject, and, as it is probable that a considerable extent of new line will be constructed during the coming year, we desire to urge upon those who have their construction in charge the vital necessity of full and intelligent consideration of the subject.

No matter how excellent and improved apparatus and systems may be devised, the anticipated benefits will not be realized until properly constructed lines are furnished for their operation. The problem of how such lines may be secured is of more vital importance now than further improvement in telegraphic apparatus. The experience of the Western Union Company in testing the quadruplex has been that it was only practicable to work it on long circuits on lines of large conductivity, and, unless we have been misinformed, it has only been successfully worked on No. 6 galvanized iron wires between New York and Boston and New York and Chicago. Any system, of rapid transmission especially, requires lines of large conductivity and very perfect insulation to be worked advantageously and profitably on any but comparatively short circuits. Notwithstanding the prejudice (which we regard as unfounded) that has been created against the compound telegraph wire, we believe that it furnishes the best and most economical solution of this problem. We do not say this to puff the compound wire, and we have no interest in so doing, but because we believe it to be true. The cost of lines properly constructed of compound wire is actually less than those constructed of other wire of corresponding conductivity, and, if properly handled and put up, it will remain intact for a longer period than other wire.

The manufacture of compound wire has been so improved that it can be furnished of any strength and conductivity required. It is true that it requires more careful handling in construction, but the advantages which it possesses more than counterbalance this.

With a properly constructed and insulated line of adequate conductivity circuits of any reasonable length can be worked with certainty by almost any known telegraph system, and to great advantage by what are known as fast telegraph systems. Without these only circuits of limited extent can be worked, and these not to the best advantage.

As before said, too little attention has heretofore been paid to this vital point in telegraphic efficiency and economy. We do not wish to see any more such miserable lines constructed, as are too many of those now operated by the telegraph companies of this country generally. The best attainable lines will in the end prove by far the most economical and profitable.

Death of the Rev. Henry Highton.

THE last number of the *Telegraphic Journal* records the death of the Rev. HENRY HIGHTON, which took place suddenly at his residence at The Cedars, Putney, England. Mr. HIGHTON was for many years one of the assistant masters at Rugby school, and for some time principal of Cheltenham College, in both of which positions he enjoyed great popularity. As a scientific man he was associated with various discoveries in connection with electric telegraphy, for which he has more than once received the medal of the Society of Arts. He took out his first patent in 1844, for a telegraph worked by high tension electricity, and employing a chemical recorder. In 1846 he invented his well known gold leaf telegraph, which, however, has never been practically used, although Mr. HIGHTON has recently been engaged in perfecting an adaptation of it to long submarine cables. In 1848, in conjunction with his brother EDWARD, he patented several improvements in needle and type printing telegraphs. He has within the last two or three years invented a battery which promises to be of much value. In 1852 he published his well known work on the Electric Telegraph, the matter of which has been largely drawn upon by more recent writers upon the same subject.

A New District Telegraph System.

WE understand that General ECKERT, the new President of the Atlantic and Pacific Telegraph Company, has commenced the organization of a company in competition with the American District Company, which latter, it will be remembered, has for some time been working in harmony, and under a contract with the Western Union Telegraph Company in this city.

The new organization it is understood, controls the patent of J. W. KATE'S automatic signal telegraph about to be issued, which consists in the employment of a series of non-conducting perforated tapes, upon the principle of the automatic system, each tape being prepared in such a manner as to transmit a signal or message corresponding to the principal or most frequently recurring wants of the party in whose residence or place of business the apparatus may be located. These tapes are wound around a grooved drum which is on the same shaft with the mainspring of a clock gearing—the clock gearing, drum and tapes being so relatively arranged that a withdrawal of the tapes winds up the spring of the clock gearing; and the reaction or retrograde motion of a spring when the tapes are released, winds up the tapes upon the drum, and sends the line current through the perforations by means of conducting rollers, between which the tapes pass.

They have also secured the EDISON patent for the same purpose, but upon a different plan. It is also rumored that the KIRCHOF patent of 1865, and the TOWLE and UNGER patent of 1873, will be controlled by the same combination.

The profits of the American District Company are not believed to be very large, in proportion to the capital invested, although they have some two or three thousand instruments in circuit in this city, but it is quite possible that the new organization may contemplate the addition of new features to the business, which have not as yet been thought of, or at least not announced by the managers of the American District.

Lease by the N. Y. Associated Press of a Western Union Wire.

THE New York Associated Press have leased a wire from the Western Union Telegraph Company, between New York and Washington. This will connect with instruments to be placed in the offices of the association in New York, Philadelphia, Baltimore and Washington, on which the greater part of the press business will hereafter be transacted. By offering extra inducements in the way of salary, the association has succeeded in engaging the services of eight of the best operators in the country, whose names will be found

in our column of personals. This arrangement will go into effect as soon as the offices and instruments can be got ready, probably some time next week. With this superior staff of operators, the Associated Press circuit will doubtless be handled in a manner superior, possibly, to any Morse circuit in the United States, or outside of it.

The Cable Steamer Faraday Heard From.

AS SUGGESTED as probable in our article on the Direct United States cable last week, the steamer Faraday has for the present abandoned the attempt to complete the laying of the cable and returned home. An Associated Press despatch from London, dated the 19th inst., announces the arrival of the Faraday at Portland, England, and states that she will refit at Gravesend and resume operations on the cable.

It is hardly probable that any further attempt will be undertaken until the winter and early spring months are past, and more settled and favorable weather for the purpose on the Atlantic may reasonably be expected.

Important to Inventors.

THE attention of inventors of electrical and telegraphic apparatus is called to the advertisement of the Electro-Magnetic Manufacturing Co. They will find it to their advantage to communicate with the company, which makes a specialty of bringing out new, useful and valuable inventions of this character.

The Telegraph.

The Official Changes of the Western Union Telegraph Company.

WE are indebted to Vice-President Geo. H. Mumford, of the Western Union Telegraph Company, for an early copy of the following important executive order,

EXECUTIVE ORDER, No. 159.

1. The Sixth District of the Southern Division is hereby consolidated with the Second District of the Central Division, and placed in charge of Superintendent R. C. Clowry, St. Louis, Mo.
2. Supt. Clowry is hereby appointed Ass't Gen'l Sup't of the Central Division, and will report to this office direct, touching matters within the district assigned to him.
3. The Eighth District of the Eastern Division, Supt D. H. Bates, and the Tenth District, Supt A. G. Davis, are hereby transferred to the Southern Division, and will be designated respectively as the Sixth and Seventh Districts of the Southern Division.
4. The headquarters of the Southern Division will be removed from Louisville to New York, Gen'l Sup't Van Horn remaining in charge, as heretofore.
5. The Seventh and Ninth Districts of the Eastern Division, Supt's Gifford and Holmes, are hereby transferred to the Central Division, and will be designated respectively as the Eighth and Ninth Districts of the Central Division.
6. Supt J. C. Hinchman is hereby appointed Ass't Gen'l Sup't of the Eastern Division.
7. The Sixth District of the Eastern Division is hereby consolidated with the First District, and assigned to Mr. A. S. Brown, who is hereby appointed District Sup't.
8. All reports for the current month will be forwarded in the same manner as heretofore, and without regard to the foregoing changes.

(Signed), WILLIAM ORTON,
President.

The Removal of the Gold and Stock Telegraph Company.

UPON further consideration the Gold and Stock Telegraph Company has decided not to remove its offices from No. 61 Broadway to the new Western Union building. The executive offices of the company will, however, be removed to the new building. The Morse and cable business of the commercial news department has been removed to the present Western Union operating room at 145 Broadway. The printing systems remain at the old quarters until February 1st. This is a temporary arrangement made on account of alterations now in progress at 86 Liberty street.

Telegraphic Construction in New York City.

THE Western Union Telegraph Company have been actively engaged during the past month or two in erecting the new pole lines by which their numerous wires will enter the new building at Broadway and Dey street. One of the most prominent of these extends from Chatham Square along Chatham street and Park Row, crossing Broadway, in front of the *Herald* building, and thence across Fulton street to the north side of the new building. Last Sunday a pole was erected for this line in Fulton street, near Broadway, which is ninety-three feet long and two feet in diameter, and reaches high above the neighboring buildings. The raising required the labor of a large number of men and two horses, and completely blocked the street for some time. The tree from which this pole was made was of California growth.

The line referred to carries forty-seven wires, arranged symmetrically upon eight cross arms, and a top pin. It is to be hoped that the telegraphic war which is evidently approaching will have at least one beneficial effect—that of compelling the removal of these cumbersome, expensive, and, at the best, unsightly pole lines, and the substitution of underground lines, as in all the large cities of Europe, and which is just as practicable in New York as in London.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended Dec. 26, 1874, was 295,162, an increase of 33,976 on the corresponding week of 1873.

The average weekly increase of messages transmitted from postal telegraph stations in the United Kingdom for 1874 was about 32,000, against about 25,000 for the preceding year.

Messrs. Siemens Brothers have appointed Mr. F. C. Webb (member Inst. C. E. and Soc. T. E.), to succeed Mr. Ricketts, who was lost in the La Plata disaster, in charge of the submersion and repair of their cables on the South American coast. In noticing this appointment *The Telegraphic Journal* says: "Mr. Webb's experience in this particular branch of the profession is, perhaps, more continuous and extensive than that of any living engineer."

The London Stock Exchange is about to be placed in direct telegraphic communication with the Paris Bourse, and the new telegraph station in Paris has just been inspected by the officials of the Submarine Telegraph Company.

A private letter from an American electrician now in Paris states that the telegraph business now transmitted over the French telegraph lines is only about one third of that done before the late war with Prussia.

A project has been formed to connect the Indian telegraph lines in British Burmah with Australia via the Malay Straits Settlement, but some hitch has occurred in Malay.

Telegraphic and Electrical Brevities.

A *SHERWD* chap went about Hartford a few days ago representing himself to be a messenger from a telegraph office, and collected about twenty dollars off a number of ladies on spurious messages. The police are on the track of the clever swindler, who did not attempt to play any of his sinful games upon gentlemen, well knowing that the fact of his using "counter blanks" would expose him to all who are used to receiving telegrams.

A *FIRE* in the *Spy* office at Worcester, Mass., on Tuesday last, did considerable damage. The Western Union Telegraph Office, which was on the first floor of the building, was compelled to remove to the offices at the depots and the Bay State House for a few days.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended December 15, 1874, and bearing that date.

157,708.—ELECTRIC HIGH AND LOW WATER ALARMS. Jno. E. Watson, Louisville, Ky., assignor of two thirds his right to John Watson and Geo. S. Allison, same place. Filed September 19, 1874.

Flexible springs, with which contact is made in either direction by an arm controlled by a float within the boiler, are used, so that continued motion of arm and float is not impeded.

1. The combination with a float F', its rock shaft E and indicator h, and the conducting arm C, of the flexible circuit making arms a', substantially as and for the purposes specified.
2. The combination of the float, the rock shaft, and the conducting arm with the flexible circuit closers, alarm and switches, substantially as set forth.

157,764.—TELEGRAPH RELAYS AND SOUNDERS. Wm. S. Rose, Colchester, Ill. Filed April 13, 1874.

Magnets carried on pivoted lever A, and adjusted to or from armature by set screw n, elevating or depressing the lever.

The combination of the horizontal bar A, provided with cross bar B and adjusting screw m, with the magnets D D and their armatures, substantially as shown and described, and for the purpose set forth.

IMPORTANT TO INVENTORS.

Inventors of Electrical and Telegraphic arrangements are invited to communicate with the

ELECTO-MAGNETIC MAN'G CO.,

36 Broad Street,

(P. O. Box 1,804),

NEW YORK.

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS of every description, at

No. 54 SOUTH FOURTH STREET,

(Corner Chestnut street),

PHILADELPHIA.

They solicit the patronage of their friends and the telegraphic fraternity generally.

F. L. POPE & CO.,

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,
No. 40 WEST EIGHTEENTH STREET ;
or to
L. G. TILLOTSON & CO.,
8 Dey street, sole Agents.

GEOERGE H. BLISS & CO.,
 41 Third Avenue, Chicago, Ill.
 CINCINNATI, O., ST. LOUIS, MO.,
 Elm St., cor. 5th. 409 North Third St.
 Manufacturers and Dealers in
TELEGRAPH INSTRUMENTS AND SUPPLIES.
 RELAYS, unequalled for beauty and strength;
 COMBINATION SETS; BOX and POCKET RELAYS.
 CHALLENGE, PONY and REPEATING SOUNDERS.
 KEYS, various styles, including the SCHNEIDER KEY, just
 out, no legs, wire connections above the table.
 REGISTERS, with Springs or WEIGHT.
 CUT OUTS, many varieties, including a new style of PEG CUT
 OUT, with an adjustable LIGHTNING ARRESTER, just out.
 REPEATERS—HASKIN'S AUTOMATIC, and others,
 SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES
 and LIGHTNING ARRESTERS.
 ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also
 SELDEN PRINTER.
 ELECTRIC BELLS, HOTEL ANNUNCIATORS, FIRE and BURGLAR
 ALARMS, and WATCHMAN DETECTORS.
 ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHT-
 ING APPARATUS.
 MEDICAL INSTRUMENTS and APPARATUS on hand and made
 to order. Second hand Instruments for sale cheap,
 and repairing done at short notice.
 BATTERIES in great variety, including the latest inventions;
 also a full assortment of battery material.
 WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE
 WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED
 LINE WIRES; SUBMARINE, SUBTERRANEAN and
 HOUSE CABLES.
 INSULATORS—BROOKS, SCREW GLASS and KENOSEA CARBON.
 BRACKETS, PINS and SPIKES, TELEGRAPH POLES,
 LINE BUILDERS and REPAIRERS' TOOLS.
 TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANI-
 FOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES,
 ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and
 AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
 PRICE LISTS FURNISHED FREE ON APPLICATION.
 Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are
 elegantly finished and mounted on highly polished rosewood,
 mahogany and walnut bases.

CHAMPION BURGLAR ALARM
 AND ANNUNCIATOR COMPANY,
 40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS and OPERATORS throughout
 the country to act as our agents for the introduction of our
 superior BURGLAR ALARMS and ANNUNCIATORS into private
 houses, hotels, banks, &c. Upon receipt of plans of houses
 we will send skilful mechanics to estimate upon work, or will
 give any information in writing that may be required. *Liberal
 commissions will be paid upon any orders that may be secured for
 us.* Our Alarms and Annunciators have just been awarded the
 FIRST PREMIUM of the American Institute.
 Explanatory Circulars will be furnished upon application to
 the Secretary.
 L. G. TILLOTSON,
 CORNELIUS ROOSEVELT, Secretary and Treasurer,
 40 West 18th Street, New York.

ECONOMIZE!
 Procure the best and cheapest Tele-
 graph and Electrical Instruments and
 supplies of all kinds from,

 Send for circular.

**Durability, Efficiency, and Economy of Expense
 and Labor at last Secured.**
THE EAGLES METALLIC BATTERY.
 PATENT APPLIED FOR.
 The undersigned having secured the exclusive Agency for the
 manufacture and sale of the
 EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
 and other purposes yet devised.
 The Battery cell is made of lead, and forms one pole of the
 battery. Sulphate of copper is the only chemical required to be
 used.
 These Batteries have been fully tested during the last year,
 although only recently offered for sale, and have proved to be
 superior to any other as regards efficiency, economy and dura-
 bility. When once set up they require no attention for from
 four to six months, according to the service required of them.
 Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for
 running motors. Price, \$2.25.
 On Locals, one No. 1 cell is used in place of two Daniells, at a
 saving of nearly one half in cost.
 No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon applica-
 tion to
F. L. POPE & CO.,
 (P. O. Box 5503.) 38 VESEY STREET, N. Y.

WATTS & COMPANY,
 No. 47 HOLLIDAY STREET,
 BALTIMORE, MD.
 SUPERIOR TELEGRAPH INSTRUMENTS, RELAYS,
 SOUNDERS, KEYS, OFFICE WIRE, BATTERIES
 OF EVERY DESCRIPTION,
 SWITCHES, GALVANOMETERS,
 RESISTANCE COILS.
 A COMPLETE STOCK of EVERYTHING for the TELEGRAPH
 OFFICE or ELECTRICAL LABORATORY.
 Special attention given to repairing Scientific Instruments.
 Several of our workmen having served their time in the most
 prominent European manufactories, enables us to guarantee
 satisfaction.
 SEND FOR CATALOGUE AND PRICE LIST.

AMERICAN COMPOUND TELEGRAPH
 LINE WIRE.
COPPER FOR CONDUCTIVITY.—STEEL FOR STRENGTH.
 The superiority of the COMPOUND TELEGRAPH WIRE compared
 with IRON, consists in its LIGHTNESS relative TENSILE STRENGTH,
 CONDUCTIVITY DURABILITY, EFFICIENCY and RELIABILITY.

Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,
TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor **SILLIMAN**, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, - - - - - PUBLISHER.

SATURDAY, JANUARY 30, 1875.

VOL. XI.

WHOLE No. 446.

The Telegraph at the Antipodes.

THE following connected and intelligible account of the Australian telegraphs and telegraphic connections with Europe, written by Mr. Edward A. Arling, a young American, now resident in Australia, was originally printed in the *Australasian*, a weekly newspaper published at Melbourne, Australia, and will be found of interest:

"It is just two years ago that the first through message was flashed from London to Australia, a distance of over 13,000 miles, and the connection then established has, with but slight interruptions, remained unsevered from that period, allowing of daily communication between the mother country and the most distant possessions of the British Crown. By means of the electric wire the principal items of important current events, as they transpire in various parts of the world, now find an accustomed place in the columns of all the principal newspapers of Australia. Australia, in fact, has by this connection been brought into direct contact with the world at large. Europe, Asia, Africa, and America, North and South, are all united, and even the islands of the West Indies are brought within the magic circle. A few short years ago and the mention of such a fact would have been regarded as an almost impossible venture, but since London has been brought within a few hours' distance of us, the whole thing is looked upon as a very ordinary matter, and means are already being devised to still further shorten the distance by improving the means of communication. The actual length of wire rope and wire which stretches in a direct line from London to Melbourne is something like 13,518 miles, including 10,044 of submarine cable, and 3,474 of land line. Over this immense distance there must necessarily be many repeats of messages. The first section is from Falmouth to Gibraltar, a cable of 1,154 miles; then to Malta, 1,120 miles; and Malta to Alexandria, 924. Then follows a land line of 224 miles from Alexandria to Suez, a cable from Suez to Aden, 1,462 miles, and Aden to Bombay, 1,819 miles. The line across from Bombay to Madras is 600 miles, and three other cables connect with Batavia, where a land line of 480 miles runs through the island of Java to Banjoewangi, and a cable of 1,186 miles effects the jointure with Australia. From Port Darwin to Port Augusta there is a stretch of 1,400 miles over a lonely country. In 200 miles more Adelaide is reached, and then 570 miles brings us to Melbourne. With this unprecedented distance, and numerous stoppages for repeats, it is no wonder that the contents of messages frequently reach the recipient in an unintelligible form; and when we consider also that the Dutch line is in the hands of the Dutch Government, there is still more reason for the commission of egregious blunders. Some little confusion may also be occasioned at times from the fact that the cable alphabet is not, in all respects, precisely similar to that employed on the land lines, the system of telegraphing being different. In a Christmas number of *All The Year Round*, published some years ago, and entitled "The Slaves of the Lamp," a very admirable description was given of the working of the Atlantic cable by the operators at Valentia, by means of reflectors, and in a darkened chamber. The Morse system, which is now almost universally used for ordinary purposes, is very simple; but to attain to proficiency to write at the rate of between 40 and 50 words a minute, and to receive by sound, instead of reading from the tape, requires time and great aptitude. Bombay is an important telegraph station as regards India, but the Australasian extension may be said to commence at Singapore, and it is from that point that the line branches off to China and Japan. Extending northward from Shanghai, the telegraph now runs up to the Amoor River, where it connects with the longest of all long inland lines, constructed by the Russian Government, a length of nearly 5,000 miles, through Siberia, and forming, as it were, a northern belt to the whole Asian continent. It passes through Tomsk, Omsk, Novgorod, on to Moscow and St. Petersburg, where it finds its way by several routes to the south and the west of Europe. About a year ago, when the cable between Madras and Penang was interrupted,

this Siberian line was utilized, and the messages were found to be transmitted correctly and well.

An extension on this branch from Posietta, in 47 deg. south, across the Pacific to San Francisco, would complete the circuit of the world, and freely realize the Shaksperian idea of a girdle round the world. The original route selected from England to the East was through Austria, Turkey and Persia, known as the Indo-European line, but in view of European complications arising in that quarter, it was deemed advisable, as a means of security, to lay a direct cable from Falmouth. For a time there was a keen competition between the two companies, but eventually the rivalry was merged, and an amalgamation took place. The whole of the cables have been constructed by companies in sections, and for a time each company acted independently, but now their interests are identical, as, to a very large extent, each one is dependent upon the other. A new cable line is projected, if not actually in course of construction, and it is one in which Australia has a direct interest. The colonies of New South Wales, Queensland, and New Zealand, acting unitedly, have agreed upon a guarantee—5 per cent., I believe—for the Messrs. Siemens to lay down a cable from Singapore to Queensland, but instead of touching at Batavia it will be carried in a more northerly direction to Macassar, and the shore end will be landed at Normanton, in the Gulf of Carpentaria. It is rather a long stretch of cable, but it will be more advantageous than having one's messages bungled by Dutch operators in their passage through Java, and presented in the form of a series of conundrums. New Zealand, which has long been out in the cold, is also to be brought into the charmed circle, but it is apparently not yet decided as to which island the shore end is to be landed on. The distance from Sydney to Auckland is 1,315 miles, and to Nelson 1,180. The nearest point would be from Tasmania, but that is out of the question. From Melbourne to Nelson is 1,410 miles, and to the Bluff 1,203, but the arrangement is not with Melbourne. Some day Fiji will be asking to be joined with Sydney, and 1,780 miles of cable would be required, and there is now every prospect of King George's Sound being brought into direct communication with Melbourne by a line from Adelaide to Eucla, and from Eucla to Albany. This would close another gap of some 1,400 miles, and give us early information of the whereabouts of our mail steamers, if nothing more, but the gain would be all on the side of Western Australia, which, from her position, is at present completely isolated from the Australasian group.

People who have been accustomed for years to get their news in the gross are rather inclined to object to the present piecemeal and homoeopathic system which is prescribed by the existence of the telegraph. They allege, and with some truth, that the cable news received day by day destroys the mail intelligence brought each month. The daily items contain just sufficient to interest, if not to altogether satisfy; but the details of news received some 30 or 40 days later savor of staleness, and the result once learned so far in advance diminishes the appetite for particulars. There are other people who are quite surprised that, with daily telegrams from Europe, sensational incidents are not served up regularly every day. The price of wool, copper and tin may not have any great interest for the bulk of the population, but these items have their importance to those specially concerned. It is, perhaps, a little surprising that, with the whole world before us, so few instances of real importance should transpire, and yet we find that the monthly mail budget brings us no account of important omissions, the telegrams being filled out with news too trivial for direct transmission. The present high tariff of £9 8s. 6d. for twenty words, inclusive of name and address, militates in a great measure against the reception of longer and fuller public messages, and no doubt prevents such a free use being made of the line for private purposes as would otherwise be the case if a more moderate scale was adopted. Twenty words being the minimum, a system of packed messages is resorted to, by which merchants and others are enabled to send as many or as few words as they please, paying *pro rata*. And for the carrying out of this advantageous system three separate agencies are now established in Melbourne, and the course adopted is this: a firm, say Brown, Jones & Co., register themselves at one of these agencies, and adopt a cypher word, "Cocolorum," which signifies Brown, Jones & Co., of Melbourne, to the London house of Jones, Brown & Co., Great St. Helen's, Bishopsgate street. Then in order to effect cheapness, combined with brevity and secrecy, a regular code of cypher words may be drawn up for general use. Such as "Bedtick" may mean hardware scarce in the market; "Tadpole," will send remittances by next mail; "Taper," shipments of tallow large, and so on, *ad infinitum*, as may be required. Some of these messages present a strange concatenation of words, which to a casual reader would be simply unintelligible, but 40 or 50 of these words grouped together might contain four or five separate messages of more or less im-

portance. Fancy such reading as this:—"Grashopper, loafer, blasphemy, shivering, gag, potomac, gurgle, grizzled," and yet these words would make up a tolerably long message. Passengers to and from the colonies register themselves by a single word or number, and upon arriving at their destination are enabled to at once communicate with their friends. Young gentlemen with expectations may obtain bank credits from home in as many days as it formerly occupied months, and shipowners and masters of vessels have found the telegraph of the greatest use in deciding upon charters, etc.

The new masts and yards for the Loch Ard were ordered from England even before the vessel had arrived here, but after she had been spoken by a ship bound to Adelaide. Announcements of deaths are frequently received, and legacies sometimes. In commercial circles the telegraph has its advantages as well as its disadvantages, but it prevents over speculation and engenders much caution. The Roman Convention in 1872 adopted, for the sake of uniformity, a system which is now universal, and strictly enforced. It was there and then decreed what number of syllables should constitute a word, and it was also allowed that a group of five figures should be regarded as one word. It is strange that won't, and can't, and such words are counted as two on the colonial lines—but only having four letters they can, without the apostrophe, be transmitted as one word by the cable. New Zealand passes as a single word, but South Australia would be two. The line is drawn very fine in some instances, and compound words are frequently so jumbled together as to render them almost unintelligible, and strange mistakes are sometimes made in dividing words which should not be so divided. As to the time occupied in transmission, the average is from 10 to 12 hours; that is decidedly too long, and six hours would be a very reasonable time, but much depends upon the amount of business on the line. The Australian portion of the line from Batavia is never over crowded, but there is a jam sometimes the other side of Singapore, with the Indian and China business, which is very large. The shortest time, I believe, in which a message has been received, is three hours; that is, of course, allowing always for the difference in the astronomical time, for it must be borne in mind that we in Australia are nine hours and forty minutes in advance of London. Nine o'clock in the morning in England is equivalent to seven o'clock in the evening in Melbourne. In six hours messages have been repeatedly received from end to end, and I believe that the feat could be accomplished in less than one hour, and will be before long. We know that the result of a Derby reached Bombay from Epsom in two minutes and a half, and the result of the Derby of April last was sent from Banjoewangi to Adelaide in two minutes. The gap between Bombay and Java could certainly be bridged over within the hour. Let us hope that we may see it done the next Derby day, in May next, when the laying of the second Australasian cable may cause some competition.

E. A. A.

Phillips' Insulated Telegraph Wire Works.

THE manufacture of insulated wire for office and outdoor use has become an extensive and important business. One of the principal manufacturers engaged in this specialty is Mr. Eugene F. Phillips, of Providence, R. I.

Starting with but sixteen "carriers" for the manufacture of insulated wire in the year 1870, Mr. Phillips' works at No. 20 Conduit street, Providence, has now 1844 to turn off work with. On entering his shop the constant rattle and busy hum of the machines cause the visitor to remark that it has anything but the appearance of business being dull.

The contrast between what is termed the winding room, where magnet wire is made, and the braiding room strikes the visitor very forcibly. The machinery for the manufacture of magnet wire is of the most improved and approved description, and do their work just as thoroughly and efficiently, though much more quietly, than those employed in the manufacture of braided wires. The braiding machines are marvels of accuracy and mechanical ingenuity.

The patent finish of the braided wires manufactured by Mr. Phillips, the patents for which are owned by him, is one of the marked improvements, and in the factory a long room 106 by 15 feet is devoted exclusively to this part of the work. The braided wires turned out at this establishment is generally conceded to be the best braided wire made. It has found customers in almost every city in this country and Canada, and quantities of it have also been purchased, in England, Scotland and other foreign countries.

Another specialty of Mr. Phillips' manufacture is rubber covered wire, of which large quantities are constantly required to supply the demand. Large orders for this wire are received for the Government use in this country and Japan. There has been heretofore a prejudice against rubber covered wire, which has arisen from the fact that, when the rubber was vulcanized out

the copper wire there was a chemical action on the rubber which eventually destroyed or greatly impaired its insulating quality. The chemical action also caused the wire to become brittle. This objection has been overcome by the process used by Mr. Phillips. The orders received for this wire are satisfactory evidence that its merits have become known and appreciated. A mistake was made in the first lot of this wire manufactured in not vulcanizing the rubber, which made it liable to melt and ooze out under the heat of the sun. This difficulty has been entirely overcome, and the rubber covered wire now furnished by Mr. Phillips is as nearly perfect as it is possible to make it. The wire is in the exact centre, and will stand any amount of bending in extreme cold weather without cracking, and will not soften in hot weather. It is adapted for outside, or underground, or any other use for which it may be required.

All descriptions of braided, rubber covered, magnet and insulated wires are made by Mr. Phillips, and his energy and enterprise are meeting with the recognition and reward due to them.

Correspondence.

We do not hold ourselves responsible for the opinions of our correspondents. Our columns are open to free discussions on all telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Congress and the Telegraph.

WASHINGTON, D. C., January 27.

TO THE EDITOR OF THE TELEGRAPHER.

NOTWITHSTANDING but a little over four weeks of the present Congress remains, and that its time will be much more than occupied by the necessary legislation to carry on the government during the long interval between its close and the commencement of the next session, and the Louisiana question, Civil Rights bill, etc., telegraph bills continue to be introduced.

On Monday two of these, which if there were any probability of action upon them would be of great importance, were introduced in the House. The first by Mr. Butler, of Massachusetts, proposes that all telegraphic lines of communication shall be made post-roads, and the Postmaster General is authorized to advertise for the transmission of all Government dispatches in the same manner as the transmission of mails are now advertised for.

Section two provides that all companies shall receive and forward dispatches from other companies without any extra charge for designating the point where the same came upon its line, and prohibits preference being given to any class of business.

Section three prohibits the companies, inland and ocean, being interested directly or indirectly in the collection or transmission of commercial news.

Section four requires the rates for special telegrams to newspapers and commercial news associations to be the same, which rates shall be publicly displayed—such rates in no case to exceed the rates charged to the Associated Press and the American Press Association on the first of January, 1875.

Section five provides that all telegrams shall be privileged communications in law to the same extent that sealed letters now are, and the contents shall not be divulged by any agent or officer of the company, except for the purpose of justice, by order of a court of competent jurisdiction.

Section six makes the tariff uniform to all parties for similar services; Government dispatches, when certified by a proper officer, to have precedence without prepayment, at rates to be fixed annually by the Postmaster General: all other telegrams to be transmitted in the order received, except those designated to go at night.

Section seven makes the divulging of the contents of any telegram, or willful delay in sending, or injury to telegraph lines or apparatus, a misdemeanor, punishable by fine and imprisonment.

The second, by Mr. Williams, of Indiana, is a bill to incorporate the National Union Telegraph Company. The incorporators named are H. E. Paine, S. H. Rollins, Charles Stearns, J. Y. Sibley, Seth L. Milliken, R. B. Elliott, W. J. Pinman, Preston Smith, John George and George Moon. One hundred thousand dollars subscriptions to the stock and fifteen per cent. paid in is required before the company can organize.

The bill gives the right of way over all post roads, including railroads, and provides that for the purpose of facilitating correspondence, and enabling the signal service bureau to promptly transmit reports, telegraphic messages shall be received at such post-office as the Postmaster General may direct, and be transmitted by the National Union Telegraph Company to any address on the lines of said company, under such regulations as the Postmaster General and chief of the Signal Service and the said company may establish.

That the charge for transmission of special telegrams to newspapers and commercial news associations for each one hundred and twenty words or less for each three hundred miles shall not exceed sixty cents if sent at night, and ninety cents if sent during the day.

The Postmaster General and chief of the signal service are made *ex-officio* directors of the company.

It is not improbable but that the active telegraphic contest which is being developed may have had something to do with the bill introduced by Mr. Butler, as it is understood here that he is in sympathy with Mr. Jay Gould in his telegraphic demonstrations.

There is a very serious question as to the right of Congress to regulate the traffic of existing telegraph companies, but there can be no doubt of the propriety of prohibiting discriminating charges by one company as against another, and this is already proposed in the bill previously introduced by Mr. McCreary of Iowa, the substance of which appears in my communication of the 13th inst., printed in THE TELEGRAPHER of the 16th. Mr. McCreary's bill ought, to pass, and probably will if it can be reached and acted on before the 4th of March. It would seem that there could be no difference of opinion as to the justice of this measure. There is no valid reason why telegraphic companies should not receive and transmit messages delivered to them by other companies upon the same terms they do those handed in by private parties; and charging for dates should not be permitted, unless made general and not exceptional.

Section three of Mr. Butler's bill looks like a very unarrantable interference with the legitimate business of telegraph companies. That this distribution of commercial and news reports is a losing business to the companies engaging in it will not be doubted by those who best understand it. The transmission of thousands of private despatches at regular rates is now avoided by our bankers, brokers and merchants through the regular commercial and financial reports which are furnished to them for a mere pittance in comparison to what it would otherwise cost, but I think it would be difficult for Mr. Butler or any other Congressman to show any reasonable ground for legislative interference in the premises.

Great interest is manifested here in the telegraphic war, for the facts in regard to which we are indebted to THE TELEGRAPHER, and opinions in matters pertaining thereto are varied but freely expressed. There is a united sentiment, however, as to the lack of wisdom of the Western Union officials in their treatment during the past four or five years of inventors and inventions pertaining to telegraphy; their contemptuous expressions in reference to the Stearns Duplex, and its subsequent purchase by them—their action on the Page patent, the Automatic Telegraph, and finally their extravagant puffing of the Quadruplex and its inventor, before they had secured either the one or the other—proves a lack of knowledge and sound judgment somewhere.

Especially will this be apparent if the rumor proves true that the "Stearns Duplex" is of no value unless licensed under the patents of Mr. Moses G. Farmer, recently re-issued to him, and covering all the essential features of duplex telegraphy.

If the "Atlantic and Pacific" should secure the inventions of Little, Farmer, and Edison (and it is rumored they have), they would be the owners of all the valuable methods of rapid transmission, which would give them an advantage of incalculable importance.

CAPITOL.

Is the New Departure Genuine?—Caution Taught by Former Experiences.

TO THE EDITOR OF THE TELEGRAPHER.

THERE seems to me to be something a little singular in the correspondence between General Eckert and President Orton, on the resignation of the former gentleman from his connection with the Western Union Telegraph Co. General Eckert's letter is short and terse, without excuse or regret, while Mr. Orton's is really, or assumes to be, in bad humor. He says: "In view of the fact, now clearly ascertained that, while holding a confidential position with this company you have been for some time past secretly carrying on negotiations with its enemies, and before tendering your resignation had made arrangements to accept employment in the service of the opposition, I promptly comply with your request." Has not an employé a right to better his condition in the line of business in which he has been educated while he is in another employ? Has a dry goods clerk no right to change his place, with a view of improving his condition, while he is employed, or must he wait until he is discharged, or the house fails, before he can seek employment elsewhere? It may answer for the "great monopoly" to lay down such laws, but are the employés obliged to obey them? I trust not.

There is, however, another view of the correspondence to which I wish to call the attention of the readers of THE TELEGRAPHER. Is it not just such a correspondence as would take place provided there was an understand-

ing between the parties that, for an object, it was necessary to get a Western Union man into the opposition? We all remember with what a flourish of trumpets it was heralded to the world that Mr. Orton had left a very important position in Washington for the purpose of taking the presidency of the United States Telegraph Co., and organizing and prosecuting an opposition which should be worthy of the name. Bnt, alas! how were the hopes and expectations of all who were opposed to a monopoly in telegraphing, either by the Western Union or any other telegraph company, disappointed when one morning it was announced that that company had gone over to an "opposing" company with Mr. Orton at its head.

Again, General Lefferts was elected President of the Gold and Stock Telegraph Co., as has subsequently appeared, for the purpose of throwing that institution into the hands of the Western Union. I am not disposed to be a croaker, but we should not allow our wishes and desires to master our reason so but what we can look at all sides of the subject before we go off in ecstasies at the supposed guarantee that there is to be an opposition to the monopoly that is worthy the name. Let us gather a little of the fruit before we judge its quality. President Orton, General Eckert and Mr. Chandler are all honorable men; but in these days of gigantic operations, credit mobiliers and Pacific mail subsidies, we must not take the appearance for the substance of the things desired.

THOMAS.

Telegraphic Matters at the State Capital.—Fire and Pestilence.—A Cheap Edition of The Telegrapher wanted for Impeccable Operators.

ALBANY, Jan. 26th.

TO THE EDITOR OF THE TELEGRAPHER.

OUR mutual friend "Occasional," of Chicago, is setting us a good example in the very interesting news letters with which he favors us from time to time. There are many other cities of less size than "Ch." from which such letters might very profitably be received. Of course, all places may not furnish the same amount of incident, but certainly none are so dull that they cannot "occasionally" furnish something to interest and edify the profession.

We "Capitalists" (not bloated bond-holders, but residents of the Capital) are now quite busy, on account of the meeting of the State Legislature, which convened January 4th, organized, adjourned for a short recess, and are now again in session.

The office at the Capital is in charge of Mr. J. F. McAuliffe, formerly of Binghamton. This office is used for commercial business only, all "press" matter being sent from the main office. The amount of this kind of business sent daily varies considerably, ranging from five to twenty thousand words. Several correspondents who formerly sent their specials by the A. & P. lines, now patronize the W. U., which adds considerable to the business. As it would not probably be interesting to your readers, and as the gentlemen who do the work are not anxious to have their names or deeds in print (of neither of which have they cause to be ashamed, as they are worthy of record if it were necessary), it does not seem advisable to name them.

It is rumored that, notwithstanding the alleged sale of the Quad, to Jay Gould, in the interest of the A. & P., we are soon to have a Quadruplex Repeater, to be used on the Boston and Buffalo through circuit. If this rumor proves to be true it will make a very great addition to our present facilities. It would give us two extra circuits—one to Buffalo and one to Boston via the Quad—also leaving a spare wire to Buffalo, and one from Springfield to Boston. It is expected that the operating room, now nearly filled up, will have to be enlarged to make room for two more new "quartette" tables to hold "Our Youngest."

Last Thursday morning, about five o'clock, a fire broke out under the stairs leading to the fourth floor of the Museum building, where the operating room is located. When discovered the fire was burning briskly, and our "all night" man, "J. R." made a lively run down the burning stairs (the only way to get out) and gave the alarm. The flames were soon subdued without causing much damage. On Friday evening about eleven o'clock, another fire broke out on the first floor, back of the Receiving room. This was also soon extinguished, and not much damage done. The old saying that "misfortunes never come singly" has been verified with us.

Last week in connection with the fires and the bitter cold weather, an epidemic broke out in the office. It seemed to be a sort of "Epizootic" or old fashioned influenza. Six men were on the sick list, unable to put in an appearance, at one time, and several others were kept at their desks only from a sense of duty, they being more fit for the hospital than the office. I have since learned that the epidemic prevailed throughout the city, thousands were afflicted in the same way. As we have now endured fire and pestilence, a flood would seem to be the next in order. Luckily, we are

on the fourth floor, so that it would have to get "high" to disturb us.

An incident occurred here recently which may be worth recording: In the course of the regular morning "test," a few days ago, the Observatory Loop was found to be open. The chief was beginning to get anxious as the time to start "signals" approached, but just before that time arrived the circuit closed. The operator, on being questioned, explained that as the night operator desired to leave a note for him where he would be sure to find it, he had opened the key, placed the note between the points and then screwed the lever down tight, thus closing (?) the circuit and making sure of the delivery of his note. This newly invented circuit-closer has not yet been patented, and will, for the present, be adopted only on "Duplex" circuits.

The A. & P., under management of Mr. C. H. Sewell, seems to be doing a fair share of the business, judging from the number of branch offices which they have opened.

To close up with, let me venture to suggest that you issue a cheap edition of THE TELEGRAPHER (say a little one for a cent) to meet the wants of a certain class of men who either "don't like the paper" or "can't afford it," yet who seem to be utterly unable to get along without reading it regularly.

That THE TELEGRAPHER may continue to be successful as a telegraphers' paper, is the earnest desire of
DOUBLE-SIX.

Propriety of Telegraphy as an Occupation for Females.

TORONTO, Jan. 16th.

TO THE EDITOR OF THE TELEGRAPHER.

If you do not object to lady correspondents, I would like to say a few words in reply to the article by "Nihil Nameless," entitled "Will the Coming Operator be a Woman?" in your issue of the 9th inst. Although he writes from the States, I think he can hardly be a "free and enlightened citizen of the glorious Republic," or he would not be so fond of quoting "our fathers," and telling about the superiority of the "good old times" over the present. He seems to forget the old proverb, "Times change, and we with them." Many things which answered very well for our grandmothers would be very unsuitable for the young ladies of the present generation, and I think the men have had at least as much as the women to do with bringing about this new order of things. Our respected grandmothers were taught to look forward to marriage as the chief, almost the sole object of their lives; and our grandfathers, also, must have had more faith in the advantages of matrimony than the young men of the present day possess, for they did not hesitate so long before making up their minds to take the "fatal plunge" from "single blessedness" to "double misery." Most "eligible young men" nowadays are either too prudent or too ambitious to care about taking a wife till they have a good establishment to put her in, and a comfortable balance at the bankers to keep it up with. In the meantime the young ladies must live and dress, and of course cannot do so without money. Many of them, moderately endowed with talents and enterprise, whose parents are not very liberally supplied with this world's goods, and have younger children to educate and provide for, do not care to stay at home, wasting their lives in unproductive idleness. They have too much principle to marry men who do not suit them, merely for the sake of getting homes. They feel that their lives, and what they are to make of them, are questions which they must solve themselves—not wait for marriage to solve for them; so they take the matter in their own hands, and bravely proceed to work out their own destinies. To be sure, they don't all succeed. Many of them are not fitted either by nature or education to make their own way in life; more have not sufficient stability of character and perseverance to succeed in doing so; some grow weary of the strife, give up ingloriously and marry for a living; but the best and strongest struggle on hopefully, and in time win and deserve the best reward this world has to give, the consciousness of having been true to themselves, and the possession of a brave, self-reliant character. The grand thing for girls, as well as for men, is to find something to do, and then do it heartily. As Carlyle says, "An endless significance lies in work: in idleness alone there is perpetual despair." It is surely far better for us to be engaged in some useful business, earning our own living and making the most of our abilities, than to sit idly with folded hands waiting for the "coming man," who is often so long in coming and worth so little when he arrives.

Admitting, then, that independence is a good thing for some women, the next question is, what are the most suitable occupations by which she is to gain that independence? Sewing, of course, is admitted to be one very suitable employment; but that busi-

ness, like most others, is already overcrowded and underpaid; and, besides, many women are far better fitted for intellectual than for manual labor. If their talents lie in that direction, why should there not be female lecturers, female clergymen, female physicians and also female operators? No doubt the "old fogies" of forty years ago would have been astonished at the idea of female operators, but they would probably have been quite as much astonished at the idea of there being any need of operators at all, and I really cannot see that the opinions they held on the subject forty years ago affects it, in any way now—the mere fact of them voting it absurd did not and does not make it so. I do not see that there are any more obstacles in the way of woman's prosperity in this business than in any other? She is not obliged to exclude herself from social privileges any more than other people are who engage in any regular business; and as for the "unwholesome confinement," that is an objection which might be urged against all regular employment, and any moderately healthy woman can stand it well enough. She does not need to throw away one particle of real womanly modesty, though she certainly may have to part with some of that timidity and pretty helplessness which some men consider characteristic of the sex, and approve of, simply because it is flattering to their own vanity. If her modesty and "those finer qualities of mind and heart," etc., are so weakly developed in her as not to be able to stand the test of companionship with men, then they can't have been worth very much in the first place.

I think the office "Nihil Nameless" works in must be an exceptionally rough one, for in our office profanity is not allowed and is seldom indulged in; tobacco is prohibited, and spittoons are "conspicuous by absence."

The way in which a woman is treated in this as in every other business, depends to a great extent on the woman herself. If she conducts herself properly, with ladylike dignity and reserve, she stands a very good chance of being treated as a lady; if she does not, she cannot expect to be. If she behaves as a lady should do, and any man is so very unmanly as to treat her disrespectfully, she will despise him too much to be affected by his conduct. I will do operators and men in general the justice to say that very few of them are so degraded, and possessed of so little self-respect as to take pleasure in insulting a lady without provocation. Woman's mission to-day is as high and holy as it ever was, though not quite so narrow. I don't believe in those senseless advocates of "Woman's Rights," whose extravagant and absurd ideas have brought contempt and ridicule on the very object they are trying to uphold, but I do believe that in whatever sphere of life woman has been allowed to take a part her presence has had a refining and elevating influence on men, and, I think, too, that the benefits resulting from this companionship are mutual. We lose a little, it is true, by working among men, but we gain a great deal. We see more of their faults and follies than do our sisters who stay quietly at home, but we also see more of the earnest manly side of their characters, and so are able to form a more just and true estimate of them than it is possible for those to do who only see them in society or at rest in the home circle. However, I don't think there is any more danger of women monopolizing operating than there is of their monopolizing preaching, lecturing, etc. The same cause that prevents them absorbing other professions will hold them in check here. Proficiency in any business can only be acquired by long and patient practice, and very few women stay at it long enough to qualify themselves for the higher positions in the professions, but I do think the few of us who really mean to make it our life work, and are earnestly trying to discharge our duties faithfully, and to excel even in the highest branches of the service, should be allowed a fair chance to succeed.

Railroad offices, I admit, are not nice for ladies, and the gentlemen are heartily welcome to keep those as long as they please, but most commercial offices, I think, are at least as well adapted for ladies as for gentlemen. Whether they get them or not will depend on the ladies themselves. If the managers find them as expert, industrious, intelligent and trustworthy as the gentlemen, they will employ them—not otherwise. Ladies have no right to undertake men's work and claim men's wages, and then expect any privilege or immunity on account of their sex.

It is perfect folly for any one to learn telegraphing just at present, for the profession is greatly overcrowded; but I can see no reason why girls should not learn that which does not apply with equal force to boys.

The Automatic Discussion.

TO THE EDITOR OF THE TELEGRAPHER.

WILL we never have an end to the automatic dispute? After Frank Pope's labored, and, as I thought, exhaustive article of last week, here comes this week's paper with another blast from Craig's "bazoo," followed by

one from Baltimore, and winding up with a chirrup from Little. I expected that Little would have been silenced by that shot he got a few weeks ago, but no, he is like Banquo's ghost. As for Craig, he reminds me of John T. Raymond as Col. Sellers. He has been blowing hard for 20 years. The chap from Baltimore, who signs "Automatic," gives us the facts, I believe, and as he is an employe, should know. He says "a first class puncher will prepare sixty messages an hour." What does he mean by a first class puncher? Is it Craig's "10 year old?"

"Automatic" claims only that he can double the speed of the Morse. I believe "Automatic" is telling the truth, as he is in a position to see the practical working of the machine.

Why don't Craig and Little take the American Bank Note building and stick out a sign, "down with monopolies," send messages at a cent a piece, and "give us a rest." C. D.

A Sensation and Conjectures.—Telegraphing the President's Message.—Changes and Visitors.

CHICAGO, January 20.

TO THE EDITOR OF THE TELEGRAPHER.

QUITE a stir was created in telegraph circles here when it was generally known that Gen. Eckert had resigned his position with the Western Union Company to accept the Presidency of the Atlantic and Pacific Company. Various theories were advanced for this move, some claiming he had gone over to the latter company to manoeuvre it into the hands of the W. U.; others, and by far the great majority, claiming that it was a decidedly antagonistic move on his part towards the W. U. When it also became known that the Quadruplex had been sold to Jay Gould, it began to look as if things were warming up down about New York notwithstanding the season of the year. There are strong hints that the W. U. will have to fall back on the Duplex.

The President's Louisiana Message was handled with the usual correctness on the A. and P. lines, and at about the usual speed. The patrons of that line seem very much pleased at the recent rise in the stock of the company, as it bespeaks better facilities and insures the handling of their business promptly.

On the Western Union lines the Message was repeated at Cleveland this time, and was received over four wires by Night Manager Springer, "Billy" Wallace, "Charlie" Thayer, and "Dad" Armstrong, and sent to Milwaukee by Messrs. Cobb, Anderson, Whitcomb and A. J. Long. Dan Francis sent it to Salt Lake. About one hour and forty minutes was the time occupied in getting it from Cleveland and transmitting it to Milwaukee.

The Duplex of Mr. C. H. Haskins, Gen'l Supt. Northwestern Telegraph Company, is doing excellent work between Milwaukee and St. Paul. No transmitter is used by his system. The line is switched on Morse from Duplex by simply opening a button, it being worked by two ordinary Morse keys at each end. It is hoped that some of our Northwestern friends will give us a detailed description of this Duplex through the columns of THE TELEGRAPHER.

Mr. H. E. Stansbury has been transferred from the all night management of the W. U. office here to the regular night force. "Jack" Congdon takes "Stans's" place, and Mr. "Eddie" Dennis fills the position heretofore occupied by "Jack." "The boys" all think the latter one of the best appointments made in some time. "Ed" is a universal favorite. Mr. Chet. Andrews, who has always displayed considerable talent as an artist, has exchanged places with Mr. Whitcomb, of the W. U. night force here, and now devotes his entire time (days) to the crayon and the canvas, gracing the office with his cheerful presence nights only. Chet. is a good fellow, and we know THE TELEGRAPHER will wish him Godspeed in his new profession. Charley Wilkinson, who resigned from the day force in the W. U. office here some time ago for the same purpose, we understand, is making rapid strides in his new undertaking. The genial countenance of Mr. J. D. Reid, the operator's friend, formerly editor of the *Journal of the Telegraph*, beamed down upon us last week. He was here on business connected with the W. U. Co.'s statistics, and was shown round the office by Gen'l Anson Stager.

Charlie Mixer, one of the "vets," was also in the town last week, and shook hands all round with the boys. Jack Martin showed him round in the W. U. office, and chief operator Rudd in the A. and P.

OCCASIONAL.

L. G. TILLOTSON & Co. are having another story added to their store on Dey street, at the expense of the Western Union Telegraph Co. It is composed of a framing of timber, profusely ornamented with glass insulators, and when all the wires are run over them to the rear of the new Western Union building, Tillotson's establishment will look like a grand radiating electrical dispensary, which in fact it is.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JANUARY 30, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

(P. O. Box 5503.) 38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,
AT

No. 38 VESEY STREET, New York.

ELEVENTH VOLUME.

The Publisher, in announcing the Eleventh Volume of

THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year.

All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER

is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to or in the interests of no TELEGRAPH COMPANY, CLIQUE or COMBINATION, but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, no LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL
UPON THE
AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore:

ONE COPY, ONE YEAR.....\$2 00
SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELE-
GRAPHIC FRATERNITY must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The Progress of the Telegraphic Contest.

ELSEWHERE we give our readers a resumé of all matters of interest and importance in connection with the vigorous telegraphic contest, which has been to most people somewhat unexpectedly inaugurated. The most important feature since our last issue has been the practical and successful introduction upon the Atlantic and Pacific lines of the automatic system, which is said to have been worked between Washington and Boston on the old wires of the company at the rate of 600 words per minute.

There has been less of excitement in telegraphic circles during the past week than for the one preceding it, but there seems to be no diminution of activity on either side. The managers of the Western Union Company have at length seemed to realize that they have probably the hardest contest before them that the company has experienced. The manufacture of quadruplex apparatus is pushed forward vigorously at the company's shop, and they profess to believe at any rate that it was not within the power or at the option of the great quadruplexer to turn over his invention to Mr. JAY GOULD, or any other man or company. In this matter EDISON is in his element, for it gives him the opportunity of "going back" on one party and the other with cheerful and characteristic impartiality and regularity. It is only a question of time and opportunity when he shall desert the newest of his new friends, and, if possible, turn their own guns against them as he has at least attempted to do in the case of the Western Union.

In this connection we may properly refer to the communication which appears in our correspondence columns over the signature of THOMAS, which suggests caution in receiving all the hostile demonstrations as really genuine. THOMAS is evidently a lineal descendant of his apostolic namesake, and naturally and constitutionally a doubter. It must be confessed that telegraphic experience and history give excuse for entertaining doubts of the genuineness of such movements, and may suggest the possibility that a large sized cat may be concealed in the meal tub. As regards the instance presented by our correspondent in the connection of Mr. ORTON with the United States Telegraph Co. in its closing weeks as its President, we do not consider the cases at all parallel. We were well informed in regard to the affairs and manipulations of the United States Company during that time, and for some months previously. When Mr. ORTON accepted the Presidency of that company, resigning the office of Commissioner of Internal Revenue, to which he had recently been appointed, to do so, he was deceived as to the actual condition and standing of the company. That he was put in the position by the manipulators of the company to sell it out and consolidate it with the Western Union is, no doubt, a fact, but that he was aware of the real purpose for which his services were required until some time afterward we do not believe. He was not well informed in regard to telegraphic affairs or management, and his predecessor and those associated with him had got things into such a condition that, to a person situated and surrounded by the influences Mr. ORTON was, there seemed to be but one course to save anything from the wreck for the honest stockholders. Probably if the same thing was to be done over again, Mr. ORTON, with the telegraphic knowledge and experience since obtained, might advise a different course, which would, perhaps, prove in the end fully as beneficial to the honest stockholders before mentioned as the one that was actually adopted.

The doubts suggested by our correspondent are not confined to him, for the same are daily suggested to us verbally, and by letters from correspondents and friends of THE TELEGRAPHER. In reply to these we can only say that, to the best of our knowledge and belief, the contest is as it appears, a real one, and that there is every prospect that it will be bitter and protracted. What the final result may be we cannot, of course, predict. Behind all extensive operations of a

similar character there are always persons and interests not telegraphic to be served. In this case the prices of stocks are to be advanced or depressed, and much money is expected to be made by the principal manipulators out of the fluctuations of the market. This of course has nothing to do with the reality of telegraphic competition, and is not a purpose which should excite any great interest or sympathy on the part of the telegraphic fraternity. Personal ends are to be served in other directions, which are of no interest or importance, either to telegraphers or the general public. The only question to be considered by them is how far the competition, by whatever causes and purposes instigated and supported, is genuine; how long it will be maintained, and to what extent it will be carried.

We believe that there are underneath the demonstrations which have attracted the attention of the public, causes operating which preclude the possibility of an early adjustment of the difficulties, and that we may reasonably anticipate a protracted contest. We see it cropping out in Congress, where bills are being introduced to affect the position of the parties to the contest. Probably nothing important can be done during the four weeks which remain of the present session, but the presentation of these antagonistic measures have an effect—especially on the stock market.

So far as the telegraphic fraternity are concerned there can be no doubt but that active telegraphic competition will prove beneficial to their interests. As we have before remarked, the sympathies of the practical telegraphic laborers will naturally be with the party which pays them the best and treats them most fairly. Each must decide for himself or herself which is the one, and sympathize accordingly. Having no voice in the direction of affairs, and but little influence in their conduct, they should endeavor to discharge faithfully, and to the best of their ability, the duties for which they are employed, and leave to the managers and manipulators the tricks and devices which are relied upon to secure an advantage one way or the other. Those who hold remunerative situations with either Company will do well to hold on to them until they are satisfied that something permanently better is attainable.

As for the public—those who use and pay for telegraphic facilities, they are likely to be benefitted by an increase of such facilities, and, probably, at a not distant period, by a reduction in the charges for telegraphic service. The company or combination which shall best serve the public will no doubt have its sympathy and material aid so far as their patronage is concerned. Thus will all parties be made happy—speculators in telegraph stocks by fluctuations in the prices—those who have inventions and devices they wish to dispose of and have adopted by an increase of customers and demand for them—those who have grievances by opportunities to ventilate and revenge them—the fraternity by increased demand for their services—the public by additional facilities and cheaper rates—and THE TELEGRAPHER by having something of general interest to present to its readers weekly.

Election of Mr. E. D. L. Sweet, Trustee and Vice-President of the Atlantic & Pacific Telegraph Company.

At a meeting of the trustees of the Atlantic & Pacific Telegraph Company, held Tuesday, Jan. 26, at the office of the Company, No. 198 Broadway, Mr. E. D. L. Sweet, who, for the past six years, has held the position of General Superintendent and Executive Manager, was elected a Trustee and subsequently second Vice-President of the Company.

At his own request Mr. SWEET was authorized to transfer his headquarters to Chicago, Ill., his former home, from which he came to this city six years since, with the intention of returning there when certain purposes had been accomplished. These he now regards as either fully accomplished or assured, and he, therefore, feels at liberty, with the consent of the Execu-

tive Committee, to indulge his personal preferences as regards his future residence.

Mr. SWEET came to New York nearly six years ago to assume the duties of General Superintendent of the Atlantic & Pacific Telegraph Company. He found the Company in anything but a prosperous condition, incumbered with debts and embarrassed in its operations by inadequate business facilities. The improved position which it occupies to-day is unquestionably due mainly to Mr. SWEET's labors and careful management. Believing in the principle which has been persistently advocated in THE TELEGRAPHER, that the unification of all the lines and companies competing for business with the Western Union under practically one management, was the only way in which a prosperous and successful competing company could be established, he has labored assiduously to develop such a unification. Recognizing the fact that the public, which uses and pays for telegraphic service, desires more than one telegraph company to deal with, and that so long as telegraphing remains a matter of private enterprise, competition, more or less efficient will be had, he has sought to build up such a Company as should be able to best serve the public. It has required patient, arduous and protracted labor, but aided in his policy by the other officers of the Company, he congratulates himself at length on the realization of his hopes and desires, and returns to his home in the West, with the satisfaction which arises from the consciousness of work well done. The task of building up the Atlantic & Pacific has yet to be accomplished, and at the West Mr. SWEET will continue his labors in that direction.

We learn that at the meeting of the trustees of the Atlantic & Pacific Company on Tuesday, when a communication from Mr. SWEET was presented, asking for his transfer to Chicago, there was a general recognition of the value of the services he had rendered to the Company; and the opinion was unanimously expressed that to him was in large part due the credit for the success which had placed the Company in its present leading position.

While Mr. SWEET's removal to the West will necessarily interrupt, to a certain extent, the close intimacy which has characterized his relations with the Executive Committee and officials of the Company in this city, he retains their personal friendship, esteem and good will, and has the satisfaction of leaving matters in the hands of able and experienced gentlemen who will cooperate with him in carrying forward the work which he came here to do, and in making the Atlantic & Pacific Company a practical telegraphic and financial success.

Literature.

THE *Phrenological Journal* for January and February is on our table. These two numbers will be found of special interest to telegraphers. The January number contains a splendid portrait and biography of MARSHALL JEWELL, late Governor of Connecticut and Minister to Russia, and now Postmaster General of the United States. Mr. JEWELL was a telegraph operator in his youth, and by energy and perseverance he has secured a handsome fortune, and been crowned by well deserved honors. The February number contains a portrait of the late EZRA CORNELL, and a biographical sketch of his life, with which our readers are already familiar. Published monthly, at \$3.15 per year, by S. R. WELLS, 389 Broadway, New York.

The *Science of Health* is another excellent periodical, issued from the same publishing house, the title of which sufficiently indicates its contents. It contains many hints which will be found of great value to members of the telegraphic profession, and its contents are of great interest to all, \$2.15 per year. S. R. WELLS, 389 Broadway, New York.

Change of Firm.

Mr. JESSE BUNNELL, having withdrawn from the firm of PARTRICK, BUNNELL & Co., on the 1st of January, the business will be continued as heretofore at 38 South

Fourth street, Philadelphia, and 22 Dey street, New York, by the remaining partners, under the name of PARTRICK & CARTER.

Personals.

Mr. E. LELOUPE has been transferred from the management of the Washington, D. C. office of the Southern and Atlantic Telegraph Company to New Orleans, La., of which latter office he is to be the manager.

Mr. W. W. BURHANS has been appointed manager of the Washington, D. C. office of the Southern and Atlantic Telegraph Company.

Mr. R. P. BROOKS, formerly with Mr. J. W. BURNHAM in the Western Union telegraph office at the Fifth Avenue Hotel in this city, has received the responsible appointment of ticket agent of the Baltimore & Ohio Railroad Company at their office in this city, No. 315 Broadway. Mr. BROOKS' telegraphic and other friends will be gratified to learn of this recognition of his merits, popularity and ability.

The Telegraph.

By Cable.

THE CABLE STEAMER FARADAY.

LONDON, Jan. 25.—The Direct United States Cable Company's steamer Faraday, instead of coaling at Woolwich, will proceed to a Scottish port for repairs. She can hardly start out again to try and pick up her cable off the Newfoundland coast until the settled weather of next spring or early summer.

The Telegraphic Situation.

THERE is not much of startling interest to add to what has already been told in regard to the telegraphic situation. Both parties have kept rather quiet, so far as anything of interest to the public is concerned, but are busily engaged in perfecting their combinations to strengthen and improve their respective positions. The election of Mr. E. D. L. Sweet to the office of second Vice-President of the Atlantic and Pacific Telegraph Company, and the proposed transfer of his headquarters to Chicago, his former home, is one of the notable incidents of the present situation, and is treated of more fully elsewhere.

Another notable incident is the practical introduction of the automatic system upon the lines of the A. and P. Company, and its use will be made more general upon the lines of that company at an early day. At present it is being worked between New York and Washington, and New York and Boston, upon the A. and P. and Franklin wires, and, as it is said, with very excellent results.

Nothing is said as yet of the proposed use of the quadruplex upon the A. and P. wires, and if the automatic should realize the expectations entertained of it, it may not be necessary to introduce the quadruplex upon the lines of that company, although it has acquired the title to the patent, so far as the suppositious inventor can give it. It is probable that further developments of the purposes of the company will shortly be made. It is intended to establish a practical unification of all the companies and systems competing with the Western Union Company under one management, and this it is believed has been insured already.

The Western Union managers are very busily engaged in the transfer of the executive headquarters and main office to the new building on the corner of Broadway and Dey street, which it is intended shall be accomplished by to-morrow, Sunday. The executive officers of the company realize the gravity of the situation, and will leave nothing undone that is practicable to fortify their position, and if possible cover the ground which has apparently been lost. They make no declaration of what they intend to do, but claim that so far as the quadruplex is concerned at least, their right to continue its use upon their lines to any desired extent is secured. This, of course, is denied by the other party, and when the patents are issued there will probably be some lively legal proceedings in connection with this matter.

There is an apparent outward calm, but all parties are wary and vigilant and the end is not yet. The prospect for lively and interesting telegraphic times is good, and those who desire to be fully and promptly posted will as usual look to THE TELEGRAPHER for reliable information.

Removal of the Astor House Telegraph Office.

THE telegraph and railway ticket agency, so long established at the Astor House, in this city, under the management of Mr. Gustavus Swan (who for over

twenty years past has been connected more or less prominently with the telegraphic interests in this city), has been removed, while the Astor House is closed for the extensive alterations and repairs which are to be made upon it, to No. 229 Broadway, in the block above. This office connects with the Atlantic and Pacific Telegraph Company.

Removal of the Western Union Office to the New Building.

THE new Western Union building and its vicinity presents this week a scene of extraordinary activity. The lease of the present office at 145 Broadway having been extended only till the first of February, the officers and employes of the Company are straining every nerve to get things in readiness for the grand higha which is expected to take place on Sunday next. For the past week almost every pole within half a mile from the office has served as a sort of gymnasium, where from morning till night the agile line man perched from 75 to 100 feet above the curbstone has hauled away at an apparently endless array of wires, to the amazement of gaping rustics from New Jersey and Long Island, who congregate upon the street corners and watch the operations for hours with unabated interest. The lines are brought on the new poles to different points in the rear of the new building on Church and Fulton sts., from whence they run from immense distributing poles to a range of iron fixtures on the outside of the building, just outside the half story underneath the grand operating room, where the batteries, etc., are to be located. The iron fixtures on the north side will accommodate about 125 wires, and that on the west side about 250.

A trip through the interior of the building reveals the fact that matters are still in a very chaotic condition, although rapid progress is making in every department. Of course the portions of the building which are to be occupied by the telegraph company for its own uses are much farther advanced than the remainder. The interior of the grand operative room is nearly finished, and it already presents a magnificent appearance. The tables are being put in, and a portion of the switch will be in readiness by the end of the week. The batteries are being got ready in the battery room, and the cables running from the lightning arresters above the windows in the half story to the switch, and from thence to the operating tables are in place. Unless the outside line work should be delayed by bad weather, or some other unforeseen occurrence, it is probable that the operating department will be moved on Sunday next, which will complete the transfer from the old building to the new.

Owing to unforeseen and unavoidable delays, it is probable that it will take a month or so yet to bring matters into presentable shape, though Supt. A. S. Brown, Assistant Electrician Gerrit Smith, and Acting Manager A. S. Downer, who have immediate charge of the work, are pushing it forward with the utmost energy.

New City Offices of the Atlantic and Pacific Telegraph Company.

ARRANGEMENTS having been made on behalf of the Atlantic and Pacific Telegraph Company with the proprietors of the Windsor Hotel, a new and elegantly fitted up office of that Company has been opened at this fashionable locality. This is said to be the handsomest telegraph office in the country. It is in charge of Mr. P. J. Egan, who was for a long time associated with Mr. J. W. Burnham at the Fifth Avenue Hotel office of the Western Union Telegraph Company.

Arrangements have also been concluded with the proprietors of the St. Nicholas Hotel, and an Atlantic and Pacific office opened, which is in charge of Mr. George M. Seaman, Jr., as manager. Mr. Seaman has for some years been in charge of the railroad and steamship ticket office at the St. Nicholas, and is widely known and very popular with the guests of this house, and others.

Foreign Telegraphic Notes.

THE Globe Telegraph and Trust Company have declared a dividend of 3s. per share upon the preference shares, being at the rate of six per cent. per annum, and 2s. per share upon the ordinary shares, making with previous quarterly payments a dividend at the rate of five per cent. per annum.

The number of messages sent over the Cuba submarine telegraph line during the month of December, 1874, was 2,073, estimated to produce about £2,300, as against 726 messages which produced £742 in the corresponding month of 1873.

The traffic receipts of the Direct Spanish Telegraph amounted for the month of December, 1874, to £1,271, against £1,224 in the month of November.

The traffic receipts of the Eastern Extension (Aus-

tralasia and China) Telegraph for the month of December, 1874, amounted to £18,172, and for the corresponding month of 1873 to £20,400.

The traffic receipts of the Eastern Telegraph for the month of December, 1874, amounted to £31,725, and for the month of December, 1873, to £35,238. A circular issued by the Secretary gives a record for the last month of the latest dates of messages received from India, China, and Australia, which shows that the cables are working with uniform speed and efficiency. The time occupied in the transit of messages has been—from Calcutta, 56 minutes; from Bombay, 54 minutes. The comparative average of working speed of the Red Sea and Indo-European routes between London and Calcutta, during the past official year, has been 4 hours 33 minutes by the former (via Falmouth) and 4 hours 39 minutes by the latter. Increased efforts have been made to improve the speed and to attain a further degree of accuracy. The new recording instruments, worked by skilled English clerks, are used at all the stations between England and India.

The traffic receipts of the Great Northern Telegraph for the month of December last amounted to 294,333fr., and for December, 1873, to 287,356fr. The total traffic receipts for the year 1874 amounted to 4,427,890fr. (£177,116), and for the year 1873 to 3,352,542fr. (£134,102), showing an increase of 1,075,348fr. (£43,014).

The receipts of the Submarine Telegraph Company for the month of December, 1874, amount to £7,895 against £7,933 for the corresponding month of 1873.

The directors of the Western and Brazilian Telegraph Company have declared an interim dividend of 5s. per share for the quarter ending December 31, 1874.

The steamship International having taken on board from the tug Victor the necessary length of cable stores and appliances at Silvertown, proceeded to Dartmouth to take on board the electric cables of the Post-office, and proceed direct to Guernsey, to repair the Channel Islands telegraph. The various tests of the damaged cable have not as yet been very decisive of the nature of the fault in it, and it is improbable that anything definite will be arrived at until a further test shall have been taken from the Channel Islands side, although an impression is entertained that the fault is not very distant from Guernsey.

The Directory of the Peruvian International Exhibition of 1875 offer a premium of from \$200 to \$500 for the best telegraphic apparatus for fixing upon a railway line the relative situation of trains in motion on the same track, so that conductors may know the minimum distance between them when running.

The telegraph in the State of Guatemala, Central America, is now completed from the capital to Quetzaltenango, the largest city in the North of the Republic, and will soon be extended thence to the port of Champerico, on the Pacific.

Annual Meeting of the American Compound Telegraph Wire Co.

The annual meeting of the American Compound Telegraph Wire Co. was held at the offices of the company in this city, on Thursday, January 21st, and the following officers reelected for the ensuing year:

President, Chester Snow; Secretary and Treasurer, Alanson Cary; Electrician, Moses G. Farmer.

A dividend of \$1 per share was declared on the stock of the company.

Poetic (In)justice.

A TELEGRAPH pole has just been planted in front of the Franklin statue in Printing House square, in such a position as to ruin the view of the statue from the City Hall. It shows the encroaching tendency of the giant monopoly, but there is a sort of poetic justice in having the old philosopher hoisted on his own petard, or what is the same thing, thrown into the shade by the progress of his own discovery.—N. Y. Graphic.

The Southern and Atlantic Telegraph Line.

WE are glad to learn that the finishing touches are about to be given to this line, securing an independent communication from New Orleans to New York. In one more week the line will be in working order. Poles have been raised and wires stretched from Mobile to Lee station, on the N. O. & M. railroad, which is only nine miles from New Orleans.

The Southern and Atlantic Company has fought its way through almost inch by inch. Litigation has met it at every turn, but so far the company has seemed to come off victorious. A petition for an injunction has recently been filed in the United States Circuit Court

at New Orleans—Judge Woods—by the Western Union Company, asking that the new company be forbidden right of way along the line of the Mobile road, on the ground of its interference with the exclusive rights of the petitioner. This matter has clearly been settled in the Superior District Court of the Parish of Orleans, in favor of the Southern and Atlantic line, and now the United States Court is the last resort of the monopolists. The case has been fixed for hearing on the twenty-first instant, and much interest will attach to the decision of Judge Woods.—Mobile Daily Tribune.

Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS—NEW YORK, JAN. 23, 1875.

ASSESSMENT NO. 71.

17, 22, 51, 58, 280, 350, 381, 398, 414, 438, 481, 527, 561, 605, 617, 652, 667, 671, 717, 725, 801, 869, 899, 908, 920, 934, 1103, 1148, 1207, 1251, 1336, 1437, 1485, 1516, 1559, 1564, 1572, 1600, 1603, 1605, 1607, 1608, 1609, 1610, 1611, 1612, 1626, 1637, 1639, 1653, 1655, 1657, 1672, 1690, 1691, 1698, 1729, 1773, 1818, 1835, 1917, 1931, 1934, 1953, 1954, 1964, 1968, 1978, 1995, 2005, 2118, 2128, 2145, 2160, 2179, 2244, 2280, 2302.

MISCELLANEOUS.

69.—1149.
68.—19, 800.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended December 15, 1874, and bearing that date.

157,778.—VOLTAIC BATTERIES. R. Arthur, Baltimore, Md. Filed October 19, 1874.

The inner perforated cylinder for keeping in place the mass of zinc fragments, has permanently attached on one side a tube for the withdrawal of liquids, and on the other a tube extending down into a cavity filled with mercury in the bottom of the cup, for insertion of an electrode.

1. In a voltaic battery the inner perforated cylinder provided with the attached tube a, for containing mercury and for passage of the electrode, as shown and described.

2. In a voltaic battery the combination of the cylinder B, provided with the tube a, extended below it, and the jar A, having the groove or cavity in its floor for reception of said tube, as shown and described.

3. In a voltaic battery, the cylinder B, provided with the attached tube b, for removal of fluid surrounding the porous cup, as shown and described.

157,787.—PRINTING TELEGRAPHS. Samuel J. Burrell, Brooklyn, N. Y., assignor to Truxton Burrell, same place. Filed February 23, 1874.

Printing and type wheel magnets controlled by one main circuit, by varying strengths of current. The relay at sending station is used as a resistance. By depression of a proper key the battery is disconnected therefrom, and connected to the line, thus strengthening the current to control the printing.

1. The within described method of operating telegraph printing mechanism by cutting out the relay magnet at the sending station, so that the current is thereby strengthened, to render the printing mechanism operative at the receiving station or stations, as herein specified.

2. In combination with an electric circuit controlling the two operations of adjusting types and producing impressions, a resistance and means for cutting out the same at will, in order to perform one of the two operations, leaving the resistance in the circuit to perform the other, all substantially as herein specified.

3. In connection with an electric circuit controlling a printing mechanism, and with a resistance and means for cutting out the same at will, and means for causing such cutting out to produce the desired effect, the combination of a key or means not only for the cutting out the resistance, but also breaking the connection, so that no portion of the current can move through the resistance, substantially as herein specified.

4. The lever I I', forming the several contacts and breaks, so as to successively induce the operations of cutting off the connection of the local battery to the type wheel magnet, cutting out the relay coil of the main line, and closing the local circuit to the impression magnet, as herein specified.

157,880.—PRINTING TELEGRAPHS. John E. Smith, New York, N. Y. Filed November 12, 1873.

Printing and type magnets in same circuit, former requiring more powerful current, and operated by cutting a special resistance out of circuit at transmitting station by means of continued action of a shunting magnet, operated by prolonged closure of circuit.

A resistance coil or rheostat and a shunting magnet and connections, substantially as herein described, in combination with a main circuit in which are placed the printing and the type wheel magnets of any number of telegraph instruments, for the purpose of making the current for operating the printing magnets more powerful than is necessary for rotating the type wheels.

Married.

GREENLEAF—HOYT.—At the residence of the bride's father, New Durham, N. J., Wednesday evening, January 13, 1875, by the Rev. Telfair Hodgson, Pastor of Trinity Church, Hoboken, N. J., Mr. ENOCH GREENLEAF, Jr., to Miss AMINE C. HOYT.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET;

or to

L. G. TILLOTSON & CO.,

8 Dey street, sole Agents.

GEOURGE H. BLISS & CO.,
 41 Third Avenue, Chicago, Ill.
 CINCINNATI, O., ST. LOUIS, MO.,
 Elm St., cor. 5th. 409 North Third St.
 Manufacturers and Dealers in
TELEGRAPH INSTRUMENTS AND SUPPLIES.

- RELAYS, unequalled for beauty and strength;
- COMBINATION SETS; BOX and POCKET RELAYS.
- CHALLENGE, PONY and REPEATING SOUNDERS.
- KEYS, various styles, including the SCHNEIDER KEY, just out, no legs, wire connections above the table.
- REGISTERS, with SPRINGS or WEIGHT.
- OUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.
- REPEATERS—HASKIN'S AUTOMATIC, and others,
- SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.
- ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.
- ELECTRIC BELLS, HOTEL ANNUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.
- ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.
- MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand instruments for sale cheap, and repairing done at short notice.
- BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.
- WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.
- INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.
- BRACKETS, PINS and SPIRES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.
- TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANIFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
- PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

CHAMPION BURGLAR ALARM
 AND ANNUNCIATOR COMPANY,
 40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skilful mechanics to estimate upon work, or will give any information in writing that may be required, *Liberal commissions will be paid upon any orders that may be secured for us.* Our Alarms and Annunciators have just been awarded the **FIRST PREMIUM** of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

L. G. TILLOTSON,
 President.
 CORNELIUS ROOSEVELT,
 Secretary and Treasurer,
 40 West 18th Street, New York.

ECONOMIZE!

Procure the best and cheapest Telegraph and Electrical Instruments and supplies of all kinds from
LANNERT & DECKER,
 31 1/2 Prospect St., Cleveland, O.
 Send for circular.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
 PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,
 now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.
 No. 2 is a round cell, designed for main line. Price, \$2.

Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,
 (P. O. Box 5603.) 38 VESEY STREET, N. Y.

WATTS & COMPANY,
 No. 47 HOLLIDAY STREET,
 BALTIMORE, MD.

SUPERIOR TELEGRAPH INSTRUMENTS, RELAYS, SOUNDERS, KEYS, OFFICE WIRE, BATTERIES OF EVERY DESCRIPTION, SWITCHES, GALVANOMETERS, RESISTANCE COILS.

A COMPLETE STOCK of EVERYTHING for the TELEGRAPH OFFICE or ELECTRICAL LABORATORY.

Special attention given to repairing Scientific Instruments. Several of our workmen having served their time in the most prominent European manufactories, enables us to guarantee satisfaction.

SEND FOR CATALOGUE AND PRICE LIST.

A MERICAN COMPOUND TELEGRAPH LINE WIRE.

COPPER FOR CONDUCTIVITY.—STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE compared with IRON, consists in its LIGHTNESS relative TENSILE STRENGTH, CONDUCTIVITY DURABILITY, EFFICIENCY and RELIABILITY.

Address, American Compound Telegraph Wire Co.

Pittsburg, Pa.,
Portland, Maine,
Peoria, Ill.,
Providence, R. I.,
Quebec, L. C.,
Rochester, N. Y.,
Richmond, Va.,
St. Louis, Mo.,
St. John, N. B.,
Springfield, Mass.,
San Francisco, Cal.,
Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,
TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury, Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Early Submarine Telegraphy.

TO THE EDITOR OF THE SCIENTIFIC AMERICAN.

In your journal of January 9th Mr. George B. Prescott gives a brief account of some of the earlier experiments in subaqueous telegraphy. As this is a matter of much scientific as well as historical interest, I trust you will afford me space for a few notes on the same subject.

Prior to the employment of gutta percha for this purpose various attempts were made to insulate subaqueous telegraphic conductors, which were attended with only partial success. The plan usually adopted was that of winding conducting wire with thread saturated with insulating compound, and inclosing it in a tube. Dr. W. O'Shaughnessy made the first actual experiments of this kind for telegraphic purposes. He built a line, twenty-one miles in length, of iron wire, supported on bamboo poles, near Calcutta, India, in 1839. His line also embraced 7,000 feet of submerged wire, insulated with cotton thread saturated with pitch and tar. This was the first telegraph line of any length ever constructed in any country, and was worked successfully.

The first public telegraph line in England was opened from London to Gosport, eighty-eight miles, in February, 1845. In the summer of 1846, an attempt was made, under the direction of Prof. Wheatstone, to extend this line across the harbor to Portsmouth by means of a submarine wire a mile in length, but it failed to work successfully. This wire was, I think, insulated with India rubber, and enclosed in a leaden tube.

Gutta percha was first introduced into England in 1845. In March of that year R. A. Brooman patented the method now universally employed, for preparing the raw material for use in the arts, covering everything into which gutta percha could be manufactured. This was called the Master Patent. In September of the same year, Henry Bewley patented a machine for making tube, hose, etc., similar in principle to the American lead pipe machine of Tatham, patented in 1841. In 1846 C. W. Siemens, of London, sent a sample of gutta percha to his brother, Dr. Werner Siemens, who had been appointed a commissioner by the Prussian government to consider a telegraphic system, to see whether it would answer for coating subterranean wires. The latter soon discovered its remarkable insulating properties, and recommended an experiment upon a large scale, which having been sanctioned, he laid down a line of about five English miles near Berlin, Prussia, in the summer of 1847, which worked successfully. (*Journal of Society of Arts*, April 23d, 1853.)

In 1847 and 1848 more than a thousand miles of gutta percha covered wire was laid down in Prussia, which for several years proved successful, after which it gradually failed, owing to the impurity of the material. In March, 1848, Dr. Siemens made several successful experiments in the harbor of Kiel for the Schleswig-Holstein government, using a gutta percha cable of considerable length for firing submarine torpedoes. The same year he laid across the Rhine, at Cologne, a gutta percha coated wire, which was protected by a strong chain.

In 1846 the Gutta Percha Company was formed in London for the purpose of working the Brooman, Bewley and other patents. In June, 1846, Mr. Samuel T. Armstrong, of New York, received from one of the directors of this company a small quantity of the raw gutta percha, together with an invitation to visit the works in London. He left for Europe in March, 1847, spent six months in England and on the continent, visiting all the gutta percha factories then in existence, and finally purchased the patents for the United States, returning to New York in September, 1847. While in Europe he doubtless witnessed the manufacture of the insulated wire for Dr. Siemens, an immense quantity of which was furnished in 1847 by the same Gutta Percha Company of London.

In the latter part of 1847 W. S. Wetmore, of New York, imported a consignment of gutta percha for Mr. Armstrong. It was, probably, some of this lot with which Mr. Craven experimented, as mentioned by Mr. Prescott. I have been told that Mr. Craven and his

wife covered a wire themselves at their home in Newark, N. J., which he laid down as an experiment at the Passaic river crossing, in that city. On the 22d of May, 1848, Mr. T. M. Clark, Secretary of the Magnetic Telegraph Company, wrote to the Treasurer, George H. Hart, Esq., of Philadelphia:

"The wire has been down there (at Passaic river) nearly a month, and it has worked to a charm. It has been tested in various ways to see if there is any difficulty about it, but none has ever yet appeared. I am well satisfied that the plan is a good one, provided the wires can be kept out of the reach of anchors." This cable was, therefore, probably laid the last of April, 1848. Mr. Prescott states that James Reynolds covered the first cable that was laid across the Hudson River from New York to Jersey City, but makes no mention whatever of Mr. Armstrong, who was the proprietor of the establishment at which the cable was covered, and the owner of the Brooman and Bewley patents under which it was made—Mr. Reynolds (who was then employed by him) being the man who built and probably ran the machine used in coating the wire. This machine was the same in principle as Bewley's and Tatham's, previously mentioned. The cable referred to consisted of a No. 9 iron wire covered with half an inch in diameter of gutta percha. It was laid at five o'clock on the morning of the 15th of June, 1848, by the steamboat United States, from Cortlandt street, New York, to Jersey City, under the personal supervision of T. M. Clark and John W. Norton, directors of the Magnetic Telegraph Company. This cable had a leak in it from the start, but New York and Philadelphia telegraphed through it—by alternately cutting off the battery at the receiving station—for four days, when the wire was cut by an anchor.

Mr. Craven applied for a patent on the 12th of May, 1848, for his process of insulating wire by means of gutta percha. William Gordon also applied for a patent for the same thing on the following day, May 13. Both of these applications were rejected on the ground that, the insulating property of gutta percha being well known, its use to protect wires was not a patentable invention. Reynolds applied for a patent on his machine June 9, 1848, which was rejected for lack of novelty. But, notwithstanding all this, one George B. Simpson, of Washington, succeeded in engineering a bill through Congress, giving him a patent for insulating wires with gutta percha, which was issued May 21, 1867, and is now in force. Even if the subject matter were patentable, it is difficult to see how any one in this country could rightfully claim the invention, as it was made by Dr. Siemens in the winter of 1846-47, and the first importation of gutta percha into the United States was not until near the close of 1847. Mr. Prescott says: "One of Mr. Reynolds' workmen named Champlin, shortly after this cable was laid, went to England and communicated the process to the Gutta Percha Company," etc. This statement cannot be correct; for, as we have seen, the cable in question was not laid till June 15, 1848, while the Gutta Percha Company probably covered Dr. Siemens' four miles of wire in the summer of 1847, and certainly the 1,000 miles subsequently laid down by him in 1847 and '48.

W. H. Barlow took out a patent in England April 27, 1848, for covering wire with gutta percha by means of heated grooved rollers. The Bewley machine has, however, been much more generally used for this purpose than any other—having, of course, received more or less improvement at the hands of subsequent inventors.

F. L. POPE.

Elizabeth, N. J.

Interchange of Telegraphic Business.

THE bill introduced into Congress requiring the telegraph companies to interchange business and *pro rata* charges whenever their several necessities require it, has attracted a great deal of attention in Wall street, where the matter is regarded as a game between the Western Union and Atlantic and Pacific Telegraph Companies. It is expected that the bill will be reported favorably. Should it ever pass, however, it will be the beginning of a bitter war between the two telegraph companies, as the Western Union will never consent to share its facilities with its rival.

This telegraph bill is regarded by the officers of the Atlantic and Pacific Company as entirely fair, and as requiring no more than ought to be required in the relations even of competing companies. It is claimed by them that the custom of charging for extra work has never been practiced by any telegraph company in this country except the Western Union, and the Western Union does not charge for extra work on transfer business received from telegraph companies with which it is on friendly terms. The law of Connecticut and of several other States requires this free transfer of business, and the design of the present bill is to place the telegraph interests, throughout the country on a common footing. Mr. Orton, President of

the Western Union Telegraph Company, said yesterday that he considers the bill to be intended to affect Wall street, and it is not aimed at the Western Union. He claims that Congress has no right to legislate concerning the terms of transfer, and gives, as his opinion, that there is no chance for the passage of such a bill, arguing that Congress has no more right to legislate in these matters than it has to establish the rates of transfer between a Pullman line of cars and Dodd's express.—*New York Daily Tribune*.

Arizona U. S. Telegraph Line.—New and Reduced Tariff of Rates.

LIEUTENANT THEODORE SMITH, Superintendent of the Arizona U. S. Telegraph Line, yesterday received from Gen. Myer, Chief Signal Officer at Washington, the tariff of rates established by direction of the Secretary of War, to go into effect on the 15th instant. There is a great reduction in the charge for private and business telegrams over this line, but the rates to the Press are raised. We give the tariff from San Diego to the several points on the line, as follows: For messages of ten words or less to Yuma, 25 cents; to Stanwix Station, 50 cents; to Tucson, 75 cents; to Florence, 50 cents; to Maricopa Wells, 50 cents; to Phoenix, 50 cents; to Wickenburg, 50 cents; to Prescott, 75 cents; to Camp Verde 75 cents. Where the rates are 25 cents for ten words, the rate for each additional word will be 1 cent; where the rates are 50 cents for ten words, 2 cents will be charged for each additional word; and where the rates are 75 cents for ten words, the rate for each additional word will be 3 cents. All rates in United States currency.

This is the lowest telegraph tariff in the United States, and it now remains to be seen, by the increase in the business of the line, whether the people are disposed to take advantage of it. A letter of 110 words can be telegraphed from San Diego to Yuma for \$1 25, to Tuscan, Prescott and Camp Verde for \$3 75, and to any other point on the line in Arizona for \$2 50—in greenbacks.

For Press despatches 2 cents per word is charged between San Diego and Tucson, Prescott and Verdi; 1½ cents per word for any distance between 300 and 450 miles, and 1 cent per word for any distance under 300 miles.

Lieut. Smith has moved into the brick building adjoining the Western Union office, on Fifth street, which will be occupied as the headquarters of the line.—*The San Diego (Cal.) Daily Union*.

[Special Despatch to the *Daily Graphic*.]

Mr. McCrary's Telegraph Bill.—A Blow at a Gigantic Monopoly.

WASHINGTON, January 18.—There is every prospect that Mr. McCrary's bill, which was introduced in the House of Representatives on the 11th inst. and referred to the Judiciary Committee, will pass and become law. It strikes a direct blow at that greatest of monopolies of modern times, the Western Union Telegraph Company, and is clearly a bill of reform in the interest of the business community and people at large. I append the text of the proposed law.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That every telegraph company which has accepted or may accept the provisions of the act of July 25, 1866, relative to telegraph lines, shall mutually interchange with every other such telegraph company messages from points on the line of one company destined for points on the line of the other company; and every such company shall receive such messages from every other such company, and promptly transmit and deliver the same at their destination at the regular tariff rates established by such company between the points to and from which such messages are transmitted, and without any additional charge for words deemed necessary for indicating the route or manner of transmission; and any officer or employé of any such company who shall refuse to receive, or who shall fail promptly to transmit and deliver any message at the rates and in all respects in the manner as in this section provided, shall be punished in the Courts of the United States of the district where he may be found, by a fine not exceeding \$1,000, or by imprisonment not exceeding one year; and such person, and also such company, shall be liable for damages to the party injured, which may be recovered in the name of the telegraphic company receiving the message from the original senders.

A New Telegraph Company.

A TELEGRAPH company has been organized at Peoria, Ill., under the name of the Illinois Valley Telegraph Company. It proposes to put up lines to Chicago and prominent points in Indiana and Missouri.

**Meeting of the American Electrical Society.—
Interesting Paper from Mr. C. H. Haskins.—
—Telegraphic News and Notions.**

CHICAGO, Jan. 26.

TO THE EDITOR OF THE TELEGRAPHER.

THE meeting of the American Electrical Society last Wednesday evening was by far more largely attended, and the most interesting of any since the formation of the society. The way business was transacted, and the interest manifested by those present, clearly demonstrated the fact that the right men were at the head of it. The President, General Anson Stager, presided. Vice-President Dr. C. H. Haskins, of Milwaukee, was also present, as well as C. H. Summers, and Colonel J. J. S. Wilson, of the Executive Committee. The roll was called by Recording Secretary C. S. Jones, who was in his place, as usual. One of the directors, Superintendent R. C. Clowry, of St. Louis, was also present. Prominent among other members present were Superintendent J. P. Fowler, A. and P. Telg.; Superintendent G. H. Thayer, N. W. R. R. Telg.; Manager H. C. Maynard; Mr. Firman, of the Fire Alarm; S. L. Robinson, Manager W. U. Board of Trade Chicago office; Master of Repairs W. U. Co., Chicago, W. O. Hopkins; Electrician W. U. office, Chicago, F. W. Jones, and others.

The record of the proceedings of the previous meeting was read and adopted, and some ten or fifteen new members elected; among others, Mr. Weller, Manager W. U. Telegraph office, Milwaukee; Mr. Kellogg, Electrician, Western Electric Manufacturing Company, Chicago, and Mr. Vigus, General Superintendent's Clerk, W. U. Co., Chicago, for whose benefit the rules were suspended, and they were proposed and elected at the same meeting, so that they (being present) could participate in the proceedings of that meeting. Quite a novel idea (to many members of the society at least) was presented by Mr. Haskins, which was the use of condensers as repeaters. The circuits were set up in the room (General Stager's) representing three circuits of 400 miles each. The duplex polarized relay was used, and battery was furnished by the W. U. Co. By this system a double pointed key is necessary; those not being available, a Stearns transmitter was used at either end, and the wire taken out of a binding post to do the breaking. It was shown that the breaking could be done promptly, right on the dot as it were, through the 1,200 miles of artificial line there represented. Mr. Haskins explained that the use of condensers was by no means a thing of recent date, as their uses had been known nearly a hundred years. They had been used by Farley on submarine cables, but had never as yet been used as repeaters. Mr. Haskins did not claim that he had perfected the system by any means, but gave it to the society, so that they might experiment upon it in the crude form that he presented it. He had tried it on a wire by one route from Milwaukee to St. Paul, and back by another route, making no choice of any wire, but taking them as they were available, and with this system of repeater at St. Paul the response on the receiving or terminal instrument, which sat right alongside of the sending instrument in Milwaukee office, was instantaneous. I might go on and lengthen the description, and tell you how none of the battery current passed out upon the line, but it was simply the induction current; but space and time forbids. A paper upon the subject is among the society's files, and will no doubt be printed at an early date, when your readers will get a full description. Until it is printed by the society it is not the property of the public. The meeting throughout was very instructive, especially to the younger members. A feeling among operators who are not members seems to exist, especially in the W. U. office, that this society is a kind of a prim, high backed chair kind of an organization. If they could have been present at the meeting just mentioned, and heard the joking by the members every time there was a chance previous to opening the meeting and after adjournment, they would have a different conception of it. Superintendents, operators and repairers there mingle, and for a time forget their different stations, and are only men and boys, as it were, seeking after knowledge, or imparting it to one another. "The boys" are very much mistaken if they think their superiors do not want them in this society, as I have frequently heard the different superintendents express the hope that ere long every operator in their employ would become members. It was for them (the operators) that the society was more especially formed, as those in an-

thority can get together at any time and discuss such subjects as appear before these meetings, and many of those who were prominent in organizing the society make great sacrifice personally to be present at the meetings. Those for whose benefit it was originated should certainly be willing to do the same. Some talk has been had of organizing a local society, to meet weekly, which shall be an auxiliary to the American Electrical, and have such men as Mr. Summers and Mr. Jones talk to us as Mr. Haskins does to his operators in Milwaukee. We might have such a society, and have no "dry algebraic technicalities" either.

Mr. F. W. Jones was appointed a committee of one to explain the quadruplex at the next meeting of the American Electrical Society. Something interesting may be expected, and there should be a large attendance.

Persons who patronize the telegraph have very little idea, as they pass in their occasional message from time to time, of the immense amount of work done by the various companies. One of the gentlemen on the night force kindly furnishes the following showing in the W. U. Office: on the night of the 20th, up to 10 P. M. that night, there was received for the different papers, exclusive of the Associated Press reports, 23,600 words; at 12 (midnight), 36,100 words; and at 1.30 A. M., 38,400 words. Of this amount the Chicago Times alone got 17,800 words; Tribune, 13,100; and the Inter-ocean, 7,500 words. The same night there was, of regular report, 4,500 words, and Smith extra 1,500 words, making the enormous amount of 44,400 words, besides the large number of half rate messages. No doubt quite as good a showing for the A. and P. Co. could be made had we the figures, proportionately of course to the facilities of the two companies; what would our fathers have thought had it been predicted to them that in a quarter of a century this toy of our grandfathers' days should grow to be such a benefit to mankind?

Messrs. Bale (not Ball, as your printer made me say recently) and Portier of the W. U. force, have returned from their holiday trip to Canada, looking very much invigorated. I am told by one of the employes of the Great Western Company that none of the wires of that company, except the western wire, is leased by the W. U. Company, and that one only, because the G. W. had no use for it, and that they (the G. W.) can terminate the lease at pleasure. As the W. U. Co. I understand, are responsible, to a certain extent, for the debts of this defunct organization, this looks hardly plausible. The W. U. Co. don't generally do things by halves, as this would indicate, but I give the statement for what it is worth.

I understand there is not to be an office opened at I. C. R. R. shops here as "suggested in a former communication," as the office at what is known as Weldon's station, on that road, near 16th street, is near enough to serve every purpose.

Hon. A. Spaddock, by one of the W. U. day force, is very good for Hon. A. S. Paddock, the newly elected senator in Nebraska. No doubt he would scarcely know himself if addressed as "Spaddock."

One of the day men taking night report in W. U. office a few nights ago, must have been very sleepy to get Reinhart & Kingsley for Rev. Charles Kingsley in a London cable message. It might have "passed" that way, but the idea of two men dying at the same age, 56 years, seemed rather preposterous, and it was caught on the Milwaukee sending wire by the irrefragable "Z" with his "ditching machine" and "patent egg sifter."

I understand the A. and P. Co. are now working the duplex system of D'Infeville between New York and Buffalo as well as between New York and Washington. It works so satisfactorily that it will be introduced West, no doubt, as soon as the instruments for it are completed.

OCCASIONAL.

**Christmas and New Year's Telegraphic Greetings.—
Retirement of Dr. Plummer and Accession
of Col. Lamb to the Superintendency of
the Third District.—Webfoot Con-
verted on the Tobacco Question.**

ALBANY, OREGON, Jan. 10.

TO THE EDITOR OF THE TELEGRAPHER.

"HERE we are again, boys!"—with Christmas and New Year's both past, and "we" settled down to work, with the sweet memories of those two days still lingering around us, suffice it to say we had a good time, and, being a bachelor, enjoyed it. On New Year's morning the operators on the O. & C. R. R. lines each indited and transmitted a telegram of greeting and good wishes to their efficient and esteemed superintendent, Mr. Falgout, who very appropriately replied to the same over the lines. The assistant chief operator was also duly remembered, for which he now returns his sincere thanks again, and expresses the earnest and heartfelt wish that we,

each and every one, may be permitted to exchange greetings on New Year's morning, A. D. 1876.

Some time since I stated that Dr. O. P. S. Plummer, Superintendent of the Third District W. U. Telegraph had resigned. This information I gave as I got it direct from the doctor's lips, and he said the 1st of November would be the day from which he could devote his whole time and attention to his neat and lucrative drug store on First street in this city; but by some means Col. Lamb, his successor, failed to appear until the 5th inst., when he arrived per steamer, and the W. U. boys all received notice of the change. The boys ought to feel happy over getting such a pleasant gentleman and efficient and experienced Superintendent as Col. Lamb to succeed Dr. Plummer. This district extends from Yreka, Cal., to Victoria, V. I., making quite a nice little "heat," as we "woodsmen" say.

On last Thursday morning the operators, desiring to express their sentiments in some way, called a meeting, and after inviting the Ogn. & Cal. and O. C. R. R. boys in Oregon and N. P. R. R. boys in Washington to join them, a "farewell telegram" was sent to Dr. Plummer, who was in the W. U. office in this city. The Daily Bulletin, of Portland, tells it right: "A very pleasant affair to Dr. O. P. S. Plummer, late superintendent of the Western Union Telegraph line, occurred at the telegraph office in this city on Thursday morning last. It should have appeared in yesterday's issue, but was mislaid. To Messrs. Jacobi and Thurman, operators, we are indebted for it. Each operator between Yreka and the northern station stood at his keys, while the following message was sent, to which they gave their signature:

"Dr. O. P. S. Plummer: In severing your connection with us as Superintendent of this District, please accept our thanks for the many kind acts received at your hands, and we trust that the cordial relations that have existed as Superintendent and operators may be continued through life. Hoping that you may succeed beyond your expectations in whatever you undertake, we are still your friends. (Signed by 66 operators.)"

DR. PLUMMER'S REPLY:

I thank you all sincerely for your friendly expressions, and assure you that the memories of yourselves and our pleasant past relations will ever rest among the brightest in memory's recesses.

O. P. S. PLUMMER.

Since September 15, 1868, Dr. Plummer has faithfully performed his duty, succeeding in placing the enterprise on a firm foundation. The workings in every department are most excellent, and to his industry and energy in greater part it is due. The affairs have been transferred to a good and capable manager in the hands of Col. Lamb, his successor." All of which am so!

What has become of Nettie Bronson, Elias, and "Dose odder fellers vat don't vas happy." Let's hear from them some more. By the way, you might gently intimate to Nettie that Webfoot, "having seen the evils of his way," has become a hopeful "convert" to her views regarding the use of the "weed"—having paid up his cigar account in full, thereby causing the heart of an old Israelite to bound for gladness, and also winning the eternal gratitude of a certain R. R. agent, by presenting him with my hitherto fondly cherished "Meerschaum." But for fear Nettie might be after taking unto herself too much credit, candor compels me to say that a certain one in Oregon—not a "sister," as Nettie says—together with some "tracts" addressed to me on a "crusading expedition" from the vicinity of the Erie, Pa., W. U. office, had as much or more influence to bring about this great revolution as Nettie's efforts; but I know Nettie will rejoice over the conversion of the "sinner" as truly as though she was the cause of it all. Am I right? Any way I am satisfied.

WEBFOOT.

**The Experience of a Female Telegrapher
Against Nihil Nameless' Assump-
tions and Forebodings.**

TO THE EDITOR OF THE TELEGRAPHER.

"NIHIL NAMELESS" is the happy possessor of very correct and perspicuous ideas concerning telegraphic journalism, but when he leaves that subject, and attempts to portray the shady side of a lady operator's life, he becomes at once hopelessly entangled in a net of sophistry and guesswork.

Granting for a moment, however, the truth of his remarks as applied to the benighted region of the Buckeye State, from which he hails, I wish to enter an emphatic protest in behalf of the more civilized West. I am an operator of six years' standing; have held offices in several States, and at points widely separated. I know personally and professionally many lady operators with whom I have compared notes regarding our business experience, and I have yet to know or hear of any one meeting the horrors which Nihil deprecates in our behalf.

He complains of social exclusion and unwholesome offices. Most office hours end at 8 P. M.; in cities earlier—time enough, surely, for some social recreation, I don't mean dissipation. I never found any difficulty in getting leave of absence in the day time or evening, if I left a competent substitute; and few of offices are necessarily heated or unwholesome, with a little care in securing ventilation. I admit that in railroad offices a lady cannot always stop the smoking while the habit is so universal, yet if she has a spark of decision she can clear her own office of loafers who know no better than to smoke in her presence. It does not seem to have entered Nihil's mind that separate departments may be instituted in cities, or even that smoking can be prohibited. Witness St. Louis, where ladies and gentlemen work together.

I am no extremist, contending that telegraphic work be given up to woman's control, nor do I think it ever will be; but I believe she can and ought to fill more positions of trust and responsibility than she does at present. Stock yard and railroad offices are not the most desirable positions in the service, but rough and uneducated men will have business at any office. They have rushed into mine, swearing frightful oaths, and stopped with apologies the moment they saw me. Four years ago political excitement ran high in the town where I was working. My office was in a large room, holding perhaps 150 persons, and on election night completely filled with excited and half drunken men. I stayed until 2 A. M. getting returns for them, and during all that time, if any one so far forgot himself as to utter an oath he was at once ignominiously hustled out into the rain and darkness. More than that; the next day a noted rough came and begged my pardon for having talked so loud in his excitement. Only once in all my experience have I encountered anything like the rudeness so greatly feared (and exaggerated), when a drunken Texan—the roughest of his class—staggered into the office, and, seeing me alone, began to talk in a profane and insolent manner. But even he left at once, and "stood not upon the order of his going," when I promptly ordered him out. Pardon so much egotism, I only wish to sustain my position with illustrations from my own personal experience.

On one of the southwestern railroads, noted for the rough character of its employés, a lady was sent to one of the way stations. Her advent was marked at once by a cessation of profanity over the wires, and she told me she never met with anything but respect and kind treatment from the desperadoes who manned the trains. I cannot comprehend how any one can be frightened by the bugbears which Nihil's imagination has conjured up. Bad as he represents mankind to be (and he is right), wicked and abandoned as many of them are, I believe any self-respecting girl can follow telegraphing anywhere on this continent without annoyance.

Has "Nihil" so low an opinion of lady operators as to suppose they would remain in the service another day if his doleful picture was correct? It is not a choice between telegraphy and starvation. The ability and independence which enables a lady to become a successful operator would gain her a living in a dozen other ways. Neither does it follow because she is no longer ignorant of the vices of humanity that her abhorrence of them is lessened (Pope to the contrary notwithstanding), or that her sensibilities are blunted in any degree.

Public opinion has changed mightily within the last decade, and any lady of dignity, perseverance and grit, will be sustained and respected in any profession which she honors by undertaking.

LADY.

An Insurance Banquet.—The Protection Life Insurance Co.

CHICAGO, January 21st.

TO THE EDITOR OF THE TELEGRAPHER.

THE banquet given by the Protection Life Insurance Company of this city to its officers and agents, at the Grand Pacific Hotel this evening, was one of the grandest affairs of the kind which has transpired for some time. Among the telegraphers interested in this association present we noticed Col. Edwards, the secretary of the company—an "old timer;" and Martin Ryan, the actuary of the company, who is also a member of the Board of Directors, and editor of the company's paper, *The Advocate*. Mr. Ryan was formerly connected with the telegraph of Canada, and for a long time worked on the W. U. night force in this city. He is one of the old "staid boys," and takes great pleasure in explaining the merits of the Protection to his old comrades whenever he meets them. We also noticed W. C. Long, who has an agency in the Protection, and has opened an office at his residence, working for them evenings. We understand he is making liberal offers to those of his telegraphic brethren who wish to insure in the Protection. If telegraphers who are insured in the Tele-

graphers' Mutual Benefit Association feel that they can carry more insurance than they have in it, or if those who for any cause fail to insure in the Telegraphers', and want good, cheap insurance, they can find no better company than the "Protection." The plan is very much like the Telegraphers', only the membership being larger the insurance costs somewhat less. Prominent among the telegraphers invited who could not attend, from sickness or otherwise, was Mr. H. C. Maynard, night manager W. U. Company in this city, who, we understand, is a member of the Protection family. If the gentlemen who responded to the toasts at the banquet this evening were all telegraphers, or your paper was an insurance journal, we might give you quite a good account of the meeting, but as it is can only refer to the speeches by the telegraphers, after the President of the company, Mr. L. P. Hilliard, had been introduced and spoken a few minutes upon the difficulties which he encountered in organizing the company in 1870. Mr. Ryan was called upon to respond to the toast, "The new departure." His speech was rather a statistical one, but contained some telling hits, which elicited considerable applause. He showed that for the \$9,000 paid into the company by deceased members, the company had paid to their families the enormous sum of \$879,479.01, and that if they had been insured in old line companies, they would, for the amount paid in by their protectors, have received but \$256,815. I hope you and your readers will pardon this somewhat lengthy dissertation upon a subject not strictly telegraphic, but I was anxious to impress the necessity of insurance upon the fraternity. More telegraphers die and leave their families but the remembrance of their virtues (which won't buy bread and butter, nor warm the house) than any other profession, and as this Protection Company embraces a number of well known telegraphers among its officers and members, and offers insurance within the reach of all, I thought an account of the telegraphic part of their banquet not amiss. I had almost forgotten to speak of Col. Edwards' speech, which was loudly applauded. It was a motion to adjourn.

INSURANCE.

Telegraphic Changes in California.—Fortunate Telegraphers.

SAN FRANCISCO, Jan. 20.

NOT having seen my notice of the following changes, I take the liberty of sending them to you, commencing with the A. and P. office here, in which there has been a general change—Major Hammond having assumed the duties of Managing Director of the Pacific Division. Mr. L. N. Jacobs, for some time past manager of the San Francisco office of that company, resigned, as did also Mr. Hubbard, receiver. The vacancy created by the resignation of Mr. Jacobs is filled by Mr. J. G. Bloomer, of the fire alarm telegraph of this city, author of "Bloomer's Cryptograph," which is a work of decided merit, and, being greatly needed, has been a financial success. Mr. Edw. Reese, for a long time of the W. U. Tel. Co., relieved Mr. Hubbard. Mr. Con. Dwyer, of the W. U. operating room, has transferred himself to the same department of the A. and P. Co., while Mr. Horace Jones, of the latter place, fills the vacancy caused by Mr. Dwyer's leaving. Mr. Harry Bennett, of the A. and P. Tel. Co. here, was one of the lucky speculators during the late rise, clearing up with about \$7,000, and "S. F." not being ethereal enough, he betook himself to that part of Mount Davidson in Nevada, known as Virginia City, where he still "pounds brass" for the A. and P. Co. despite his strike. Sensible youth. Mr. Geo. Tenf, manager of the W. U. Tel. Co. at Virginia City, is reported to have made about \$300,000 during the same "rise." Mr. Sam'l Chubbuck, manager of the Gold Hill office of the same company is said to have done very well in this way, and has also gained the honor of being elected by a large majority to represent his district as Senator in the Legislature of the State of Nevada.

Accessions have been made to the ranks of the San Francisco office in the persons of Jos. H. Thatcher, of Virginia, Nev.; Wm. F. Archibald, of Buffalo, and Geo. D. Field, of Chicago. The latter gentleman has been somewhat indisposed since his arrival, and rusticating at present across the bay at Oakland. Manager J. P. Yontz has now a full and efficient force, and is assisted by Mr. Chas. T. Dozier, chief operator, and Mr. Geo. Sawyer, assistant chief, with Wm. Foley, Jos. H. Thatcher, Arscott Venton, Chas. A. Boynton, T. S. Cunningham, Wm. F. Archibald, Miss Fannie Wheeler, Horace Jones, John A. and Geo. W. Campbell, E. Somerville, Wm. E. Smith, operators.

Within the past year the company have extended their lines very much, and have not yet taken their men out of the field. These extensions are warranted by the rapidity with which this wonderful State is being settled up.

Changes among other operators in this division to some extent will form the substance of my next letter. An inquiry from the East last week revealed the fact

that Mr. James D. Lillis, at present a receiver in the San Francisco office, has been engaged in telegraphy since Feb. 10th, 1847.

CLIX.

A Local Electrical Society.—Telegraphic Item.

TO THE EDITOR OF THE TELEGRAPHER.

I HAD hoped some one more able than myself would write you about the Local Electrical Society, formed in Milwaukee, which now consists of about thirty-five members. It was owing mainly to the exertions of Mr. C. H. Haskins, General Superintendent N. W. Tel. Co., that the society was started. He has tried to organize such a society for the past two years, but heretofore little or no interest was taken in it by those he wished to benefit. He delivers a lecture every week before the society, which is very instructive. He began down at the roots, and is gradually working up among the branches. We want a few more such men as Mr. Haskins up among the "Grand Moguls."

The wife of Mr. Hankinson (the worthy Assistant Superintendent of the Northwestern Telegraph Company) is now lying very ill at her home, Grand Rapids, Mich., and he has been summoned to her side. Fears for her recovery are entertained. Her case has puzzled some of our best physicians in this section. Mr. Hankinson has the heartfelt sympathy of all the fraternity who know him.

By a conversation over the line, I hear of honors done to a telegrapher. Mr. John Mullen, who is but twenty-four years old, has been elected to the Minnesota Legislature, from Blakely, Minn. He is an old chum of Frank Cargill, of the St. Paul, Minn., office of the Northwestern Telegraph Company. They worked together out in Dakotah some years ago. The weather in this section has moderated considerably since my last.

NORTHWEST.

Presentation to Mr. W. W. Cummings.

ST. LOUIS, Mo., Jan. 15.

TO THE EDITOR OF THE TELEGRAPHER.

ON New Year's morning, at half past nine o'clock, Mr. W. W. Cummings was surrounded at his desk by the day and night force. Before he had time to read the Riot Act Mr. Joseph Purcell stepped forward, and in a brief but very appropriate speech presented him with a pair of handsome chromos on behalf of the operators in the St. Louis office. Mr. Cummings was taken completely by surprise, and, after some little time, responded in a few well chosen remarks. It was a happy affair to all concerned. Mr. Cummings is justly popular with all the operators, and all joined in wishing him a Happy New Year.

Mr. Frank K. Swain, who has been with us for a long time, but thinks there is "no place like home," has resigned, and returns to New York. Frank has a host of friends here, and all are sorry to see him leave us.

C.

Miscellaneous.

Consumption of Zinc in Batteries.

Dr. P. H. VAN DER WEYDE, of this city, made a number of special experiments for the purpose of determining whether the consumption of zinc in a galvanic battery is greater when the circuit is continually opened and closed through an electro-magnet, than when it remains permanently closed with the same amount of resistance in circuit. He found that the consumption of zinc is the same when the current is permanently closed, whether the electro-magnet is made to sustain a weight or not. If, however, the current is often interrupted by breaking the contact rapidly, as in the case of electro-magnetic engines, induction coils, etc., the consumption of zinc increases by the action of the induced or reflex currents generated at every break of contact, and which acts most injuriously on the battery. It is well known that an induction coil with its continuous contact breaker wears the battery out very rapidly by reason of those induced or reflex currents, the power of which depends upon the size of the electro-magnets. In telegraphing, the electro-motive force is principally consumed to overcome the resistance in straight wires, while the coils of the magnets form a comparatively small portion of the circuit; therefore, the induced currents in this case do not practically amount to much. Therefore, telegraph batteries last much longer in proportion than those employed for induction coils, electro-magnetic engines, or in general for charging intermittently large powerful electro-magnetic coils. As the forcible removal and replacement of the armature from and to a charged electro-magnet, also induces secondary currents in the coils, which react on the battery, such removals and replacements, when continually repeated for a time will—notwithstanding the battery current remains permanently closed—cause a certain increase in the consumption of zinc.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, FEBRUARY 6, 1875.

THE TELEGRAPHER: PUBLISHED EVERY SATURDAY at 38 VESEY ST. ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION. One Copy, One Year, - - - - \$2.00. INVARIABLY IN ADVANCE. Single Copies Five Cents. SPECIMEN COPIES FORWARDED FREE ON APPLICATION. Communications must be addressed to J. N. ASHLEY, Publisher, 38 VESEY ST., New York.

THE TELEGRAPHER. A JOURNAL OF ELECTRICAL PROGRESS, DEVOTED TO THE INTERESTS OF THE Telegraphic Fraternity and the Advancement of Electrical Science and the Telegraphic Art. Published Every Saturday, AT No. 38 VESEY STREET, New York.

ELEVENTH VOLUME. The Publisher, in announcing the Eleventh Volume of THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year. All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to or in the interests of no TELEGRAPH COMPANY, CLIQUE or COMBINATION, but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL UPON THE AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore: ONE COPY, ONE YEAR.....\$2 00 SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELE-

J. N. ASHLEY, Publisher, (P. O. Box 5503,) NEW YORK.

The Telegraphic Situation.

THERE is nothing of very exciting interest in regard to the telegraphic situation to report to our readers this week. No additional manifestoes have been issued by the opposing parties and no public movement has been made.

The Western Union Telegraph Company, since our last issue, have been busily engaged in moving their various departments from 145 Broadway to the new building erected by the company, on the corner of Broadway and Dey street. Most of the executive offices and other departments, except the receiving, operating and delivery, were moved last week and on Sunday of this week. The operating and other departments referred to were moved Monday night last, and on Tuesday the business of the company was transferred to the new building entirely, and 145 Broadway, which has so long been the principal telegraphic centre for the telegraph business of the country, was left solitary and desolate, probably never more to be occupied for a similar purpose.

The new building is yet in a very incomplete state—even the portions occupied for the company's business being not entirely finished, and things are not yet in a proper condition to give our readers a detailed description of the new quarters and arrangements.

The officers of the company have very little to say in regard to the position of affairs, but are firm in the determination to hold on to the quadruplex until, if ever, it is legally wrested from them. They claim that the bargain with the great professor of duplicity and quadruplicity was complete, and that he had received a considerable sum of money on account, and that it was not at his option to shake off his obligations to them in the free and easy style which is characteristic of him.

The Daily Graphic of last Tuesday publishes the following account of an interview with President ORTON, which, while it was rather amusing and evidently somewhat baffling to the gentleman in search of information, yet is sufficiently definite as to the position of the company in regard to duplex and quadruplex inventions.

On Saturday a gentleman called upon him (Mr. Orton) at his office in the old Liberty street building. He was polite, but looked nervous and as if pressed with business.

"I want to learn," was the request, "the principle and operation of the duplex and quadruplex telegraph machines, if it is no secret."

"No," was the reply, "it is not especially a secret, but I could not explain them to you at present. I haven't the time. They are difficult matters to explain."

"Won't you explain to me, then, in what relation your company stands to these inventions?"

"If you will take a pencil," said Mr. Orton, speaking slowly, "and write, I will dictate all I have to say to you upon that point in a single sentence."

The pencil was immediately produced, and on the inside of a torn envelope the following words were written as they fell from his lips:

"This company claims to own all patents issued or to be issued upon applications now pending for duplex and quadruplex telegraphy."

"Will you tell me what the nature of the point in dispute is?"

Mr. Orton put on his hat. He cast a casual glance out of the window, and then turning and fixing his eyes on his questioner, said: "If you should own a house and sell it to me, and afterwards, if you were of such a disposition, should sell it to another man, don't you see that there might naturally arise a dispute about title?"

As Mr. Orton concluded he bowed slightly and moved towards a clerk's desk near the door, where he hastily gave some directions. In a pause that ensued the visitor made another appeal for information by asking him whether he could not mention some person who could and would explain the operation of the new machines. Mr. Orton seemed to withdraw himself from the clouds, and then said (politely): "No; I do not know of any such person to whom I could send you."

"Mr. Orton (quickly, while there was still an opportunity), will this matter come to an issue soon?"

He had again mysteriously withdrawn himself, and was only corporeally present, but he returned after a moment, and said (still politely):

"There will undoubtedly be a contest of title."

Further efforts to obtain information from this source seemed likely to meet with no better success, and the visitor (politely) withdrew.

The Atlantic and Pacific Telegraph Company are using the automatic system to advantage, and it is fully vindicating its value where there is a large amount of business to be transmitted, and the number of wires available is limited. It is in constant service between New York and Washington, and New York and Boston, and has proved a great assistance in keeping up the business when a portion of the wires were disabled. In working the automatic in connection with the Morse system a great advantage has been developed in the employment of skilled Morse operators as punchers, the operators receiving by sound and punching the strips for repetition without the necessity of their being first copied. This is, we are informed, regularly done in the Atlantic and Pacific office here when messages are to be repeated. Automatic apparatus is soon to be placed on the main routes of the Atlantic and Pacific Company west, as well as south and east. As suggested last week, the automatic will probably obviate the necessity of introducing the quadruplex into practical use on the lines of the Atlantic and Pacific Company. At the same time it is not contemplated to make use of the automatic exclusively, but to combine that and the Morse system in the business of the company.

We are also informed that on Sunday last a printing automatic arrangement was successfully operated between this city and Philadelphia—that is to say, the messages were printed in roman letters on the receiving slip. This required four wires, but the managers of the company are hoping that by further improvements it may be found practicable upon one or two wires. Unless this can be effected, while the experiment is a very beautiful one, it is not likely to prove very advantageous in actual service.

The excitement consequent upon the changes which took the public by surprise two or three weeks ago has subsided, and all parties are settling down to earnest work, to prepare for carrying on the telegraphic contest effectively.

We believe that there is room and a demand for two strong telegraph companies and systems in this country, that, properly conducted, these may both be successful, and that the interests of both the public and telegraph employes will certainly be advanced by such reasonable competition.

The Interest of Operators in a Proper Qualification for their Duties.

It is too often the case that telegraph operators neglect their own interest by an insufficient realization of the importance of thoroughly or adequately preparing themselves for the proper discharge of their important and responsible duties. Those who are ambitious of occupying the higher telegraphic positions must not only be willing to labor industriously, but must seek to acquaint themselves with the principles of the science which underlies the telegraphic art. The mere ability to manipulate a key or read telegraphic signals as they are transmitted over the wire, do not by any means constitute a telegraph operator, in the true sense of the term; and yet how many who call themselves, and are generally considered such, know no more of the business than this. If any emergency arises such operators are helpless, and must rely upon the chief operator or circuit manager to extricate them from their difficulty, which, perhaps, a merely superficial knowledge of electrical science would enable them to easily surmount themselves.

It is not to be expected that every telegraph operator should be an electrician, in the ordinary acceptation of the term, but there is no excuse for ignorance of the common principles of electrical science in its relation to telegraphy. Those who care more for temporary ease and enjoyment than advancement in their profession, will not, of course, take the pains necessary to qualify themselves properly for the discharge of their

duties. In this respect those who were engaged in the telegraphic service in its earlier days were better qualified than the majority of telegraphers at the present time.

It would be for the advantage of telegraph companies to have their employes more thoroughly educated than they now are, and to establish a higher standard of telegraphic knowledge and ability, especially in the more important positions, than is now required. There is, in fact, no real standard of telegraphic ability and knowledge. Many of those who consider themselves and are considered first class operators, are without the acquired ability which even second class operators should possess. This fact has often been presented heretofore, but as yet nothing has been done to improve the matter. To a person with a disposition to acquire knowledge, the telegraphic service is a perpetual school in which knowledge may be obtained daily which will be of value through life. But there are many telegraphers who, after years of service, actually know no more of the principles of electrical science than they did when they first became operators. They have no desire to learn more than is sufficient to enable them to send and receive messages.

We should be glad to see a movement on the part of telegraph employers to induce their employes to become better educated. They should encourage such a disposition on the part of employes, and should provide facilities for the instruction of those who may manifest a disposition to learn.

These should also be encouraged by promotion, and an increase of compensation according to their industry and proficiency. Cheap labor in telegraphing is not desirable or remunerative to employers, and is in fact, taking everything into consideration, more costly than properly educated, skilled and remunerated labor would be. We believe that if a disposition was manifested on the part of telegraph employers to encourage and reward application and study by proper promotion and remuneration, most telegraphers would thereby be induced to advance themselves in the study and practice of their profession. For the lack of such encouragement many of the best and most reliable and valuable telegraphers are constantly leaving the telegraph service to engage in other employments who would otherwise be glad to occupy telegraphic positions.

We hope that there may be ere long a reform in this respect, and that telegraph employers and employes will find some means of cooperating to bring about such a desirable result.

High Toned Journalism.

The following appears in the last number of the *nondescript* sheet published in the Post-office box of the Western Union Telegraph Company, in this city:

Gamewell's fire alarm system has proved a complete failure in more than one half the cities in which it is used.

The explanation of this and other similar unfounded and lying attacks upon GAMEWELL & Co.'s American Fire Alarm Telegraph system, which is in successful operation in most of the cities of any importance, and a large number of even the smaller cities and villages in this country is, that the publishers of the sheet referred to applied to Messrs. GAMEWELL & Co. for an advertisement, which was refused, probably for the reason that the paper having no standing or respectable character, it was not deemed advisable to be represented in its columns.

Another elegant extract is as follows:

It appears from late developments that the Manhattan Quotation Company is not to be run out so easily by the Gold and Stock people. They have by a peculiar strategic movement in finance placed 30,000 in their treasury to keep the pot boiling. As both sides employ telegraphers, we say—good enough.

As the Gold and Stock Telegraph Company is mainly owned and entirely controlled by the Western Union Telegraph Company, the force of the quotation,

in a paper published as above by employes of the latter company, will be apparent.

With one more extract from the rich placer of scandal and scurrility referred to we will leave the subject to our readers, and the consideration of the parties interested:

It is understood that some time ago the American District Telegraph Company mortgaged their entire property to the Union Trust Company for \$100,000. This arises from the fact that it is, and has been, managed by a set of reckless stock jobbers.

As one of the directors of the American District Telegraph Company, who is also largely interested in its management and prosperity, is a Vice-President of the Western Union Telegraph Company, the peculiar fitness of such a slur upon him will be recognized. The loan referred to was made some time ago, and was paid off long since, and this attempt to make scandal out of it, in the interest of a rival concern, is the more outrageous, as the facts might easily have been ascertained, and have already appeared in the daily papers of this city.

As evidences of high toned journalism we submit the above to the readers of THE TELEGRAPHER.

The Great Western Telegraph Company.

THE affairs of the Great Western Telegraph Company of Chicago appear to have got into an inextricable muddle. For the last two years the company has been in court on numerous suits and counter suits, the last move being the appointment of a Receiver to wind up the company, and secure the proceeds of the assets of the company to the creditors. The Receiver has leased a portion of the lines belonging to the company temporarily to the Western Union Telegraph Company, which lease has been sanctioned by the court.

The company appears to have been mismanaged from the start, and the consequence is that the stockholders who were induced to invest in its shares have lost their entire investment, the assets of the company probably not being more than sufficient to pay its liabilities, which are said to amount to about \$200,000, and it is regarded as doubtful if even they will eventually realize sufficient for this purpose.

Naturally, the stockholders are not disposed to regard with equanimity their loss, and are disposed to be somewhat troublesome over the matter. How they are to help themselves is a difficult problem to solve.

Much bad blood has been caused, and crimination and recrimination is the order of the day amongst the principals in the construction of the lines and management of the company. Mr. SELAH REEVE, the contractor for the construction of the lines, charges the President of the company, Mr. JOSHUA STARK, of Milwaukee; the Secretary and General Agent, Mr. BOND, and the General Superintendent, A. H. BLISS, with incompetency, and the most glaring incapacity and unfaithfulness, while, on the other hand, the parties above named retaliate with a charge that Mr. REEVE has been guilty of a most infamous attempt to get possession of the largest part of the property of the company.

The President of the company issued a call for the annual meeting, to be held at Chicago January 26th, and made a long statement of the affairs of the company, in which he charges the General Agent and Superintendent with disposing of the bonds of the company, and of accounting for but a small part of the proceeds.

Mr. SELAH REEVE also issued a circular abounding with invective and abuse, and charging the officials of the company with peculations of various descriptions.

About fifty stockholders attended the proposed annual meeting, but were met with an injunction prohibiting them from taking any action. This injunction was served upon the stockholders by being read to them by a deputy sheriff while in session, and its reading was followed by a scene of confusion; violent denunciatory speeches were made, and the lie freely bandied about among the contending parties. The

detailed report of the meeting fills some three and a half columns of the *Chicago Times*, and is of course too long for reproduction in the columns of THE TELEGRAPHER. Finally, a resolution was adopted that the officers of the company give notice to the stockholders of the time which it will be legal for them to come together for the purpose of electing a directorate and officers of the company, and the meeting adjourned.

Subsequently, an informal meeting was constituted by a portion of the stockholders, at which more violent language was indulged in, and, after another exciting scene, this was also adjourned, and so the matter ended for the time.

Western telegraph stockholders do not seem to take a "skinning" as quietly as their more experienced Eastern brethren. As there appears to be no probability of their ever receiving back a dollar of their money, there seems to be but little use in such cantankerous displays on their part.

"Under which King, Bezonian?"

THE telegraph sheet, whose only publication office is the post-office box of the Western Union Telegraph Company in this city, and whose publishers and nominal editors are employes of that company, is certainly suspiciously kind and liberal in its treatment of the "opposition." Can it be possible that the rumors of wavering allegiance on their part are correctly based on reported "negotiations," and that they are preparing to follow, at the opportune moment the great professor of duplicity and quadruplicity in his transfer to the enemy's camp?

It certainly looks suspicious, and we would advise the executive officers of the Western Union Company to ascertain whether more of its enemies may not be found among those whom they have fostered, and who are yet its paid adherents.

A Happy Relief.

ONE of the happiest effects of the transfer of the professor of duplicity and quadruplicity from the Western Union to the opposition side, is the relief afforded to the Editor of the Western Union official organ from the necessity of writing puffs and complimentary notices of that individual, and his supposititious inventions, against his conscience, knowledge and belief. He seems much happier since this relief was afforded, and life affords a better prospect of comfort and enjoyment to him. We congratulate him on the happy relief.

"Dere's a Heap o' Trouble on de Ole Man's Mind."

ONE of the small fry telegraphic journals has been in the habit of worrying the intellects of its readers—that is of such few of them as have any—with divers electrical conundrums, emanating from "the teeming brain and untiring nerve" of the "great genius" whose organ, or rather whose accordeon, the said sheet is popularly supposed to be. But, alas! when this "celebrated inventor" mysteriously disappeared with the "crowning triumph" of his illustrious career, to wit, the "quad," in one of his coat tail pockets, he likewise carried off the answers to all the puzzles! And there isn't, probably, another party in the whole world except the "great genius," that can solve them. We give it up! It is very sad.

A New Brand of Office Wire.

THE successor to the great puzzle maker started off last week with what we venture to predict is a riddle that will "stump the crowd." He wants to know how to work a polarized relay with "one cell of battery and a continuous coil of short office wire! No doubt the "teeming brain" of the "great genius" would be able to accomplish this, if he could only find "a continuous coil of short office wire," but as the children used to say, "that's just where the catch is!"

Personals.

Mr. ROBERT STEWART has been appointed General Superintendent of Telegraph of the Baltimore and Ohio Railroad, and will take charge February 15th, Mr. STEWART has been Superintendent of Telegraph of the United Railroads of New Jersey Division of the Pennsylvania Railroad since the lease, and was for many years previously connected with the New Jersey lines.

Mr. L. L. LATHROP has resigned his position as Manager of the Atlantic and Pacific branch office, No. 4 Wabash avenue, Chicago, Ill.

Mr. M. C. GROSS, of the Atlantic and Pacific main office, Chicago, Ill., takes charge of the No. 4 Wabash avenue branch office as manager.

Mr. EMOBY, of the Syracuse, N. Y., office Atlantic and Pacific Telegraph Co., takes the position in the Chicago, Ill., office of that company, made vacant by promotion of Mr. GROSS.

Mr. J. G. THORNTON has been appointed Assistant General Superintendent of the Southern and Atlantic Telegraph Company, headquarters at Macon, Georgia.

Mr. P. T. STEVENS has been appointed Superintendent of Construction and Repairs of the Southern and Atlantic Telegraph Company.

The headquarters of Mr. GEO. H. GRACE, General Superintendent of the Southern and Atlantic Telegraph Company, will be for the present at No. 51 Pine street, New York.

Mr. A. G. THOMPSON, an old veteran, has returned to his first love, and accepted a position at St. Louis, Mo.

Mr. NOAH TRISSELL, an old telegrapher, has been appointed ticket agent for the Rock Island and Pacific and C. and N. W. Railroads and the several steamship lines at Omaha, Neb.

The Telegraph.

The Southern and Atlantic Telegraph Co.

THE line of the Southern and Atlantic Telegraph Company has been completed to New Orleans, and an office has been opened at the corner of Gravier and Carondelet streets in that city, in charge of Mr. Ed. Leloupe. The S. and A. Co., have had very great obstacles to contend against in completing their line, having been opposed and obstructed in every possible manner, but have at last succeeded in establishing connection with the objective point.

It is proposed to establish a fair competition for business, and there is no doubt, but that the public will patronize the company liberally. Mr. Leloupe, the manager of the office, is well and favorably known among the business men of New Orleans, and his appointment will prove advantageous to the company, and satisfactory to the public.

The appointment of Mr. J. G. Thornton, of Macon, Georgia, Asst. General Supt., is also a good one. Although the actual appointment is of recent date, Mr. Thornton has really acted in that capacity for some time, and has given excellent satisfaction, displaying tact and ability in the discharge of his duties.

The prospects of the Southern and Atlantic Company are good. It establishes telegraphic competition in an important section of the country, where there has been none of any account for many years, and its advent has been heartily welcomed by the press and the people.

Foreign Telegraphic Notes.

THE telegraph in Guatemala is completed from the capital to Quezaltenango, the largest city in the north of the republic, and will soon be extended thence to the Pacific.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended January 9, 1875, was 342,877—an increase on the corresponding week last year of 29,181.

An additional wire between Madrid and Santander, which the traffic from England had rendered necessary, has just been completed by the Spanish Government. Communications with Madrid and the interior of Spain, via Santander, will be much accelerated thereby. Telegraphic communication with Bilbao, which has been suspended since August, 1873, is also now re-established by the opening of a coast cable between that town and Santander.

The traffic receipts of the Western and Brazilian Telegraph Company, from the 20th November to the 25th December, 1874 (five weeks) were £12,764 17s. 4d.

The Directors of the German Union Telegraph Com-

pany have decided to pay an *interim* dividend of 11s. 9d. per £15 bond.

The Western and Brazilian Telegraph Company have announced an *interim* dividend of 5s. per share for the quarter ending December 31, 1874.

Testimonial to a Popular Superintendent.

As Mr. F. P. SHERWOOD, Superintendent of the American District Telegraph Company, was leaving the office on Montague street, Monday night, he was requested to step into an adjoining room, as several of his friends had "something to say" to him. To his surprise he found the managers and members of the company's police force awaiting him, and without delay Mr. S. E. Bronson, in a neat speech, presented him with a valuable gold hunting case watch, as a token of regard from the employés of the company. Mr. Sherwood accepted the gift and heartily thanked the donors. The watch is one of the neatest of time pieces, and on the inner cover bore the inscription, "Presented to F. G. Sherwood, Superintendent, by the employés of the American District Telegraph Company, January 11, 1875."

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended December 22, 1874, and bearing that date.

157,962.—ELECTRICAL PHOTOMETERS. Wm. W. Goodwin, Camden, N. J. Filed May 13, 1874.

Standard candle supported on a balance-arm carrying sliding weight. Consumption of a predetermined amount of the candle allows the arm to tip, its dipping in a mercury-cup, and closing an electrical circuit to magnets controlling devices which cause the candle to be blown out, the gas to be shut off, the metre and a clock stopped.

1. The combination, with a photometer, of a battery, conducting wires, and electro-magnets, substantially as described, for the purpose of instantly and simultaneously arresting the operation of every part of the said photometer in testing the quality of the gas.

2. The combination in a photometer, substantially as described, of the electro-magnet 29 with the balance K, for the purpose described.

3. The combination of the mercury-cup 28, platinum point 27, balance-lever K, electro-magnet H, and conducting wires, with the air puffing apparatus, substantially as and for the purposes set forth.

4. The combination, in a photometer, substantially as described, of the electro-magnet H and the catch bar h on the armature, with the levers f' and g', for the purposes set forth and described.

5. The combination, consisting of the valve G, weight g'', and levers g' and g'', liberated by the descent of the armature of the electro-magnet H, substantially as set forth, for the purpose of extinguishing the flame of the candle R by liberating a puff of air from the reservoir I, as described.

6. The combination of the notched stem f''' with the gas valve F, arranged in combination with the lever f' and electro-magnet H, substantially as and for the purpose described.

7. The combination in a photometer, substantially as described, of the dog 13 and the vulcanite disk 12, with the lever 16, operated by the armature of the electro-magnet P, as set forth, for the purpose of arresting the motion of the balance wheel 20 of the clock, as described.

8. The combination in a photometer, substantially as described, of the vulcanite disk 6 and dog 8 with the meter-gear and battery, for the purpose of arresting the motion of said meter as set forth.

9. The combination in a photometer, substantially as described, of the stationary posts s' s'' s''', and their respective conducting wires, with the insulated posts t' t'' and switch 32, for the purpose of changing the direction of the electric current, as described.

10. The combination in a photometer, substantially as described, of the electro-magnetic coils 29, with the return wire from the balance K, for the purpose of retaining the contact of the platinum point 27 of the balance with the mercury in the cup 28, as described.

11. In combination with a Bunsen photometer, substantially as described, the connecting wires or their equivalent mechanical devices, whereby by the instant and simultaneous extinguishment of the candle flame and arrest of all the moving parts of the photometer are produced.

158,071.—TYPE-WRITERS. Hans Rasmus Malling Johan Hansou, Copenhagen, Denmark. Filed Dec. 11, 1873.

The paper carrying surface is flat. Pressing down the type, prints, and at the same time, by completing the electric circuits causes the table to move along the space of one letter.

1. The combination of the converging types b with a flat paper carrying surface or table, d, wheels e, rails f, frame g, toothed rack G, wheel K, and shaft i, substantially as and for the purpose described.

2. The combinations of the types and a flat paper carrying surface or table, d, which is operated by a coiled spring, with the insulated spherical shell a of the writing ball c, electro-magnets g, and escapement v, all arranged and operating substantially as and for the purpose shown and described.

3. The combination of the converging types b with a flat paper carrying surface or table, d, wheels e, rails f, frame g, toothed rack G, wheel K, shaft i, rails h, and toothed rack or beam H, arranged and operating substantially as and for the purposes specified.

158,086.—MANUFACTURE OF PIPE INCASED TELEGRAPH WIRE. Samuel R. Honey, Newport, R. I. Filed Nov. 9, 1874.

1. The herein described manufacture of pipe incased wire—that is to say, pressing out the pipe through the die of a pipe press, and introducing the wire through the core of the press loosely within the pipe simultaneously and progressively with the formation of the latter, in the manner and by the means substantially as shown and set forth.

2. In the apparatus of the kind herein referred to, the passage d, leading from the exterior of the apparatus through the core, and terminating at the free or outer end of the latter, substantially as shown and described.

Married.

STOCKMEYER—WHISSEN.—At the residence of the bride's mother, Mr. JOHN E. STOCKMEYER, Agent and Operator at Carlisle, Ill., O. and M. R. R., to Miss LELIA WHISSEN, of Chillicothe, Ohio. (Johnny, may you always be happy!)

IMPORTANT TO INVENTORS.

Inventors of Electrical and Telegraphic arrangements are invited to communicate with the

ELECTO-MAGNETIC MAN'F'G CO.,

36 Broad Street,

(P. O. Box 1,804),

NEW YORK.

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS of every description, at

No. 54 SOUTH FOURTH STREET,

(Corner Chestnut street,)

PHILADELPHIA.

They solicit the patronage of their friends and the telegraphic fraternity generally.

F. L. POPE & CO.,

MANUFACTURERS AND DEALERS

IN

Telegraph Instruments and Supplies.

STANDARD TELEGRAPH INSTRUMENTS,

EAGLES METALLIC BATTERY,

NONPARELL TELEGRAPH INSTRUMENT,

INSULATED WIRE, etc., etc.

Send for Circular and Price List. Address,

38 VESEY STREET, NEW YORK.

(P. O. Box 5508.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET

or to

L. G. TILLOTSON & CO.,

8 Dey street, sole Agents.

GEOURGE H. BLISS & CO.,
41 Third Avenue, Chicago, Ill.
CINCINNATI, O., ST. LOUIS, MO.,
Elm St., cor. 5th. 409 North Third St.
Manufacturers and Dealers in
TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS, unequalled for beauty and strength;
COMBINATION SETS; BOX and POKET RELAYS.
CHALLENGE, PONY and REPEATING SOUNDERS.
KEYS, various styles, including the SCHNEIDER KEY, just
out, no legs, wire connections above the table.
REGISTERS, with SPRINGS or WEIGHT.
CUT OUTS, many varieties, including a new style of PEG CUT
OUT, with an adjustable LIGHTNING ARRESTER, just out.
REPEATERS—HASKIN'S AUTOMATIC, and others,
SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES
and LIGHTNING ARRESTERS.
ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also
SELDEN PRINTER.
ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR
ALARMS, and WATCHMAN DETECTORS.
ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHT-
ING APPARATUS.
MEDICAL INSTRUMENTS and APPARATUS on hand and made
to order. Second hand instruments for sale cheap,
and repairing done at short notice.
BATTERIES in great variety, including the latest inventions;
also a full assortment of battery material.
WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE
WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED
LINE WIRES; SUBMARINE, SUBTERRANEAN and
HOUSE CABLES.
INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.
BRACKETS, PINS and SPIKES, TELEGRAPH POLES,
LINE BUILDERS and REPAIRERS' TOOLS.
TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANI-
FOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES,
ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and
AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
PRICE LISTS FURNISHED FREE ON APPLICATION.
Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are
elegantly finished and mounted on highly polished rosewood,
mahogany and walnut bases.

CHAMPION BURGLAR ALARM
AND ANNUNCIATOR COMPANY,
40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout
the country to act as our agents for the introduction of our
superior BURGLAR ALARMS AND ANNUNCIATORS into pri-
vate houses, hotels, banks, &c. Upon receipt of plans of houses
we will send skilful mechanics to estimate upon work, or will
give any information in writing that may be required, *Liberal
commissions will be paid upon any orders that may be secured for
us.* Our Alarms and Annunciators have just been awarded the
FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to
the Secretary.

L. G. TILLOTSON, President.
CORNELIUS ROOSEVELT, Secretary and Treasurer,
40 West 18th Street, New York.

A NEW GALVANIC BATTERY.

**Durability, Efficiency, and Economy of Expense
and Labor at last Secured.**

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon applica-
tion to

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Original Articles.

The New Western Union Telegraph Building.

THE growth and development of the telegraphic system of the United States seems, to one who has been familiar with it from its earlier years, little less than miraculous. It is impossible for the mind to grasp, without an effort, the actual extent of the vast network of telegraph lines that has been woven across the Continent from Newfoundland to British Columbia, and from New Orleans to the settlements on the Red River of the North. But the growth of telegraphic business in the commercial metropolis of the United States is an infallible index of that of the whole system, and in no way can we get a more adequate idea of the latter than by a glance at the progress which has been made in this city during a comparatively few years.

Fourteen years ago the general offices of the different telegraph companies in this city, now consolidated with others under the name of the Western Union Company, were all accommodated in the small yellow brick building 21 Wall street, corner of Broad. Indeed, until within the past year, this building has contained a telegraph office of some sort for the best part of a quarter of a century. At the date just referred to, the Western Union Company was a comparatively small affair. Its lines were nearly all comprised within the States of Ohio, Indiana and Michigan, extending eastward only to Buffalo and Pittsburg, and westward to Chicago. The New York, Albany and Buffalo, the Atlantic and Ohio, and the American companies occupied the Wall street building, the first named working six wires, the second one, and the third twenty-two, including two city wires. In all there were not more than thirty instruments worked in this office, and here, with very few exceptions, all the telegraphic messages to and from this city were sent, received or repeated.

In the spring of 1861 the whole establishment was removed to 145 Broadway, which at that time afforded nearly twice as much space as was needed to transact the business of the different companies. The building was fitted up in what was regarded at that time as a very expensive, and, in fact, sumptuous manner. The American and Atlantic and Ohio lines had an operating room on the ground floor, while the New York Albany and Buffalo operators were quartered in the front room on the third floor. This room was regarded as a model of neatness, convenience and good taste. Mr. J. D. Reid, who was then Superintendent of that company, had an opportunity to carry out his own excellent ideas in regard to arranging and fitting it up, and the result was, perhaps, the most entirely satisfactory operating room, all things considered, that the writer ever remembers to have seen. The subdued yet cheerful light, the ample space about the tables, and the noiseless carpet under the feet, which brought out with beautiful distinctness the sharp, clear click of the Chubbuck sounders, rendered it as quiet and pleasant a workroom as a person of any profession could ask or wish for. But it was not fated to last long. The New York and Buffalo line was soon swallowed up by the Western Union, followed first by the opposition, or United States Company, and then by the American Company. This series of consolidations rendered it necessary to entirely remodel the building, and a new general operating room was fitted up on the fourth floor of the building, and all the wires except the metropolitan were transferred thither in 1867. There were at this time about eighty Morse and six Phelps combination printing instruments in the general operating room, and eighteen Morse instruments in the city line operating room. The number of main wires was about seventy-five, not including loops.

By 1872 the growth of the establishment rendered another reconstruction imperatively necessary, and in January of that year the general operating room was transferred to the top floor, which had been very elegantly fitted up for that purpose. The number of line wires had by this time increased to 130, and the number of instruments in both operating rooms to 168, counting duplex instruments and repeaters as two each. Meanwhile the executive and other depart-

ments had not only filled the original building, but had overflowed into the two adjoining buildings on Liberty street, and it had already become apparent that arrangements must be made to secure additional room at no distant day. It was, therefore, decided upon to take immediate measures to erect a magnificent and commodious building, of the most thorough and substantial construction, for the accommodation of the company's offices and business. The premises on the northwest corner of Broadway and Dey street were secured for the location of the new edifice, and active operations were commenced during the summer in clearing away the old buildings and laying the foundation of the new one. It was originally intended to have the new building in readiness by the spring of 1874, but various unforeseen delays prevented its completion, and it was, in fact, only by the most strenuous exertions that the portion to be occupied by the telegraph company was sufficiently completed to render it habitable by the time when they were obliged to vacate the old building.

The size of the new building is 105½ by 75½ feet on the ground, the shorter side fronting on Broadway. The basement and first story are of granite, and the walls above these are of granite and Philadelphia brick. The novel and somewhat *bizarre* appearance of this combination has been much criticised, but it is probable that when the colors have become somewhat toned down by the lapse of time, that the general effect will be tasteful and pleasing. The second story is about 18 feet in height, while the basement, third, fourth, fifth and sixth stories are 12 feet 8 inches each. Above this comes a low story about 8 or 9 feet in height, and next above, in the eighth story, is the grand operating room, 21 feet in height, and covering the whole size of the building. The ninth and tenth stories are included in the Mansard roof, which rises to the height of 165 feet. Above this is the clock tower, square at the base and octagonal above the dials, surmounted by an observatory balustrade, the whole height of the building and tower being 226 feet. The flag staff is of iron, and rises as high, and possibly a little higher than the cross on Trinity spire, which is about 275 feet above the pavement. The grand entrance is at the middle of the Broadway front, with a staircase leading to the second floor. The portico is supported by graceful columns of finely polished granite. At either end of the balustrade above the portico, upon granite pedestals, it is intended to place statues of Franklin and Morse. Above the sixth story and in front of the low seventh story, projecting braces of stone work are arranged, which support a continuous balcony running round the two sides of the building fronting on the street, which is reached from the windows of the operating room in the eighth story. In order to render the building as nearly fire-proof as possible, the floors are arched between the iron girders, and floors of tiling and artificial stone are used instead of wood, so that the window casings, doors, and base boards form about the only combustible portion of the building. The entire establishment is warmed throughout by steam from boilers placed in the basement. Four elevators are in use, two for the use of employes and the others for the public.

In describing the mammoth building which has been erected for the transaction of the executive as well as the regular telegraph business of the company, necessarily centering at the headquarters, commencement is made at the basement story. So extensive is the building, and so much space is occupied in the transaction of the business, that some departments must unavoidably be but briefly noticed.

Commencing at what may be termed the basement story, on the north side of the grand entrance on Broadway, the office of the Treasurer is located. The business of this department is very large, as may be supposed, and it is desirable that it should be easily reached from the street. The rooms for this department have been very handsomely fitted up, and every requisite convenience for the public, and for those employed in connection with it, have been amply provided.

Entrance to the Receiving Department is had by wide doors opening both from Broadway and Dey street, into a large square lobby, from which inner doors open into the extensive room specially devoted to the reception of messages, and for the use of the customers and those having business with the telegraph department.

The counters and desks in this room are all of cherry with mahogany tops, and surmounted by very handsome ornamental glass partitions, the latter rising about two feet from the tops of the counters, and affording an excellent view of the spaces enclosed by them. All the business in this department is done in full view of the customers and public, while at the same time effectually concealing from unauthorized eyes any secrets which are not proper for general information.

Upon entering the extensive hall the visitor first sees the cashier's office, which is immediately adjoining the Broadway front of the building. Here the

financial business of the office is transacted, and the telegraphic transfers, or telegraphic money order business, which is an extensive and constantly increasing branch of the operations of the company, are carried on. This department is under the charge of Mr. Leonard Cox, Cashier, who has occupied that position satisfactorily to the company and the public, he having succeeded to the position upon the decease of Mr. John Horner.

Between the cashier's office and the receiving counters there is an open space of some extent, by which access is had to an elevator, which carries passengers as high as the fifth story of the building. In the corner adjoining the elevator a large square place has been enclosed surmounted by a wide counter. To what use this is to be devoted is not as yet known. Properly fitted up it would afford an excellent accommodation for reporters and telegraphic newspaper correspondents, who contribute so much business to the company, especially at night. This suggestion is made for the benefit both of the company and its customers.

Beyond this open space are the counters devoted to the Receiving and Delivery Departments. First is the Cable Receiving Office, as it is termed, where the messages for transmission by the European and Cuba Cables are received. The business of this office is transacted exclusively in gold, greenbacks not being a recognized currency for cable messages, however freely they may circulate in all other parts of the building. Mr. Charles D. Hoyt has charge of this important business, with which he has been connected for several years, and by his courtesy and excellent business qualifications has secured a well deserved popularity. He is ably assisted by Mr. M. D. O'Connor, and probably these two gentlemen handle more actual hard money than any other two now in the telegraph business in this country. It may be said, however, that they do not despise greenbacks for their personal use, notwithstanding they handle so much gold daily in the service of the company. The general receiving windows are beyond the cable office. These are three in number, and at certain times of the day they are fully occupied by customers anxious that their despatches shall have precedence. Ample accommodations are provided for the satisfactory and rapid transaction of business, and Messrs. John B. Otman, Edmund Clasback, and John C. Stewart, who have, by years of service in that capacity, become familiar to, and by their geniality and courtesy very popular with the telegraphing public, are the day receivers. Mr. Samuel Dunlap is the night receiver, relieving the others when the rush of business is over for the day.

Mr. John Shires, who has charge of the Delivery Department, has a window adjoining those of the Receiving Department. In the Delivery Department there are constantly employed about 130 messengers. These are under the immediate charge of Mr. John Dawley, who keeps his numerous corps in an excellent state of discipline.

In arranging the plans for the new building the messengers seem to have been overlooked, and the space devoted to them is not so well adapted to their use as it should have been. However, it is being fitted up as conveniently as possible, and is a decided improvement upon the quarters previously occupied in the old building. It is above ground, whereas before, the delivery clerks and boys were relegated to the cellar, which was dark and ill ventilated, and almost any change could not fail to be an improvement. The entrance to the messengers' room is on Dey street, entirely distinct from any other entrance, so that the messengers are not brought in contact, and do not interfere in any way with any other portion of the business or building.

Beyond the delivery window another counter, similar to the others and fitted up in the same manner, has been extended across the room. This has not as yet been assigned to any purpose, and it was facetiously suggested, in response to inquiries as to what use it was to be put to, that it was to accommodate the "opposition" when they should be consolidated with the Western Union, which every true Western Union man firmly believes is their inevitable ultimate destiny.

The lower end of this floor is devoted to the Purchasing and Supply Department, of which Mr. Wm. Hunter has for so many years been the able and efficient chief. The offices devoted to this department are being fitted up with every convenience for the prompt transaction of the enormous business which is here carried on. The store and packing rooms are in the cellar below this floor, and an elevator will connect these with the offices above and with the upper parts of the building, for hoisting freight easily and expeditiously. Mr. Hunter probably carries on a larger business in telegraphic material, apparatus and supplies, and gets less cash returns therefor, than any other person in the business in this country.

This completes as full a description of the basement story of the building as there is space for this week, except that it would be inexcusably incomplete if no

reference were made to the pneumatic tubes by which messages are transmitted to the operating room. There are four of them—one from the cashier's desk, and three from the receiving desks. These are worked from the basement, the air being constantly exhausted by the operation of steam power, so that a strong current is constantly rushing into the open ends of the tubes. The messages are placed in small round boxes and dropped into the tubes, and are carried to the operating room in the eighth story very expeditiously, the time occupied in the transfer being only two seconds. The messages sent down from the operating room are placed in the boxes and fall to the lower office by gravity. Communication is also established between the receiving desks and the operating room by a speaking tube. The cellar and subcellar is devoted partially to the storage of line wire and other heavy supplies, but principally to the boilers and machinery used in heating and carrying on the various operations within the building. Six large boilers, manufactured by Baker, Smith & Co., of this city, furnish the necessary steam for warming the building, as well as for operating the various steam engines used for different purposes. The largest of these is a 20-horse power engine, from the Putnam Machine Co., of Fitchburg, Mass., which is principally employed, at present, for driving the Root blowers which operate the pneumatic tubes between the basement and the operating room, and the sidewalk hoisting apparatus. There is also a small double vertical engine in the seventh story, as well as three Otis elevator engines. A large double Worthington pump, capable of pumping several hundred gallons per minute, draws its supply of water from eighteen driven wells in the cellar, and distributes it throughout the building. The greater portion of it is used for operating the large water-balance elevator.

The second and third stories are still in an unfinished condition. They are to be rented for banking, insurance, and other similar purposes. The fourth story is occupied entirely by the telegraph company for its executive offices. The President's office is in front on the north side. This apartment is finished and fitted up in a style of great magnificence, the walls being tinted and the ceiling elaborately ornamented with designs in bright colors, the four corners bearing the names of distinguished electricians and telegraphic inventors. A cabinet occupies one side of the room, in the centre of which is a grate, surmounted by a bronze bust of Professor Morse. The floor is covered with an elegant Wilton carpet. The rooms of the Vice-Presidents and other executive offices are also beautifully fitted up, but with less elaboration than the President's office. The electrician and his assistant, and the *Journal of the Telegraph* are also accommodated in spacious and pleasant rooms on this floor.

The offices of the Assistant Superintendent of the Eastern Division and of the Metropolitan District are quartered in the front rooms of the sixth story.

The low seventh story, underneath the operating room, is utilized for a variety of purposes; principally, however, as a battery room. The whole length and a portion of the breadth of the room is occupied by battery stands, each stand having eight shelves capable of holding 192 small or 128 large cells. The sulphate of copper gravity battery is exclusively employed, the larger size for locals and for working several lines, and the smaller for working one or two lines only. There are about 2,700 large and 1,000 small cells already in place, besides the 2,600 of the commercial news department. On the north and west sides of the building, on a level with this story, wrought iron tubular fixtures are placed, carrying wooden pins and glass insulators, to which the line wires are brought from the lofty poles in Dey, Church and Fulton streets. The leading-in wires enter above the windows, through hard rubber tubes, and are attached directly to the lightning arresters, which extend along the wall near the ceiling in a continuous range. From the arresters, gutta percha coated stranded wires, made up in cables of eight wires each, pass along the ceiling of the room to the base of the switch on the floor above. From the switch an 8 wire cable is conducted along the ceiling to a point underneath each operating table, and passes from thence up through an aperture to the centre of the table above, as will be hereafter described. This story also accommodates the department for the copying, enveloping and distribution of received messages. These are collected and thrown down through a drop from the operating room, when each one is instantly copied, by placing upon it a sheet of damp copying paper and then passing it between rollers turned by steam power. They are then enveloped and dropped down through a tube to the delivery department on the basement floor, or sent to the city line department, as the case may be. It is contemplated to arrange machinery for transporting the received messages directly from each operating table to the counter of the copying clerk, and this will, doubtless, be done ere long. On this floor are situated wardrobes, and other conveniences for the accommodation of the operators.

Ascending a short flight of stairs the visitor finds himself ushered into the grand operating room, which occupies the entire eighth story. When viewed from the Broadway side this lofty and spacious room presents a truly magnificent appearance. The roof being trussed, this room is unbroken by a pillar or column, except the four that support the tower. The apartment is thoroughly well lighted by ranges of large windows on every side, which command a most extensive and beautiful view in every direction, embracing a large portion of New York city, as well as Brooklyn, Jersey City, Newark, Staten Island, the bay, and the North and East rivers. The side walls of this room are tinted a faint lilac color, the ceiling being bordered with a tasteful and elaborate tracery, the prevailing colors being buff, blue and gold. In the centre of the ceiling is a large and admirably executed panel, representing a section of blue sky partially veiled by fleecy white clouds, the effect of which is very pleasing. Midway of the north side of the room, and on the right, looking from Broadway, is the switch, which, when fully completed, will form the most striking feature in the room. It is 22 feet in length and projects from the wall some 12 or 15 feet, and is divided into six sections. The entire switch, as at present arranged, is capable of accommodating 300 line wires, that being the number of vertical straps. Beneath the lower ends of the straps are arranged a corresponding number of spring jacks, one for each line wire, into which are inserted the wedges carrying the instrument wires, loops, etc. The spring jacks, in common with all the metal work of the switch, are nickel plated and highly polished, and the designating number of each circuit is engraved upon an ivory tablet and affixed thereto. The mountings and ornamental woodwork of the switch are not yet set up, but will be of the most elaborate and elegant design and execution, and above the switch will be placed the desk of the manager of the office.

The operating tables are of hard wood, highly finished and polished, each table being divided by vertical plate glass screens into four compartments, each compartment accommodating a single set of apparatus, thus affording space for four operators to work conveniently at each table without interfering with each other. As before stated, each table has its own cable of four pairs of gutta percha coated wires, enveloped in tarred canvas, through which the main circuits are led from the switch; similarly, a fine wire cable, carrying four local battery wires and one return wire for the group, leads from the battery room to each table. This is an excellent and effective arrangement, having been thoroughly tested by two or three years' use in the old office.

The whole number of wires entering the switch is as follows:

From the East.....	25
" South.....	29
" West, via Albany.....	22
" West, via Erie and Pennsylvania R. R.....	28
From New York City and suburbs.....	52
Branch and short wires.....	8
Private wires, etc.....	8
Auxiliary offices (59 loops).....	100
Total.....	272

The whole number of sets of Morse instruments now in operation in the room is 149, besides 9 sets of duplex and 1 of quadruplex. There are 6 sets of button repeaters—4 of these being used for connecting lines at the switch, etc., and 2 for duplicating press reports on different routes, East and West. There are also 4 sets of Milliken automatic repeaters, and 6 Phelps combination type printers, the latter being driven by a small upright steam engine on the next floor below. This makes, at present, the equivalent of 197 single sets of apparatus. Several additional sets of quadruplex and duplex apparatus will be set up within a short time.

Nearly in the centre of the room, directly in front of the switch, is an enclosure surrounded by a counter, for the use of the assorting clerks. The messages taken in from the public in the Receiving Department on the basement floor are shot through pneumatic tubes which terminate in this enclosure. These, as they arrive, are assorted by a number of clerks, who deposit them in receptacles having plate glass fronts, arranged along the outside of the counter, whence they are at once taken and distributed to the proper operating tables by the office messengers.

The commercial news department of the Gold and Stock Telegraph Company is provided with accommodations in the northeast corner of the main operating room. The financial system, as it is termed, is worked by a motor transmitter, having 36 piano keys, and capable of operating 20 distinct circuits simultaneously, although only 13 circuits are as yet required. The instruments used on these lines are Phelps' small type printers, to the number of 100 or more. Two other transmitters likewise operate respectively the cotton and produce quotation circuits. There are also eight Morse instruments in this department.

The city and railroad wires are operated by young ladies, and occupy the western end of the room.

The whole number of operators employed on the day force is nearly 150, of whom about 60 are ladies. The night force usually consists of about 30. Altogether, about 250 persons are employed in this one room, including managers, operators, clerks and messengers. For lack of space we are obliged to omit the names of the operating force. The officers are as follows:

Superintendent of Metropolitan District, A. S. Brown.

Acting Manager of New York Office, A. S. Downer.

Chief Operator Eastern Wires, D. R. Downer.

Chief Operator Western Wires, J. H. Dwight.

Chief Operator Southern Wires, S. H. Edwards.

Chief Operator City Wires, Miss L. H. Snow.

Chief Operator Cable Wires, W. J. Dealy.

Night Manager, T. Dolan.

Night Chief Operators, T. C. Kennedy, S. S. Bogart, Jr.

Night Chief Operator City Wires, T. Brennan.

Night Chief Operator Cable Wires, E. A. Leslie.

Superintendent Commercial News Department, D. J. Ludwig.

Assistant Superintendent Commercial News Department, H. Van Hovenburgh.

From this description it will be seen that this is probably the finest, most complete, and thoroughly well appointed operating room in the world. No pains, skill, nor expense has been spared to promote the comfort, convenience and health of the operating staff. Standing at the entrance and looking down the spacious and lofty room, filled with long ranges of instrument tables, industrious operators, and nimble-footed messengers, the general aspect is effective and beautiful, though it is sadly marred by a straight, ugly screen stretched across the room about two thirds of the way down, which cuts off the perspective of the rows of tables, and entirely breaks up the unity of artistic effect.

There seems to be no necessity whatever for such a barrier between the ladies' department and the remainder of the room, and the management would display good sense, as well as vastly improve the appearance of the apartment, if they would abolish it altogether, as is done in most other large offices.

Mr. G. M. Phelps, the Superintendent of the company's extensive manufactory in this city, is engaged in constructing an electric clock system, by which the large dials in the tower, and the dials in all the rooms of the building will be operated by one regulator. This is not yet completed or introduced. When it is we shall give a detailed description of it, which cannot fail to interest our readers.

'Condensers as Automatic Repeaters.'

BY C. H. HASKINS.

At the last meeting of the American Electrical Society held in Chicago, Mr. C. H. Haskins, explained a system of "Condensers as Automatic Repeaters," which was very interesting. Mr. Haskins did not expect, when he thought of bringing his matter before the society at that meeting, that he should be present himself, he therefore prepared a paper upon the subject, and forwarded it to the secretary of the association to be read by him. The paper failed to arrive in time to be used, but Mr. Haskins himself being, as I remarked before, unexpectedly present explained the system by instruments, as well as language. Not being able, however, to quote his language at that time, I have, through the kindness of the Recording Secretary, Mr. C. S. Jones, been permitted to copy the paper by Mr. Haskins on the subject, and as parts of it are quite novel, I have thought it would be interesting to the fraternity at large, and offer it to them through the columns of THE TELEGRAPHER. The paper reads as follows:

OCCASIONAL.

"Mr. President and Gentlemen of the Society.

I design this evening to give you the result of some experiments in the use of condensers as automatic repeaters on Morse land lines.

Although condensers were invented nearly one hundred years ago, being among the first of Electrical apparatus, yet telegraph (which does not yet number forty years) has, until very lately, made little or no use of them. At first they were the playthings of the laboratory, and when they were loaded and fired off, so to speak, they never failed to excite the admiration of the audience. But for years they were classed with air guns, oxyhydrogen explosions, and all the other strange apparatus, and experiments with and by which the chemical professor or the travelling lecturer, enlightened his class or excited the wonder of his audience.

All this time the condenser was known only as a reservoir in which could be stored electricity of high tension. Every one knew that it could be filled gradually, but it emptied only with a destructive and instantaneous discharge.

Finally, long submarine cables were laid. At once various problems arose, making it necessary to know what the capacity of the cable was. What the condition or capacity of the dielectric or insulating coating was, etc., etc. And the condenser was found to be exactly the thing. For the electricians began using it as a grocer would his pint measure, for comparing and measuring capacities of cable conductors, etc.

Then it was found that a cable could be worked more rapidly and efficiently by charging a condenser at the receiving end, and by putting the key to the ground at the sending end, the charge so stored up would flow back through the cable, clearing it out rapidly, as it were, and reversing the deflection of the needle. This system superseded, to a great extent, the first system of using reversing batteries. Next followed the application of the condenser to duplex and to automatic telegraphy, and then Mr. Varley discovered that by using condensers at each end of the Atlantic Cables and not allowing any battery current to enter the cable, but working by inductive currents instead, he got rid of the earth currents almost entirely, and then again increased the efficiency of cable working. And this brings me to my experiments. When one side of a condenser is connected to the earth and the other side to the positive pole of a battery, the other pole of which is also to earth, current will flow from battery into the condenser until the conducting wire and the attached condenser plates are charged to the tension of the pole of the battery from which it flows. The effect of this charge will be to discharge the opposite plates to the earth; and now what is the condition? The battery side of the condenser is of the tension of its battery. The opposite side is as far below the tension of the earth as the other is above it. Now remove the wire attached to battery and connect it to ground, that side will discharge to earth with a vigor depending upon its excess of tension over the earth while the opposite side will be filled with electricity from the earth. When the discharge ceases the equilibrium is restored both sides of the condenser, and their wires being of the tension of the earth. If, however, you remove the wire from either side of the condenser, thus cutting it off from the battery or earth, there would be no discharge. Remove it from both and the condenser will hold its charge for a considerable length of time, as it can only escape by connection through the air or other leakage.

I do not state these facts as new, but merely as an explanation of what follows to those who may not be familiar with the action of condensers and the laws that govern them, the annoyances inseparable from the use of automatic repeaters and their adjustment. The use of way batteries, etc., led me to attempt the application to land lines of a similar arrangement to that which had been found so efficient in cable operating. I made the circuit in this manner. The keys must be double pointed, with battery attached to the anvil and a ground to the back stop, while the line wire is fastened to the lever of the key, as the magnetic effect of a current ceases when the current becomes static; and, as the current will cease flowing as soon as the condenser fills, it is necessary to use a polarized relay, so that when the current flowing in one direction closes the armature on the local points it will remain closed until the key is opened and makes contact with the back post, when the current flowing in the opposite direction will open it.

The local connections are made in the ordinary manner at the point of junction of the two circuits, where the automatic repeater would be used. I put a condenser attaching the two lines direct to the two sides without battery; there are no circuit closers on the keys, for the keys are left open when receiving with the line connected to ground by the back contact of the levers. A button for breaking is put in the wire near the key. When the line is at rest there is no current on the circuits. Now, suppose the man at the positive battery end closes his key, the current rushes in, closing his relay, and flowing through the wire, until the condenser is filled; its charge in tension is that of the battery that fills it. Its quantity depends upon the amount of surface it contains. Instantly the opposite side of the condenser sends a charge equal in quantity and tension along the line to the farther end and to ground, closing the receiving relay, then the sending man breaks instantly his side of the condenser, discharges back through his key to ground, opening his relay while the other side receives a charge from the earth at the other end, reversing the action of the receiving relay, and opening that, also; the action is instantaneous and very vigorous. When the receiving man wishes to break, he opens the button breaking circuit. This locks or holds the condenser in the condition in which it may be at. That instant, if the relays are open, no effort of the sending operator can close them. If they are closed, they cannot be opened by any effort of his; he is as effectually broken as if his line was down, and the former receiver closes his key to the positive pole of his battery being to ground; he draws, so to speak, from his side of the condenser, until he has reduced its tension to

that of the negative pole of his battery, to which it is attached, and from the earth, at the further end of the lines a charge rushes in to fill the other side of the condenser to its own tension, he opens his key and the action is reversed. Thus, the charge and discharge of the condenser works the relays at each end perfectly, and the offices can break each other without the intervention of a repeater or a main battery. The question will naturally be asked, Can way officers receive by this system, also? I answer, Yes, any number of polarized relays can be put in the circuits either side of the condenser, and all will be worked alike. To send, however, the way offices should have a battery to be attached in a manner not easily shown without the aid of diagrams. This battery should be of sufficient capacity to charge the section of line upon which the office is located, and its action will then be precisely similar to that of the terminal battery on the same circuit. In the course of my experiments upon artificial lines I found that two or more condensers in succession charged each other as perfectly as if there was but one in circuit. I made up a line representing three circuits of 9,000 ohms each. The first and second circuits were connected by the condenser, and the second and third by another. A current from a positive 100 cell gravity battery was attached to one key and a like one of a negative polarity to the other polarized relays, placed in any of the three circuits were worked vigorously. The resistances represented three lines of No 9 wire of about 450 miles each or a total of 1,350 miles of line, and yet the signals went through perfectly in each direction. In tests upon actual lines the results were the same. A condenser was connected at St. Paul, Minn., to two wires running to Milwaukee, making two circuits of nearly 400 miles each. The signal repeated to Milwaukee came as strong as the original one, although the latter was made by the battery current, and the former by condenser discharge—charge, in other words—the one was a battery effect, and the other an inductive one.

If you will recollect that the tension of the induced current is the same as that inducing it, you will see that its power to escape from the wire is no greater than that of the battery current; therefore, the volume of received current must be the same; moreover, as each particle or portion of the battery current carries with it its own tension, all that reaches the condenser must be of the same tension of the battery, and if the escape from the line is heavy, it is only necessary to write a little slower to fill the condenser as perfectly as if the line was in a good state of insulation. Experiment has also developed the fact that a branch line may be connected with a through line at any point by attaching one side of the condenser to the through wire, without cutting the wire, and the branch line to the other side, no instrument or battery are necessary at the junction. If the branch line has a battery at the further end, and instruments, that office can work direct with offices on the main line, or the branch wire may be attached direct to the main line, and battery, instruments and condenser, may all be at the further end of the branch line, and yet this office may work direct, exactly as if the main line looped in and out; and if ordinary way offices are put in on a branch wire in this manner, and each terminal office provided with a condenser, so that no current goes to line from any office, then any number of branches may be run in different directions, all single wires, and yet all work with each other direct. I might follow the combinations much further, for as I investigate, the complications and variations seem endless, but I will not trouble you further to-night. I hope at some future meeting to show you some of these circuits in operation, that you may judge of the practical value of what I have told you. I will close now by stating what I believe to be the advantages of this system of repeating on through circuits: first, the annoyance and expense of maintaining automatic repeaters is done away with—repeaters always adjusted, day or night, and always ready for work; second, it allows of attachment of branch lines at any point of the main line; third, the amount of wear of battery is extremely small, as only a sufficient quantity to fill the line wire and condenser is used at each closing. A very large number of lines could thus be worked from one gravity battery.

Other advantages are daily becoming apparent, but as I am still experimenting, I will speak of those at a future meeting."

THE report of the Eastern Telegraph Company (Limited) for the six months ended 30th September, 1874, has been issued. The revenue for that period amounted to £176,806. The sum is appropriated as follows: £46,323 for the ordinary expenses; £30,222 for special expenditure during the half year; £828 for income tax; and £98,425 for two *interim* dividends of 1½ per cent. each, and interest on debentures, leaving £1,007 to be carried forward.

The Western Union Company and Telegraphic Inventors and Inventions.

TO THE EDITOR OF THE TELEGRAPHER.

AN editorial which appeared in the New York daily *Tribune* of the 6th inst., referring to the reduction of rates advertised by the Atlantic and Pacific Company, very pertinently remarks that, "If the superior modes of transmission, of which the Atlantic and Pacific Company claims the monopoly, warrant the reduction, the Western Union has certainly made an enormous mistake in failing to secure these patents when it could."

It was, indeed, a very great mistake; for, as I am informed, the Western Union Company could have acquired, on their own terms, the automatic machinery which is now being used to their serious disadvantage before it was stolen by the party who has since conveyed it to the Atlantic and Pacific. This must be all the more galling from the fact that the reduction of rates is to take place within the exact limits where this automatic system is operating, and that further reductions will follow the track of its introduction, while the Western Union Company have no weapons at their command, either of offence or defence.

It is a singular fact that every improvement in the art of telegraphy which has been brought out in the last seven years has been developed upon opposition lines; and whatever of them the Western Union Company have acquired was first contemptuously derided. Even now, with all this painful experience, an employé of the Western Union Company (and in their service is some of the best telegraphic talent in the world) cannot obtain a fair hearing and trial with any improvement which is counter to antediluvian notions, but is forced to carry his brain work, much against his will, to the enemies of his employer for development, or defraud himself of honest recompense. There is a remedy for this; and, doubtless, if the matter could be looked at by Mr. Orton with his own eyes, the company over whom he presides, with generally so much ability, would be regarded with greatly increased confidence by inventors.

The Western Union Company should befriend inventors and encourage invention. Its existence as the leading telegraph company of the world necessitates this policy. The course of General Braddock, in his celebrated march against the Indians in ante-revolutionary days, is an apt illustration of my meaning in this communication; and in that sense it will probably be understood. QUEN SABB.

An Electrical Problem Incorrectly Stated.

NEW YORK, February 9.

TO THE EDITOR OF THE TELEGRAPHER.

IN your last issue you make an allusion to a problem incorrectly published under my name in the *Operator*. The problem I gave for publication in that paper was as follows:

"Being given a continuous piece of wire, one cell of battery, one Morse key, and one galvanometer, to send equal reverse galvanic and steady currents at their maximum over the galvanometer, the wire used may be of any material, diameter, and length, but should remain unbroken, untwisted, and not forming an inductive coil, and the key should be a single contact key."

I hope you will do me the justice to publish the above, which is a scientific electrical problem, including calculations according to the laws of electric currents, and can be applied to practical purposes.

I must respectfully decline the title and reputation of "successor to the great puzzle maker" gratuitously given to me in *THE TELEGRAPHER*, which I should certainly have deserved if I had asked anybody to solve this with a "continuous coil of short office wire."

GEO. D'INFREVILLE.

129 Broad street, New York."

THE correspondent of the *Pall Mall Gazette* writes: "In the International Telegraphic Congress, which will be held in St. Petersburg this summer, the Submarine Cable Companies intend to take an active part. They have already prepared a motion that despatches shall be reckoned by the number of letters and not words, because the words are confounded and run together at present in an almost incredible manner, thereby considerably reducing the number and increasing the work of the telegraphic agent in the same proportion."

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, FEBRUARY 13, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

(P. O. Box 5503.) 38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS OF THE

Telegraphic Fraternity and the Advancement of Electrical Science and the Telegraphic Art.

Published Every Saturday,

AT No. 38 VESEY STREET, New York.

ELEVENTH VOLUME.

The Publisher, in announcing the Eleventh Volume of

THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year.

All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER

is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to or in the interests of NO TELEGRAPH COMPANY, CLIQUE or COMBINATION, but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, no LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore:

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELE-GRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The Western Union Telegraph Company and Inventions and Inventors.

OUR correspondent, QUIEN SABE, calls attention to what may be considered an important defect in the management of the Western Union Telegraph Company, if what he states is true, and that his criticisms are, at least, warranted by the facts we do not think can be reasonably questioned.

It is essentially necessary that the Western Union, as the great telegraph company of the country, and by all odds the largest telegraph company in the world, considering the extent and importance of its lines, should be kept well up with, if not in advance of, the progress of telegraphic invention and development. While it could not reasonably be expected that it should adopt every so-called improvement and invention that may be presented to it for examination, yet all such should be carefully, candidly and intelligently investigated, and if found to be really of value and importance the inventors should be fairly and liberally dealt with, and the benefit thereof secured to the company. That such has not been the case hitherto, all who have sought to demonstrate their inventions, with one notable exception, have found, to their discouragement, delay and red tape intervene until the inventor becomes discouraged and is compelled to seek elsewhere for a purchaser, among those who are inimical to the interests of the company.

Especially it would be supposed that invention on the part of its employes (and that it has in its employ some of the best electrical and telegraphic talent in this country and the world is undoubtedly true) would be encouraged, and that every facility would be afforded them to demonstrate the value and importance of their inventions and discoveries. As a matter of fact, however, these are compelled to find opportunities to develop their inventions on rival lines, and to dispose of them if really of value to rival interests.

Should any one be inclined to dispute these statements we would ask him to point out to us what important telegraphic invention or discovery, with the exception above referred to, the Western Union Company has originally adopted?

Has it not, on the contrary, been the policy of the company to decry inventions as of no importance or value, until they have been developed on other lines and by other companies, and then, if possible, secure them at increased cost? Was not this the case with the duplex invention of Mr. STEARNS, which was declared to be valueless until finally purchased at a large cost by the company, since when it has been as extravagantly lauded as previously unreasonably decryed? Has not the automatic system, which the company could have secured at a very reasonable cost originally, been ridiculed and treated contemptuously while it was being perfected and developed, until now it is in the hands of an opposition growing in importance and strength, and made the basis of a reduction of rates now, and a still greater reduction in the near future, over a more extensive territory? And what has the Western Union Company got to meet the automatic system in the hands of an active competing company? It has the duplex, which may be found valueless to them under a certain contingency, and the quadruplex or double duplex, for which its title is dubious and of which it may very probably be deprived, and which, in any event, it can only retain at the expense of protracted and costly litigation.

It will not answer to treat inventors and inventions superciliously; and to endeavor to avoid adoption of inventions by decrying them as valueless is a very shallow way of treating a vital subject. Such a course has brought upon the Western Union Company much of the difficulty which it has now to encounter. It is perhaps too late to remedy much of the damage which has already been done; but it is not too late to learn wisdom from past experience and to adopt a wiser course in the future.

Inventors, we know, are apt to be a troublesome set, not unfrequently needy and importunate; but they must

be regarded as at least necessary evils, and should not be discountenanced on that account.

The strength of the opposition to the Western Union Company, which now threatens it with so serious injury, lies in the fact that its managers have not been sufficiently appreciative and enterprising to secure the advantages in improved telegraphic inventions which the Western Union officials have ridiculed and decryed. The world moves, and the management of a great telegraphic organization must move with it, if it desires and intends to secure permanent success.

The Telegraphic Situation.

IN preparing the weekly budget of information in regard to the telegraphic situation there are some matters of interest to give our readers.

On Saturday morning the Atlantic and Pacific Telegraph Company announced a considerable reduction of tariffs on a portion of their principal through circuits, to take effect on the 15th inst.

The new rates are as follows: Between New York City and Washington, D. C., and intermediate points, 25 cents for 10 words and 2 cents for each additional word; present rate, 40 and 3.

Between New York City and Albany, N. Y., and intermediate points, 25 and 2; present rate, 40 and 3.

Between New York City and Boston, Mass., and intermediate points, 25 and 2; present rate, 30 and 2.

Between all points east of New York, to and including Boston, and all points north of New York, to and including Albany, and all points south of New York to and including Washington, D. C., 40 and 3; present rate, from 40 and 3 to 60 and 4.

The date, address and signature to be transmitted free, as heretofore.

The announcement of this reduction, which is made over the signature of Gen. ECKERT, as President of the company, further stated that "the greatly increased facilities afforded by the use of improved modes of transmission, owned exclusively by the Atlantic and Pacific Telegraph Company, render this reduction practicable, and reductions elsewhere will soon be made."

This announcement had the effect to depress Western Union stock about one per cent., but this it subsequently recovered. Up to the time we write this no official announcement has been made of the proposed action of the Western Union Company in response to this demonstration of the Atlantic and Pacific Company. It is understood, however, that the managers of the former company will shortly go below these rates. President ORROR stated, in response to inquiries, that the company had done nothing yet in regard to it, that "thus far the reduction was small business; but that when the Western Union began to cut, it would be to the blood."

The lines of the Atlantic and Pacific Company have been divided into divisions, one the Western, to be called the Pacific Division, and to include all lines west of Buffalo. This division will be under the management of Mr. E. D. L. SWEET, who has removed his headquarters to Chicago, having closed his office here, and finally started for the latter city on Wednesday morning last.

The Atlantic Division will comprise all the lines of the company east of Buffalo, and will for the present be under the management of Mr. A. B. CHANDLER, Assistant General Superintendent.

The Atlantic and Pacific Company continue to realize good results with the automatic system on their wires, and are preparing to introduce automatic apparatus on all their principal circuits.

Should the Western Union Company go below the new rates of the Atlantic and Pacific Company, it is understood that the latter will double the number of words transmitted at the same price. It is evident, that, for a time at least, the public are likely to have cheap telegraphy to their heart's content.

The Western Union Company has negotiated abroad a new loan of \$5,000,000. Four and a half millions

of this amount is to take up bonds of the company outstanding, which will soon become due, and the balance will go into the treasury for such use as the company may see fit to make of it. The additional half million will be more than required to pay the cost of the new building over and above the amount of the loan previously contracted in London for that purpose.

Quadruplex matters have been very quiet since our last issue, but the Western Union officials are confident of their ability to hold on to the invention for whatever it may be worth to them. From what we can learn we are inclined to think that the quadruplex has been accorded much more importance than it deserves. What has been stated heretofore in THE TELEGRAPHER in regard to the necessity of specially favorable conditions and wires of exceptional conductivity in working it successfully, has been found to be correct, practically.

Upon a consideration of the condition of affairs, we do not find it materially changed from last week, except in that of the prospective reduction of rates. Both parties are bitterly hostile at present, and intent on damaging each other in their respective interests as much as possible

The American Electrical Society.—Subordinate Telegraphical and Electrical Associations Practicable and Desirable.

THE American Electrical Society is gradually getting into good working condition, and bids fair to realize all that the most sanguine of its advocates and promoters anticipated of benefit and advantages to be derived from it. The great development and progress of electrical science and the telegraphic art in this country renders such an association of great importance and value.

A good start has been made in Milwaukee under the leadership of Mr. CHAS. H. HASKINS, the able electrician and telegrapher who occupies with distinguished ability the position of General Superintendent of the North Western Telegraph Company, in the organization of a subordinate local association for the purpose of increasing electrical and telegraphic knowledge and information. It is very important and desirable that similar associations should be speedily organized in all the leading telegraphic centres. The advantages to be derived from such associations are too evident to need any lengthened demonstration from us.

We should be pleased to see such an organization effected in this city without further delay. There are here electricians of great ability, and telegraphers who are not excelled by any in the country. Our Western friends have got the start of us in this matter, but we should not be content to let them enjoy this honor alone. We have neither time or space to discuss this matter at length this week, but suggest that steps be at once taken to establish a similar organization here. THE TELEGRAPHER will cooperate to the fullest extent in such a movement. Who will start it?

We should be pleased to hear from the telegraphers and electricians of New York on the subject, and freely tender the use of the columns of this paper to advance the project.

The New Western Union Building.

WE print this week a full description of the new building erected and occupied by the Western Union Telegraph Company, on the corner of Broadway and Dey street, in this city. This is the largest and most costly building erected for telegraphic occupancy and use in the world, and we have no doubt our readers, both in this and other countries, will read with interest this description of it, which has been prepared for our columns. It illustrates in a most striking and forcible manner the great progress and development of the telegraph business in this country. Any one who, even ten years ago, should have predicted that the time would come when it would be possible for

any telegraph company to be so sumptuously and expensively located, would have been considered a wild enthusiast.

The Telegraphers' Ball.

THE First Annual Invitation Ball of the New York Telegraphers' Association took place, as previously announced in THE TELEGRAPHER, on Thursday evening, the 4th inst., at Fererro's Assembly Rooms, Tammany Hall. The affair was a success, and the occasion was a very enjoyable one. The company assembled unanimously pronounced it one of the best entertainments within their experience. The supper and appointments of the ball were satisfactory, and greatly enjoyed. There were 176 couple present.

Crowded Columns.

IN consequence of the space occupied by the description of the new Western Union Telegraph building and offices, and the great pressure upon our columns otherwise this week, we have been obliged to omit much matter intended for the present number, some columns of which is in type. Correspondents and contributors whose favors fail to appear, as expected, will understand the reason therefor. We will give all a chance to be heard as soon as possible. In the meantime our friends must exercise patience, and console themselves with the thought that they do not have more occasion for the exercise of this virtue than the editor.

Personals.

MR. ROBERT STEWART having resigned his position as Superintendent of Telegraph for the United Railroads of the New Jersey Division of the Pennsylvania Railroad, no successor will be designated, but a Superintendent of Telegraph for each subdivision will be appointed, as follows:

New York Division, Mr. WM. ETTINGER, office at Jersey City; Amboy Division, Mr. W. J. CARTER, Camden; Belvidere Division, Mr. W. H. WILMOT, Lambertsville. Their appointment will take effect Feb. 15.

The address of Mr. GEORGE H. GRACE, General Superintendent of the Southern and Atlantic Telegraph Company, should be 51 New street, New York, not 51 Pine street, as erroneously stated last week.

MR. E. D. L. SWEET, Vice-President and General Manager of the Atlantic and Pacific Telegraph Company, left New York for Chicago on the 10th inst., where he will have his headquarters hereafter.

The Telegraph.

Foreign Telegraphic Notes.

THE Society of Telegraph Engineers have acquired with Sir Francis Ronald's library a MS. catalogue compiled by himself, which purports to comprise all the works which have ever been published in any language on the subject of electricity and the cognate sciences, and this catalogue contains nearly 10,000 entries: but only about half of these works (5,000, including pamphlets, etc.), were in the possession of Sir Ronald himself. This catalogue will shortly be published by the Society of Telegraph Engineers, and the library itself will be accessible, under the necessary regulations, to all who may be interested in the science of electricity.

The Central American Telegraph Company have received confirmation of telegraph advices to the effect that the shore end of their cable has been successfully laid at Demerara by the screw steamer Norsman, and that the tests were most satisfactory. The authorities at Georgetown rendered every assistance, as also her Majesty's ship *Druid*, which accompanied the expedition.

The West India and Panama Telegraph Company (Limited) have issued a circular announcing that the dispute between the Company and the India Rubber, Gutta Percha, and Telegraph Works Company had been settled, and the terms are embodied in the following clauses: "The Colon Jamaica cable, with its officers, instruments, etc., is to be banded over to this Company. The £100,000 in cash and shares now unpaid, and forming the balance of the original contract sum, is not to be paid. The contractors' claims in respect to the St. Kitts Deviation, the Demerara Extension, repairs, extra cable, and other matters, amounting altogether to £73,752, are released. The contractors cancel and hand over £9,600 of this com-

pany's debentures now held by them. This company releases the defendants from all other claims, and all claims of the defendants against this company are released. The defendants are to give their assistance in procuring the transfers of concessions and subsidies not yet secured to this company, and settle with the parties to whom those concessions, etc., were originally granted." The contractors have also agreed, it is stated, to supply the company with fifty miles of new cable for repairs on very favorable terms. All further legal proceedings in the suit are now stayed.

The German Federal Council has resolved to invite the Chancellor to cause a report to be drawn up by experts having especial regard to the following points: 1. Whether in all cases of extension the municipalities of the places benefited may not be fairly called on to contribute, a scale being prepared from existing data to show the cost of erecting and working new stations at small towns, and the losses suffered on their account by the central administration. 2. Whether the railroad companies are now contributing a fair share for the benefits they enjoy, and whether new agreements ought not to be entered into with them which shall be more equitable to the public. 3. And, finally, whether the administration, as now worked by districts, is not a needlessly costly organization in itself, and one admitting many minor economies, especially by the employment of female labor in the offices.

West India and Panama Telegraph Company.

MR. WILLIAM ABBOT, of London, states in his circular referring to this company that its shares, after a long period of depression, are at last attracting some attention. "The new directors are fairly entitled to the sympathy of the shareholders, inasmuch as the policy to which they have specially directed their attention, viz., the linking together of North and South America by the cables of the Central American Company, from Para to Demerara, has been most unfortunately delayed by a series of mishaps entirely beyond their control. A new cable was despatched from England in the steamship *Norsman*, and the shore end has now been successfully submerged. It is expected that the line from Demerara to Trinidad, and thence to Ponce, will be completed by the end of January; thus, if all goes well, telegraphic communication between Buenos Ayres and New York via the West India and Panama system, will be fully established by February next." He also states that the entry of the Brazilian and Western Brazilian Companies into the list of dividend paying securities is a very healthy sign, as it reduces to a comparatively small amount the extent of capital invested in submarine enterprise which is unproductive to the original subscriber. The new Black Sea cable promises well for its proprietors. This line unites Odessa to Constantinople; already the traffic is satisfactory, and it will no doubt in time considerably augment the revenue of the Eastern Company through the lines of their system in the Levant.

Who Stole that Despatch?

DURING the memorable campaign of 1873, when "Poppleton's famous despatch" exploded like a bomb shell over the heads of the defunct "Kourt House Klan," Mr. Frank Lehmer, the manager of the Omaha office of the Western Union Telegraph Company, published a card, from which we quote the following extract:

"The publication in newspapers in this city of private despatches sent over the wires of this company entitle the public to a full explanation. The most emphatic and explicit orders are given to every employé to treat as most sacredly confidential every message committed to us."

This card was subsequently endorsed by Gen. Supt. Anson Stager, as follows:

"Your card is approved, and I suggest you add the following—This case is remarkable as being the only instance known to the company where operators have betrayed its confidence."

The *Journal of the Telegraph*, the official organ of the company, in reproducing these cards and accompanying statements denounced the publication of the Poppleton despatches in a double headed leader, closing its comments on "the extraordinary breach of trust" as follows: "We wish as summary a punishment could be meted out to the editor who accepted, and, perhaps, paid for the stealing of the intercepted despatches. This is not the first time the game of bribery has been tried. The editorial chairs have many blacklegs in them who have prices for violated honor always ready. This 'Rosewater' may be one of them."

Now, we apprehend, *Manager Lehmer*, *General Stager* and the *editor of the Journal of the Telegraph* were well aware that the stealing of despatches by telegraph officials was not such an uncommon affair as they tried to make the public believe. Without going into details, we can recall instances when "telegraph

officers" of the "very highest" rank had amassed wealth by making systematic use of their sacred trust, and speculating on information obtained from private despatches that passed over the company's wires; and now we propose to call public attention to a remarkable instance of "telegraphic theft" which requires explicit explanation at the hands of the gentleman who tried to class the editor of *The Bee* among editorial blacklegs.

Last Friday afternoon, on returning from the "senatorial battle field" at the State capital, we received the following telegram:

"St. Louis, Jan. 22.

"To E. ROSEWATER: Send two or three hundred words about Paddock. Who is he, antecedents, position, and how elected?"

(Signed,) G. W. FISHBACK,
"Managing Editor Democrat."

In compliance with this request we deposited a despatch conveying the desired information in the Western Union Telegraph office at 8.30 P. M. This despatch appears in the *St. Louis Democrat* of the 23d; but, on examining other St. Louis and Chicago exchanges, we discover that its contents were stolen in the Western Union Telegraph office, and almost literally transcribed into despatches sent by the Omaha agent of the Western Associated Press. Here is the proof. The special despatch to the *St. Louis Democrat*, written by us, opened as follows: "Algernon Sidney Paddock, elected to-day to succeed Senator Tipton, is a native of Glenn's Falls, New York, born Nov. 5, 1830, of Puritan ancestry. He is distantly related to Gideon Welles and General and Senator Sherman, and was educated in Union College."

The closing sentences of this special telegram read as follows:

"A Conservative Republican of the Seward school, Mr. Paddock is in full sympathy with the party, and will doubtless act and cooperate with it in the future. His election to-day was secured mainly as a compromise between the opponents of the strongest Republican candidate, General Thayer."

Now look at the transcribed telegram that appears on the morning of the same day in "The Chicago Times and St. Louis Globe, although somewhat condensed. It begins as follows:

"Algernon Sidney Paddock, elected to-day to succeed Senator Tipton, is a native of St. Lawrence Co., New York, and is about 44 years of age, and of Puritan ancestry, distantly related to Gideon Welles, General and Senator Sherman."

Here are the closing sentences:

"THOUGH a conservative Republican — Mr. Paddock is full of sympathy with the party, and will doubtless act and cooperate with it in the future, his election was secured mainly as a compromise between the opponents of the strongest Republican candidate, General Thayer."

Now, if this is not a clear case of "telegraphic theft," we should like to know where the author of the transcribed despatch obtained his information. How it was possible for him to arrive at precisely the same conclusion, and why he expressed his views almost verbatim in the language employed by us. While two reporters might generalize the same facts in somewhat similar terms, it would be utterly impossible for them to begin and close their despatches in almost identical sentences, unless one reporter had access to the messages of the other. It is, therefore, self-evident that the special telegram to the *Democrat* was stolen by somebody in the Western Union office. That despatch was paid for by the *St. Louis Democrat*, and was consequently the exclusive property of that journal. It was just as secret as any other private despatch, nobody outside of the telegraph office could possibly have obtained possession of it, since no other copy was made by its author. "Who stole that despatch?" Will General Stager, who so severely (and we claim unjustly) denounced the editor of *The Bee*, for publishing a political despatch obtained without solicitation on the eve of an exciting election, investigate this case, punish the offender, and put a stop to a practice which is not only unjust to the patrons of his company, but is also a shameless breach of trust? Will Manger Lehmer, who we understand is reporter for the *Western Associated Press*, give us another card explaining "who stole that despatch?" — *The Omaha Bee*.

Liability of Sureties.

In the suit of the Atlantic and Pacific Telegraph Company against Barnes and others, the defendants were sureties for a clerk of the plaintiff. In January the plaintiff found the clerk in arrears in his accounts \$15 92. They did not inform the defendants of this until they discharged him on March 2, when he was in arrears \$269 67. The defendants claimed that in good faith they should have been informed as soon as he began to make default. The General Term of the Supreme Court, Judge Curtis, giving the opinion and

Judge Speir concurring, overrule this defence, holding that the bond being absolute in terms and not requiring such notice, the defendants are liable. Judge Freedman dissents—holding that the character of the clerk was the basis of defendants' agreement, and they were entitled to notice of its deterioration.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended December 22, 1874, and bearing that date.

158,156.—RECEIVING INSTRUMENTS FOR ELECTRIC TELEGRAPHS. C. Wheatstone, London, England. Filed Nov. 13, 1874.

1. The combination, in a receiving instrument, of an inking disk, and a tracing or marking disk independently connected to the maintaining power, substantially as described.
2. The inking disk G, having a peripheral groove, in combination with the ink reservoir, substantially as and for the purposes set forth.
3. The combination, with a tracing or marking disk, of the electro-magnet and armature, giving a to and fro movement of the disk, and an independent maintaining power continually rotating the same, substantially as and for the purposes set forth.

158,157.—TRANSMITTERS FOR AUTOMATIC TELEGRAPHS. C. Wheatstone, London, England. Filed Nov. 13, 1874.

The transmitter, constructed with contact points and actuating levers, controlled by the passage of perforated paper, thereover, in manner and for the purpose substantially as herein shown and described, to send into the telegraphic circuit short currents of equal duration at various intervals and alternately in opposite directions, so as to determine the occurrence of printed lines and intervals of various lengths in the receiving instrument.

158, 158.—PERFORATORS FOR TELEGRAPH PAPER. C. Wheatstone, London, England. Filed March 7, 1873.

1. The combination, in a perforator, of the three keys A B C, the series of punches and connecting devices, substantially as herein shown, each key controlling a combination of punches differing from that controlled by either of the others.
2. The combination, with the keys and punches, of the paper feed and connecting devices, each key controlling the feed to advance the paper a space corresponding to the perforations controlled thereby.

For the week ended January 5, 1875, and bearing that date.

158,442.—AUTOMATIC OR CHEMICAL TELEGRAPHY. William E. Sawyer, Washington, D. C. Filed Nov. 10, 1874.

1. A sheet, roll, or strip of paper, perforated for telegraphic transmission, in lines running from left to right, as in an ordinary printed page, substantially as shown and described.
2. The combination of a line, main transmitting battery, contact-point brush or roller therefor, a local battery and contact point brush or roller therefor, with a circuit through the primary wire of an induction coil, and a contact-point brush or roller throwing the secondary wire of the induction coil into line and connecting the line to earth, substantially as set forth.
3. The combination, with a line, its battery and contact-point brush or roller therefor connecting the line to earth and throwing the secondary induced current into the line, for the purpose of clearing the same of tailings, as set forth.
4. The combination, with a line and its transmitting battery, of an induction coil, the secondary current from which is thrown into the line immediately after each signalling pulsation, substantially as described.
5. The method of operating an automatic or chemical telegraph by first simultaneously, or nearly so, closing the transmitting circuit and the local primary circuit of an induction coil, and then, upon breaking the transmitting circuit, and instantly before breaking the local primary circuit of the induction coil, closing the circuit of the line through the secondary wire of the induction coil and to earth, substantially as and for the purposes specified.
6. In combination with the main line circuit, a metallic point, brush, or roller, connected or connecting to an induction coil and to earth, substantially as and for the purposes specified.
7. The combination of a metallic point, brush, or roller, closing the circuit of a local battery through the primary wire of an induction coil, and a metallic point, brush, or roller closing the circuit of the secondary wire thereof to the line, the local circuit being broken at or just after the completion of the secondary wire circuit, as set forth.
8. In a chemical telegraph receiving instrument, the combination, with a shunt within a shunt circuit, of the primary and secondary wires of an induction coil and resistances, as set forth.
9. A non-inductive resistance, composed of a length of wire arranged in parallel returning layers, substantially as shown and described.
10. The combination, with a line or circuit, of a commutator, or circuit changer, or current diverter, and two series of apparatus or batteries composed of different parts or sections or

two circuits, or two parts of one apparatus or battery, the series, parts or sections, or circuits referred to, being alternately connected to the line by the commutator, substantially as and for the purposes specified.

11. In chemical telegraphs, the method of producing a clear sharp record, assuming a positive battery current to be the impulse to be recorded, by charging the line in the following manner: First, transmitting an induced positive impulse; second, a battery positive impulse; third, an induced negative impulse, followed or not by a negative battery impulse, or with the polarities named reversed, substantially as set forth.

For the week ended January 12, 1875, and bearing that date.

158,636.—ELECTRICAL PHOTOMETER BALANCES. Wm. W. Goodwin, Camden, N. J. Filed Aug. 21, 1874.

Sliding pen 5 set at 0, and candle balanced by moving weight F. 5 is then slid on arm A to number indicating grains to be consumed, the candle holding down the balance arm against F and 5 till the amount is consumed, when they pull down the balance arm, which completes at 10 and H an electrical circuit to G, which, attracting its armature, holds the balance secure against any vibrations, and maintains the circuit connection for any other desired operations.

1. The combination, in a balance for photometers, substantially as described, of the micro-metrical adjusting weight F and the bar 6 with the power arm of the lever A.

2. The electro-magnet G and the armature bar of g', in combination with the power arm of the lever A, arranged as described, for the purpose of holding down the lever A, with its platinum stem 10 in contact with the mercury in the cup H, as set forth.

158,672.—ELECTRIC FUSES. C. A. Browne and Isaac S. Browne, North Adam, Mass. Filed Aug. 22, 1874.

Furnished ready to receive priming when about to be used. The tube A, having wires a a in a packing, C, and provided with open ended chamber D for the priming.

THE FAVORITE.

Price, \$5.00.

Having reduced the price of these standard instruments, we are now prepared to furnish them to amateurs, students, academies, &c., with battery, connecting wires, chemicals, and one copy of "Telegraphy Made Easy," for \$6.50. Will be sent by Express, C. O. D.

Just published, "TELEGRAPHY MADE EASY." Sent to any address on receipt of 25 cents.

Address,

ISAAC HALL,

43 Centre Street, New York,

Manufacturer of Telegraph Instruments.

REPAIRING, JOBBING, &c., AT REDUCED RATES.

IMPORTANT TO INVENTORS.

Inventors of Electrical and Telegraphic arrangements are invited to communicate with the

ELECTO-MAGNETIC MAN'FG CO.,

36 Broad Street,

(P. O. Box 1,804),

NEW YORK.

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS

of every description, at

No. 54 SOUTH FOURTH STREET,

(Corner Chestnut street,)

PHILADELPHIA.

They solicit the patronage of their friends and the telegraphic fraternity generally.

 Manufacturers and Dealers in
TELEGRAPH INSTRUMENTS AND SUPPLIES.
 RELAYS, unequalled for beauty and strength;
 COMBINATION SETS; BOX and POCKET RELAYS.
 CHALLENGE, PONY and REPEATING SOUNDERS.
 KEYS, various styles, including the SCHNEIDER KEY, just
 out, no legs, wire connections above the table.
 REGISTERS, with SPRINGS or WEIGHT.
 CUT OUTS, many varieties, including a new style of PEG CUT
 OUT, with an adjustable LIGHTNING ARRESTER, just out.
 REPEATERS—HASKIN'S AUTOMATIC, and others,
 SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES
 and LIGHTNING ARRESTERS.
 ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also
 SELDEN PRINTER.
 ELECTRIC BELLS, HOTEL ANNUNCIATORS, FIRE and BURGLAR
 ALARMS, and WATCHMAN DETECTORS.
 ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHT-
 ING APPARATUS.
 MEDICAL INSTRUMENTS and APPARATUS on hand and made
 to order. Second hand instruments for sale cheap,
 and repairing done at short notice.
 BATTERIES in great variety, including the latest inventions;
 also a full assortment of battery material.
 WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE
 WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED
 LINE WIRES; SUBMARINE, SUBTERRANEAN and
 HOUSE CABLES.
 INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.
 BRACKETS, PINS and SPIKES, TELEGRAPH POLES,
 LINE BUILDERS and REPAIRERS' TOOLS.
 TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANI-
 FOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES,
 ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and
 AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
 PRICE LISTS FURNISHED FREE ON APPLICATION.
 Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are
 elegantly finished and mounted on highly polished rosewood,
 mahogany and walnut bases.

CHAMPION BURGLAR ALARM
 AND ANNUNCIATOR COMPANY,
 40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout
 the country to act as our agents for the introduction of our
 superior BURGLAR ALARMS and ANNUNCIATORS into pri-
 vate houses, hotels, banks, &c. Upon receipt of plans of houses
 we will send skilful mechanics to estimate upon work, or will
 give any information in writing that may be required, *Liberal*
commissions will be paid upon any orders that may be secured for
us. Our Alarms and Annunciators have just been awarded the
FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to
 the Secretary.

CORNELIUS ROOSEVELT, Secretary and Treasurer,
 40 West 18th Street, New York.
 L. G. TILLOTSON, President.

 and Labor at last Secured.**

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the
 manufacture and sale of the

EAGLES METALLIO BATTERY,

now offer them to the public as the best Battery for Telegraphic
 and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the
 battery. Sulphate of copper is the only chemical required to be
 used.

These Batteries have been fully tested during the last year,
 although only recently offered for sale, and have proved to be
 superior to any other as regards efficiency, economy and dura-
 bility. When once set up they require no attention for from
 four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for
 running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
 saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon applica-
 tion to

F. L. POPE & CO.,

(P. O. Box 5503.) 38 VESSEY STREET, N. Y.

**LECLANCHE
 BATTERIES.**

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will
 allow TWENTY CENTS for each
 used-up Porous Cell of this Bat-
 tery that are returned to us free
 of charge, in good order. A
 change is made in the discount
 to the trade. A list will be fur-
 nished on application to

Omaha, Neb.,
Philadelphia, Pa.,
Pittsburg, Pa.,
Portland, Maine,
Peoria, Ill.,
Providence, R. I.,
Quebec, L. C.,
Rochester, N. Y.,
Richmond, Va.,
St. Louis, Mo.,
St. John, N. B.,
Springfield, Mass.,
San Francisco, Cal.,
Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THEIR CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING, HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, FEBRUARY 20, 1875.

VOL. XI. WHOLE No. 449.

[Written for THE TELEGRAPHER.]

Adieu to "145."

By J. J. McD.

FAREWELL old honored spot, a long farewell;
"Tis loath, indeed, we are to part with thee;
No more within thy time-stained walls will dwell
Those bygone scenes of merry jest and glee,
Where oft, in bright and happy days long past,
Full many heroes of the art have trod;
But now, their gladsome voices hushed at last—
Their forms lie mouldering 'neath the green cold sod.
And as—like some delightful happy dream—
They faded from thy precincts day by day,
Borne upon life's surging, troubled stream,
Others as swiftly came and passed away.
And thus, for years and years, hast thou beheld
The many changes in time's ceaseless flight;
That though they but a single moment dwelled,
Have known the comforts of thy genial light,
In thee, old home of telegraphic lore!
Uncultured genius to perfection grew,
And, master of thy mysteries, to thy door
Oft bade a last and loving fond adieu.
No more beneath thy dear old roof will sound
The well known *click*, that to the practised ear
From far away, o'er land and ocean bound,
Hath spoken oft the tale of love and cheer.
Or told of loved ones gathered to the tomb,
Or brought sad tidings of disaster dire,
To cast o'er all a sudden, mournful gloom
Where'er 'twas borne upon the magic wire.
And now, forever buried in the past,
Thy noble, faithful, duty's done and o'er—
The march of time has brought the hour at last
When we must part with thee forever more.
But though the future many changes bring,
Until the golden sun of life shall wane,
Fond recollections to our hearts will cling,
And bring thee back in dreams to us again.

Original Articles.

Bits of Reminiscence.

By JOHN OAKUM.

ALL readers of THE TELEGRAPHER are familiar, no doubt, with the story of the sensation created in Syracuse some years ago, by the *Star* publishing what Jack Selden told its credulous local editor, by wire, one Sunday night about Barnum, the giraffe and the Old Number 5 hand engine. If there be any who are not, let them seek out that genial telegraphist, fisherman and philosopher, and get the story from his own lips; no one else could do it the shadow of justice. But there have been other instances in which newspapers have been made the victims of circumstances owing their origin to telegraphic causes. Some years ago a rural reporter for the Associated Press sent to the New York Agency a despatch as follows:

"Thomas Barnard was found lying by the roadside near here yesterday, apparently frozen to death. Arrangements were made for his burial, when, to the surprise of the authorities, he revived just as he was being lowered into the grave. To-night he is sitting in the Central Station thinking of earthly things."

Now, I cannot attempt to explain what the author of that despatch meant by his concluding words. I remember in earlier years when an *attache* of a struggling morning paper that our editor-in-chief, who had been a minister abroad under President Buchanan, and whose circle of friends was large, occasionally came back to the editorial room under the influence of considerably more champagne than he could conveniently manage. On these occasions he invariably attempted a "leader" on some sublime theme, and not infrequently he would call one of us to him and in his dignified and pleasant manner would say; "Read that (pointing to what he had written), and see if it's all straight." On being told it was straight enough, but that it ended in the middle of a sentence he would close one eye in a most comical manner and remark confidentially: "That's it, that's it, my son; I've soared so high I can't light in my present condition." In other words, the wine being in the wit was out, and he hadn't the requisite clearness of head to bring to an intelligible close what had been so bravely begun. The correspondent alluded to above was, I infer, in a similar predicament from a lack of experience in rounding sentences, or from some other cause,

and having got his man into the station house, knew of nothing to add except "thinking of earthly things."

Without discussing that point further, suffice it that the despatch came to hand in the form given, and though editors of press telegrams are supposed to be educated in a sort of Gradgrind school, and to be men of facts, with no element of sentiment or humor in them, they do sometimes depart from the straight and narrow path in which they generally plod their way. This was a case in which the temptation to let a good thing go intact was yielded to, and so the despatch got refiled for Pittsburg, Cincinnati, Chicago, and the west generally, without undergoing a curtailment of its funny part. The "boys" along the line recognized its humorous side, and each had something to say. The operator at Chicago "opened" and made some flippant remark, which New York did not catch, owing to the high adjustment of Cleveland's repeater. The natural result was that New York asked Cleveland: "What did he say?" To which the latter replied petulantly. "Oh, go on; he said he would take sugar in his." New York, with a laconic "i, i," proceeded, and no more was thought of the matter until the next week, when quite a little disturbance was raised, and an inquiry instituted on the basis of the following, which had appeared in a Pittsburg paper:

"Thomas Barnard was found lying by the roadside near here yesterday, apparently frozen to death. Arrangements were made for his burial, when, to the surprise of the authorities, he revived just as he was being lowered into the grave. To-night he is sitting in the Central Station thinking of earthly things. He says he will take sugar in his."

During the war of the rebellion I remember a similar occurrence, though hardly as funny. New York was sending an account of a battle, and was saying: "His horse was shot from under him," when some one "broke" and said "g. a. horse." New York, evidently disgusted with the frequent breaking, did not proceed, and a mischievous chap of my acquaintance, who was reading Dr. Holmes' "Elsie Venner," and who was much taken with the narrative in that part where Bernard Langdon shoots Dick Venner's horse as that worthy attempts to throw the fatal lasso over Bernard's head, opened his key and went ahead from the book: "And the wild horse of the pampas was buried 'neath the turf by the wayside in the far off New England." The description of the battle appeared that afternoon in the *Fall River News* as follows:

"His horse was shot from under him. And the wild horse of the pampas was buried 'neath the turf by the wayside in the far off New England. At least three thousand prisoners," etc.

"My next," as the inventors of enigmas say, is not a telegraphic story, but the affair took place in the customers' department of a telegraph office, and perhaps that will admit the story to telegraphic circles. A gentleman who had been connected with establishing the old National line of stage coaches through the West was narrating to some friends how, on one occasion when their own team was broken down, the wagon of a farmer had been appropriated by some of the surveying party, whereat his "bucoic nibs" was considerably incensed. The gentleman who was telling the story was then in command of the men, and, returning to the scene of the accident and disturbance, sought to allay the farmer's indignation, telling him no harm was intended, that the use of the wagon was actually necessary, and would be paid for with pleasure, etc. This put a different face on the matter, completely taking the starch out of the man of agricultural pursuits, who hemmed, and hawed, and asked if the gentleman thought twenty-five cents would be too much. He was rewarded with a shining half dollar, and a silver quarter was bestowed on each of his tow-headed progeny, of whom there were seven or eight standing about. As the gentleman went on with his story a strong bodied, rough visaged Teuton, who sat waiting in the window seat for an answer to a message that he had sent, expressed the liveliest interest in the narrative, and seemed to grasp the essence of all the humor there was in it. And when the gentleman concluded by telling how surprised and delighted the whole family was, and said that the half dollar to the old fellow and the quarters to the children came like sunshine in a shady place into their simple lives, the face of cousin German indicated plainly that the tender spot was down in his heart of hearts was touched. The gentleman, perceiving he had entrapped one more auditor than he had counted on, made his acknowledgments, as a matter of courtesy, by turning to Dutch and saying, blandly, "Those were primitive times, you know, PRIMITIVE times, sir."

"Yah, dot is so," responded old mahogany head, "dose railroads ish hell."

Troubles are like dogs—the smaller they are the more they annoy you.

Are Rules made for Managers to Observe, or only for Employes beneath that Rank?

BY OCCASIONAL.

It has been my fortune, or misfortune (as you may please to term it), during the fifteen years I have been in the telegraph business, to be employed by almost every telegraph company that has lived and died during that time, in almost every capacity, from manager to messenger (not excluding battery and repairman). I have also been a member of the telegraphic staff of a number of the prominent railroads of the country. The rules of nearly all of them, in regard to the conducting of the business connected with the operating department, are so nearly alike that it is not necessary at this time to particularize or name any certain company.

It is a fact conceded by all intelligent thinkers that the manager who keeps his department within the bounds of the rules laid down for the governing of the same is the *best* manager, and more especially is this the case where infractions of the rules are treated with the greatest severity and rigor. There is a rule, however, that I would like to call attention to, as its non-observance by many of our well known managers has caused it to be almost entirely disregarded by many operators. It will be found on page 21, Western Union Book of Rules—rule 34, and reads as follows: "Profane, obscene, or other ungentlemanly language will not be allowed upon the wires nor in the offices of this company."

Could anything be plainer than that in its language? Was it not evidently the intention of the framers of that "Western Union" rule (which has been adopted on telegraph lines all over the country) that ladies and gentlemen might perform service in the same room in any office of that company and not be obliged to listen to profanity, obscenity, or other ungentlemanly language?

Should a manager who is daily in the habit of using language classed under any of the three heads named in this rule be called a *good* manager? I think not. What should be the duty of employers who see this rule trampled upon day after day, while other rules of less magnitude are enforced with the most radical severity? I am of the opinion that *every* rule should be observed to the letter, and I do not think that *any* manager, no matter what length of time he has served the company he has the honor to represent, should be considered a good and efficient manager if he allowed any rule to be treated with impunity by his employes.

Now, if this is the case, if such conclusions are true, what shall be said of the manager who himself disobeys this rule?

My attention was called recently to one of this class, who, upon the slightest provocation, "pours out the vials of his wrath" upon the devoted head of the offender. In ungentlemanly language, do you ask? Aye, worse, by far; the most profane language is used. Now, suppose the offender had manliness enough to retort, and use the same kind of language, what is the result? He violates not only a standard rule of the company, but is also guilty of insubordination to his superior, and, of course, he must apologize or be degraded, resign or be discharged. "Consistency, thou art a jewel but rarely found" attached to "*red tape*."

Are rules made for managers to observe, or only for employes beneath that rank?

Will some of our worthy superintendents (I am proud to say there are such) answer this interrogation?

The rule should either be observed, stricken from the book of rules, or else an amendment appended, allowing managers to swear at their employes when they feel like it. In either case it would be better understood than as it now stands.

Who Was He?

A YOUNG railroad telegraph operator residing in Harrisburg was not long ago sent to call a conductor at eleven o'clock at night. He wasn't quite familiar with the location of the conductor's house, but he thought he would make a guess, and probably he would hit the right one. Going down the street on which the conductor resided, he carefully noted the houses until he thought he had the right one. Stepping up to the door he gave the bell handle a yank that almost broke the wire, and then he stood there knocking his heels against the door steps, waiting.

Presently the door opened, a female form appeared, two arms were clasped around his neck, a pair of lips were pressed several times to his cheek, and a low voice murmured: "Dear John, I thought you were not coming to-night; it was so late!" "Thunder!" exclaimed the astonished telegrapher, "I ain't John!" There was a shriek, a girl vanished, a door slammed, and the telegraph operator was left standing on the steps in utter bewilderment. Sadly he retraced his steps to the depot, and once there he vowed never more to hunt a man, unless he had the number of his house down fine.

Congress and the Telegraph.

WASHINGTON, D. C., February 17.

TO THE EDITOR OF THE TELEGRAPHER.

THE active and bitter contest which has been inaugurated between the Western Union and the Atlantic and Pacific Telegraph Companies has made telegraph matters in connection with Congress more lively than they promised to be a few weeks ago.

The bill introduced by General Butler in the House, regulating the telegraphs of the country, which was referred to the Judiciary Committee, has been reported back by him from that committee. This bill is accompanied by a report, the object of which is to show that it was originally proposed to control, if not own the telegraph, as part of the postal service of the country, and that the right and power of the Government to do this in the interest of good government and for the prevention of monopolies, either in prices of transmission of intelligence, or by superior advantages of early intelligence, which shall give one man an undue, unnatural and fraudulent advantage over his fellows in carrying on the exchange of commodities among the people, or in affecting the value of securities of the Government, in whichever way it may be stated, is complete under either the third or the seventh clause of the eighth section of the first article of the Constitution. The report proceeds to criticise at some length the business arrangements between the Western Union Telegraph Company and the New York Associated Press, and asserts that the former "can crush out or buy up all rival lines whenever it desires to do so," and that every leading journal must have full reports both of general and commercial news, and that they can only be obtained from the Associated Press, and by compliance with whatever rules and regulations it may dictate. A refusal to comply with them would be the loss of telegraphic news, of readers, of advertisements and of subscribers.

The bill and report were recommittees and ordered to be printed. There is little probability that they can receive consideration and action at this session, of which only about two weeks remains. Legislation is very backward, several important appropriation bills yet remaining to be acted upon, in addition to other important and pressing matters. Among other bills the Army Appropriation Bill is sure to lead to protracted debate, and this has but just been reported.

A more significant movement is the resolution introduced by Mr. Dawes in the House on Monday last, which was adopted, as follows:

Resolved, That the Committee on the Judiciary be directed to inquire if the Western Union Telegraph Company have refused to transmit despatches for the American Press Association, or any other parties among the several States, on account of criticisms by such association on said telegraph company, with power to send for persons and papers, and to report by bill or otherwise.

This action is understood to have been caused by the refusal of the Western Union Company to send reports to certain papers formerly supplied by the Pacific and Atlantic lines, under a contract which was continued by the Western Union Company after it had absorbed the P. and A. lines. It is charged that a despatch having been sent by the American Press Association which reflected upon Mr. Orton, the latter suddenly terminated the contract and deprived the papers referred to of any news reports unless obtained through expensive special despatches.

In the Senate last week Mr. Dorsey, from the Committee on Post Offices and Post Roads, reported with amendments the bill recently introduced by him to establish certain telegraphic lines in the several States and Territories, and to regulate the transmission of commercial and other intelligence by telegraph, which was placed on the calendar.

On Monday of last week an important Act, explanatory of the Page Patent Act, which was introduced on the 18th ult. by Mr. Spencer, referred to the Committee on Patents, and recently reported favorably from the committee, was taken up and passed. Subsequently Mr. Conkling, of New York, moved to reconsider, on the plea that he wished to be heard on it, and his motion was agreed to, which ties the bill up for the present. It enacts "That the Act approved March 9th, 1868, authorizing the issue of a patent for 'induction apparatus and circuit breakers' shall not be construed as authorizing the issue of a patent for any invention applicable to telegraphic apparatus; and any issue, under color of said Act, of letters patent for any such invention applicable to telegraphic apparatus, is hereby

declared to be null and void, as contrary to the meaning and intention of said Act of March 9th, 1868."

The lack of time may prevent the final passage of this Act, but the action of the Senate will no doubt have an important influence on pending litigation to enforce the Page patent.

President Orton, of the Western Union Telegraph Company, spent several days in this city last week, laboring to counteract the efforts which are being made to obtain legislation of an unfriendly character to the Western Union Telegraph Company.

CAPITOL.

Dull Times at the State Capital.—A Successful Burglary.—Automatic Telegraphy in Albany, etc.

ALBANY, Feb. 9.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE been waiting, like the immortal "Micawber," for something to turn up, but as this is a place where "few die and none resign," there appears to be little probability that anything very startling will soon occur, and as it seems useless to wait for it any longer, I send along what there is, before it becomes too stale to be palatable.

Notwithstanding the presence of the Legislature, Albany is quite dull this winter; the Senate and Assembly having comparatively little business to be transacted, and business generally being very poor.

Mr. Waterbury, of the night force, has been on the sick list for several weeks, and was for nearly two weeks unable to work, during which time Mr. C. C. King, of the day force, performed double duty, thus "scooping in" the extra.

The house of the well known Superintendent of Repairs, Mr. Geo. C. Thompson, in Bath-on-the-Hudson, was entered by a burglar on the night of the 3d inst. The burglar picked two locks and one pocket, getting about twenty-five dollars. Just as the gent. was leaving the house, Mrs. T. awoke and roused her husband, who seized his revolver and gave chase, but as the weather was a little too frigid to think of going far in "nature's airy garb," George concluded to let him go.

The damages caused by the late fires have been substantially repaired, "and yet we are not happy;" we still long for a marble palace with velvet cushioned elevators to waft us to our aerial abode. The prospects are, on the contrary, that should the old rookery called the Museum Building burn down, we might stand a chance of being obliged to work for the State awhile, as there is a report in circulation, outside of the telegraphic circles here, that "all the telegraph operators want their office to burn down," which puts us in rather an unenviable light.

The A. & P. have introduced the automatic system here and are apparently preparing for a vigorous campaign. The reduction of rates, which is advertised to take effect the 15th inst., will reduce the tariff on messages between here and New York from forty to twenty-five cents. This early reduction of rates is considered by some to be an almost suicidal act, but the result is yet to be seen.

As war is inevitable, we say: "Let it come," it cannot do us much harm—it may do us much good—it will at least solve the much discussed question as to the value of the automatic system.

The T. M. B. Association is in a flourishing condition here, there being fourteen good paying members attached to this agency. This we consider a fair showing in proportion to the number of telegraphers hereabouts. One fact is noticeable, *i. e.*, that they are all now employed or formerly were employed by the W. U.

Those who have formerly worked in this office will rejoice with us on learning that on January 1st the use of soft paper blanks for copying repeated messages became a thing of the past, all business being now copied on No. 1 blanks with pen and ink.

The name of our very popular chief operator, Mr. Morgan, got rather badly mixed up a few days ago, somewhat like this: An operator on a city line inquired if the chief (giving his name) was in. The question was translated as follows: "Is that (tt) organ in?" As we could produce nothing in the musical line except a pair of drumsticks and a speaking tube, he was informed that the organ wasn't in. Nevertheless the room resounded with vocal music when the blunder became known.

Here's one that was discovered before it was too late: as received, "Lilly Oweu;" as corrected, "D. McEowen."

DOUBLE-SIX.

Severe Storm.—Telegraph Lines Damaged.—An Error Corrected.

February 7.

TO THE EDITOR OF THE TELEGRAPHER.

FOR the past two days we have experienced one of the worst storms we have had in several years. A

great many of the wires were more or less affected with the electrical storm; some were broken and others so badly crossed and mixed up as to greatly impair telegraph facilities. The St. Paul and Sioux City R. R. line was down nearly two days, and nearly all the lines in the northwest worked badly. The snow fell and drifted in some localities to a great depth, badly blocking up the roads. All regular trains on the St. Paul and Sioux City Road were abandoned on the first and second, and passenger trains that had just started out turned back. It was reported there was 4½ feet of snow fell on the level in Green Bay and Oshkosh, Wis., and the snow in the former place was drifted to the depth of 8 feet in some of the streets, completely suspending travel and some kinds of business for a time. The thermometer was down in the twenties at these cities. At Winona about 2 feet fell, drifting 4½ feet in the streets of that city. At St. Paul and Minneapolis only about 6 inches fell; but, strange to say, it drifted to the depth of 2½ to 3 feet in the streets and at different points on the railroads leading out of those cities.

In a former communication, in referring to the Telegraph College of the Valentines, at Janesville, Wis., I said that it was reported that an arrangement was made by some of the telegraph officials of the Northwestern Railroad to give situations to the Valentine graduates. This was an error on the part of my informant, as the railroad he referred to is in Iowa, and not under the control of the Northwestern Railroad telegraph department. That such an arrangement does exist on an Iowa road I am positively informed; but, as far as I can learn, no bonus has been paid to any one or by any one officially connected with the road I intended to name, except you call station agents officials, as several of them have arranged for some of the students named, and they are the only ones I have ascertained as having done so. Until I have positive proof that the officials of that road are connected with "the fraud," I shall refrain from naming the road.

I regret that the name of the Railroad was erroneously reported to be the Northwestern, as no railroad in the country has the telegraphic department so well managed, or, at least, any better than the Northwestern, and no more faithful and honest a telegraph Superintendent can be found than Mr. Thayer. The correcting of this error where Mr. Thayer is known is entirely unnecessary, as he is too well and favorably known there to have an anonymous communication affect his character or standing as a Supt. and gentleman; but there may be those who do not so familiarly know the gentleman, and I make the correction to obviate all chance for any misunderstanding. NORTHWEST.

The Telegrapher Imposed Upon.—Correction of a "Fishy" Item.

ALBANY, OREGON, February 1.

TO THE EDITOR OF THE TELEGRAPHER.

IN the issue of THE TELEGRAPHER for January 9th there appears in the "Personal" column an item fully illustrating the advantages of "going away off" for news from "hum." The item referred to states that "J. M. Fish, formerly of Salem Railroad office, had been promoted to the chief operator's position on our road." This is certainly news to us fellows here, who have had no notice of the change (?) until it appeared in your columns. This information is false, and whoever wrote it knew it to be so at the time, and for what purpose it was imposed upon you I know not, but think the ghost of the scoundrel who some time ago imposed upon you the report of "Webfoot's" death is running at large somewhere in Oregon. If I catch him he had better say his prayers on the spot. Such conduct is very low lived and mean, and no one but a lying scoundrel would be guilty of imposing such stuff on a confiding public, and should be caught he would receive the public condemnation he so richly deserves from the Oregon telegraphers. Suspicion already points to a certain person as being the author, and his future action will certainly be closely watched.

I would not have referred to the matter had it not been that some of the boys (knowing I am the only correspondent in Oregon) have twitted me on writing such stuff east; but I have not got so short of material that I have to "make it up," as that item was. Every item written by me has been as near the truth as it could be composed, and I have no desire to do otherwise at this date; but 'spose it's so natural for some people to "prevaricate" that "they" can't tell the truth. As I do not reside in a glass residence I come out flat footed, and if any body gets "struck" I can't help him. WEBFOOT.

The North Pennsylvania Railroad Telegraphers

PHILADELPHIA, Feb. 10.

TO THE EDITOR OF THE TELEGRAPHER.

I WILL try to give the numerous readers of THE TELEGRAPHER an idea of the operators employed

along the lines of this company, the information in general having been kindly furnished me by several of the operators on said lines.

The train being late at Bethlehem, "B," (Junction of the L. V. and C. R. R. of N. J. (L. & S. Div.) Railroad,) I boldly stepped into the telegraph office of this company and soon made the acquaintance of Mr. Clewley, "D," day operator, and Mr. C. A. Hammann, "H." Mr. H. does very little at the art, except in the evenings after "D" leaves, but he is an expert at the business. Mr. Edwards, "V," the genial Ticket Agent, also does a little manipulating now and then. The train having arrived "I made my bow, and made my speech," and boarded the train, and soon thereafter landed at Hellertown, "J," where Mr. Wilson, "W," with a smiling countenance holds forth. Bingen, "B N," not on the Rhine but on the Sacon, is the next station; here a Mr. Sell predominates and is noted for his promptness in reporting trains. We passed a station and soon come to Coopersburg, "C. A.," where Mr. Wambold, "Z," presented himself. The next halting place was Quakertown, "Q," Messrs. Stoneback and "R," have charge of the station and business, the latter being the assistant. Perkasio, "P A," soon came to light after emerging from darkness, there being a large tunnel, through which we passed, near the place. Mr. Hedrick is taking his ease here. The next station I was informed was Sellersville, "S," here Mr. Sellers, "M," and Mr. Beidler, "R," have charge of all the business; the latter named gentleman is the assistant and has just launched into the "telegraph" business. At Telford, "M S," the next station, Mr. Horning, is operator, besides being Ticket, Freight and Express Agent. The stations being situated close together on this part of the road, I soon reached Souders, "S. D." where, after having introduced myself, Mr. Landis, "J C," and Mr. Schuge, "N C" (also called North Carolina), took me in their cosy little office and treated me as if I were U. S. Grant or some other unfortunate being. Hearing "All aboard," I soon was on board and had hardly seated myself ere Hatfield, "C E," hove in sight and a hurried introduction informed me that Mr. Barndt is here taking his leisure in smoking his Habanas, and according to the one he gave me he smokes only good ones. Alighting on the rear platform and after having a good airing (as the rear door was locked, and it was a jolly cold day), I soon heard that we were approaching Lanesdale, "F," Junction of the S. C. and Doylestown Branch roads, both roads being branches of this road, and both running in opposite directions—Morristown being the terminus of the S. C. and Doylestown the terminus of the Doylestown Branch roads. Mr. U. S. Beaver, "U," *alias* United States, and his active assistant Mr. Moyer, "M O," have their hands and heads full. "M O" informed me that Mr. Shute presided over the "Paper Collar machine" at Doylestown, and that no telegraph communication has as yet been made to Norristown; Mr. Coughlin, however, being the agent there, I left him with a "G M," and looking over the time table I read North Wales, "N. W.," where I was soon taken to and where I found Mr. Finney, "D K," *alias* Railroad Finney, and Mr. Yocum, "W Y," *alias* Wyoming, presented themselves as being the brass pounders in the brick palace which I beheld. At the next station, Fort Washington, "G," generally abbreviated "The Fort," Mr. Cravens is Operator and Manager of the business, and kindly conducted me to what is termed a "Pee Wee" train, which stops at every station. After getting on board I soon heard the brakeman sing out Edge Hill, "E H," where I met an old friend of mine, Mr. Leech, the active agent and operator, and a great admirer of the fair sex. Abington, "A," the next telegraph station, is the Junc. of the N. E. P. R. At the terminus of said branch is Hartsville, but no lightning slinger is required there yet, for want of the implements to sling it with, but at Harboro, "H B," on said road, Mr. Reiff gives his "O D." Ax "A," Mr. Sparks, "O," an old timer, and "H," his assistant are situated. After leaving "A," York Road, "K" was soon visible, where Mr. Riegel, "J E," has charge of the grand structure and the business thereof, and is said to be fully able to do it. Next come Erie Avenue, "N P," here the P. R. R. crosses this road; Mr. Stout is the Agent and Operator at this point, and with his well built constitution and with a beaming face he greets all he comes in contact with—I mean fellow mortals. He ushered me into the presence of his partner in the blessings of this life and his little "sounder," I was sorry to leave such good company, and get on board the train which was starting, and soon arrived, as a Dutchman said, at Filidely, (Phila.) Berks and American streets, the passenger depot of this company; Mr. Bumm, "U," and another, Sell or Andy, as I heard them call him, are the operators. The latter is the assistant and was formerly Mgr. of the W. U. Tel. office at Coopersburg, Pa., before accepting his present situation. Mr. Bumm has been operating for over two years at this office and seems to know his place, being a courteous gentleman and bearing a never failing reputation, as his assistant informed me to be a fact. At the Freight depot, Front

and Willow streets, "X," Mr. Utt, "T," and his Mr. Bansch, "M," generally called "Dutch Mike," do the business in the telegraph line for the different officials there. The latter it is said is often the unfortunate victim of jokes and tricks imposed on him by the numerous individuals employed in and around the building, but a glass of beer and a pretzel is said to relieve his anything but pleasant feelings, after having been dearly sold, otherwise they will rise as high as "fever heat." A telegraph office has lately been established at Fifth and Chestnut with Mr. Burus, "J," as operator. At Walnut street office, "N," Mr. Iddings, does the manipulating.

This completes my trip over this road, and I hereby express my gratitude and thanks to the operators along this route for their numerous favors shown to me during my trip.

As this is the first communication from this line, I hope you will excuse its lengthiness, and the grammatical errors contained therein.

Z. Y. X.

Opening of the Southern and Atlantic at New Orleans.—Western Union Promotions and Changes.

NEW ORLEANS, LA., January 30.

TO THE EDITOR OF THE TELEGRAPHER.

THE Southern and Atlantic Telegraph Company have at last completed their line to this city, and have established an office which has been very neatly fitted up, in an excellent location, corner Carondelet and Gravier streets, which is right in the centre of the cotton trade.

Since the Pacific and Atlantic lines were absorbed by the Western Union that company has had a monopoly of the telegraph business of this city, and the public, and especially the merchants, are much pleased to have competition re-established. The A. and S. Company have met with all sorts of opposition and delay in completing the line, but have at last succeeded in overcoming them, and we are assured has come here to stay. Mr. Ed. Leloupe is the manager of the company in this city, and it is an excellent selection.

Mr. D. Flanery, who has for many years been Superintendent of the Western Union Company at New Orleans, has been appointed Chief Constructor of the Southern Division, which embraces all the States south of Ohio, and east of the Mississippi River. New Orleans district has been merged with that of Mobile, under that prince of good fellows, Mr. Merriwether, who comes from Mobile to relieve Mr. Flanery. Mr. James Alleyn, who has been so long associated with Mr. Flanery, now takes charge of the New Orleans Western Union office as manager. General Superintendent Van Horne, of the Southern Division, is here for a few days.

T.

The Protection Life Insurance Company.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR correspondent in Chicago, who signs himself "Insurance," obtained a gratuitous advertisement last week for the Protection Life Insurance Company, and, among other things, exhorts all members of the telegraphic fraternity in want of good and "cheap" insurance to take out policies in the above named company. Being one of the fraternity mentioned, and not desiring to see any of my collaborators in the business deluded out of their hard earned cash, I take the liberty of advising any one in want of more insurance than they have at present to give the Protection a wide berth. I characterize the whole institution as a "delusion and a snare." I have had some sad experience with this very concern, and know whereof I speak. No later than last month our city papers contained a telegram from Chicago of still another judgment against the company. The suit was brought by the widow of one of the company's oldest policy holders and judgment obtained, with the jury out but five minutes. This is but one of many similar cases with companies who pretend to afford such a cheap insurance to their patrons.

When coöperative societies pretend to provide life insurance, if they do not steal the livery of heaven to serve the devil in, they at least raise hopes which are destined to be disappointed. A prominent feature of this class of insurance is the uncertainty of everything connected with it.

The amount which a policy will yield is uncertain.
The amount of assessment is uncertain.
The times of payment are uncertain.
The tenure of membership is uncertain.
The claim to indemnity is very uncertain.
But, among so many uncertainties, there are some things so certain as to be beyond dispute.
It is certain the losses will be greater;
That it will cost more to pay them;
That he who dies first will receive most and pay least;

That he who dies last will pay most and receive nothing;
That the young pay too much;
That the old pay too little;
That the originators of the plan did not understand it;
That it was gotten up to make money;
That the future will repeat the past;
That this plan will ultimately fall to pieces;
That all who have anything to do with it will be disappointed and deceived.

ONE WHO KNOWS.
Not an Insurance Agent.

Winter Sports of Telegraphers on the Rocky Mountains.

SIERRA SUMMITS, Jan. 30.

TO THE EDITOR OF THE TELEGRAPHER.

NOT having seen anything in your paper from this part of the great trans-continental line, and thinking that a communication from the remote summits of the Sierras, where the growl of the grizzly and the mirthful laugh and shout of the snowshoer breaks the quiet winter solitude, would be perhaps acceptable, as showing how telegraphers amuse themselves up here, the following, of which I was an eye witness, is submitted for the benefit of your readers.

Not long since one of our neighboring hamlets was surprised by the appearance of a noble looking youth, stately and graceful as a statue, with a melodious laugh, and whose stories would excite and interest the most dull and stupid, who arrived in their midst to fill the position of night manager of one of the Central Pacific offices situated in those magnificent snow galleries, so well known to the tourist and others seeking pleasure in the beautiful mountains of California. Other gentlemanly members of the fraternity, whom we will style Shanghai and Banty, on account of the dissimilarity in their personal appearance, proposed to the aristocratic operator from New York, styling himself James Aspinwall *alias* old Jim Kearney, to take a little snowshoe exercise. Now, the new arrival was hardly up to the business, and, consequently, the first attempt wasn't an entire success. The trio started down hill together, when old Jim's shoes got the better of him and steered for a stump. Seeing his imminent danger of a collision he made a most frightful jump, such as may be found described in popular dime romances of Indian warfare, where the noble red man makes his dying yell and leap.

The party again ascended the hill with our friend James, heartily wishing all the time that his old friend Burbridge, train despatcher from the east, could be along, so as to enjoy the sport with the boys.

The ascent having been made, it was intimated to James that there might be a difference in the shoes, and another pair was substituted, which resulted in his making another fearful leap.

Providentially no bones were broken, but our hero thinks that wisdom is displayed in the old adage, "Learn to shoot a gun before you go to war." P.

To Correspondents.

HORACE.—Your communication was promptly consigned to the waste basket. You probably never heard of the law of libel. If you desire to make such statements in regard to a person they should be made over your own signature. To endeavor to use the columns of a journal for such a purpose, and carefully conceal yourself under a *nom de plume*, is, to say the least, dastardly and cowardly. THE TELEGRAPHER cannot be used for such purposes.

SOUTHWEST.—Your communication would be a very good advertisement for one of a class of institutions of which we do not approve, and which we consider inimical to the interests of the telegraphic fraternity. If you are, as you say, a subscriber to THE TELEGRAPHER, you will do well to read the notice to correspondents at the head of the correspondence column. Your communication was not dated anywhere in particular, and was unaccompanied by your name and address, which of itself would have insured its passage to the waste basket, even if it had been otherwise unobjectionable.

J. E. S., New York.—We do not know the address of Mr. J. T. Sprague. His residence, however, is in England, and not in this country. The articles on Dynamo-electric machines and induction coils which you refer to were published in the *English Mechanic* and appropriated bodily by the "professor," and printed in his organ without any intimation of the source from whence they were derived.

THE EVAPORATION OF METALS BY ELECTRICITY.—

Mr. Hopkins describes an interesting experiment, which consists in passing a charge of electricity through a very fine thread of platinum, or other metallic foil, the thread being kept in place between slides of microscope glass. The effect of the heat from the electric discharge is to vaporize the metal, which is instantly condensed in a transparent layer upon the cold glass, which can then be studied by the microscope, and can be used in various ways to determine the character of the metal and the peculiarities of the discharge.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, FEBRUARY 20, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,
AT

No. 38 VESEY STREET, New York.

ELEVENTH VOLUME.

The Publisher, in announcing the Eleventh Volume of

THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year.

All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER

is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to or in the interests of no TELEGRAPH COMPANY, CLIQUE or COMBINATION, but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, no LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL
UPON THE
AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore:

ONE COPY, ONE YEAR.....\$2 00
SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) NEW YORK.

Congress and the Telegraphic Competition.

AS WILL be learned from the interesting communication from our Washington correspondent, CAPITOL, the contest between the competing telegraph companies which has recently attracted so much attention crops out in the proceedings of Congress. The backward condition of legislative business and the brief time remaining of the present Congress, will probably prevent any very important action before the adjournment, but there is an evident disposition to hold the Western Union Company to accountability, so far as Congress has the power to do so, for any extreme measures which it may be inclined to resort to for the purpose of embarrassing and crippling its competitors or those who may be regarded as identified in interest with them.

The bill introduced by Mr. BUTLER, the purport of which has already been given in the columns of THE TELEGRAPHER, has been reported to the House from the Judiciary Committee, but we regard it as hardly probable that it can be acted upon before the adjournment. It must necessarily lead to considerable discussion, and for this there is no time. Some of the provisions of this bill are good, but as a whole it cannot meet with approval, and should not pass. As we understand it, it proposes to practically confiscate the property of the telegraph companies, and inaugurates a Government telegraph system, without proper compensation to owners of telegraph property or adequate consideration of their interests.

As every reader of THE TELEGRAPHER is aware, we have opposed Government ownership and management of the telegraphs first, last, and all the time. Our opinions on this subject have undergone no change, and we believe that nine tenths of the public and the telegraphic fraternity concur with us in this opposition. For this reason we are inflexibly opposed to anything looking towards such ownership and management. At the same time we are in favor of any proper and needed legislation which shall tend to prevent any undue and unreasonable restrictions being imposed by any company upon the operations and business of its competitors, and so far as Mr. BUTLER'S bill goes in this direction we regard it favorably.

The resolution offered by Mr. DAVES on Monday last, directing the Judiciary Committee of the House to inquire whether the Western Union Telegraph Company had refused to transmit reports for any papers belonging to or receiving reports from the American Press Association, in consequence of criticism of that company, and to report what legislation, if any, is needed on the subject, is significant. The report of the committee, which was authorized to send for persons and papers, will be awaited with interest. There does not seem to be any great amount of sympathy for the Western Union Company in this Congress, at any rate, and this action is a warning to that company that in the existing contest it must not resort to means which have heretofore proved very effectual in preventing active sympathy with those opposed to it.

The passage by the Senate of the Explanatory Act in regard to the PAGE Patent, relieving the telegraph interest from an impossible burden in consequence of the extraordinary patent issued to Prof. PAGE and his legal representatives, by his former associates in the Patent Office, whether it becomes a law during the present Congress or not, cannot fail to have an important influence upon the pending litigation to enforce that patent. Mr. CONKLING tied it up for the present by a motion to reconsider, and it will very likely fail for want of time, but the readiness of the Senate to pass the act, indicates the estimation in which that patent is held. We hope that the friends of this act of justice will use their best exertions to pass it before the termination of the session.

We regret the necessity for carrying these matters before Congress, as we consider it for the interest of all parties that the contest should be fought out without resort to special legislation for or against either. The

contest, however, is a very bitter one, and personal feeling and interests enter into it to an unusual degree, and no doubt every means will be resorted to to cripple one and advance the apparent interests of the other that shall be possible. It is apparently a war to the death, and the advantages are by no means altogether on the side of either party. The result, so far as the public are concerned, will be a great increase of telegraphic facilities and cheap rates; for the employes, increase of demand for their services, and for the telegraph companies a maximum of business and a minimum of net receipts.

The Automatic Telegraph System.

THE general introduction of automatic telegraph apparatus upon the main circuits of the Atlantic and Pacific Telegraph Company, will soon prove or disprove the reliability of the claims which have been made for it of advantages over other telegraphic systems. It will also solve other questions in connection with it, which have troubled some of our telegraphic friends, especially as to the effect which it will have upon the interests of telegraphic employes. Despite all the assertions and arguments to the contrary, we have never believed that the introduction of the automatic telegraph apparatus would result in diminishing the number of telegraph employes, or unfavorably affect their compensation. Many telegraphers have differed with us upon this point, and unscrupulous enemies of THE TELEGRAPHER have endeavored to use our recognition of the advantages of automatic apparatus to its injury.

It is, as we understand it, the purpose of the Atlantic and Pacific Company to introduce automatic apparatus upon all its main circuits as rapidly as possible, the experiments thus far made with it having already sufficiently demonstrated its advantages. Only through these advantages can the reduction of rates already made, and the further reductions proposed, be justified. It will be noticed that these reductions are upon the routes on which the automatic system is in use, and further reductions will be made as the use of the system is extended.

It would unquestionably have been much wiser for the Western Union Company to have secured the control of automatic telegraphy when it was in its power to do so, rather than to regard it contemptuously as a worthless factor in the telegraphic problem. Feeble and uncertain as were the earlier efforts to develop a system of automatic telegraphy, it was all along evident that time and experience would cure the defects, and that it contained a germ which would eventually develop into a perfected and valuable system. It is not safe at this age of the world, and in the light of past experience, to despise the day of small things. With a good automatic system under its control the Western Union Company would have been invincible. As it is, it has nothing fitted to cope with it. With improved lines, such as may now be had by the use of the improved compound wire and more perfect insulation, the capabilities of the automatic apparatus are almost incredible, and it is a tremendous advantage to the party which controls it.

The Telegraphic Situation.

THE principal belligerent operations in the pending telegraphic contest at the present time are being carried on at Washington in efforts to obtain some Congressional action affecting the interests of the Western Union Company. From such information as we have been able to obtain, as we have elsewhere stated, we do not think that in the short time which remains any radical, important or definite action can be had, but until the session is over it is probable efforts to that end will be continued.

On Monday last the reduction of rates over certain important telegraphic circuits, as detailed in the last number of THE TELEGRAPHER, went into operation.

The Western Union Company reduced at the same time, over the same routes, and to the same figures as its competitor. No more, no less. The Executive

Committee of the Western Union Company have authorized the President in his discretion to reduce the rates over routes which are covered by competing companies. So far that company has only followed the lead of the opposition in the matter of reductions notwithstanding Mr. ORTON's assertion that when his company did begin to cut it would be "to the blood."

Matters are gradually becoming more settled in the new Western Union building, but there is yet a great deal of work to be done before it will become entirely comfortable for occupation.

The reorganization of the Atlantic and Pacific lines, under the changed circumstances and conditions of the business, is proceeding as rapidly as possible. There is necessarily a great deal to be done to get the company in order for an active, bitter and prolonged contest, but it is gradually being accomplished satisfactorily.

Undoubtedly both parties now fully appreciate the magnitude of the contest which is before them, and while there is no very obtrusive demonstration on either side, both are at work strengthening themselves for the task, which is likely to tax their respective resources and energies to the utmost.

The Death of an Early Telegraph Inventor.

THE death of HARRISON GRAY DYAR, which occurred at Rhinebeck, N. Y., on the last day of January, is an event worthy of special mention, from his early connection with the invention of the electric telegraph. The statement which we print in another column gives the facts in relation to Mr. DYAR's connection with telegraphic invention, some of which will, undoubtedly, be new to most of our readers.

Mr. DYAR was, as it appears, twenty years ahead of Prof. MORSE in inventing and actually operating a practical electric telegraph system, and it is claimed for him that to him actually belongs the honor of being the inventor of the electric telegraph. His decease brings up anew the discussion of the question of the invention, and the evidence seems certainly very strong that to Mr. DYAR rightfully belongs the honor.

The change which has taken place since those efforts half a century since to develop the telegraph, and the present time, when it has become a universal and indispensable agent of civilization, is so great as scarcely to be realized by the present generation. Sir FRANCIS RONALDS, in England, and HARRISON GRAY DYAR, in America, were in advance of their age, and only as their connection with life is severed are their great achievements recognized.

The "Nondescript" Edison Organ.

THE "nondescript" organ of T. A. EDISON is no longer published in the post-office box of the Western Union Telegraph Company in this city; and one of its publishers and nominal editors has wisely withdrawn from his connection with it. In justice to the Western Union Company and Mr. ALLEN, the retiring proprietor, we make this announcement, as both are entitled to the credit of withdrawing their countenance from such a disreputable concern.

The "nondescript" still retains its proud preëminence as the only organ of the great professor of duplicity and quadruplicity, since the defection of EDISON from the Western Union interest has relieved the *Journal of the Telegraph* from that unpleasant position. It continues to laud the professor as the great telegraphic "I Am" and embodiment of all electrical and telegraphic ability and wisdom.

In keeping with its character and association, it displays its wonted economy of truth. We certainly never dignified it by crediting it with being a sub-organ of the Western Union Company. Whatever criticisms we may at times have felt called upon to make of that company, we never so grossly maligned it as that. We cheerfully concede to the "nondescript" all the credit it can derive as either an organ or sub-organ of

the professor of duplicity and quadruplicity. Neither have we, as it asserts, credited EDISON with being the "great professor of automatics." We have too much regard for the truthful character and the reputation of THE TELEGRAPHER for that.

The man is worthy of his "organ," and the "organ" of the man. Those who know either or both will appreciate the compliment (?)

Not Guilty of Bribery.

We have received a communication from VALENTINE BROTHERS, of Janesville, Wisconsin, denying the statement of our correspondent, NORTHWEST, that they had bribed or offered to bribe some operator to recommend their school, and tell applicants he learned there, and defying the writer to prove his assertion. As we have no desire or intention to do injustice to any person, we cheerfully give them the benefit of the denial.

Personals.

Mr. CHAS. D. HOYT has retired from the position of Chief Receiver of the Cable Department of the Western Union Telegraph Company, New York, to engage in mercantile business.

Mr. JOHN B. OLTMAN has been appointed Chief Receiver, Cable Department, Western Union Telegraph office, New York, in place of Mr. CHAS. D. HOYT. This is an excellent appointment, and the promotion is well earned by many years of faithful service to the company.

Mr. JOHN SHIRES has been transferred from the Delivery Desk of the Western Union Telegraph office, New York, to the Receiving Department, same office, in place of Mr. OLTMAN.

Mr. FRANCIS CLAIR succeeds Mr. JOHN SHIRES in charge of the Delivery Department, Western Union Telegraph office, New York.

Mr. T. G. KENNEDY is Night Chief Operator Southern and Eastern Circuits, Western Union office, New York.

Mr. ALBERT E. SINK has been appointed Night Chief Operator on Western Circuits, Western Union main office, New York.

Mr. S. S. BOGART, Jr., has been transferred from night to day Chief Operator of the Erie and Pittsburg Circuits, New York Western Union office.

Messrs. DENNIS HARMON, Jr., CHARLES F. HUTCHINSON and E. J. FULLUM have accepted positions in the cable department, Western Union New York office.

Mr. O. J. DEALY, Manager of the Cable Department in the Western Union office, New York, has resigned.

Mr. E. A. LESLIE has been appointed Chief Operator of the Cable Circuits in the New York Western Union office.

The Telegraph.

By Cable.

TELEGRAPH CABLE STEAMERS FIRED UPON.

MADRID, Feb. 16.—The Carlists on the northern coast have again fired on steamships engaged in the telegraph cable service.

The Gold and Stock Telegraph Company.

THE difficulties and litigation which have existed between the Gold and Stock Telegraph Company and the Manhattan Quotation Telegraph Company have been adjusted, and the two companies will hereafter work in harmony with each other. This is not a consolidation, but a working arrangement between the two companies in their mutual interests. Both will still be maintained and serve their respective patrons as heretofore.

From the first of March next the charge of the Gold and Stock Company to brokers and others furnished with quotations will be increased from \$10 to \$20 per month. Previous to the competition between the two companies the charge was \$6 per week. Twenty dollars per month is regarded as a reasonable price for the service rendered, and as cheaply as any company can afford to do the business in a satisfactory and effectual manner.

The Manhattan Company has never reduced its nominal charge to its customers.

Notes from the Western Union.

It is rumored that the iron flagstaff on the tower of the New Western Union Building was one of the "heads of difficulty" between President Orton and General Eckert, which the latter referred to in his "keerd." General E. said it wasn't strong enough, and President O. insisted that it was, and more too. How sad the former must have felt, when he gazed from the windows of the opposition on Thursday last, and saw that flagstaff bow before the gale (being weak in the roots) till it stood at an angle of 60 degrees, like a damaged lightning rod. Such omens are uncomfortable. As the philosopher remarked, "I utterly disbelieve in them, of course, but still I had a *leetle* rather not see the new moon over my left shoulder."

A gentleman from the third floor was escorting a vivacious and beautiful lady friend through the grand operating room the other day. She wanted to know why there was a week's washing hung up to dry across the room. Her gentlemanly *cicerone* explained the supposed object of it. "Bnt" she continued, "is it to keep the boys from looking at the girls, or the girls from looking at the boys?" He supposed it was the former, of course. "Well," persisted his fair companion, "if they are so homely you don't want the boys to see them, why don't you have them wear masks? It's a shame to make this palatial room look like a washerwoman's back yard!" The gentleman promised to submit this ingenious proposition to Mr. Mumford.

We don't believe a word of the story about a quarrel between Tillotson and the Centaur Liniment man about the monopoly of putting advertisements on the elongated clothes-horse in the new operating room. Still there can be no doubt something ought to be done to increase the business of the "department."

A scientific gent, who was inspecting the Western Union Building, mistook the Phelps transmitter in the C. N. D. for the celebrated quadruplex. When Van assured him that it was a much bigger thing, inasmuch as it was capable of transmitting a despatch in twenty different directions at once, simultaneously, he was astonished, and got out his note book and pencil. Happening, unfortunately, to lay his hand on one of the brass knobs, and getting 250 cups of "fluid" through his fingers, "sddent like," he bolted down stairs like a streak.

Proposed Consolidation of the American District and Fire Alarm Telegraph in San Francisco.

THE American District Telegraph Company of San Francisco, through its President, Mr. George S. Ladd, has made a proposition to the Board of Supervisors to take charge of the Fire Alarm Telegraph of that city, and to connect it with the District System. The proposition appears to be that the city should appoint and pay the employes specially required for the Fire Alarm Telegraph service, but that the District Company should take charge of the lines and apparatus and maintain them, returning them at any time they should be required to do so to the old quarters, without cost to the city.

What the advantage is to be to the company does not very plainly appear, but the proposition is strenuously opposed by Major Hammond, the General Manager of the Atlantic and Pacific Company in California.

The matter has been discussed at several meetings of the Supervisors, Mr. Ladd appearing for the District Company and Major Hammond for the Atlantic and Pacific Company in opposition. During the contest Major Hammond offered, on behalf of his company, to take charge of the Fire Alarm Telegraph and maintain and operate it without cost to the city.

At the last advice the matter was still under consideration.

The Guatemala, Central America, Telegraphs.

THE Government of Guatemala has made a contract with Mr. Stanley McNider for the construction of about three hundred miles of telegraph, in addition to the lines contracted for by Mr. McNider in October, 1872. The new lines will give the Government and the public prompt communication with the towns of San Marcos (office opened Jan'y 8), Huehuetenango, Quiche and Jalapa, and the Atlantic port, Izabel, and place Guatemala on a footing with the most advanced countries in telegraphic facilities.

Reduction by the American District Telegraph Company.

AT a meeting of the Directors of the American District Telegraph Company, held on Tuesday last, it was resolved that on and after March 1st the rental of instruments to subscribers should be reduced from \$2.50 to \$1 per month.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended January 23d, 1875, was 342,067—an increase on the corresponding week of last year of 17,467.

At the half yearly general meeting of the shareholders of the Eastern Telegraph Company in London, January 28th, the Chairman said that the company had at last succeeded in getting a direct line through France, and the company would now have exclusive use of another reliable route to Egypt and the East. He also stated that at the present time there were only 23 messages a day to Australia.

Direct telegraphic communication is now established between the Bourse in Paris and London, and it is notified that all telegrams intended for the Paris Bourse should be written on the forms expressly provided for this service, which can be obtained on application at that office.

The Faraday, steam telegraph ship, will not return to Woolwich, as expected, but will shortly proceed to the North, in order to undergo some repairs rendered necessary by the heavy weather she has recently encountered.

The Central American Telegraph Company have received a telegram announcing the arrival of the steamship Hooper at Cayenne with the cables to duplicate the system of the West India and Panama Telegraph Company, and to complete the service between that port and Demerara. The cables are reported to be in perfect condition.

In Peru the telegraph question continues to be debated in Congress. A number of the members are opposed to the management of the lines passing into the hands of the Government, but it is probable that the measure will be carried.

Advices from Bogota state that Mr. Stokes, a representative of an English Submarine Telegraph Company, is at the capital to obtain a concession to lay a telegraph cable along the west coast of Columbia.

In Guatemala the telegraph has been extended to the City of Quezaltenango, which puts the capital in communication with the commercial and agricultural centre of the departments of Altos, one of the finest sections of the Republic. From Quezaltenango lines are constructed to San Marcos and to the port of Champerico.

Telegraphic and Electrical Brevities.

THE Pennsylvania R. R. Co. will introduce a new telegraphic arrangement for wrecking cars, consisting of a small table with a sloping cover, upon which the instrument will be placed. Beneath the table is a reel of cable wire, and upon the cover a patent clamp for severing and making connections. Each wrecking car will be supplied with the instrument, and connections may be made and communications opened in five minutes after arriving at any point upon the road.

Citizens of California are memorializing the Government to authorize the extension of telegraph lines from the Northern Pacific telegraph lines to the light-houses and life-saving stations on the coast of California, and make an appropriation therefor.

The Butler Telegraph Bill.

At the evening session of the House of Representatives at Washington, on Wednesday last, the bill "To establish certain telegraphic lines in the several States and Territories as post roads, and to regulate the transmission of commercial and other intelligence by telegraph" was reported from the Judiciary Committee, and Mr. Butler, of Massachusetts, who originally presented it, explained and advocated it. It was debated at considerable length. Mr. Butler moved the previous question, but the House refused to second it by a vote of 89 yeas to 77 nays—not two-thirds. Finally, the House adjourned without action, leaving it to come up as unfinished business on Thursday.

[From the Syracuse Journal.]

Death of a Distinguished Discoverer and Scientist.

On the last day of January, 1875, the Hon. Harrison Gray Dyar (uncle of Mrs. F. S. Smith, of this city), died at Linwood Hill, in Rhinebeck, N. Y., aged sixty-nine years and eleven months. Mr. Dyar was the inventor of the electric telegraph, and erected the first line, and despatched the first message over it, on the American continent. This may seem strange to our readers, as the credit for this great discovery has generally been conceded to Prof. Morse. But Mr. Dyar

erected his line on Long Island in 1826—ten years before Mr. Morse commenced talking about his discovery. The explanation is this: Mr. Dyar employed some assistants in getting up his line; when up, and promising success, one of these (to extort a concession of a share in the patent) commenced a suit against Mr. Dyar, claiming \$20,000 damages. Mr. Dyar was brought before a Judge Irving, of New York city, examined and the suits dismissed. But his troubles with his associates were not ended. Just at this time there broke out a great excitement in the country in regard to "bank frauds," in the large cities, and another suit was commenced against Mr. Dyar for conspiracy, connecting his discovery with these frauds by communicating secret messages from city to city, and he was actually obliged to flee from the city, by advice of friends, to prevent falling into the hands of the sheriff a second time—first to Rhode Island and then to France.

Mr. Dyar's counsel in these suits was Chas. Walker, a brother-in-law of Prof. Morse. About ten years after these transactions, in 1836, Prof. Morse began to talk about his discovery, and through the assistance of Amos Kendall, Prof. Henry, F. O. J. Smith, and others, he got Congress to aid him in putting up his experimental line between Baltimore and Washington in 1844—eighteen years after Mr. Dyar had erected his short line, and sent the first message, on Long Island.

Mr. Dyar, like many other great men, was somewhat singular. He was modest, retiring and reticent. When he made this discovery he was only about twenty-one years of age. He was an inexperienced young man from New England, without many friends or acquaintances in the then largest city of the country. He was, just as he was making one of the greatest discoveries in the world's history, treated as a criminal and conspirator, and actually compelled to seek safety in flight.

Mr. Dyar reached France, and commenced immediately to delve into the hidden mysteries of nature, and soon made other discoveries in chemical science, and was awarded therefor, from one of the royal societies of that country, the princely sum, in those times, of \$300,000. He remained abroad over twenty years, and then returned to New York city. There he invested his capital in Broadway and Fifth avenue property—the latter his place of residence. He also purchased a summer home on the Hudson, where he was at his death. About ten years since Mr. Dyar married a New England lady, who survives him, with two children, a son and daughter.

The following communication was published in one of the Washington papers in 1872:

THE FIRST TELEGRAPH.—AN INTERESTING LETTER.

WASHINGTON, D. C., Jan. 30, 1872.—To the Editor of the Evening Star: On reading your issue of Saturday evening, I noticed your remarks on the honors due to the originators and perfectors of "the telegraph system," and my mind was carried back more than fifty years, to the great race between the southern horse, "Henry," and the northern horse, "Eclipse," which took place on Long Island, and was won by the northern horse. It assumed in advance the character of a sectional political match, and the excitement raged so high that great efforts were made to convey the result to the city of New York in the shortest possible time. To accomplish this, a Mr. Dyar (whose Christian name I have forgotten) erected at his own cost telegraph wires, and successfully accomplished the object.

After this Mr. Dyar proposed to erect a telegraph line between New York and Philadelphia, and applied to the Legislature of New Jersey for the necessary powers to pass through that State. This request was not only unceremoniously refused, but Mr. Dyar was denounced as a wizard—a dangerous person to be permitted in the community. Vexed, disappointed and almost disheartened, the original projector was actually driven from his home and country, and found refuge in Europe, where his scientific abilities were appreciated and fully rewarded by the accumulation of large wealth. After the success of the telegraph he returned to this country, too late to claim what was justly his due, as the time prescribed by law to procure a patent had expired. Still, Mr. Dyar, with characteristic unselfishness, refused to go before a court and testify in a case where Mr. Morse had prosecuted for infringement.

I saw Mr. Dyar about the year 1850, when he informed me that then he had all the machinery, as used at the great race, stored in a warehouse in New York, and that it was the same in all particulars as that used by Mr. Morse. I think Mr. Dyar is still living in the city of New York, and can verify all I have said.

I do not write this as detracting an iota from the great honor justly due to Mr. Morse or others, whose efforts have established the telegraph, but to record facts which have transpired within my knowledge, and should appear in history as a comparison of the

past with the present, showing, as it does, the wonderful progress of the present age in arts, science and enterprise, and also of public opinion.

Respectfully yours,

ASA WHITNEY.

Born.

WHEELER.—To A. F. WHEELER, Manager Western Union Telegraph Company, Salem, Oregon, a daughter, first "copy," ten pounds, both a "rattler" and "sounder." Bully for Gus! First fruits from the epidemic matrimonial which prevailed so extensively among the telegraphers in Oregon a short time since. WEBFOOT.

Died.

STALCUP.—At Washington, D. C., February 6, 1875, JOHN STALCUP, an operator in the Western Union Office in that city.

THE ART OF TELEGRAPHING.

WANTED—TELEGRAPH OPERATORS,

and every young Man or Woman who expects to become one, to send for the "Art of Telegraphing," illustrated on a large heavy sheet by eight drawings. Nothing like it has ever before appeared, and its value cannot be over-estimated to seven eighths of all who now have, or expect to have anything to do about telegraph offices or wires, or their rules and regulations. Mailed free for 25 Cents; or a smaller sheet, with the Morse Alphabet and all the usual "Abbreviations and Signals, arranged in a novel and unique manner, for 10 Cents. You have not seen the like before.

Address,

"TELEGRAPH EXCHANGE,"

107 South Third Street,

PHILADELPHIA, PA.

THE FAVORITE.

Price, \$5.00.

Having reduced the price of these standard instruments, we are now prepared to furnish them to amateurs, students, academies, &c., with battery, connecting wires, chemicals, and one copy of "Telegraphy Made Easy," for \$6.50. Will be sent by Express, C. O. D.

Just published, "TELEGRAPHY MADE EASY." Sent to any address on receipt of 25 cents.

Address,

ISAAC HALL,

43 Centre Street, New York,

Manufacturer of Telegraph Instruments.

REPAIRING, JOBBING, &c., AT REDUCED RATES.

IMPORTANT TO INVENTORS.

Inventors of Electrical and Telegraphic arrangements are invited to communicate with the

ELECTRO-MAGNETIC MAN'G CO.,

36 Broad Street,

(P. O. Box 1,804),

NEW YORK.

GEOURGE H. BLISS & CO.,
41 Third Avenue, Chicago, Ill.

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

- RELAYS, unequalled for beauty and strength;
 - COMBINATION SETS; Box and Pooket RELAYS.
 - CHALLENGE, PONY and REPEATING SOUNDERS.
 - KEYS, various styles, including the SCHNEIDER KEY, just out, no legs, wire connections above the table.
 - REGISTERS, with SPRINGS or WEIGHT.
 - OUT CUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.
 - REPEATERS—HASKIN'S AUTOMATIC, and others,
 - SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.
 - ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.
 - ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.
 - ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.
 - MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.
 - BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.
 - WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.
 - INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON. BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.
 - TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
 - PRICE LISTS FURNISHED FREE ON APPLICATION.
- Our TELEGRAPH INSTRUMENTS and ELECTRIC APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

CHAMPION BURGLAR ALARM AND ANNUNCIATOR COMPANY,
40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skilful mechanics to estimate upon work, or will give any information in writing that may be required. *Liberal commissions will be paid upon any orders that may be secured for us.* Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

L. G. TILLOTSON, President.
CORNELIUS ROOSEVELT, Secretary and Treasurer,
40 West 18th Street, New York.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.
The undersigned having secured the exclusive Agency for the manufacture and sale of the
EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.
The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.
These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.
Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.
On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.
No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,
(P. O. Box 5503.) 38 VESEY STREET, N. Y.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,
No. 40 WEST EIGHTEENTH STREET
or to
L. G. TILLOTSON & CO.,
8 Dey street, sole Agents.

AMERICAN COMPOUND TELEGRAPH LINE WIRE.

COPPER FOR CONDUCTIVITY.—STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE compared with iron, consists in its LIGHTNESS relative TENSILE STRENGTH, CONDUCTIVITY DURABILITY, EFFICIENCY and RELIABILITY.
Address, American Compound Telegraph Wire Co.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,
TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

Original Articles.

The Kenosha Carbon Insulator.

By F. L. POPE.

If the history of all the experiments which have been made in telegraphic insulation in this country and in Europe could be written by a competent pen, it would form one of the most instructive, not to say amusing works that could possibly be imagined.

Mr. Shaffner, in his *Telegraph Manual*, has given us some glimpses of it, it is true, but as a whole, the subject still awaits its chronicler. The cloth and gum-lac insulation of the original Baltimore and Washington line, in 1844, was almost immediately superseded by a glass knob set upon a wooden pin. This proved to be a partial success, or, at least an essential improvement, and at once a host of inventive telegraphers set their minds at work to improve its form and to devise various shields and protections to prevent its fracture. A mere list of the different plans devised and adopted from that day to this would alone fill a column. But the end of the first quarter of a century of invention and costly experience found at

Fig. 1.

Fig. 2.

least 95 per cent. of the telegraph wire mileage of the United States still strung upon the glass insulator, and subject to all the grave inconveniences with which the use of that material has rendered telegraphers but too familiar. It is true that other and far superior methods of insulation had been devised, but like most other good things, they entailed a considerable increase in first cost. This fact operated as a bar to their rapid and general introduction. Thus the reign of the glass insulator remained for the most part unbroken—which, by the way, is more than could safely be affirmed as a rule of the insulator itself.

The importance of this subject was recognized by the more intelligent telegraphers at a very early day. I have before me a copy of the *American Telegraph Magazine*, of Dec. 15th, 1852. In an article upon insulation the editor, Mr. Donald Mann, says: "The improvement of telegraphic insulation is the most important matter now to be considered in the building and working of telegraph lines"—a remark which is as true to-day as it was twenty-two years ago. He further goes on to say: "Science has told us, ever since the first mile of telegraph was erected, that we should not rely upon glass as an insulator, and yet we have used it almost universally. Every one has observed that, whenever the weather is wet or foggy, any article of glass is covered with a thin film of water, and, of course, every 'insulator' on a line of telegraph is so covered with moisture. And when we reflect that on a line of telegraph five hundred miles in length there are 15,000 such imperfect insulators to conduct the fluid from the wire, we are at no loss to account for the dissipation of all, or nearly all the galvanism generated by the battery, and the consequent bad working of the line." Finally, after some further dis-

ussion of the subject, he closes with the following suggestion: "It is well known that *dry wood*, as an insulator, is inferior to no other material. Shellac is also as perfect an insulator as we have. Now saturate and cover dry wood with shellac varnish, and we have a cheap and nearly perfect insulator. Moisture does not condense on and cover a varnished surface as it does a glass surface."

In this crude suggestion of Mr. Mann's lay the germ of the invention of the Kenosha Insulator. The original idea was tried and failed. Exposure to the weather soon covered the varnished surface with minute cracks, which retained moisture, or allowed it to penetrate into the pores of the wood. A few years later the inven-

Fig. 3.

Fig. 4.

tion was again revived, the wood in this instance being coated with coal tar. This proved little, if any, better in practice than the original plan. Five or six years ago a new compound was discovered, which seemed to be admirably adapted to the purpose under consideration. The results of a somewhat extensive practical trial proved so satisfactory that in 1871 a manufacturing company was organized, consisting of several well known telegraph men, prominent among whom was Mr. Z. G. Simmons, of Kenosha, Wis., President of the North Western Telegraph Company. The new company immediately proceeded to establish a manufactory of insulators at Kenosha, and to introduce the new invention into practical use as rapidly as possible. During the first year or two many serious obstacles and drawbacks were encountered, such as seem inseparable from all new enterprises. Not only was the inevitable prejudice against innovations to be overcome, which in the case of insulators is, for obvious reasons, a very serious one, but there were imperfections in the process of manufacture which could only be made known by experience or actual use. In 1872 Mr. C. H. Haskins became connected with the company; his skill and knowledge as an electrician, and practical experience as a telegraph manager, has proved of great value in the development and perfection of the invention and of the processes of manufacture. Mr. Haskins introduced, among other improvements, the system of making a thorough actual test of every insulator before allowing it to leave the factory. In this way the standard of excellence has been gradually raised, and the sale and use of the insulator proportionally extended.

A few months ago the writer, in passing through Kenosha, took occasion to visit the establishment where

Fig. 7.

these insulators are manufactured. A brief description of the insulator itself in its different forms, and of the process of manufacture, will doubtless possess much interest for telegraphers.

Figure 1 represents the original form of the insulator, of which pattern a large number are made. It is shown as fixed upon a pin and inserted in a cross-arm. The same form may be used with a bracket similar to that of a common glass insulator.

Figure 2 is a sectional view, which exhibits the internal arrangement and the mode of construction. It will be observed that in form the insu-

lator is long, and of small diameter. The object of this is to give as great an insulating distance as possible from the supporting pin to the point where the line wire is attached. The small diameter also narrows the conducting surface, and thus adds to the electrical resistance. The upper part of the insulator, including the wire groove, is covered with a cap of sheet zinc, which is put on by machinery, by a process which will be explained hereafter, and which preserves the wood from splitting or being injured by the exposure of the end of the grain to the weather. The body of the insulator is of white wood, thoroughly kiln dried, and then coated with the insulating compound, which is composed of tar and charcoal flour, the tar being subjected to a process which gives it a certain degree of elasticity, and prevents it from cracking under the influences of changes of temperature. Brackets, pins and cross-arms are also treated by the same process. The surface of the coating, when finished, is of a glossy black, and highly repellant of moisture. It penetrates some distance into the body of the wood, and adheres to it with the utmost tenacity.

Figures 3 and 4 showed a modified form of the above insulator, in which the zinc cap is replaced by one of cast iron, provided with a projection for holding the tie wire, as shown. The peculiarities of its construction are sufficiently explained by the illustrations.

Figure 5 is a perspective view of the suspension or hook insulator, a form which combines superior insulating qualities with great strength as well as convenience in use. The body of this insulator is of maple, treated by the above described process. The peculiar form of hook used was devised by Mr. Haskins, and possesses many advantages. The objections to the ordinary forms of suspension hooks are well known. The line wire is cramped in placing it in the hook, and its tensile strength is often greatly injured by the operation. The vibration caused by the wind tends to still further injure the wire at the point where it is clamped. In Mr. Haskins' hook the line wire is secured by a tie wire. The arrangement is so clearly shown in figure 5 as scarcely to need description.

Fig. 6.

Fig. 5.

Figure 6 is a sectional view of this form of insulator. The projection of wood into which the hook is screwed is surrounded by a deep groove, and is covered with a malleable iron ferrule. The hook itself being also of malleable iron, the whole arrangement necessarily possesses great strength. The insulator is inserted into a hole bored in the under side of the arm, and is secured with a pin, in the manner clearly shown in the illustration.

There can be no doubt that, other things being equal, an insulator which holds the wire by suspension is preferable to one which is supported upon a pin above the arm. In a heavy shower the drops of rain falling upon the top of the arm are dashed into a fine spray, which often rebounds to the height of a foot or more, and thus a constant shower of water is thrown into the interior of the insulator, wetting the whole inner surface, and seriously affecting its insulating qualities. Again, it sometimes happens that wet snow will become piled up at the arm, so as to reach the wires, and cause a very serious leakage. The suspension insulator is free from both these objections, while it is not only a stronger but a far neater looking method of supporting the wires.

The process of manufacture in itself presents many interesting features. The factory is situated in the City of Kenosha, directly upon the shore of Lake Michigan, and in immediate proximity to a wharf for the convenience of unloading vessels bringing lumber and other material. The machinery is situated in a large two-story building, adjoining which is another building used as a storehouse and testing room. In the yard are two dipping and two baking houses. The machinery is driven by a steam engine of fifty horse power.

The raw material is received at the factory in the form of white wood and maple planks from the forests of Michigan.

The white wood planks are 2½ inches in thickness, and are used for the cap insulators, while the maple, which are used for suspension insulators, are thinner by half an inch. The white wood is cut into sticks 2½ inches square and 5 feet in length by a circular saw; and these are next turned into a cylindrical form by means of a machine resembling a hollow auger, and then cut into blocks about 4½ inches long, each one of which is an insulator in the rough. These blocks are then successively subjected to the operation of three different machines, the first of which shapes the inside of the insulator, including the socket for the pin, by means of a rapidly revolving cutter; the second cuts the screw thread in the socket, and the third shapes the top into a hemispherical form, and cuts the groove for the tie wire.

The sheet zinc, which is used for covering the upper portion of the insulator, is received at the factory in strips about five inches broad. A powerful swaging machine, in the second story of the main building, cuts from a strip, at a single blow, a suitably shaped piece of the metal, and forms it into a cup. Two other machines, by pressing this cup in dies, gives it a form resembling half an egg, and a fourth machine cuts the edge off evenly. Finally, this is firmly "spun" on to the wooden insulator, which has been prepared in the manner before described, and the latter, after having been cleaned out smooth by a rapidly revolving scraper, is then dropped through a trough to the floor below, to be taken to the dipping room. The suspension insulators go through a similar process, the hooks being screwed in by an appropriate machine.

The dipping houses are provided with large tanks filled with the insulating compound before referred to, which is kept in a semi-fluid state by the application of heat. The insulators are thrown into these tanks and thoroughly coated with the material. They are then placed in racks and taken to the baking houses, where they are subjected to a temperature of 250 or 300 degrees Fahrenheit for a period of thirty-six hours. The dipping and baking process is now gone through with a second time, after which the insulators appear in the glossiest of black coats, and after having been provided with pins or brackets, as the case may be, are ready for the testing room. The process of preparing cross-arms, by dipping in the compound and subsequent baking, is precisely the same as that employed for insulators.

The final operation of testing is conducted in a room especially fitted up for that purpose, at the northern extremity of the works. Large shallow tanks are provided, in which are placed, racks each capable of holding 210 insulators. These tanks are filled with water to such a height that when the insulators are placed in the racks in an inverted position, the rims will be just above the surface. Each insulator, before being placed in the rack, is dipped full of water. Figure 7 will serve to illustrate the manner in which the test is made. One pole of a battery of 500 cells of sulphate of copper gravity battery is connected with a metal plate, P, lying in the bottom of the tank, and the other pole to a delicate horizontal galvanometer, G. The instrument used at the time of my visit was a Varley galvanometer of about 900 ohms resistance, and a very sensitive instrument. The wire from the galvanometer is attached to a rod, R, having an insulating handle, which is thrust rapidly, in succession, into the water within each insulator. Of course, the slightest current passing from the inside to the outside of one insulator, would be at once indicated, and any insulator showing a leakage is condemned.

A record is kept of the results of the test of each lot, which I was permitted to examine. The defective insulators averaged only about one fourth of one per cent. of the whole, or say one in 400, which is a remarkably good showing. The defects usually arise from splits or cracks which are too minute to be detected by the eyes of the workmen during the process of manufacture. It would hardly be possible for a defective insulator to undergo such a severe test as that just described, and thus, by eliminating the causes of the defects discovered from time to time, the quality of the product has been enormously improved within the last two or three years. As an illustration of some of the difficulties which a new invention sometimes has to contend with, my attention was called to a large pile of insulators in cross-arms which had been condemned and taken down from a railroad in Western Pennsylvania. The insulators were of the suspension pattern above described, and had been shaved down with a drawing knife or hatchet, in order to get them into the holes in the cross-arm, which were a size or two too small for them. By this operation the insulating coating had been completely pared off, and the result, as a matter of course, was not favorable to the reputation of the insulator.

The capacity of the works at present is sufficient to turn out from 3,000 to 5,000 insulators, and about 1,000 cross-arms per day. The demand for them is rapidly increasing. They are used exclusively on the lines of the Northwestern Telegraph Company, and the Western Union Company are introducing them extensively on their lines in the Western States. The cost is but

little if any greater than that of glass insulators of good make and material; they are seldom broken or damaged in any way, while their high insulating qualities may be inferred from the test to which they are subjected at the factory. Their use thus far has been mainly confined to lines in the Western States. The electricians and telegraph managers of that section speak in high terms of their insulating qualities and durability in actual service.

The Kenosha Insulators are packed for shipment in boxes containing 100 each, and are kept for sale by the principal dealers in telegraph supplies throughout the country. Any desired information in regard to them may be obtained by addressing the Kenosha Insulator Co., Kenosha, Wis.

Congress and the Telegraph.

WASHINGTON, D. C., Feb. 24.

TO THE EDITOR OF THE TELEGRAPHER.

THE telegraphic contest which is being waged between the Western Union and the Atlantic and Pacific Telegraph Companies seems to have been transferred for the present to Congress. Notwithstanding the vigor with which this has been waged thus far I have seen no reason as yet to change the opinion heretofore expressed, that nothing of any importance will be done. The backward condition of the legislation indispensable for carrying on the Government for the next fiscal year, and the brief time which remains to accomplish this, would of itself defeat it.

The evidently crowded condition of the columns of THE TELEGRAPHER warns me of the necessity of brevity. On Wednesday evening of last week Mr. Butler's bill "to establish certain telegraphic lines in the several States and Territories as post roads, and to regulate the transmission of commercial and other intelligence by telegraph," which had been recommitted to the Judiciary Committee, was reported and discussed at some length. In explaining and advocating the bill, Mr. Butler referred to the fact that since this bill was reported messages were sent between Washington and New York at half the previously existing rates, and asked if reporting the bill did so much good in fourteen days, what would be the effect of the passage of a bill that would bring these Telegraph Companies to their senses? This is an instance of special pleading—shrewd, perhaps, but not very disingenuous. Mr. Butler knows perfectly well that reporting his bill had nothing to do with the reduction of rates.

After debate the House adjourned, and the bill went over as unfinished business, and probably will remain unfinished until the end of the session.

In the Senate on Monday last, during the consideration of the Postal Appropriation Bill, Mr. Dorsey submitted, as an additional section, the Postal Telegraph Bill recently reported to the Senate from the Committee on Post-offices and Post-roads. This was, after debate, finally laid on the table, and Mr. Dorsey's demand for the yeas and nays on the motion was not sustained. This probably ends the Postal Telegraph Bill in the Senate for the present session, though Mr. Dorsey gave notice that he should call it up again.

The bill explanatory of the Page patent has been recommitted to the committee, and there is no prospect of obtaining final action upon it at this session.

The Sub-committee of the House Committee on the Judiciary are engaged in investigating the action of the Western Union Telegraph Company under Mr. Dawes' resolution, but do not seem to make much headway in establishing the charges upon which it was founded. Mr. Orton, of the Western Union Company, Mr. J. W. Simonton, of the Associated Press, and Mr. Somerville, the general Agent of the American Press Association, have been examined. Messrs. Orton and Simonton explained the relations between the Associated Press, and denied that there was any partnership in news between them, or that the Western Union Company was under any obligation to or did refuse to transmit reports for others than members of the Associated Press. The rates to the Associated Press were less because they were very large customers of the Telegraph Company. Mr. Orton also denied that the company had refused to transmit reports for any paper on account of criticisms or unfavorable comments on the company or its management, instancing the *New York Herald*, which had certainly been very free in its comments on the company, but which continued to receive its reports on its lines. The reason that certain papers were cut off was because they were being supplied with reports at exceptionally low rates, and were derelict in paying even the prices contracted for.

So far it does not seem probable that this investigation will amount to anything. The active operations against the company has compelled Mr. Orton to spend some time in Washington, and Mr. A. B. Cornell, one of the Vice-Presidents of the Western Union company, has also been here looking after its interests.

I understand that Mr. W. E. Sawyer has been experimenting with his system of automatic transmission over the Western Union lines between this city and New York during the last two weeks, and with good success, obtaining a high rate of speed, the telegraphic characters received on the chemically prepared paper being "clear cut" and entirely free from "tailings."

CAPITOL.

New Discoveries in Electrical Science.—What Next and Next?

The Discovery of the Anti-Friction Properties of Matter during the process of Electro-Chemical Decomposition Credited to Mr. George Little, the Anglo-American Electrician, Inventor and Patentee of the "American Electro-Chemical Rapid Automatic Telegraph System," now Performing Effective Service in this Country.

TO THE EDITOR OF THE TELEGRAPHER.

YOU, as also many of your numerous subscribers will, doubtless, be surprised at having your attention directed to an expired English patent of date April 8, 1867, copies of which may be seen in the Astor Library in this city, and in the United States Patent Office, wherein it is distinctly shown, and illustrated by elaborate drawings, that the passage of currents through conductors in contact with a liquid or moisture changes the frictional adhesion of the vibrator, and in order to regulate the same by the application of greater pressure, so as to work a secondary circuit, Mr. Little shows how to adapt a self-acting "Archimedean screw" to the vibrator, so as to control its rapid motion when under very delicate adjustment, evolution of hydrogen during decomposition driving the decomposing points of contact apart, brought about by the reactionary anti-frictional agency of the hydrogen.

RIP VAN WINKLE.

New York, Feb. 1, 1875.

A New Telegraphic Sounder.—The Quadruplex at the A. E. S. Meeting.

CHICAGO, ILL., February 8.

TO THE EDITOR OF THE TELEGRAPHER.

WE have been having another spell of weather and cold prairie winds since my last. February 2d and 3d were the about the coldest days this winter; the thermometer was not as low as it has been, but the velocity of the wind being greater (about fifty miles an hour), the cold was much more severely felt.

"Jim" Pettit, of the Western Union day force here, must be one of the luckiest men in the business in these parts, as I am told he was made a happy father, won a \$20 ring at a raffle, and got a "respectfully referred," all in one week's time. The first mentioned prize came "with a squall," January 31st, is of the male persuasion, and weighed eight pounds. When it arrived it immediately called for a pair of Indian clubs and performed a series of movements which lays Root and Stansbury away out of the sunlight. As an alarm to waken "Jim" any hour of the night, it's a decided success, and don't need to be wound up. This being the third edition for "Jim" the quality can't be beat. It's a "quad," and can work with ease all "four" sides, requiring at least four "operators" to keep it "petted." That's very poor punning, but I have been acting punster for several children's parties lately, and it's not a very good time of year for punning any way.

Since Edison, "the great professor of duplicity and quadruplicity," has gone back on W. U., as reported here, that little heap of scurrility we had dished up twice a month to us grows beautifully less. We are just beginning to discover the fountain head. Well, it's not the first ship that's been made to sail more secure by casting overboard the Jonah, and we Western boys are glad to see the change for the better.

The next meeting of the American Electrical Society promises to be very interesting. Mr. M. L. Lawson has made a fine large drawing of the quadruplex, four by eight feet, showing all the connections, which will be explained by Mr. F. W. Jones. It is also expected that Mr. Jones will explain a new system of "quad," his own invention, which, I understand, worked very satisfactorily in the Western Union office here on the evening of the 6th. I hope to be able to give you all the essential electrical points of this new "quad," shortly, and probably a wood cut, by which it can be fully explained to the readers of THE TELEGRAPHER.

I am pleased to see the interest the ladies are taking by replying to "Nihil Nameless," and hope they will not wait until they are called out by "Nihil Namelesses," or any other man, to do their duty in writing for THE TELEGRAPHER hereafter, but take hold and

do their share. I know there is talent among them as well as among the gentlemen, as the Chicago lady who replied to "Nihil" is well known here to be very well fitted by her education and acquirements to do good service in that direction. The communication signed "Jo." was well received here, and greatly commended for its telling hits on "Women's Mission," "The Coming Man," etc. I am a little more radical, however, than "Jo.," although not in for women's rights in the full acceptance of the term. I believe, "when a woman does as much work as a man, does it as well, and works as many hours to do it, she should have the same pay as a man—no more—no less." In justice, how can it be otherwise?

Before I close this already lengthy letter, allow me to offer the hand of good fellowship to "Double Six," at Albany. I hope he will keep on telling us what the "capitalists" are doing in the old Empire State, and that other localities will help to keep THE TELEGRAPHER the success it always has been, by following the example of OCCASIONAL.

The Arizona Military Telegraph.

SAN FRANCISCO, CAL., Feb. 10.

TO THE EDITOR OF THE TELEGRAPHER.

WHILE at San Diego last week I called upon Lieut. Theo. Smith, Superintendent of the Military Telegraph Line, built by the Government in the fall of '73, between San Diego, Cal., Yuma, Prescott and Tucson, Arizona Territory, an extension to which has been built between Prescott and Camp Verde, and another extension in process of erection between Tucson and Camp Apache. Lieut. Smith is a practical operator and electrician, a graduate of the Signal Service School of Instruction at Washington, D. C., and holds a second lieutenant's commission in this important arm of the War Department, and has full charge of the section of Military Telegraph as described. He assumed charge of the line soon after Congress turned the line over to the Signal Service Department, and has made many changes worthy of note. In November last eight operators from the Signal Office at Washington arrived at San Diego, and were stationed along the line, relieving civilian employes, who had refused to enlist for five years, at a salary of \$75 per month—the only alternative to their relief. Civilian employes are still retained in the persons of Mr. Jacob B. Smith, chief operator of the line between San Diego and Maricopa Wells, and manager of San Diego office; Mr. Patrick Kearney, chief operator between Prescott and Tucson, managing Prescott office; and Mr. R. H. Howo, at present constructing the extension between Tucson and Camp Apache. These three are well known as good, reliable operators, but will evidently be relieved as soon as their successors may be qualified, although the Superintendent has recommended their retention, the policy of the Department being to manage and work the lines by commissioned officers and enlisted men. Upon the recommendation of Lieut. Smith, a great reduction in rates for private business has been made, the highest tariff being 50 and 10. This for a telegram from Prescott to San Diego or Tucson, or between either of these three farthest distant points (being about 450 miles), is very low; in fact lower, I think, than will pay. They have increased the rates to the press, which is poor policy, and not likely to help build up the three newspapers in the Territory, or those in California which patronize the line. Territorial newspapers, and, in fact, all papers in new, sparsely settled parts of the country, have a great deal to contend with, and, when possible, should meet with encouragement rather than opposition from those from whom their supplies are obtained. When the reduction in private rates is taken into consideration, and the decrease of expense consequent upon a substitution of enlisted telegraphers at lower rates than the civilians they succeeded, the increase of the rates for press despatches seems unwarranted. Mr. Smith has established his headquarters at San Diego, not the least of reasons being the perfection of the climate and the pleasant associations and surroundings of that city in embryo. With Mr. McCabe as chief clerk he has ample time to perfect a system of compulsory education and advancement for those under his charge, which cannot fail to bring all to a point of ability by which transfers may be made without depression. One idea he is carrying out is the rule compelling all operators to copy the press despatches as transmitted between the principal offices, so that in time each will be as efficient as the other. Copies of these reports being mailed to him by each operator weekly, it leaves no room for avoidance of the duty, however averse they may be to it. As the duties of the employes are solely in the office, and the hours short, this system can be worked to advantage on this line. The operators, as at present stationed, are as follows: F. C. Kelly, Indian Wells, Cal. This office is on the mountains, on one side of which lies the great Colorado Desert, on the other side the arable land of San Diego County. Yuma office is in Arizona Territory, at the

confluence of the Colorado and Gila Rivers, and opposite the military post and reservation of Fort Yuma, Cal. This office does a heavy private business, and is in charge of Sergeant E. W. Bontelle. Stanwix, A. T., a repair office, William E. Guild operator. Maricopa Wells office is the repeating office for line repeaters, arranged so that San Diego, Prescott and Tucson, or the offices on these branches, may work with each other through Maricopa. A set of Milliken's repeaters, from L. G. Tillotson & Co., costing \$300, are at Yuma, doing good service this winter. Sergeant A. M. Geissing is in charge at Florence, Mr. Hull at Phoenix, and William C. Barden at Tucson, the seat of civil government of the Territory; Mr. Ramsay at Wickenburg, and William H. Storey at Camp Verde. The lieutenant informed me that, to enable him to carry out his system of coeducation, he had subscribed for THE TELEGRAPHER, as a telegraphic expounder, and for the *Journal of the Telegraph*, as a reference for tariffs, now necessary by their connection with the Western Union line at San Diego. These will be supplied free to the operators along the line. The line will soon be extended to Sauta Fe, N. M., Congress having appropriated an amount more than sufficient to close the gap between that place and Tucson, which are about 450 miles apart. Mr. J. W. Thompson is in charge of the Western Union office at San Diego, and well pleased with the change from Yreka, Cal. Don Marco Forster, a wealthy native ranchero, is manager at Las Flores. Richard Egan, Esq., J. P. (meaning, in this instance, Justice of the Peace, but might be construed into Jolly Phellow, if you knew him), has charge of San Juan Capistrano; Mr. Polhemus of Anaheim office, Mr. Clarke assisting. In my next will give the names of other telegraphers in Southern California.

It may not be out of place to remark that Wm. C. Bashford, at one time connected with the San Diego offices of the W. U. and Military, then under the joint management of William E. Smith, has just been elected City Treasurer of Prescott, A. T., by a flattering majority, considering the age of this rising young merchant. Prescott is the most important military office on the line, that place being the headquarters of the military department of Arizona, General Crook commanding, Colonel Chandler chief quartermaster; both of these officers manifesting great appreciation in the welfare of the telegraph. CLIX.

Western Union Telegraph Co. and Telegraphic Inventions.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR correspondent, "Quien Sabe," in your last issue gave a somewhat vague idea that he knows of some one whose genius isn't appreciated by the Western Union magnates. Why did he not enter more into details? Now, in regard to his statement that every great invention in telegraphy during the past seven years has been "developed on opposition lines." This is a "glittering generality." He might have said *both* instead of "every," and then he would not have been correct. Assuming as I do that the perfection of the "duplex" and "quadruplex" are the only "great inventions" in telegraphy during that time, and regarding the "automatic" as a problematical utility, let us see how "Quien Sabe's" charge can be applied to them.

First, in regard to the duplex. This has been a subject of constant experiment with every one who had the merest smattering of knowledge of telegraphic science for years. And the Western Union lines were and are always open to people who think they have an idea or two on the subject and want to try experiments with new inventions. Those who remember Tom Edison as an operator in the W. U. Boston office will recollect the persistence with which he was always *experimenting*. And his experiments ranged from a device for annihilating cockroaches who stole his lunch, by means of a sheet of tin foil connected with a strong battery and a ground, up to the quadruplex—the idea of which was then faintly developed in his mind. And let me remark, by the way, that T. A. Edison has many warm friends in Boston, who will be slow to believe that the good qualities he then possessed (as well as others not so good) have deteriorated to the extent that some of THE TELEGRAPHER's remarks would lead its readers to suppose.

But to resume. Among the experimenters on the duplex Mr. J. B. Stearns was fortunate enough to hit upon devices which made it practicable. Being himself the President of an "opposition line," what more natural than that he should place his invention at its disposal.

Thus matters stood for some years. Meanwhile Mr. Stearns urged its advantages upon the Western Union officials with such persistence that they gave it a trial. Two trials, in fact, were made on their lines between Boston and New York. At each end operators of acknowledged ability were placed. Those in Boston were Mr. J. E. Wright and Mr. T. A. Davin, than whom

two better operators never handled a key. The result of both trials proved entirely unsatisfactory, and the Western Union officials rejected the duplex as of no practical importance. The writer has had experience of its working during those years on the opposition lines. He has stood over Mr. Tom Curry while receiving and seen him copy more from imagination than from any *Morse* to be heard on the sounder, and has wondered that such an instrument should have been retained in use, as it was for several years, in that state of its perfection.

Mr. Stearns continued his experiments until in 1872, I believe, he hit upon the use of a *condenser* in connection with his duplex. This proved the key that solved the problem. Again a test was made on the Western Union wires, resulting in its purchase at a price which was surely large enough to encourage inventors to continue their labors.

In regard to the "quad," no one will claim that it has not been brought to its present stage, at least, mainly on the Western Union lines.

Of the merits of automatic telegraphy I have nothing to say. "Quien Sabe" says the Western Union might have secured the improved automatic system on their own terms before it was "stolen," etc. Certainly they might, but they did not consider it worth while, and the wisdom of their failure to do so can be criticised with more judgment a year or even six months hence.

But how about the system having been "stolen" and conveyed to the A. & P. by the thief? Do the managers of that company stand before the public as receivers of stolen goods? I was under the impression that the A. & P., by absorbing the Automatic Co., thereby acquired the "system" as well as the wires and property of that company. How is it?

In this connection I may say that neither "Quien Sabe" nor any others need fear for the Western Union. They have several sets of the "quad," already, and as many more sets as may be manufactured before the "quad" patents are issued cannot be taken from them. This point was settled legally in the suit brought by them against the Franklin Co., to prevent the latter using the "duplex."

So in regard to the automatic, if there proves to be merit in it, the W. U. will obtain control of it sooner or later.

Another point of "Quien Sabe," viz., that the W. U. has in its employ some of the best telegraphic talent in the world, I am not willing to admit, in the sense he evidently intends—*scientific* talent.

Had he said "skilful telegraphers," no one would gainsay it. But I have yet to hear of an American electrician comparable with Varley, Sir Wm. Thomson and other foreign electricians. Moses G. Farmer, of Boston, ranks high as an electrician, as also Dr. Bradley, of Jersey City, and others, but they are *not* in the service of the W. U. Mr. Haskins, of Chicago, Mr. Prescott, of N. Y., and Mr. Milliken, of Boston, have each studied the science, and have made many improvements in the mechanical apparatus in use, but neither of these gentlemen could justly be ranked among "the best scientific electricians of the world," as "Quien Sabe" evidently means by "telegraphic talent;" nor would they accept such a flattering designation. The fact is, we of America, as a class, are remarkable for ingenuity—inventive genius; a skill in the adaptation of ideas to practical purposes. But the original ideas themselves have thus far, as regards telegraphy, been in the main supplied by foreign scientists.

In conclusion, I will only add that I fail to see the point of the allusion to General Braddock, and ante revolutionary times, in the last paragraph of "Quien Sabe's" communication; unless, indeed, he intends General Braddock as a prototype of the W. U. Company, and himself the Washington whose advice Braddock did not accept. However, the cases are too widely distinct to admit of such a comparison. At least, as a W. U. employe, I hope the alleged Braddock-like pigheadedness of the W. U. managers will not result so disastrously to the rank and file as the blunder of Braddock in the field. JOHN STERLING.

THE Sheffield Scientific School has just received a very important addition to its physical apparatus in an immense electro-magnet, together with the accessories necessary for the study and illustration of magnetic phenomena. This apparatus has been presented to the school by William Wallace, of Ansonia, who for many years made a special study of electricity and magnetism, and for his own use has constructed some of the largest and most efficient pieces of apparatus ever employed in this department of physics. This magnet is only second in size, it is believed, to one other in the country, which was made by Mr. Wallace a few years ago, and was purchased by the Stevens Institute of Technology. The Yale magnet weighs altogether nearly half a ton, and is capable of lifting, it is said, twenty times that weight, or over ten tons, when in full action.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, FEBRUARY 27, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

The Telegraphic Contest.—How it Should be Conducted, and the Conditions Required for Success.

THE telegraphic as well as the general public are necessarily deeply interested in the contest which has suddenly assumed so much importance, for the telegraph business of the country. The present contest differs in many respects from those which have preceded it since the telegraph was established as an indispensable and important agent of civilization. New elements have been introduced which will tend, probably, to protract the struggle and render the ultimate result more doubtful than it otherwise would be.

The acquisition of the automatic system by the opponents of the Western Union Company is an important point, and tends to render the chances more equal than they would otherwise appear to be. Conceding to the much vaunted quadruplex, if the Western Union Company should be successful in retaining it, all that has been claimed for it, it cannot compete with the automatic in practical operation. The experience with the quadruplex thus far has by no means justified the claims which have been so strenuously urged in its behalf, and, as we understand, it has demonstrated the correctness of what has been stated in regard to its capabilities editorially and otherwise in THE TELEGRAPHER. With exceptionally good wires and insulation, and under favorable climatic conditions, and with really superior operative talent, it can be worked advantageously, otherwise it is of little advantage.

The management of the Western Union Company have apparently come to realize the necessity of a fast telegraphic system, and for the last two weeks, as we learn from our Washington correspondent, has been experimenting with an automatic apparatus patented by Mr. W. E. SAWYER, of the latter city, and, it is said, have obtained very good results. It has not so far developed as great rapidity of transmission as the LITTLE automatic, but has been worked up to from 400 to 500 words per minute. We do not know in what respect this differs from other automatic inventions, or whether it is clear of complications with or infringements of previous automatic patents. If it should be, very probably the Western Union Company will adopt it, and it will then be automatic against automatic.

There is one point upon which ultimate success very

materially depends, which, we fear, is not sufficiently appreciated by either party, and that is the necessity for decided improvement in the character of the lines upon which the instruments are to be worked. Improvement in apparatus will not be of as much importance as otherwise, unless the character of the lines shall be improved. The conductivity of the lines should be increased, especially if fast systems of telegraphy are to be successfully worked upon them. In the construction of new lines, especially, care should be taken to secure great conductivity and high insulation. With the compound wire as it can now be made, the copper being deposited at any desired thickness upon the steel core, the objections heretofore urged against it are entirely obviated, and conductors of great tensile strength and capacity of transmission can be obtained, combined with moderate size and weight of wire per mile. As this wire can be made and sold at relatively less cost per mile than iron wire of equal conductivity, we do not see why it should not come into general use for telegraphic purposes. There is certainly no necessity for continuing the use of glass insulation, as either the BROOKS or the improved Kenosha insulators are superior in every respect to glass.

Taking it for granted that there is to be no serious interference by Congress with telegraph interests for at least some years to come, the field is open for private telegraphic competition, and it should be conducted intelligently, and with a view not to temporary effect upon the prices of telegraph stocks, but to establish a permanent, successful and remunerative telegraphic business. If the personal feelings which enter into the present competition could be eliminated it would be all the better, although it might, perhaps, detract somewhat from the interest at the present time. With economical management and a disposition on the part of the telegraph managers to look rather to the legitimate profits of the business than to the money to be made by the fluctuations in the price of telegraphic shares and securities, we can see no reason why the telegraphs should not prove as remunerative in the United States as in the Dominion of Canada, where the President of a telegraph company recently declined a proposed grant of a thousand dollars for his services because the shareholders were only receiving 7 per cent. upon their investments, and where the telegraph shares of both companies are held at a premium.

We do not desire to see a cut-throat policy inaugurated in the telegraph business of this country, but that rates for telegraphic service should be maintained at a fair and reasonable standard. This is unquestionably the true policy, and that which will be most beneficial to all parties, the public as well as proprietors of telegraph property and telegraphic employes.

The Telegraphic Situation.

SINCE our last week's article on "The Telegraphic Situation," nothing of startling interest or importance has transpired in the telegraphic contest which has been inaugurated. Prest. ORTON, of the Western Union Telegraph Company, has been in Washington for the purpose of testifying before the Committee which is conducting the investigation under Mr. DAWES' resolution, and looking after the interests of his company generally, which are threatened with unfavorable legislation. Our Washington correspondent, CAPITOL, tells our readers of what has been transpiring in connection with telegraph matters in Congress, and it appears thus far to have been "much ado about nothing."

Aside from this, and the testing of Mr. SAWYER'S automatic apparatus on the lines of the Western Union Company between New York and Washington, we do not hear of anything of special note on that side. It is understood that the Western Union officials are pleased with the results of their experiments with the SAWYER automatic thus far, but we have not learned as yet whether it is proposed to adopt it.

Prest. ECKERT, of the Atlantic and Pacific Company, and the other officials of that company are busy reorganizing the service to meet the altered and enlarged condition of affairs, and are gradually getting matters into a satisfactory working order. Naturally there is a large amount of work to be done in this direction, and it is desirable that it should be substantially accomplished before the time comes when construction, reconstruction and repairs must be attended to. As the frost comes out of the ground the existing lines will require to be thoroughly overhauled and repaired, and put in the most complete order possible to accommodate the increase of business, which has already manifested itself to an encouraging degree.

We are informed that, since the reduction of rates was announced, there has been a steady and very satisfactory increase of business and receipts on the lines of the Atlantic and Pacific Company generally, and not merely on the routes upon which the reduction has been made.

The automatic apparatus has been got into operation at Buffalo, N. Y., and works very satisfactorily, and enables the company to transmit its business satisfactorily notwithstanding interruptions to a portion of its wires. In a few days the automatic system will also be in operation in the Cincinnati and Chicago offices of the company.

In this connection it is gratifying to know that the best talent in the employ of the company is used, and paid full salaries to work the automatic. The punchers and copyists, as well as transmitters, are required to be operators, and are found to be the most economical as well as the most reliable. The facility with which good Morse operators learn to work the automatic insures them against the much dreaded competition with "cheap labor" that has prejudiced many telegraphers beforehand against the automatic system. The operators in the Boston office of the A. and P. Co., for instance, with one week's instruction and practice became expert automatic punchers and operators, and required no further attention. The great increase of telegraphic business will, undoubtedly, notwithstanding the introduction of the automatic system, furnish remunerative employment to all who are engaged in telegraphy. Those who have been inimical to THE TELEGRAPHER because it has recognized the practicability and advantages of automatic telegraphy, and its inevitable ultimate adoption in connection with other systems in this country, will soon be convinced that we were right, and that the bugbears which they have conjured up in this respect are merely imaginary possibilities.

The Southern and Atlantic Company is working its line to New Orleans successfully, and report business as good. This company does not make much noise in this part of the country at least, but it is being carefully managed, and has established much needed competition over an important section of the country. This it has done against every possible obstacle and opposition that could be put in its way or brought to bear against it. It meets a necessity, and is popular wherever its lines go in the South.

The Dominion Telegraph Company.

WE print in another column the report of the Annual Meeting of the Dominion Telegraph Company, from which, and the Annual Report to the Stockholders, it will be seen that the company is, notwithstanding the depression of general business, in a flourishing and highly satisfactory condition. An additional investment of \$100,000 for extensions in the Provinces of Ottawa and Quebec during the present year, and another \$100,000 for extensions in the Maritime Provinces, to meet and make connection with the new cable, if it should be got in successful operation, was authorized. These sums are to be obtained not by incurring an indebtedness but by the issue of new stock, which, so great is the confidence of investors in the economical and honest administrations, can be readily and easily placed at par.

A noticeable feature of the report is the remarks of Mr. McMURRICH, the President of the Company, declining a proposed grant of \$1,000 for his services during the year, on the ground that he desired to see a larger dividend than 7 per cent. on the stock before accepting compensation.

The prospects of this company are most gratifying, and it is evidently managed in the interests of the stockholders and the public.

Its management and that of the Montreal Telegraph Company, its competitor, affords a marked contrast to that of most Telegraph Companies on this side of the line.

Unavoidably Postponed.

We have received from "Nihil Nameless" a reply to the communications which have been drawn out by his former communications in regard to female telegraphers. It was intended for this week's paper, but owing to its length and the pressure upon our columns, its publication is unavoidably postponed until our next issue. It will not, however, be damaged by the delay, and will no doubt be looked for and read with interest when it does appear.

Manifold Paper, Books, etc.

THE advertisement of Messrs. H. D. ROGERS & Co., of Cincinnati, Ohio, will be found of interest, and worthy the attention of all who have occasion to use manifold paper, books, train order books, etc. As patentees and manufacturers they are prepared to offer inducements to purchasers which will make it for their interest to deal with them. They are also the Western agents of L. G. TILLOTSON & Co., of this city, for the sale of their instruments and telegraphic apparatus.

Personals.

Mr. JOHN W. HAYS, Western Union Telegraph Co., Sandusky, Ohio, has accepted a position on the night force of same Co. at St. Louis, Mo.

Mr. ALBERT BREWER, late of St. Louis, Mo., has gone to Corsicana, Texas.

Mr. JAMES C. DE LONG, Little Rock, Ark., Western Union office, has been transferred to Marshall, Texas.

Mr. WALTER S. PEARSON is working for the Western Union at Denver, Colorado.

Mr. T. J. HERBEL, late of W. U., Kansas City, Mo., has been appointed Manager at Ellis, Kansas.

Mr. HENRY C. LUCKINGS has been appointed to a position on day force, Western Union office, St. Louis, Mo.

Mr. H. C. SPRAGUE, Kansas City, Mo., has been appointed Superintendent Telegraph L. L. & G. and Mo., Ft. Scott and G. Railroads, *vice* E. B. McDill, deceased.

Mr. CHARLES N. HART has been appointed Superintendent Telegraph of the St. Louis, Lawrence and Western R. R. at Lawrence, Kan.

Mr. JOHN E. STOCKMEYER of Dayton, Ohio, but late of Vincennes, Ind., is agent and operator at Carlyle, Ill., O. and M. R. R.

Mr. WINFIELD S. FRENCH is acting as substitute for Mr. CHARLES E. BURROUGHS, St. Louis, Mo., Western Union office, the latter having gone east to commit matrimony.

At a meeting of the Board of Supervisors, San Francisco, Cal., Feb. 9, Mr. Sims, from the Committee on Fire Alarm and Police Telegraph, reported that he had investigated the charges against Mr. GREENWOOD, Sup't of the Fire Alarm Telegraph, and that there was no truth in them.

Mr. WM. MORTON has been promoted to the position of Chief Assistant of the Fire Alarm Telegraph at San Francisco, Cal.

Mr. T. McLEOD, operator Fire Alarm and Police Telegraph, San Francisco, Cal., has been removed for neglect of duty.

Mr. J. S. URQUHART has been appointed operator in the office of the San Francisco, Cal., Fire Alarm and Police Telegraph, in place of Mr. T. McLEOD, removed.

Mr. HARRY MORTON has been appointed operator in

the San Francisco, Cal., Fire Alarm and Police Telegraph, in place of Mr. J. C. BLOOMER, resigned.

Mr. JNO. F. WALLICK, Sup't Western Union Telegraph Co., who suffered a broken leg by falling through a bridge at Cambridge City, Ind., some three weeks ago, is resting comfortably with no unfavorable symptoms.

Mr. H. DYHR, of the German Telegraphic service, who has been sent out by the German Government to examine the telegraphic systems of this country, arrived in New York on Sunday last.

Mr. D. DORAN has been appointed Superintendent of Construction and Repairs for the Atlantic and Pacific Telegraph Company.

Mr. M. C. BRISTOL, Superintendent of Construction for the Western Union Telegraph Company, was in the wreck on the Panhandle Railroad, near Mingo, Ohio, on the morning of February 19th, but escaped without injury. By this accident two sleepers' and an officer's car went down the bank, and taking fire, were entirely consumed. Gen. Manager McCULLOUGH, of the Pennsylvania Company, had three ribs broken.

Mr. WM. J. DEALY has been appointed manager of the Atlantic and Pacific office, No. 198 Broadway, New York.

Mr. MAWRY SMITH has been appointed manager of the city offices of the Atlantic and Pacific Telegraph Company in New York.

The Telegraph.

By Cable.

DESTRUCTION OF A TELEGRAPH LINE IN CHINA.

LONDON, Feb. 23.—Chinese fanatics have destroyed the telegraph line between Foochow and Amoy.

The Reduction on American District Rents.

THE reduction of rental of instruments by the American District Telegraph Company in this city from \$2 50 to \$1 per month, was not general, as stated in THE TELEGRAPHER last week, but applies only to the down town districts—the first, third and sixth.

Prospective Reduction of Telegraph Cable Charges.

Mr. ORTON, President of the Western Union Telegraph Company, has received the following telegram from the London manager of the Anglo-American Cable Company.

"On and after the 1st of May, 1875, the tariff from New York to the United Kingdom and France will be reduced to fifty cents per word, gold. This company's word system of charging messages will be extended to the continent of Europe and to all other countries, so far as this company's rates are concerned.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom, for the week ended Jan'y 30, 1875, was 339,733—a decrease on the corresponding week last year of 28,542.

The traffic receipts of the Eastern Extension, Australasia and China Telegraph Company (Limited), for the month of January, 1875, were £18,924, against £20,717 for the corresponding period of 1875.

The Eastern Telegraph Company's traffic receipts for the month of January, 1875, amounted to £37,730, and to £37,037 in the corresponding period of 1874.

The receipts on the Western and Brazilian Telegraph for the four weeks ending January 29 have been £10,566.

The Faraday, screw steam telegraph ship, the property of Messrs. Siemens Brothers, telegraph engineers, of Charlton, near Woolwich, has again pronounced or come up the river from Gravesend, where she has been lying since her return from the Atlantic, and she has been docked in the Thames to undergo the necessary repairs, instead of going to the north, as was at first understood to be intended.

The Telegraph Construction Company has declared a dividend on its shares of £1 16s. in cash, and a certificate of £5, represented in about equal proportions by ordinary shares of the Globe Trust and the Brazilian Submarine Telegraph, and is reported has still a large surplus in reserve.

THE German Princess Imperial visited the telegraph office in Berlin lately. There are many women employed there, and numbers have received their positions upon the recommendation of her Royal Highness. She went to see them and did not like their toilets. Next day

they received a circular directing a less extravagant style of dress, and forbidding them to wear their hair flowing in the sloven fashion.

Telegraphic and Electrical Brevities.

ON March 1st the Western Union Company will open a permanent office in the Board of Trade building, at Indianapolis, Ind., with Mr. Charles E. Weed in charge. Mr. Weed has been operator and agent at Morris, Ind., for twelve years past.

Suppose Gray's "Telephone," by means of which tunes are played by telegraph, were to be perfected to a degree equalling the use of the telegraph for transmitting words, wouldn't it then be a common thing for Strauss to sit at his far away home and play for parties to waltz at all telegraphic points where a ball might be in progress? Think of a concert by a cable, and by Listz, too!—*Louisville Commercial*.

The Western Union Company are fitting up an office in the Bates House, Indianapolis, Ind.

Annual Meeting of the Dominion Telegraph Company.

THE annual meeting of the Dominion Telegraph Company of Canada was held at noon on Wednesday, February 10, 1875, in the executive offices of the company, at Toronto.

Mr. J. C. Small read the notice calling the meeting and the annual report, as follows:

DOMINION TELEGRAPH COMPANY'S SIXTH ANNUAL REPORT.

The directors have great pleasure in placing before the shareholders their sixth annual report.

At the last general meeting, held in February, 1874, the directors recommended and obtained the sanction of the shareholders to an issue of additional stock to the extent of \$100,000, for the purpose of building new lines and enlarging the area to be traversed, thus increasing the capacity of the company to undertake a more extended and profitable business. The financial statement now placed before the meeting will show that this additional expenditure has been attended with the most satisfactory results, and the directors feel emboldened to ask from the present meeting a further expression of their confidence by voting additional supplies for the coming season. As the company's circle of operations is enlarged, fresh towns and villages are brought within its reach, and have to be included in the network of wire, thus increasing the company's general usefulness and ensuring to it a more general support from the public.

The lines built during the past year consist of from Peterboro' to Prescott, Lindsay to Bobcaygeon, Aylmer to Portage du Fort, Seaforth to Listowell, Listowell to Harriston, Tilsonburg to Port Burwell, Hamilton to Port Dover, Harriston to Wingham, Toronto to Whitby, Toronto to Weston, and St. Catharine's to Niagara. These, with the extra wires that have been strung from Prescott to Ottawa and Montreal, not only greatly increase our capacity, but also gives us an entire new route to these important points, in all exceeding 517 miles of pole line and 1,239 miles of wire. These additions bring up the total pole mileage to 3,102 miles, with 5,807 miles of wire and 305 offices.

The further extension of the company's lines recommended by the general manager to be made in the Provinces of Ontario and Quebec during the present year, will absorb about \$100,000.

The operations of the company in the Dominion of Canada have hitherto been confined to those two Provinces. Should the company succeed in forming a through cable connection with England and Europe *via* the maritime provinces, a very valuable new field for the company's operations will have been secured, and special provisions will have to be made to carry on the work.

We are also happy to be able to announce that we have secured, at a very reasonable figure, the use of D'Inville's Duplex, which has been in successful operation on our lines between Montreal and Toronto and Toronto and Buffalo for some time past. The adoption of this will enable us to double the capacity of our trunk lines at very little extra expense.

The directors have great pleasure in expressing their satisfaction at the manner in which the General Manager, Mr. Purkis, has discharged the important duties of his office. They have also to acknowledge the valuable services of the Superintendents, Mr. Neilson and Mr. Hosmer, and of Mr. Small, the Secretary.

The General Manager also reports that the employes and agents generally have worked heartily and faithfully for the interest of the company.

All of which is respectfully submitted.

JOHN McMURRICH, *President*.

Toronto, Feb. 10, 1875.

After which the financial statements were read. Hon. Mr. McMurrich said that the stockholders had

ing heard the annual report and the financial statements read, they could see that considerable progress had been made, which progress became more apparent by comparing our condition at present with former years. While this was gratifying to the directors, it was to the interest of the stockholders that this progress should not only be maintained but increased. The prospects of the company had never been so good as at present, and the capacity for work was very large. He might mention that a few nights ago 55,000 words had been transmitted over the wires of the company. A list of plans had been drawn up, to which it would be desirable to extend the company's connection, and the most profitable points would be selected for the present year. The duplex instrument had been obtained at a reasonable cost, and largely increased the capacity of the company. In Montreal the business had doubled within two months, and it was gratifying to know that the change of management there had produced the most satisfactory results. Improvements were being made in all directions, and a better and more independent class of men were being obtained. All this, he need not remind them, cost money; but he held it to be money well spent. The issue of new stock was alluded to in the report, and he wished to say that the adoption of the report would sanction the directors to issue stock not exceeding \$100,000. This would enable the directors to make judicious extensions in Ontario and Quebec. A further sum of \$100,000 may be required to build a line to the maritime provinces, but this sum was only asked conditionally upon the arrangements being effected with the English company that was laying the Atlantic cable to Nova Scotia. He moved the adoption of the report.

In reply to an inquiry he said that the additional stock would be issued at par, they had no difficulty in disposing of the last issue at par; and a much larger amount was asked for than could be given.

The report was then adopted.

Sheriff Waddell understood that the sum of \$100,000 was required at once, without respect to the cable arrangement, and he moved that the directors be authorized to make a fresh issue of stock, not exceeding \$100,000, for extensions in Ontario and Quebec.

Mr. W. S. Lee seconded, and motion was carried.

Sheriff Waddell said he thought it should be understood that the directors had power to issue additional stock for building a line through the maritime provinces, in the event of their completing their arrangements.

Sheriff Waddell moved, seconded by Col. D. E. Bolton, "That the directors are authorized to proceed with the contemplated arrangement for forming a cable connection via the maritime provinces, and if that object can be effected, the directors are authorized to make a fresh issue of stock, not to exceed \$100,000, requisite for the construction of the through line.

The motion was adopted.

Messrs. J. S. Crocker and C. C. Foster were reelected auditors for the company for the present year.

On motion of Sheriff Waddell, a vote of thanks to the President, Vice-President, Managing Director, Treasurer, and directors of the company for their efficient and zealous services, was adopted.

In response to a motion granting \$1,000 to the President and \$10 to directors for attendance at each meeting. Hon. Mr. McMurrich returned thanks, but said he wished to see the dividend more than 7 per cent. before accepting the very generous resolution that had been proposed. If it was the pleasure of the shareholders to increase the directors' fees a trifle he would not object, but he wished to be placed on the same footing with the rest of the board. He took this opportunity of saying that he had no desire to retain the position of President. The company was in a good position, and if some young man with more energy than he had would come forward, he would willingly give place to him. He was desirous of having more time at his disposal and less anxiety, and at some future election he would take it as a kindness to be re-elected.

The motion was amended to the effect that \$10 per attendance be paid to each director for the past and current year, and carried.

The following gentlemen were declared reelected directors, under the report of the scrutineers:

- HON. JOHN McMURRICH,
- JOHN I. MACKENZIE, Esq.,
- HON. WM. CAYLEY,
- JAMES MICHIE, Esq.,
- LOUIS MOFFATT, Esq.,
- HON. T. N. GIBBS,
- S. NELSON, Esq.,
- A. COPP, Esq.,
- W. F. McMASTER, Esq.

At a subsequent meeting of the directors, Hon. John McMurrich was reelected President, John I. Mackenzie, Esq., Vice-President and James Michie, Esq., Treasurer.

J. C. SMALL, Secretary.

Toronto, 10th February, 1875.

The Telegraphers' Mutual Benefit Association.

ASSESSMENTS 72 AND 73, ISSUED FEB. 20. 1875.

Death of E. S. Springsteen and John Stalcup.

E. S. SPRINGSTEEN, of New York City, (Certificate No. 1371, issued January 23, 1872), died at Greeley, Col., January 20, 1875, of consumption.

JOHN STALCUP, of Washington, D. C., (Certificate No. 930, issued Aug. 12, 1870,) died at Washington, February 6, 1875, of consumption.

Two dollars are due on above assessments from members whose certificates are numbered not above 2374; one dollar from those holding certificates between 2374 and 2387.

RECEIPT OF ASSESSMENTS—NEW YORK, JAN. 11, 1875.

ASSESSMENT NO. 71.

27, 179, 232, 237, 238, 242, 246, 258, 451, 453, 455, 457, 476, 478, 482, 509, 516, 804, 912, 922, 1153, 1217, 1273, 1450, 1531, 1562, 1579, 1619, 1632, 1715, 1716, 1731, 1786, 1798, 1799, 1915, 1922, 1926, 1941, 1974, 1975, 1976, 2015, 2037, 2081, 2083, 2141, 2177, 2190, 2237, 2248, 2253, 2262, 2269, 2272, 2275, 2276, 2320, 2329.

ASSESSMENT NO. 70.

1924, 2281, 2282, 2283.

ASSESSMENT NO. 69.

185, 186, 187, 695, 697, 705, 1071, 1400, 1504, 1531, 1613, 1670, 1741, 2151.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

NEW YORK.

THE KENOSHA INSULATOR CO.

**TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS**

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellent of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

**THE NORTH WESTERN TELEGRAPH CO.,
THE WESTERN UNION TELEGRAPH CO.,**

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 600 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES, prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OR

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in *Fire Alarm and Police Telegraphy*, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

VOL. XI. WHOLE No. 451.

Original Article.

The Experience of a Bashful Operator.

THINKING the following may prove of interest to the readers of THE TELEGRAPHER, I will relate to you the experience of a bashful operator in search of employment.

He commences by inquiring of every third person he meets where the telegraph office is. On being shown the exact location he takes up a position directly opposite, and burying his hands up to his elbows in his pockets, gazes wistfully upward toward the operating room, which is situated in the second story of the building. After thinking over the words he will use in making his application, he removes his hat, brushes up his hair, and makes a bold strike across the street, to go up stairs; but on reaching the stairway he imagines his face is flushed, and concludes he will walk up the street a short distance to regain his composure. But on returning to the stairway he is more nervous than before and another walk is resorted to. Then he makes up his mind that it is now or never, and runs hurriedly up the stairs, afraid if he lingers his courage will fail him. He puts on an air of nonchalance, knocks at the door, and is admitted into the room, which is filled with operators, both male and female. He immediately becomes the cynosure of all eyes, and not being accustomed to occupying such a conspicuous position, his self-possession gives way, words fail him, and he hardly knows what to do, but rallies sufficiently to inquire with a *gulp* if the chief operator is in. On being answered in the affirmative, and the chief being pointed out to him, he fixes his eyes with a determined stare on the spot, and looking neither to the right or left, steps rapidly along, tipping over a spittoon which happens to be in his way, he ejaculates "good morning" in hurried accents, and without waiting for the chief to reply he states his business. Not being in want of any operators, he tells our hero to call at some future time. Hearing a very audible chuckle from some of the lady operators, who are keenly enjoying his embarrassment, he turns towards the door, and vanishes hastily from our sight, the sweat starting from every pore of his body. He stops on the next corner to meditate on the coldness of this world.

A Remunerative Telegraph Construction Company.

THE Telegraph Construction Company appears to be about the most successful telegraphic enterprise that has ever existed, and somewhat embarrassed to know just how best to dispose of their profits. The following from *The Railway News* of London will be read with interest:

"We are glad to see that the directors of this company did not act upon the very bad advice which was given to them of applying the large profits which the company have made during the past year to the liquidation of its capital. The inconveniences, to say nothing of the doubtful character, in a legal point of view, of such a course, have already been explained in our columns. We hear that the profits in hand would have been sufficient to pay off the whole of the remaining capital of the company. A distribution equal in amount to nearly one half of the existing capital of the company has now been made, but by distributing it as dividend this capital is still left intact. The dividend declared is 36s. per share, and a certificate of £5, represented in about equal proportions by ordinary shares of the Globe Trust and the Brazilian Submarine Telegraph, and it is reported that the company have still a very large amount in reserve. The whole range of industrial enterprise cannot produce an instance of success equal to that which has attended the operations of this company. From its first establishment, now ten years since, the company has distributed, in the shape of dividends and bonuses, a total sum of £1,368,174. The capital, in fact, has been repaid back to the proprietors four times over in the space of ten years, and the company still retains a manufacturing establishment of first class character, and an amount of stock and

materials the value of which far exceeds the remaining amount of the capital.

The shareholders of this company owe much of the success of their undertaking to the practical experience which Sir Daniel Gooch, the chairman of the Great Western, has brought to bear in the management of its affairs. Thanks to the able supervision which has been shown, the company has not failed in any one of its undertakings for which it has contracted, while its competitors have been subject to many severe disappointments and have incurred many heavy losses. Comparisons are proverbially odious; but when we see how severe has been the disappointment, and how numerous the blunders, in connection with the attempt to satisfy the "great want of the age" by laying the so-called Direct United States Cable, how interminable is the litigation arising out of the attempts to complete the West Indian system of cables, and how serious have been the losses in connection with the La Plata cable, it would be ungenerous not to recognize the value of that practical experience which, in the management of the affairs of the Telegraph Construction and Maintenance Company, has enabled that company to attain to its present position, and secure for it practically the whole of the business connected with the manufacture of ocean cables in all parts of the world.

How to Rush a Patent Through.

It appears the best way to get a new patent rushed through and quickly issued is to apply at the presidential mansion. In a recent case—a telegraph contrivance—the President wrote a letter to the Commissioner of Patents, requesting him to take immediate action, for the reason that the invention was needed for use by the government, and had already been adopted on the government lines; whereupon the Commissioner issued a patent, "quicker," to use a homely expression, "than you could say Jack." But we think it will strike most of our readers, as it does ourselves, that the reasons assigned might have been more properly used for postponing instead of hastening the grant of the patent. In the case of a poor inventor, whose application has been long pending, the Patent Office should be as prompt as possible. But with respect to inventions for which the government patronage has already been secured, as in the present case, what possible difference can it make to the government whether the patent is granted to day or next month?

All unnecessary interference with the usual order of business at the Patent Office, whether by the President or any other public functionary, is pretty sure to create dissatisfaction, and should be scrupulously avoided. Instead of writing requests to favor the interests of his personal friends, it would be much better if President Grant would indite communications something like the following:

"To the Commissioner of Patents.

I am informed that many applications for patents are lying in your office unexamined, and that, in the class which embraces telegraph apparatus, there are cases filed more than a year ago, which still remain undisposed of. This is a crying shame and ought no longer to be tolerated. No class of individuals has done so much for the benefit of the country as our inventors, and when they apply for patents, every possible endeavor ought to be made by the Patent Office to give them a prompt and favorable hearing.

With the large corps of assistants under your command, numbering, as I understand, about five hundred persons, including one hundred examiners, is it not possible for you to bring up the business now in arrears, and in future have things attended to with more promptitude?

I see by your report for last year that you rejected between five and six thousand applications for patents. It must have required an immense amount of time and labor on the part of your people to hunt up reasons for this enormous mass of adverse decisions.

Do you fully realize that the majority of these five thousand rejected applicants are poor people, and that your rejections, especially if wrong, carry injury and disappointment into that number of families?

For my part, were I Commissioner of Patents, I would not hesitate to grant a hundred doubtful patents rather than take the risk of depriving one of my inventive countrymen of the full benefits which the law intended to give him.

I beg to remind you that the object of the Patent Office, as intimated in the Constitution, is to encourage the progress of the useful arts by the grant of patents to inventors. But if I were to judge from your great number of rejected cases, I should say that the Patent Office appeared to consider its prime duty to be to refuse to grant patents.

I have confidence in your ability to remedy the unsatisfactory state of things I have mentioned, and I shall look to you for immediate and effective action. 'Let us have peace.'
U. S. GRANT."
—*Scientific American*.

The Great Electric Lights at South Foreland (Eng.) Light Houses.

THE electro current is generated by means of large magneto electric machines, which are driven by means of belting connected with a steam engine. Each machine is composed of ninety-six helices mounted upon six gun metal wheels, each having sixteen helices. Between these wheels are placed the magnets, eight in each division, forty of which are composed of six layers or leaves riveted together, and sixteen the end ones, having three leaves. The magnets, which are mounted in frames, are stationary, while the helices revolve at the rate of 400 revolutions per minute.

The power absorbed by the machine alone, disregarding friction, is four indicated horse power. The power of a magneto electric machine is according to the gross attractive power of its magnets, each magnet having a certain lifting or attractive power, expressed in pounds. In the machines at South Foreland each of the six plate magnets will lift 108 pounds, and each three plate magnet will lift 54 pounds, making the attractive power of the magnets in one machine to be $40 \times 108 + 16 \times 54 = 5,184$ pounds. The proportion of the lifting power to the weight of a magnet is a good indication of its value, and, generally speaking, a magnet which will lift two and one half times its own weight is a good one. Each six plate magnet at South Foreland has a weight of 43½ pounds and will lift 108 pounds.

The machines are connected with the electric lamps placed in the lenses of the tower by underground cables. The carbons used in the lamps are 10 inches long by three eighths of an inch square, regulated by automatic apparatus, and are consumed at the rate of four inches per night for each lamp. The lenses are about the same size as ordinary third order lenses.

Presentation to Supt. Stewart.

MR. ROBERT STEWART, whose appointment to and acceptance of the position of General Superintendent of Telegraph for the Baltimore and Ohio Railroad has already been announced in THE TELEGRAPHER, was, on the 4th ult., presented with a silver ice tankard, goblets and salver, by the telegraph employes of the New York Division of the Pennsylvania Railroad Telegraph line, as a token of their esteem for and appreciation of their retiring Superintendent. The presentation was made on behalf of the employes by Mr. F. C. Reed, division operator in New York.

Mr. Stewart was greatly surprised and deeply affected at this demonstration, but finally recovered his equanimity sufficiently to return his grateful thanks for the honor done him, and addressed his associates at some length. The party then adjourned to the Howard House, where a collation was enjoyed. In the evening Mr. Stewart attended the operators' ball at Ferrero's Assembly Rooms, Tammany Hall.

Lighting Segars by Electricity.

A FRENCHMAN has recently brought out an invention called the Electrical Tinder-box, which is small enough to go into a segar case. It consists of a very small galvanic battery, put in action by touching a spring, the current heating a platinum wire sufficiently to light a segar or to set fire to cotton wool steeped in spirits or petroleum.

Miscellaneous.

THE SPECTRUM OF THE AURORA BOREALIS.—The late Prof. Angstrom, who at no time accepted the theory that the spectra of gases varied with the pressure, and temperature, and chemical process, advanced the opinion that the spectrum of the aurora borealis is composed of two different superposed spectra, the one consisting of extremely feeble bands of light, belonging to the spectrum of the negative pole, the other consisting of a single strong yellow line, which is characteristic of the aurora, and which Angstrom believed owes its origin to fluorescence or phosphorescence.

EARTHQUAKES AND MAGNETIC DISTURBANCES.—Mr. Lamont, Director of the Observatory at Munich, says that many cases are known where magnetic disturbances coincide with earthquakes, and states that, on April 18, he by chance saw the needle of the declination instrument receive a sudden jerk, the oscillations continuing for some time. After some days he received news that violent oscillations of the needle had been observed in Parma, and subsequent computations showed that the movement had begun at the same moment in Parma and in Munich; while, later still, reports were received of a violent earthquake occurring simultaneously in Greece.

Why Women Should Not be Telegraphers.

CINCINNATI, O., Feb. 19.

TO THE EDITOR OF THE TELEGRAPHER.

"One point must still be very dark,
The moving why they do it!
And just as lamely can ye mark
How far, perhaps, they rue it."

Nihil seems to have been more unfortunate in his last article than in his first. In that he incurred the displeasure only of some of his own sex. In this he seems to have uncorked the vials of the fair and brought down upon his head the accumulated wrath of all the operators in the land who happen to differ with him in the "accidental circumstance of sex." Already the mutterings of the thunder are heard in the Heavens; the sky is overcast, the lurid lightnings are flashing, and the tempest is upon him. His mild toot upon his horn has called forth such a terrific blast as might well deter him from sounding another note.

It is a comforting circumstance, in this clashing of arms, that the notes of battle are thus far borne from afar. Viewing the ground that the ladies have taken, viz., "woman's rights," I fear I shall have to withdraw hereafter, for that battle will in all probability be as unending as the pilgrimage of the "Wandering Jew." Rivers of—ink will flow—thousands of innocent "coming men" will lose their scalps. But I will "speak mine opinion" before I retire.

The fair lady from Chicago, in speaking of the approaching Centennial, seems to mean that women will be found to have made a great advance. She has made a great change in position during the century about to close. As I have previously said, however, "Change is not always improvement," and I hope to be pardoned if I am yet unconvinced of the falseness of my position. She remarks, "Contact with others is refining in its tendency." I hope this is not intended as the statement of an inviolable law. If it is, and is true, away goes the time honored belief that "To touch pitch is to be defiled." Gold is a very pure metal when freed from its contact with baser substances, but it must first be separated from all contact with the elements with which it is blended ere its purity is manifest. She observes, also, "A lady will not part with more of her dignity and self-respect in giving telegraphic orders to workmen on a railroad than in giving her orders to the butcher." Are the cases parallel? In the first case she is probably surrounded by a mob of half savage men, far from her friends; in the second she is at home in her own castle, surrounded by friends. The butcher may be no better than the section hand, but her home is better than a railroad station. The butcher knows it to be his interest to be polite and attentive. Here I rest the case with "Aliqua." The fair Canadian champion has been more voluminous, and I shall be obliged to ask somewhat more space in replying to her. Please bear with me and I will be as brief as possible. She first attacks the good old times of "our fathers." I can pardon a resident of Canada the indulgence of a little spleen at the expense of my ancestors, while I reflect that they were the old fogies of Massachusetts. Their notions were sometimes straightlaced and narrow, but I question much if their children have much of which to be ashamed in the results of their beliefs. Their faults were many, but their steadfast earnestness of belief has made New England what it is. The way in which she refers to the creed of our grandmothers leads me to suppose that she rejoices in the freedom of the granddaughters from the superstitions of those old times. She says "Our grandmothers were taught to look upon marriage as the chief object in life." In defence of their teachings I will only say they had the advantage of being drawn from the Bible. From that source they drew the spirit of their laws and opinions, both political and domestic; and I am content to be classed among those (sadly behind the times I know) who are willing to believe that if we square our lives by the rules there laid down, we cannot go very far wrong. Nor will we find that we have much occasion, as we increase in years and wisdom, to change our views. We who are old foggy enough to believe in that old fashioned book are credulous enough to believe that Moses, and Solomon, and Paul drew their work from inspiration, and we do not pretend to be wiser than the Author. She laments the fact that young men hesitate to marry, and also complains that a large per cent. who do not hesitate, are worthless when they do marry. Agreed.

If the learning of telegraphy by the young ladies will make them any the readier to marry, or any the

better husbands after they are married, I say by all means let the young ladies learn, for the veriest idiot knows that there is improvement needed in this direction. But I cannot see that this will help matters much. I cannot see that knowing how to send and receive telegraph messages will any better fit a young lady for the position of housekeeper, for the business of ordering the home and the family, than "sitting idle." Will it make home any happier? the fireside brighter? the house tidier? that the wife has learned telegraphing at the expense of sewing and cooking? "Young ladies, members of large families, do not care to stay at home wasting their lives in unproductive idleness. Pray, why need they be idle? I have spent some years in observation, and I have yet to find, in ever so small a home, a good excuse for a really industrious cheerful girl to be idle. Does telegraphy open the only possible door to labor? One of those straightlaced notions of "our fathers" was that women and men should not spend too much time and money in dress. Possibly a reason for the backwardness of the young men matrimonially may be found in the fact that these old notions have been laid aside, and that, now-a-days, women who possess sufficient intellectual culture to render them attractive as companions, are generally sadly deficient in those matters of domestic and culinary culture and economy which would render them attractive as wives, and that the extravagant ideas which mostly possess them and attach to the prevailing fashions, render it necessary to possess wealth in order to bear the burden of a wife. She claims that commercial offices are better than railroad offices. Granted. Can the lady always get in a commercial office? or will not the necessity for bread compel her, as a man, to take what she can get? "Ladies should not claim privileges in offices not granted to men." Now I assert, without fear of successful contradiction, that it is impossible for a woman, from the very nature of her physical organization, to endure what a man of otherwise equal strength can endure without danger. And that, when the courtesies now extended to her shall cease, the fact will speedily be demonstrated that she is physically incapable of performing the labors which men now do in the telegraphic service.

For the present I shall bid adieu to "Jo," referring to her a general once more in concluding this article—already too long.

A word to "Lady." She announces herself as "an operator of six years' standing." Very creditable indeed. I have been sitting at the same work for nearly twice that length of time, and yet the conclusions that I have drawn from my experience are exactly opposite, though drawn from very similar premises. "If she has a spark of decision she can clear her own office of loafers," and yet she admits that, with all her decision (of which I conclude she imagines herself abundantly possessed), she could not prevent the frequent use of indecent language on election night. Did the matter of ejecting them from the room every few minutes cool the breath of shame upon her cheek? I do not mean to be offensive, but I mean to ask a plain question. When "the drunken Texan, the roughest of his class," had left her office, did not the pure heart of the woman long for the protection of home, "where no one would dare to molest her or make her afraid"? Did his prompt obedience, when ordered to leave, atone for insulted womanhood? Does the fact that the morals of the "Southwestern Railroad" (noted for the rough character of its employees) "underwent a change for the better—were completely revolutionized"—prove that it is always safe to trust our sisters in such places? She calls the employes "desperadoes." Can she, by any argument, convince the fathers of the land that they are not injuring their daughters by sending them among such men? Would she advise her sister or her friend to go among them? "I wish to enter an emphatic protest in behalf of the 'more civilized West.'" Then follows the experience of the lady among the "desperadoes who manage the trains" "in the civilized West."

"Oh, consistency, thou art a jewel!"

"I believe any self-respecting girl can follow telegraphing anywhere on this continent without annoyance." I will not suggest the Comanche country as a place to begin in. But I will say that I would as lief trust a friend of mine, one whose heart and mind I valued more than I prized her grit, among the savages, as in a telegraph office alone in the night, in some isolated country place, such as the night be compelled to accept were the profession to be monopolized largely by the ladies. And this brings me to the end. My original ground, and that which I yet maintain is, that the tendency to dull the finer sensibilities and blunt the pure, more womanly feelings, is simply manifested.

All the ladies have agreed that their presence in the profession will elevate it. I will not deny it. One says: "We lose a little; we gain a great deal." I answer: The elevation of the entire profession would not compensate, in my mind, for the slightest blot upon the fair fame of the poorest girl who now earns

her bread at the key. I do not wish the ladies to think I lack in respect for them—I have said I do not. But I respect woman so much out of the profession, and I so much fear its tendencies, that I do not want her to be in it. I am sure that if the ladies who have so forcibly contributed to your paper upon this subject could know how earnestly I feel, how fully I believe that "woman is to man what he thinks her to be," and how earnestly I deplore the fact that they choose the profession, they would sooner charge me with any other fault than unfriendliness or narrowness of mind. Woman is nature's fairest work—she should also be her purest. *Vivevale.* Nihil Nameless.

An Arctic Spell.—Anxiety for the Quadruplex.—Telegraph Matters Generally.

ALBANY, N. Y., Feb. 22.

TO THE EDITOR OF THE TELEGRAPHER.

SINCE my last letter we have had a spell of weather which would have delighted a Polar bear, but which produced quite a contrary effect upon your readers of this section. To illustrate: At the Dudley Observatory, on Saturday morning, February 13th, the mercury indicated eighteen degrees below zero; at Poughkeepsie, a passenger train on the Rutland and Washington Railroad was frozen fast on the track, and detained over four hours, with the thermometer about thirty-four degrees below zero; at Warrensburgh, Warren County, N. Y., near Lake George, the mercury seemed to have lost all its ambition and dropped to forty-one degrees below.

In consequence of the bad management of our excellent heating (?) apparatus, the temperature ranged from fifty to sixty degrees above zero in the operating room, which rendered "roasts" and "hot boxes" things to be desired and sought after. Perhaps there are others who have had the same experience. If so, they will know how to sympathize with us.

This unfortunate office seems to be a regular stopping place for epidemics. On Monday, the 15th inst., we were again afflicted. This time it broke out in a new form, consisting in a general scrubbing and oiling of tables. The fever is supposed to have been brought on by the expectation of a visit from a certain official. It seemed to have little respect for persons, as it attacked all grades, from the manager down to the dummy boy. Old things passed away and all things became new under the magical touch of soapy water and sweet oil, and yet the electrician came not.

Considerable anxiety was exhibited about this time on account of the non-arrival of the quadruplex instruments, which were expected several days before. About three o'clock one day a long box arrived, which was speedily "gone for" by the manager, who supposed he had a sure thing on the "quad." This time his disgust may be imagined, for upon being opened it was found to contain nothing but old books and messages from a country office.

A new use for the Bank Alarm Telegraph has been discovered by a Troy youth, who appears, from all accounts, to be a very practical sort of a chap. In speaking of the discovery the Troy *Whig* says: "An alarm was given at the second precinct station house last evening, about nine o'clock, on the bank telegraph circuit, when four or five policemen hastily repaired to the signal box in the Mutual Bank, expecting, no doubt, some serious difficulty in that establishment. The ears of the night guardians were fully realized, upon reaching the bank, by finding that a clerk in the institution had found it necessary to go into the cellar after a scuttle of coal, and being of a mild and timid nature, thought that he would call upon some one to accompany him on his perilous journey to the lower regions. He therefore sounded the alarm above referred to, but when the policemen arrived they utterly failed to extend the desired sympathy and protection."

Some persons seem to have considerable trouble to get the Callaud battery through their heads (which, perhaps, is not to be wondered at, considering the size of the jars and that of the heads). The operator at a way station recently said to the repeating office: "Wait a minute; I'm fixing my battery; will take your message as soon as I get the wheels in the jars."

Among other improvements which are about to be made by the Western Union is the reinsulation of nearly all the wires on the Hudson river route between Albany and Manhattanville, comprising six through and two short wires, making in all about one thousand miles of line. The old hard rubber hook insulators, which now render those wires almost useless in bad weather, are to be replaced by glass and porcelain insulators of the regular W. U. pattern. The estimate of material calls for 31,680 glasses and pins, besides several hundred pounds of nails. The work will be commenced as soon as supplies can be furnished, and will be done under the direction of Mr. George C. Thompson.

By the time this reaches you it is expected that the quadruplex will be in use for regular business between

New York and Albany. Further mention of its working will be made in my next. Notwithstanding the statement made by *The Operator*, some time ago, that the Gamewell Fire Alarm Telegraph system is a failure, it has been in successful operation in this city for about seven years, and gives the most unqualified satisfaction. Albany is acknowledged to have one of the best fire departments in the country, and its efficiency can be traced, in a large measure, to its excellent system of Fire Alarm Telegraph. The Fire Commissioners have recently decided to put up eight additional alarm stations—making seventy-three in all. Mr. William Cull, better known to “old timers” as “Billy” Cull, is Superintendent of this department, and is “the right man in the right place.”

DOUBLE SIX.

The Western Union Female Telegraphers Done in Rhyme by One of Themselves.

CHICAGO, Feb. 20.

TO THE EDITOR OF THE TELEGRAPHER.

WB are having very pleasant winter weather just now.

News items are very scarce. The following lines, which you will notice by the second verse are written by “a woman,” were lately found by the Western Union Janitor in the ladies’ lunch and dressing room, and purchased at an enormous price, although rather on the machine poetry style. It will probably do no harm to show the girls here what one of their number thinks of them, especially when they were not intended for print. Here they are—

The Chicago Western Union girls,
What a happy, healthy throng;
I daren’t tell their ages,
That would be doing wrong.

Of looks and dispositions, though,
I will tell you what I can—
Excuse all seeming deficiencies,
Remember I’m not a man.

First I notice Mrs. T.,
With hosts of friends beset;
She’s such a pleasant lady,
Our handsome, dark brunette.

Now let me notice Miss “J.,”
A blonde, stately and tall;
Though distant in her way
She is beloved by all.

Next comes Miss J. H.,
A handsome, fair haired maid;
Her agreeable, winning ways
Have broken hearts, ’tis said.

The sprightly, fair Miss D.
Has very long brown curls,
Besides a loving disposition;
She’s a favorite ’mongst the girls.

Now, who’s that delicate girl,
Who acts so very cute?
She’s a beauty to behold.
You needn’t say you “knew it” (Nute).

Lou E. is a bashful maid,
With soft brown eyes so shy;
Don’t dare to look at her,
She’ll blush and almost cry.

Lillie S. is full of fun;
A gay, bright young lass;
If any game is under way
She’ll never let it pass.

Zid Snell is a wicked piece,
Very fond of fighting duels;
Always on some mischief bent,
Her eyes sparkle like jewels.

She is a talented artist,
This her drawings off have proved;
They are certainly very solemn,
But we behold them unmoved.

Lizzie V.’s our favorite one—
Beauteous belle of the room—
Admired by great and small,
Her brightness banishes gloom.

What a merry, hazel eye
And brown—almost curly hair—
We couldn’t do without her,
So gentle and so fair.

We’re not going to forget
Little Jennie with the flaxen hair,
Bright eyes and rosy cheeks,
The fairest of the fair.

She is very kind and gentle,
And always sure to please;
But she’s the very mischief
If there’s any one to tease.

Almost forgot them? Very easy,
They were out (’pon honor),
Mrs. Louderback and Annie Veasy,
As well as Mrs. O’Conner.

I’ll now finish my rhyme,
But won’t forget little Sue,
She’s full of poetic wit—
Well, good bye, girls—adieu!

It is evident that these lines must have been written nearly a year ago, as Miss J. H., mentioned above, is now “breaking hearts” at Buffalo. Miss D. has become Mrs. F. W. Jones, of this city. “Nute,” i. e. Miss Alice Nute, is diving deep into the mysteries of phonography in this city. Lillie S. (Miss Smethells) has gone with the M. C. R. R., and Mrs. O’Conner has gone on a visit to Ireland.

OCCASIONAL.

The Telegraphers of the N. Y. & O. M. Railroad Lines.

IN THE WILDS OF JERSEY, Feb. 15.

TO THE EDITOR OF THE TELEGRAPHER.

NOT wishing to go ahead too fast, I will retrace and bring up the rear.

Mr. S. D. Blanchard, of Cook’s Falls, N. Y. & O. M. R. R., has been transferred to De Ruyter, N. Y., same road, as operator of this and the Utica, Ithaca and Elmira R. R. Sile is now at home, where we, perhaps, will hear of him no more, because rumor has it that at this early age he thinks of settling down.

There have been some changes in operators on N. J. M. Railway, which were noticed in THE TELEGRAPHER of January 23, most of which were promotions.

Mac, of “P. O.” has gone to “D. G.” Mr. P., of “M. C.,” has taken “P. O.” stations as agent, and the youthful Knapp has been appointed operator under Mr. P. Knapp was a student under Harris at “J.,” and his first position was “relief man,” but has not as yet been caught napping. We wish him success.

A young man, by name D. T. Eckerson, who learned of Mr. G. at “N. D.,” succeeds “G.,” who has married, gone West, and settled down at Newfoundland, N. J., station on the same road, as agent and operator, in place of Mr. E. B. Clay, who is now off the road; but whether Mr. C. was discharged or not I am not able to state.

And still another has learned and stepped into the ranks. Willie Plitorft, who learned at “C. H.,” has gone to “W.” as night man. He’s a sounder, and bids fair to beat the automatic. He has a great many faults, like all new beginners, but “with all thy faults we love thee still.”

In the distant horizon we see another making rapid strides to reach our lines, who, we think, will not disgrace the profession. May luck follow our young friend Willie Cass at “C. H.”

A new office has been established by the A. and P. at Union Hill (H. N.), in Jersey City, for testing purposes. It is a short distance from Weehawken cable house, North River. The Midland wires run in here before crossing the river, also the A. and P., and the Franklin wires.

An instrument has been placed in Supt. Lewis’s office at Jersey City, call “S. O.” Mr. L. and Div. Clerk Bond are the operators.

And still they come! Mike, at “J. C.,” expects soon to knock for admission to the ranks. He says, “Opposition is the life of trade,” and on this principle has, in company with W. and M., brought into life the “Ghost Telegraph Company.” Thereby hangs a tale, which will be made known shortly. Tom Thumb is connected with this line.

We are sorry to see so many of our profession taking so little interest in THE TELEGRAPHER, the only paper that takes so much interest in the operators of the globe, and yet they do not support it. One says, “Pshaw! two dollars a year is too much—can’t stand it,” and yet I know of operators going out with their friends and spending twice that sum in drinks, or something of that kind, that does them no good but a great deal of harm. I close this by saying to all telegraphers, support your supporter—THE TELEGRAPHER. P’S AND Q’S.

The Western Union and American District Telegraphs and Telegraphers in St. Louis.

ST. LOUIS, Mo., Feb. 22.

TO THE EDITOR OF THE TELEGRAPHER.

THE winter here has been one of unusual severity, yet we have had but few snapped wires. Notwithstanding the inclement weather, the Western Union have been building and rebuilding in Colorado.

The American District was introduced in this city late last fall under the superintendency of Mr. Durant, of New York. They have met with considerable success, and their circuits are being rapidly extended. Wires are now being strung between each of the courts and the general office, at 214 North 6th street. The object is the economy of time, by doing away with the necessity of lawyers waiting until their cases are called.

But few changes have been made in the W. U. office in the past year, and I will venture to say that a more reliable or better corps of operators can’t be got together.

Mr. Wm. W. Cummings is chief; A. E. Van Tyne

ass’t chief of this office; Mr. John L. Cassidy warms them up on the Cincinnati wire, while Mr. Thos. P. Wheeler holds down one side of the Chicago duplex, and Mr. Theo. P. Cook the other; Mr. Edward A. Keen amuses himself keeping New Orleans and Memphis clear, and calling out “a. i.” on 11 north; Mr. John A. Topliffe takes care of New York and a diekey luncheon; Mr. William J. Fay holds Long Horn No. 1 level (if he don’t sleep much); Mr. H. C. Mahoney says Little Rock and Montgomery keep him busy; Mr. Edward L. Parmelee—old genial Ed.—persists in getting cramps, and tries to drive the key on Omaha wire through the table. It’s fun—not mad—oh, no! Mr. James W. Cook is growing gray on Kansas City wire, and is the most amiable man in the office at noon if he’s got lots of business and C. N. D’s.

Mr. W. S. French likes Pittsburg and Indianapolis, but he won’t buy tobacco; Jimmie O’Toole says he wishes H. W. C. had taken that powder and saved him much work on day “report;” Mr. A. G. Thompson takes care of Quincy and 13 east, while Mr. Murphy does likewise on Keokuk and Vandalia; Mr. K. Eckert is in love with Springfield, Mo., Southeastern 2 and 1 east. Our old friend Deacon Joseph Purcell exchanges with “Ux.,” and leaves a full No. slip at night; Mr. Napoleon J. T. Briggs is happy with Cairo and Davenport by his side, and so is Mr. Sam Cassidy with beautiful Belleville and Decatur; Mr. H. Eckert likes Moberly, and knocks down on 1 south and 4 west, as well as 3 south; he will do, eh? Messrs. King and Lucking distribute on the city circuits.

Mr. Chas. J. Lawson is night chief; Mr. Jas. S. Nelson has got a soft thing with N. Y.; Fred Maxon sleeps on specials on Cincinnati, and Geo. Huddleston clears N. O. and H., while W. R. McDonald scoops them in on Long Horn; W. H. Loper takes it on manifold, while old reliable Sid. B. Fairchild hands it to the West and keeps a full break sheet; James A. Murray is growing thin on Chicago; cheer up Jimmie, my boy. Now, there’s Charles F. Day, just as good looking and happy as ever, works Jefferson City. (Name the first one for me.) John McNevin lost his bet, but he, with J. W. Hays, Joseph McElvaine and Richard Hollohan take a personal interest in keeping business cleared up all around; Peter Grichatt is the man that comes on at 11 P. M. and remains till 7 A. M. (Segars.) Chas. E. Burroughs has gone East to duplex, and rumor has it that two or three more of the boys are figuring how much it costs for board for two.

Go all ye and do likewise. Geo. Huddleston and Van Tyne’s daughters are soon to make their debut in society. Frank Keene has been visiting his parents at Titusville, Pa., and returns to us fresh as a rose. C.

Western Union and Automatic Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

I SEE by your issue of this date that some Electrochemical Automatic Telegraph experiments have been tried over a line of the Western Union Company. Will you permit me through your columns to say that the patent referred to of recent date, January, 1875, infringes on the following patents, granted to me of dates October, 1870; February, 1872; April, 1872; July, 1872; said patents covering the broad claim to the use (in an Electrochemical Automatic Telegraph) of inductive condenser coils, magnetic inductive current coil within a coil, shunt within a shunt, so-called non-inductive resistances, depolarizing batteries, secondary rows perforations used for the purpose of throwing a neutralizing charge into the main line, with the use of alternating currents. The above extra features being clearly set forth in connection with my “American Electrochemical Rapid Automatic Telegraph system.” GEORGE LITTLE.

Passaic City, New Jersey, February 27, 1875.

The Postal Treaty with Canada.

THE postal treaty between the United States and the Dominion of Canada, which was negotiated in the latter part of last year, went into effect on the 1st of January. Under its provisions letters can be sent from any part of this country to any part of the Dominion for three cents. The one cent postal card does not require an additional stamp if directed to Canada. Newspapers require a cent stamp only, but all postages must be fully prepaid. So far as postal arrangements are concerned the relations of the United States with the Dominion are now precisely the same as those between each State of the Union, except that, when not fully prepaid, letters to Canada are not forwarded.

Dreadful!

THE nondescript says, “THE TELEGRAPHER is an advertising sheet, without pulsation!” Who would have thought it? To be not only an advertising sheet, but also without pulsation, is really dreadful!

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, MARCH 6, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

The Telegraphic Investigation and Proposed Legislation of Congress.

AS WE predicted, the attempt to secure legislation to regulate telegraph companies and their management and operations from Congress, have not been successful. MR. BUTLER'S bill, reported by him from the House Committee on the Judiciary, got as far as unfinished business, and there it stuck until Congress expired. While there were some good features and provisions in this bill, as a whole it was injurious and mischievous, and we are glad that it has failed to become a law. There can be no valid or reasonable objection to a legal provision which shall compel telegraph companies, in the interest of the public, exchanging business with each other without being subjected to unusual or onerous conditions and restrictions; or which shall compel them to receive and transmit messages from each other's employes upon the business of their competitors, upon payment, of course, of the usual tolls therefor. Had MR. BUTLER'S bill only aimed at so much, we think it would have had a much better chance of becoming a law. It was intended to do much more than this, and it failed, as we believe all similar bills will fail hereafter.

We have already published a brief synopsis of the report which accompanied the bill from the committee and have not space enough, even if it were desirable at this late day, to print it more in detail. We find in this report, however, a communication from Mr. E. D. L. SWEET, as executive manager of the Atlantic and Pacific Telegraph Company, which has attracted our attention, and whose statements have somewhat surprised us. The communication of Mr. SWEET is as follows:

*Executive Office of the Atlantic and Pacific
and Franklin Telegraph Companies,
New York, Jan. 20, 1875.*

Dear Sir—In the course of our business at Chicago it has sometimes become necessary for our managers at Omaha and Chicago to send messages to each other over the lines of the Western Union Company. These messages have been received by the Western Union Company and the regular tolls collected until recently. For some reason, unknown to me at this time, the officers of the Western Union Company at Chicago have declined to take certain messages. These messages are, to all intents and purposes, the same as any message from a private party which might be handed in at any office. They are signed by Mr. Towler (our manager), in his private capacity, and the regular tariff of the Western Union Company tendered. This is not the only instance that may be named of a refusal of

the Western Union Company to receive messages coming from persons supposed to be in the service of the Atlantic and Pacific Telegraph Company; but it seems to me the most striking case that has occurred of the violation of the laws which should govern telegraph companies, and furnishes an argument in favor of the passage of the bill recently introduced by Mr. McCrary.

I submit this information, that you may, if deemed proper, furnish it to him, or any member of the Committee to whom the bill has been referred.

Very respectfully,
E. D. L. SWEET,
Executive Manager."

We did not suppose that at this late day any telegraph manager would assume the responsibility of refusing messages tendered in the ordinary manner, and with the amount of tolls exacted for such business. Under existing laws telegraph companies are undoubtedly liable for refusing to receive, transmit and deliver despatches, even though they may be from and intended to facilitate the business of their competitors.

When years ago we were engaged in active telegraphic pursuits, the rivalry and competition between telegraph companies was at times very active and bitter, but we have never known of an instance, personally, when messages were refused by one because upon the business and intended to facilitate the operations of a competing company. Such action is an outrage, and in violation of the legal obligations and duties of a telegraph company.

Telegraph companies are accorded certain rights and privileges, and are subject to reciprocal duties and obligations, and one of the principal of these is to receive, transmit and deliver all proper messages tendered to them upon which the regular charges are paid. This is an imperative duty, and one of which they cannot be permitted to divest themselves at will.

So far as we have learned up to the time this is written, the investigation by the House Judiciary Committee of the action of the Western Union Company has amounted to nothing. We are not yet aware what the report of the committee was, but shall probably receive it in time to publish the conclusions arrived at next week. As we understand it, the Western Union officials succeeded in purging the company of the offences charged against them specifically, and upon which that investigation was founded. Whether the matter stated in Mr. SWEET'S letter was brought before them we have not as yet heard.

Our sympathies are naturally with the telegraph companies in these persistent attempts which have been for some years past made to raid upon them in the interest of outside parties, or on behalf of a government telegraph system. We have opposed and do oppose the latter as unwise, impolitic, and contrary to the interests not only of telegraph companies and telegraph employes but of the public also. The battle has been substantially fought out, for some years to come at least. If telegraph managers will conduct their enterprises with a fair degree of wisdom, and with a view to satisfy the public requirements as well as to make money for their stockholders, government telegraphy is dead in this country. Only by such an unwise and illegal policy and action as is charged by Mr. SWEET, can a government telegraph system obtain further standing or serious consideration from Congress or the people. Their safety is now substantially in their own hands, and if they are plagued by government telegraph schemes, it will be their own fault.

Underground Telegraph Lines.

WE have repeatedly commented upon the urgent necessity for putting the telegraph lines, in large cities especially, under ground. New York is encumbered with unsightly telegraph poles, and covered with a network of wires, which are constantly and rapidly increasing in number. That some subterranean telegraph system must eventually be adopted here is unquestionable. In 1872 a charter was granted by the Legislature to a corporation which proposed to accomplish this work. It is understood that this corporation proposes to commence operations this spring. We are

not fully advised of their plans or the method of laying down and maintaining the lines which is proposed, but that something effectual in this direction is needed is daily becoming more apparent.

A reporter of the *New York Tribune* interviewed President ORTON, of the Western Union Telegraph Company, on Monday last, in regard to the probable course of his company in reference to this matter, and elicited the following, which we transfer to our columns as matter of general interest and importance:

"President Orton, of the Western Union Telegraph Company, having returned from Washington, resumed his duties at his office yesterday. In response to inquiries concerning the probable course of his company with regard to the underground system of telegraph wires, Mr. Orton said that he was disposed to diminish the unsightliness of the appearance of the telegraph wires above ground as much as possible. The proposition to place the wires underground was one which required careful consideration, as it would be an extensive and expensive experiment. If New York were a finished city, like London or Paris, perhaps such a system might be created and operated satisfactorily. In this city, however, there was no permanence in anything, more especially anything under the thoroughfares. The municipal authorities, gas companies, and private persons, are tunneling the streets continually, and would be apt to play havoc with any system of underground wires.

In London, Mr. Orton said, there is not complete satisfaction with the underground system, and the aerial wires are increasing in number yearly. In Paris, however, where there is a complete system of sewers, the underground wires work to perfection. Much had been said on the subject of the Western Union aerial wires in New York City. Mr. Orton remarked that, while disposed to diminish their unsightliness, his company had as good a right to have wires above ground as Commodore Vanderbilt had to run his cars on the surface of Fourth avenue until he saw that the public convenience and his own interest would be advanced by placing them beneath the surface. While ready to maintain their rights the Western Union Company was disposed to facilitate public comfort as much as possible. It was not unlikely that experiments would be undertaken in the business section some time this year, to discover whether the underground system is sufficiently feasible and economical in this city to justify any change.

"As Mr. Orton had cited the case of the sinking of the Fourth avenue tracks, wherein the city had paid one half of the expenses, the reporter asked if the Western Union Company intended to suggest a like scheme for the placing of subterranean wires. Mr. Orton said that if any proposition of that kind was made to the Western Union Telegraph Company it would receive the most careful consideration. Upon being further asked if it was the intention of the Western Union Company to cooperate with its competitors or the Underground Telegraph Company in the matter of the subterranean wires, Mr. Orton said that the Western Union Company had the right to sink their wires, and in any steps which they might take it was not likely that they would share their facilities with competitors."

All Quiet Along the Lines.

THERE is an absolute lack of anything of an exciting nature in connection with telegraphic matters this week. The only notable incident, so far as we have been informed, is the introduction of the automatic apparatus in the Atlantic and Pacific office at Chicago. The automatic system is now being worked between Buffalo and Chicago successfully, and will soon be introduced on other routes and in principal offices of the company. The A. and P. officials express themselves highly gratified at the success achieved in working the automatic on its wires, and have found it of great advantage in disposing of the rapidly increasing business of the lines.

We hear very little of the quadruplex of late, and are inclined to think that it has practically had its day, and that the fact, which we have stated from the first, is beginning to be realized that it has been greatly overrated, and that there remains a good deal of improvement to be made before it shall prove as advantageous and valuable as has been claimed.

MR. ORTON returned from Washington, and has been engaged in his ordinary duties here since last Monday. The adjournment of Congress on Thursday last will relieve him and the company from the necessity for watching matters so closely at Washington as they

have been obliged to do of late, in order to neutralize the persistent efforts which have been made to secure unfriendly legislation.

Some comment was caused last week by the report that the Western Union Company were endeavoring to negotiate another loan in addition to the \$5,000,000 understood to have been recently made in London. It transpired eventually, however, that this was a portion of the former loan which had not been disposed of.

The work upon the new building is being pushed forward as rapidly as possible, and matters inside are gradually getting into shape. It will, however, be some weeks before everything is completed.

An Art Criticism.

THE *Daily Graphic* of this city has been laboring for some months under an acute attack of Western Unionophobia, superinduced by over-indulgence in government telegraphic literature. Lately the disease appears to have spread from the "intellectual" to the "aesthetic" department, and the sufferings of the patient have been truly agonizing! On Thursday of last week the *Graphic* came out with a cartoon representing a dismal cave inhabited by a terrific beast with seven heads and ten horns (supposed to represent the monopoly), in the act of being defied by a somewhat vixenish looking female, bearing a shield inscribed "free trade in news and cheap telegraphing." Whether or not this is intended to typify an actual occurrence which took place at the Western Union office the same afternoon, we cannot pretend to say, but the coincidence was at least a somewhat funny one. This much is certain, that the prototype of the *Graphic's* amazon came off second best in the contest, and bad to "step down and out."

On Saturday the *Graphic* was on hand with another cartoon representing President ORTON driving a car of Juggernaut, drawn by winged steeds, over the prostrate bodies of the editors of the various daily journals attached to the New York Associated Press. WHITE-LAW REID, of the *Tribune*, seems to stand a pretty fair chance of getting out of the way, by which we presume the artist means to typify his supposed leaning towards the JAY GOULD combination, which will enable him to escape from beneath the chariot wheels of the victorious ORTON. The artist has made a great hit on the PROX's portrait. It looks more like him, if possible, than he does like himself. Pitch into them, *Graphic!* only don't let your artist commit the inexcusable mistake of putting his Western Union wires on BROOKS' insulators, thereby making it necessary to label the cross-arms "W. U. Tel. Co.," as the small boy did his picture of a horse!

The New York Telegraphers' Club.

It is proposed to organize an association of telegraphers in this city, to be known as the "New York Telegraphers' Club." This association is intended to be for social purposes only, and to promote sociability and fraternity among the large number of persons engaged in telegraphic pursuits in this city. If the movement is successful, as it certainly ought to be, it is designed to furnish rooms in some convenient locality, which shall be comfortably fitted up and provided with reading matter, etc., at which telegraphers, when not on duty, can pass an hour or two in cultivating each other's acquaintance and companionship, and enjoy reading, music and innocent amusement.

We cheerfully cooperate in such a praiseworthy undertaking, and hope all telegraphers in this city and vicinity, who are so situated that they can do so, will participate in the proposed organization. There has been heretofore too little sociability among New York telegraphers when off duty, and properly conducted, an organization like that proposed to be established will accomplish much good.

We are requested to give notice that a meeting will be held to effect a permanent organization in the auditor's office, fifth story of the new Western Union

building, March 16th, at 5.30 o'clock, P. M. All telegraphers are cordially invited to be present at the time and place above mentioned, and participate in the proceedings. It is not intended to be restricted to the employes of the Western Union Company, but to include all engaged in telegraphic service in this and adjoining cities.

The Nondescript Edison Organ Badly Afflicted.

"THE thief doth fear each bush an officer," is a saying which is very forcibly illustrated by the mental condition of the publisher of the *nondescript* EDISON organ. The last number of that scurrilous sheet gives evidence that the publisher has "got 'em bad." We fear that his stimulant must be a very bad quality of "tanglefoot," and that his mind, what little there is of it, is disturbed, and his mental vision makes a "fool of his other senses," and he sees "snakes" and noxious animals, which are in fact but the baseless fabric of over-indulgence.

We have been exceedingly amused by the *nondescript's* description of the publisher of THE TELEGRAPHER posting "in hot haste" to President ORTON, to induce him to "squelch us," the *nondescript* aforesaid. Calm your fears our insignificant friend, for we haven't had the pleasure of speaking with Mr. ORTON for more than a year—consequently, we haven't asked that gentleman to "squelch" you. If anything could be more amusing than the *nondescript's* fearful apprehensions of our influence with the President of the Western Union Telegraph Company, it would be his assumption that we aspire to the position of organ of that company, and look for crumbs from that "official table."

If it will at all relieve your maudlin apprehensions, rest assured that THE TELEGRAPHER does not aspire to be the "organ" of the Western Union or any other telegraph company. We represent the *telegraphers* of the country, and that is sufficient for us. Our principal recreation and amusement is in reading the ravings of the *nondescript*, and we semi-monthly enjoy a hearty laugh over its feeble attempts at blackguardism of THE TELEGRAPHER, its publisher, and those who contribute to its columns. So accustomed have we become to these, that we shall really miss it when it "steps down and out."

By the way, the *nondescript* shows its appreciation of THE TELEGRAPHER by stealing *verbatim* its prospects from us. We do not object to this, except that it is too good for such a sheet, and is a fraud upon its readers, for while it truthfully describes THE TELEGRAPHER, it is utterly inapplicable to the sheet which appropriates it from our columns.

The Reduction in Cable Tolls.

WE briefly announced in our last number the proposed reduction in tolls for messages to Europe by the Atlantic Cable to fifty cents per word, gold, to be made on the 1st of May next. This is a very large reduction upon the rates now charged, and will, doubtless, have the effect to largely increase the number of messages, and will popularize ocean telegraphy. Whether it will add to the gross revenue of the Anglo-American Company remains to be seen, but we think it will. The facilities now provided for the business, our cables being in good working order, exceed the demand, consequently it is the part of wisdom for the company, without reference to probable competition, to endeavor to add to the amount of business to be done, especially as this additional business will not very greatly increase the cost to the company of working the cables.

The Electric.

We have received the first number of a new telegraphic journal, the publication of which has been commenced at St. Louis by Messrs. J. W. McDONALD and FRED. B. MOXON, entitled *The Electric*. The publishers are operators in the Western Union Telegraph office at St. Louis. The paper is to be published semi-

monthly. In their salutatory the publishers say: "*The Electric*, we think, meets a demand that has existed west of the Mississippi since the establishment of the telegraph."

The paper makes a creditable appearance for a first number, and is free from the objectionable features which have characterized some similar efforts elsewhere, heretofore. We heartily welcome this new aspirant for journalistic fame and profit, and it has our best wishes for its success.

Personals.

Mr. JOHN Q. MASON, formerly of the Chicago, Ill., Western Union night force, is employed at Moberly, Mo.

Mr. J. C. DELONG, formerly of Kansas City, Mo., is at present operating at Marshall, Texas.

Mr. C. M. SMALLS has been appointed manager of the Denison, Texas Western Union office, *vice* Mr. Meyerhoff, resigned.

Mr. W. B. RICE, of Albany, Oregon, has been appointed chief operator of the Oregon and California Railroad telegraph lines in place of Mr. J. J. KENNY, resigned. This is an excellent appointment and well deserved promotion.

Mr. J. P. MCKEEVER, an old veteran, who has been officiating at Oil City, Pa., W. U. office, has left for—no one knows where.

Mr. BAUSMAN, formerly of Pittsburg, Pa., succeeds Mr. MCKEEVER in the Oil City, Pa., W. U. office.

Mr. C. A. BOLTON, an ex-telegrapher, has been assisting at Oil City, Pa., W. U. office, during the great rush of business about the first ten days in February.

Mr. GEO. ROSS, for some time connected with the Atlantic and Pacific office at Oil City, Pa., has accepted the position of counter clerk at the Western Union office in that place. He gets along admirably in his new field of labor.

Mr. S. C. STOUT has been appointed assistant operator and agent at North Wales, Pa., No. Penna. R. R., *vice* W. S. YOCUM, removed.

Mr. M. R. MILLER has been appointed assistant operator and agent at Quakertown, Pa., N. P. R. R., *vice* Mr. F. ROEPPER, resigned.

Mr. T. GRIFFITH has been appointed manager Western Union office at Canon City, Colorado.

Mr. F. C. MILLS has been appointed manager, W. U. Telegraph Company's office at Slaughter, Colorado.

Mr. C. D. HAYS, Central City, Col., W. U., has accepted a position at Austin, Texas, with the same company.

The Telegraph.

Removal of Miss L. H. Snow.

THE removal of Miss L. H. Snow from the position of chief operator of the city wires, and manager of the female department of the Western Union main office in this city, which took place on Thursday, February 25th, caused much comment among the telegraphers generally. There are many versions of the matter in circulation, but it appears that the immediate cause of this action on the part of her superiors was her refusal to submit to and obey certain rules and regulations of the office, which applied to her as well as to the other chief operators. Miss Snow had occupied the position for many years, originally with the American Company, and after the consolidation, with the Western Union Company.

Miss F. L. Daly has been appointed to the position vacated by Miss Snow.

Boston, Mass., Telegraphic Notes.

On the 19th of last month the Western Union opened a branch office at 218 Devonshire street. It is the finest telegraph office in New England, and is in charge of Mr. Jos. H. Clark. The office will do business principally with Claflin's (Ch.) and other mercantile offices in New York.

Mr. Wm. J. Parritt has been transferred from the Western Union main office to 218 Devonshire street.

Mr. A. B. Churchill takes the place of Mr. Parritt at 109 State street.

Charley McCoy has returned from his two weeks' vacation, and appears more fat and florid than ever.

Mr. W. S. Dodge has been transferred from the main office to the new post-office (Po.) as manager.

Miss Sarah A. Hodges and Mrs. Beardslee have taken positions in the ladies' department, vice Miss M. S. Bumpos and Miss M. E. Brady, resigned.

Mr. Chas. H. Davies is working the second Associated Press wire, nights, at Worcester, Mass. QUILP.

Foreign Telegraphic Notes.

THE Eastern Telegraph Company have just opened a new route to Egypt, across France, via Marseilles and Malta. They have leased a special wire for this purpose from the French government.

The telegraph cable between England and Guernsey was repaired on 7th February.

The telegraph cable between the Lizard, Cornwall, and Santander, in Spain, is broken, and the Caroline, one of Mr. Henley's ships, which is on the spot, was about to repair it.

The Union Steamship Company's steamships Asiatic, African and Angican, sailing from Plymouth, England, on the 6th, 16th and 26th of the month, respectively, will touch at Madeira on the outward voyage, for the purpose of receiving on board telegraph messages addressed to places in Cape Colony.

The number of messages transmitted from postal telegraph stations in the United Kingdom for the week ended February 6, 1875, was 342,892—a decrease on the corresponding week of 1874, of 24,284.

Telegraphic and Electrical Brevities.

THE order requiring prepayment in all cases on half rate messages sent by Western Union lines, has been revoked by President Orton, and such messages may hereafter be sent "collect" on the guaranty of payment by responsible customers.

The Western Union Telegraph Company have extended the facilities for business on the West Side by making a delivery office of the office in the Butter and Cheese Exchange. The Exchange is also provided with the reporting instruments of the Gold and Stock Telegraph Company, and there is a private line from the Exchange to lower Wall street, over which information relative to sugar, teas and other groceries is constantly obtained.

Mr. George Little has just received through his attorney, Lemuel W. Serrell, Esq., of this city, from the Emperor of the Russias, a voluminous patent, printed entirely in the Russian language, for his American Electro-Chemical Rapid Automatic Telegraph system.

Legislation in Regard to Telegraphs in Canada.

A BILL has been presented to the Parliament of the Dominion of Canada, in regard to the rights of telegraph companies in the Dominion, and especially of telegraph cable companies, whose cables are landed on its shores. The provisions of this bill we have not seen, but understand that it differs materially from the one which was passed last year, but which failed to receive the royal assent, and therefore did not become a law.

It is, however, evidently regarded as antagonistic to the interests of the Anglo-American Company, as, at a hearing before the Committee on Railways, Canals and Telegraphs, on Thursday of last week, Lord William Hay, a director of that company, addressed the Committee at some length, and explained how seriously the proposed legislation would affect their interests, and maintained that the company had a legal, moral and equitable right to land their cables in Nova Scotia.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

QUERY.—Why didn't she take along the elevated clothes horse, with its snowy muslin drapery? Will they pack it up and send it after her?

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 18 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended January 12, 1875, and bearing that date.

158,715.—TELEGRAPHIC SIGNAL APPARATUS. Joseph W. Kates, Richmond, Va. Filed Sept. 28, 1874.

1. The combination of the perforated non-conducting tapes D, with a grooved drum A, placed upon one and the same shaft with the mainspring of a clock gearing, so constructed and arranged that the withdrawal of the tapes winds up the spring, and the reaction of the spring, when the tapes are released, winds up in turn the tapes for transmission of the signals, substantially as described.

2. The perforated non-conducting tapes D, in combination with the insulated spring seated wheels G, the insulated wheels J, and the wires N, connecting the wheels J of one tape with the contact wheels G of the next, substantially as and for the purpose described.

3. The combination, with the stud d, of the loose wheel R, the spring seated insulated catch S, and the wire a, for the purpose of opposing the motion of the clock-gearing when the spring is wound up, and shutting the circuit from the operating parts until the tape, which has been drawn out, is released, substantially as described.

For the week ended January 19, 1875, and bearing that date.

158,787.—TELEGRAPH APPARATUS. Thomas A. Edison, Newark, N. J. Filed Aug. 13 1874.

"Electromotograph" in which the mechanical action of an armature is obtained by electro-chemical decomposition. A pivoted stylus, included in a circuit, is carried in one direction by the friction of a moving fillet of chemically prepared paper. When the current passes the friction is lessened by the decomposition effected thereby, and a tractile spring moves the stylus in opposite direction.

1. A moving surface in contact with a yielding vibrator, through which pulsations of electricity are passed when such surfaces in contact are of such a character that the friction will be varied by the electrical condition, substantially as set forth.

2. A vibrator, in combination with means for adjusting the pressure of the vibrator on the moving surface, and of the yielding force that moves the vibrator in the opposite direction to that derived from the moving surface, substantially as set forth.

3. The combination of a yielding vibrator, operated substantially as set forth, with a secondary circuit actuated by such vibrator, substantially as specified.

4. A telegraph instrument with a vibrator that is controlled by electro-chemical decomposition.

158,868.—INSULATING COMPOUNDS. Isaac Smith, New York, N. Y., assignor of one half his right to George A. Chapman, same place. Filed Jan. 16, 1874.

The insulating material herein described, the same being a homogeneous mixture of shellac, asbestos, coal tar, oak black, and paraffine, in the proportion substantially as set forth.

158,889.—ELECTRO-MAGNETIC GAS LIGHT APPARATUS. E. E. Bean, Boston, Mass. Filed Aug. 5, 1874.

Pressure of air upon diaphragm moves a rod controlling valve, until the rod be checked by a detent attached to the armature. At the moment of checking a circuit is completed at the burner tip through a wire attached to a pivoted lever, also moved by the rod impinging on a wire at burner. This causes the magnet to attract its armature, releasing the detent, and allowing the rod attached to diaphragm to continue its movement, completely opening the valve, breaking the circuit at the burner to cause a spark, and closing another circuit to next lamp in series.

1. The combination, with the diaphragm g and rod f, of the rocking lever v, spring wire x z, the circuit breaking wire c, and the metallic pole n, as and for the purpose herein described.

2. The combination, with the electro-magnets o p, and the armature b, of the swinging frame 3, having catch or recess 2, lever v, insulated wedge 7, springs r l, and their insulated posts q s, and the wires k k' k'' k''' k'''' l l', as and for the purpose herein set forth and described.

158,897.—ELECTRO-MAGNETIC BURGLAR ALARMS. Richard J. Brittain, Newark, assignor to John Middleton, Newark, and J. J. Thatcher, Caldwell, N. J. Filed Feb. 27, 1874.

Name drum, rotated by a spring, and indicating point attacked, is held by a drop pin, H, and detent N. Circuit closed at any point causes armature to release drop pin, closing circuit to magnet controlling detent and operating alarm, sounding alarm and allowing name drum to rotate and bring to view name of point attacked.

1. The rotating name drum M, or disk, actuated by a spiral spring or weight, in combination with a drop pin, H, and electro-magnets C and D, substantially as named, and for the purpose specified.

2. The combination with the name drum and alarm bell, of a single magnet and armature, operating to simultaneously release the name drum and sound the alarm bell, substantially as set forth.

158,927.—AUTOMATIC TELEGRAPH APPARATUS. Merritt Gally, Rochester, N. Y. Filed May 11, 1874.

1. The combination, with a perforator for preparing message matter for telegraphic transmission, and with a transmitter therefor of an intermediate device, controlled in certain operations by the paper passing from the perforator to the transmitter and in turn controlling the transmitter in its action, substantially as and for the purpose specified.

2. The transmitting or receiving mechanism, in combination with the circuit S' S', operated substantially as and for the purpose specified.

3. The combination, with a series of instruments connected to the same or to different circuits, of an electrical or mechanical connection, for controlling any or all the instruments from any one thereof, substantially as specified.

4. The tripping circuit M' M', with connector E, by means of which the transmitting or receiving movement is interrupted by the tension of the ribbon N, substantially as specified.

5. The combination, with a main line transmitting wire and instruments therefor, of an additional line wire, for controlling the instruments of the transmitting line as to their intervals of transmission, substantially as specified.

MUTUAL CONTRIBUTION PLAN OF INSURANCE,

AT ACTUAL COST, LESS THAN ONE THIRD THE USUAL EXPENSE.

PROTECTION LIFE INSURANCE CO., CHICAGO, ILL.

Charter perpetual. Capital, \$200,000. Over \$100,000 deposited with the State Treasurer for security of policy holders.

L. P. HILLARD, President. MARTIN RYAN, Actuary. C. A. WALKER, Vice-President. T. C. LAMBRETE, Asst. Secy. JOHN REID, Treasurer. Dr. J. H. HOLLISTER, Medical Director. A. W. EDWARDS, Secretary.

I will make the most reasonable terms possible to Telegraphers.

W. C. LONG, Agent, Lawndale, Chicago, Ill.

MANIFOLD PAPERS.

PREMIUM MANIFOLD PAPER and Transfer Paper (all colors), Agate and Steel Styluses, Palets, etc., for manifold writing.

Also,

ROGERS' PRINTED MANIFOLD BOOKS.

Very useful to correspondents desiring to write quotations or other matters on printed forms, saving time and labor. Also,

TRAIN ORDER BOOKS,

Letter Books, Travelling Agents' and Physicians' Prescription Books, for duplicate writing, etc., etc. Large Stock, Great variety.

As Patentees and Manufacturers we can offer inducements to purchasers. Send for Circulars.

H. D. ROGERS & CO.,

22 West Fourth street,

CINCINNATI, OHIO.

Western Agents for L. G. TILLOTSON & Co., New York,

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET

or to

L. G. TILLOTSON & CO.,

8 Dey street, sole Agents.

THE FAVORITE.

Price, \$5.00.

Having reduced the price of these standard instruments, we are now prepared to furnish them to amateurs, students, academies, &c., with battery, connecting wires, chemicals, and one copy of "Telegraphy Made Easy," for \$6.50. Will be sent by Express, C. O. D.

Just published, "TELEGRAPHY MADE EASY." Sent to any address on receipt of 25 cents.

Address,

ISAAC HALL,

43 Centre Street, New York,

Manufacturer of Telegraph Instruments.

REPAIRING, JOBBING, &c., AT REDUCED RATES.

THE KENOSHA INSULATOR CO.

**TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS**

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellant of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

**THE NORTH WESTERN TELEGRAPH CO.,
THE WESTERN UNION TELEGRAPH CO.,**

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES, prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading Dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

GEORGE H. BLISS & CO.,

41 Third Avenue, Chicago, Ill.

CINCINNATI, O., ST. LOUIS, MO.,

Elm St., cor. 5th. 409 North Third St.

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS, unequalled for beauty and strength;

COMBINATION SETS; BOX and POKET RELAYS.

CHALLENGE, PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, just out, no legs, wire connections above the table.

REGISTERS, with SPRINGS or WEIGHT.

OUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANNUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.

BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

**CHAMPION BURGLAR ALARM
AND ANNUNCIATOR COMPANY,**

40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skilful mechanics to estimate upon work, or will give any information in writing that may be required, Liberal commissions will be paid upon any orders that may be secured for us. Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

L. G. TILLOTSON,
President.

CORNELIUS ROOSEVELT,
Secretary and Treasurer,
40 West 18th Street, New York.

ELECTRIC BELLS.

We have on hand and will furnish all descriptions of ELECTRIC BELLS,

either Table or Wall Bells or Gongs, at manufacturers' prices.

Springfield, Mass.,
San Francisco, Cal.,
Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Original Articles.

The Telegraph in the West Twenty-five Years Ago.

BY OCCASIONAL.

We are too much in the habit, these "fast times," of looking ahead. I propose at present to imitate not the example of Excelsior, and look ahead, but like Lot's wife, to stop and look back. A friend of mine, a member of the American Electrical Society, had recently the good fortune to become the possessor of (among other old papers) a copy of *The True Democrat*, printed at Oshkosh, Wisconsin, August 31st, 1849, and *The Fond Du Lac Republican*, of January 11th, 1850, and by him I am permitted to use any portions of them interesting to the fraternity. The sections of country that these papers were published in at this time were probably as well provided with rapid means of communication as a great many larger places a good deal nearer Plymouth Rock, yet we find that the people were very well satisfied with the facilities, as "a tri-weekly mail had just been established from Fond Du Lac to Neenah, the mail leaving Oshkosh for Fond du Lac and Neenah every Monday, Wednesday and Friday, returning every Tuesday, Thursday and Saturday." "A steam saw mill was to be erected at Bntte Des Morts that fall!" About this time Queen Victoria was talking of visiting Ireland, and Dublin was to be illuminated. In France they were debating the question of the liberty of the press. M. Thiers was at this time chief of the movement to make the President Consul for ten years, at which time the Count of Paris would attain his majority, and thus pave the way for a return of legitimacy.

In Italy Pope Pius had refused to return to his capital on the terms proposed to him by the ministerial portion of his followers, but had issued a proclamation to his subjects imploring blessings upon them, and promised them he would appoint a ministry to conduct the government.

Kossuth had issued a stirring proclamation for the Hungarian Republic to the nations of Europe, lashing their apathy and invoking their sympathy and assistance, while the triumphant Generals, Georgy and Bem, gained victory after victory, and Prussia was offering to assist Russia against Hungary.

The brig *Eureka*, fitting out for California, "had obtained leave of the British Government to pass through the St. Lawrence."

What would the readers of some of our large dailies nowadays think if, instead of the usual "cable news," "Beecher scandal," etc., they should see something like the following from *The Democrat*, already spoken of: "Isn't it provoking? Here we are over time, press waiting and the mail not in. We are anxious to wait for the last mail, so as to give our readers the benefit of the latest news, but this time it hasn't come," etc.

It is hardly to be wondered that the people of those days thought the telegraph should be classed with such things as "mesmerism," "witchcraft," and the like, when their education was so limited that a great many wealthy persons could scarcely write a proper advertisement. The following, clipped from the same paper as the editorial excuse (for the non-appearance of the news by mail) just preceding this, may have been written by our paternal grandfather, but we must give it nevertheless. It reads as follows: "At Burrough's Hotel, Neenah, Winnebago County, Wisconsin, will be found at all times plenty of 'hog' and 'homminy,' together with as choice a variety of other 'fixins' as the country and market will afford." Guess the folks those days wasn't afraid of triphinae.

I might fill *THE TELEGRAPHER* with the rich, old fashioned yarns this paper contains, or quote a column or two about the gold excitement, and how folks who got the gold fever in those days started for the Pacific coast with ox teams; the surveying expedition to the Falls of St. Anthony, the cholera ravages, the new wire suspension bridge which had just been completed across the Ohio at Wheeling, the political controversy between the Whigs, Free-soilers, Democrats and Free Democrats, or I might tell you how bidders on gov-

ernment contracts at that time put in their bids; how one party offering six hundred and one dollars higher than the highest bid beat the party who bid five hundred dollars more than anybody else, but this would hardly be strictly speaking telegraph news. The following gleanings, however, from this *True Democrat* may be interesting: "Judge McKindley, of the United States Supreme Court, had just granted an injunction in the Circuit Court in Tennessee against the use of the telegraph lines, established by O'Reilly in favor of Professor Morse," very much disgusting the editor of *The Democrat*, who remarks that "in Ohio the decision was right the other way," that "these things of courts, decisions, etc., are necessary, but they work most outlandish sometimes." "It was about this time that Davenport, of Vermont, invented a machine for producing rotary motion by electricity and succeeded in printing a paper by magnetic power," the editor tells us, and then facetiously remarks, "Professor Morse (as he styles himself) applies this invention to transmitting intelligence from one point to another, and gets a patent for his invention."

"Bain and House invent a great improvement in the manner of that transmission and get a patent therefor." The editor of this paper claimed at this time that "O'Reilly purchased the systems of Bain and House and established lines for the introduction of this system, when 'the learned professor' prosecutes them for infringement of his patent, and the Court sustains him."

The editorial concludes, "We believe in law, but it should conform to right." Claiming that Davenport was the real inventor, or rather the real genius, "that he gains nothing—is not known—and that the last 'improver' is ousted by the magic of set phrases under the interpretation of grave judges, who, nine times out of ten, have no more conception of the science of magnetism, and the principles that Davenport's intellect grasped and applied to the benefit of man, than a certain domestic of Balaam." It is pretty certain this editor was not "a Professor Morse man" by any means, and that his style of calling a set of judges asses was about as neat as could be gotten up at this late day. It is probably well he did not have Judge Wood, of Manitoba, to deal with, or he might have had to answer for contempt of court, like "Luxton," of the Fort Garry *Free Press*.

I could not probably close this article better than by quoting the remarks of the *Fond Du Lac Republican*, of January 11th, 1850, on the advent of the telegraph at that place. It is as follows: "Morse's Telegraph line is here, and is in successful operation. According to the contract, Colonel Hotchkiss agreed to have the office open here on the 1st of January, 1850. The wires reached Fountain City on the 5th instant, only five days after the contract time.

"This shows a promptness which is truly commendable, particularly when we consider how cold the winter has been thus far. Colonel Hotchkiss leaves for Oshkosh and Neenah to raise funds for the immediate extension of the line. There is wire enough here now to extend seven miles toward Oshkosh, and is being put up as fast as possible.

"The poles to this place are heavy (thirty to the mile), and so far as our experience in telegraphic lines goes, we have one of the best lines in the West. Col. H. has associated with him in the construction of the line from Fond Du Lac to Green Bay Mr. A. A. Parker, a gentleman of experience in that business. Let the people of Oshkosh, Green Bay, etc., sustain the line that fulfils its agreement with its stockholders.

"Colonel Hotchkiss has been chosen President of the Milwaukee, Galena and Chicago line, which passes through Madison.

"Between the two papers at this place we hope to be sustained in the issue of a daily slip, containing the doings of Congress and the Legislature, as Col. H. holds out encouragement for supplying both presses with telegraphic reports for the papers and for daily slips. Mr. C. H. Hotchkiss, son of the contractor, will work the key at this place, and we believe that our reports will be accurate."

The Albany, N. Y., Western Union Telegraph Office and Contents Entirely Destroyed by Fire.—Speedy Re-establishment in New Quarters.

BY DOUBLE SIX.

ON Friday night, March 5th, the Western Union Telegraph office in Albany, N. Y., was totally destroyed by fire. Before entering upon the details, it may be interesting to hear a brief synopsis of the history of the old Museum Building, which has been occupied as a telegraphic headquarters for many years by the American Telegraph Co., and the N. Y., Albany and Buffalo Telg. Co., and latterly by the Western Union.

The building was erected in 1830, by Messrs. Thorpe

& Spragne, who were at that time quite prominent stage proprietors. It was first occupied by a Mr. Trowbridge as a museum, which was then considered the best collection of its kind north of New York. It was for a number of years the only place of amusement in the city. It was in this building that Barnum first gained notoriety for one of his greatest humbugs—"Joyce Heth." Its history, extending over a period of 45 years, if written, would fill a small volume. Its location, on the corner of Broadway and State street, made it one of the most desirable business stands in the city. As near as can be learned from the conflicting accounts which have been given, the fire originated about ten o'clock, P. M., in the newsroom of W. P. Prentice, on the first floor, State street side. One of the messenger boys was the first to discover it and at once gave the alarm. The fire department responded promptly; but, unfortunately, some of the hydrants were frozen, and so, before a stream could be brought to bear, the flames had burst through the partition in the rear of the newsroom into the triangular space in the centre of the building. This gave them a very strong draft, and as they rushed upward they dashed through the windows and rolled down the stairway like a fiery flood, and as the building was but a tinder box at the best, it was soon a mass of roaring flames.

The operators on duty had barely time to escape with their lives—Mr. Waterbury getting his hair slightly singed while running the gauntlet on the stairs. A second alarm was sounded and the reserves were brought upon the ground. Eight steamers were now hard at work but their efforts to save the two upper stories were entirely unavailing, and their attention was directed more especially to the protection of the adjoining property. For two long hours the firemen fought the fire fiend like tigers, until at twelve o'clock they conquered and the fire was under control. Several instances of daring bravery are recorded as additional proofs that the Albany fire department is unsurpassed.

Of course it was impossible to save anything from the upper floors, and so 20 sets of Morse instruments, 6 sets of Milliken repeaters, 1 set of Stearns' bridge duplex, 1 set of (whose?) quadruplex, 1 tangent galvanometer, 2 rheostats, the new switch which was put in a few years ago, all the books and files of business, dating back several years; a large quantity of supplies, including 50,000 No. 2 blanks, and 1,000 cups of Calland gravity battery, were totally destroyed. Lastly (and I came near forgetting it), our celebrated heater, whose loss is the least lamented of any. Some of the boys sarcastically remarked that, for once, the operating room was warm enough to satisfy the most cold-blooded man on the force. The loss to the W. U. Co. is estimated at \$4,000, and total loss about \$50,000. Through the courtesy of Supt. Tillinghast and W. A. Graves, of the N. Y. C. & H. R. R., an arrangement was made to open an office in the Union Depot, in the "Da." office of that company.

Supt. Brown was telegraphed, and by six A. M. arrived at the scene, and by eight o'clock A. M. circuits were arranged ready for the transaction of all the usual business, which was done, and that promptly too. The only break which occurred in the business of the company was the loss of the Associated Press despatches after ten P. M., which, as it happened, were unimportant. A detachment of operators were sent to Troy, to assist in handling the northern repeated business. Several wires were connected from the Exchange street to the State street lines, making through circuits for New York and the West. By this arrangement there was really no serious interruption to business by the disaster. The warmest thanks are due to chief operator Ira S. Kineh, of the N. Y. C. & H. R. R. telegraph office, who was on the point of leaving the city with his family, but on hearing of the state of affairs, generously gave up all his own plans and "buckled down" to the work with an energy and understanding of what was wanted befitting the occasion. On Saturday negotiations were entered into for the renting of a portion of the Exchange Building, which is Government property, and is situated directly opposite the old office, in which to open a temporary office. Considerable trouble was experienced on account of the opposition of a competing company, who occupy a small space on the first floor; but, upon telegraphing to Secretary Bristow, President Orton received permission to occupy the rooms as desired. In the meantime supplies of all kinds had been arriving by passenger trains, in large quantities, coming in by the car load, so that there was no lack of materials wherewith to go to work. On Sunday a small army of repairers, carpenters, battery men, etc., were busily engaged in fitting up the new quarters. One section of the switch formerly used in N. Y. main office was set up in the rooms formerly used as the Treasury Department of the N. Y. C. & H. R. R. telegraph. Into this the wires were run and thence distributed to the instruments, which were arranged on a wide shelf running the entire length of the room, on the north side, and on five quartette tables, which were placed

on the opposite side of the room, on one of which was placed a new quadruplex to replace the one destroyed. Two stoves were set up in this room to keep the boys from having the blues. The two rooms in the rear of this operating room were converted into battery rooms. Mr. Gerrit Smith, who will always be a welcome guest to the Albany boys, was here doing his share of the work.

The receiving office is now located in the room formerly occupied by Thos. Squires & Sons, hankers and brokers, and is in the same building, corner Broadway and State st., directly opposite the old quarters. The Museum Building will probably be put in first class order as soon as possible. As yet we are unable to learn anything definite as to future arrangements, but will keep you "posted" when anything of interest develops itself.

Duplex and Quadruplex on the Wires and at the American Electrical Society's Meeting.— Miller and Summers on Lightning Rods.—Telegraphic Notes, etc.

CHICAGO, ILL., February 27.

TO THE EDITOR OF THE TELEGRAPHER.

OH! I have got lots to tell you. I have been taking a rest and sleeping with one eye open since I last wrote to you. There has been but little "quadruplexity" (that's original, copyright secured; charge every man a dollar that is found using it, and use the money to take chances on "Billy" McMillan's diamond pin or Jim Pettit's ring).

Until quite recently I am told the duplex has been in use again between New York and here in the Western Union, and the "quad." has had a rest. Dr. Nicholson, of Cincinnati, has been here lately trying to make his system of quadruplex work between here and Cincinnati. I could not get an electrical description of it. There was some trouble developed in placing it in a long circuit that was not noticed when worked in an office circuit, as the Dr. claims it worked all right then. I believe he is now trying to overcome this new difficulty. Messrs. Summers and Jones, Western Union electricians, kindly furnished the Dr. with wire, batteries, etc., to make his tests.

In a recent letter I spoke of Mr. Andrews starting out as an artist. I have since that time seen several pictures that he has finished; one of Mr. Strong, night report man of Western Union office here, and one of Mr. Cushing, who works the Cincinnati wire nights in the same office. Both pictures do Mr. Andrews much credit. There has been a great deal of sickness among the fraternity here lately. Several of the A. and P. men have had to lay off, and a great many of the Western Union men have also been disabled. Messrs. Hurd, of the Milwaukee duplex, McCulloch, of the Quincy line, and Whiteomb, of the Dubuque line, on the Western Union day force, were among the number, and several of the night men whose names I could not learn. The three gentlemen named have again gladdened the office with their presence, however. The wife of Mr. Armstrong, of the Detroit wire of the Western Union day force, has been so ill recently as to require his absence from the office. Mr. E. S. Swift, of the Western Union day force here, had the misfortune to lose his mother, a very estimable Christian lady; she died last Monday and was taken east for burial. Mr. Dean, formerly manager of the Pacific and Atlantic Company at Galena, Ill., has, nearly ever since the consolidation of that company with the Western Union, been more or less disabled by something like the writer's palsy and general nervous prostration. Over six months ago the doctor forbade him even thinking of telegraphy. His estimable young wife, who was manager of the Western Union office, same city, at the time of their marriage, is still in charge of that office. Mr. Dean is very reticent on account of his having to remain dormant, as he is quite a practical electrician. He is allowed to write a little now, and, no doubt, letters or an occasional paper from some of his acquaintances would be acceptable.

There is probably no railroad here in the west that is any better managed, if as well as the C. B. and Q. I noticed an arrangement at one of their switches which, although not strictly telegraphic news, might interest some of your many readers. It is the safety switch at the Great Eastern crossing in the southwestern part of this city. About 800 feet west of the regular crossing is a switch for transferring freight cars to the Belt Railway track. If from any cause this switch should be turned wrong a train from the west could not be stopped in time on the short

track to avoid running into a train at right angles if one should be passing at that time on the Great Eastern. To obviate the chances for any such catastrophe occurring, a safety switch to display danger signals (if track not right, or safety signals if all right) is placed 800 feet still farther west, so that the train might be stopped twelve or sixteen hundred feet from the crossing, if necessary. Some of our other railroads leading out of Chicago might make some of the dangerous places safer at their crossings by similar contrivances.

I have information from a reliable source that on the 19th four messages were transmitted simultaneously over one wire in one direction on an office circuit, by Mr. Elisha Gray, of this city, with his telephone, and that they were recorded with a clear down stroke on four Morse sounders. On the 26th two more sounders were arranged on the same wire, and six messages were sent as above described.

The meeting of the American Electrical Society, on their last regular meeting night, was a grand success in every particular; there was a very large attendance of resident members. The President and Vice-presidents all being absent, Mr. E. M. Barton was called to the chair *pro tem*. The minutes of the last meeting were read and approved. Among the new members elected were the following well known gentlemen: Chief operator, H. W. Plum, Western Union, Chicago; Mr. Johnson, manager Western Union office, Cincinnati; Mr. E. M. Barton, secretary, Western Electric Manufacturing Company, Chicago; Mr. Annette, Cheyenne; Mr. C. C. Reed, of Michigan Central Railroad Telegraph, and Mr. Stevens, of the Fire Alarm Telegraph, Chicago. Mr. F. W. Jones, of Chicago, read a very interesting paper on the quadruplex system of Edison and Prescott, and also explained the system of Dr. Nicholson, of Cincinnati. The drawings which Mr. Jones used to explain the connections were some of the finest I ever saw, and were the handiwork of Mr. M. L. Lawson, of the Western Union night force in this city. They were presented to the society by Mr. Lawson, and a vote of thanks were tendered him for the same, as well as to Mr. Jones for the able manner in which he explained the "quad." I cannot attempt a description of his explanation. I am in hopes I can get the paper for publication in THE TELEGRAPHER.

A very able and lengthy paper on lightning and lightning rods, by Mr. I. N. Miller, of Chillicothe, O., the corresponding secretary of the society, was read by the recording secretary. Its extreme length would preclude its publication in THE TELEGRAPHER, and for this reason I did not make any effort to obtain a copy of it. It was very interesting, and would be of great benefit to your readers. Its reading called forth a good many remarks by the members present, all conceding it was a very able document. It deprecates the present system of insulating rods from buildings, claiming that to be of any service a lightning rod should be a better conductor than the building, even when the building has become thoroughly wet. That the earth plates to the lightning rods, as now manufactured, are not properly constructed, do not have enough earth surface, etc. That instead of fine pointed rods the tops of the rods should be blunt, and present more attraction for the electric cloud than the building, by being placed a great deal farther above the building than as at present arranged.

Mr. Summers thought, from the drift of his friend Miller's remarks, he had overlooked the fact that no matter how much surface was used for the earth plates, and how high rods were placed above the roofs of the buildings, the whole building would become charged by any cloud coming near enough to make use of the rod for a conductor, and that the rod should be connected to every conceivable conducting substance on the house, to be of any service at all in such an emergency.

After indulging in some personal plesantries, jokes, etc., the meeting adjourned.

On the 10th Dr. Hill, of the firm of G. H. Bliss & Co., completed the task of laying the cable through the new tunnel to the crib out in the lake, and made the connections complete at both ends preparatory to the letting in the water. This cable is intended to be used to communicate with the man at the crib, who is completely cut off from civilization, otherwise it will be a great convenience to the city authorities, as it will not be necessary, as heretofore, to send out a tug to give directions to the man in charge of the water works there, but it will be done by means of the electric spark. The instruments used are nothing but sounders and keys, and a dot code of signals are used. The cable is a two-wire conductor, with No. 9 wire wound spirally on each conductor, and both served with tarred hemp. It was contracted and paid for by the city government. It is the intention of the authorities, after the lighthouse is placed in working order, to have a signal service station established at the crib for the purpose of taking observations. As the crib is about a mile and a half out in the lake this will be quite an important signal station.

OCCASIONAL.

Congress and the Telegraph.

WASHINGTON, D. C., March 8.

TO THE EDITOR OF THE TELEGRAPHER.

Now that the Forty-third Congress has ceased to exist, I will conclude my present series of communications for THE TELEGRAPHER by a very brief statement of its action or non-action in regard to matters connected with telegraphy and telegraph interests.

No report was made to the House by the Judiciary Committee in regard to the investigation had by that committee under the resolution of Mr. Dawes. That investigation failed to substantiate the charges made against the Western Union Telegraph Company. About all that was developed by that investigation was what may be regarded as sharp practice attempted by the Atlantic and Pacific Telegraph Company, in bunching their messages, received from customers when their lines were down, and sending as one to their managers over other lines, thereby making the difference between the first ten and the following words, which the Western Union refused to send.

Mr. Butler's bill remained unfinished business to the end of the session. There could never have been any chance to pass it except on a sudden cry of "odious monopoly," and a rushing it through under the effect of such cry upon the minds of members. It had no show after the refusal of the House to pass it on the night when it was reported. There has never been a time since when it could command fifty votes.

The bills of Messrs. McCrary and Dorsey, like most measures introduced at the request of interested parties, got buried under legislation that had motive power, and now sleep in peace.

The provision requiring the removal of telegraph poles, and the substitution of subterraneous cables or wires on the Capitol grounds, and the approaches to the Capitol, was passed in accordance with the plans for improving and beautifying the grounds around the Capitol, which are hereafter to be known as the "Capitol Gardens." Some \$200,000 were appropriated in addition to the money already spent for this purpose.

Through age and hard use the fire alarm telegraph in this district has become entirely worn out, the machinery rusty and the wires rusted out. So great was the necessity for the reconstruction that at the last hours of the session the Senate inserted an appropriation of \$75,000 in the Deficiency Bill to rebuild it, and the House, in a conference report, agreed to it. Gamewell & Co. will have the contract, and the work is to be pushed right through, without waiting for a disastrous fire to demonstrate its necessity.

The schemes for Government telegraphs are regarded here as being practically dead, and can only be revived through the action of the telegraph companies themselves. With an active competition for the telegraph business of the country the rights and interests of the public will be adequately protected, and only the establishment of a great telegraphic monopoly can have the effect to induce Congress hereafter to entertain favorably any proposition to transfer to Government ownership and management the telegraphs of the country.

CAPITOL.

A Western Union Telegraph School.—The New Management of the Atlantic and Pacific Company.

SAN FRANCISCO, CAL., Feb. 17.

TO THE EDITOR OF THE TELEGRAPHER.

In speaking of matters pertaining to telegraphy on this coast, it will not be out of place, perhaps, to mention that there is at Oakland, Cal., a school of practical telegraphy, as great a contrast to the aptly termed "plug factories" as could possibly be. It is under the patronage of the General Superintendent of this division of the Western Union Telegraph Company. Students undergo an examination before a Board consisting of the General and the Assist. General Superintendents and the Electrician, to define their ideas of general business knowledge and education. Only those apparently mentally capable, and possessed of sufficient education to fit them for positions as telegraphers after they have acquired the art, are accepted as students. They then pay a certain sum per month while receiving tuition, and of course, as it is to their interest to perfect themselves as soon as possible, they don't waste much time. The school is situated over the Western Union office at Oakland, and is under the direct charge of Mr. B. R. Bates, manager of that office. The operating room is neatly and comfortably fitted up for the accommodation of about ten students, the full compliment being now at work. Registers are provided to enable each to see his or her own writing as they make it on the key, and when it is perfectly recorded it is assured it has been correctly sent. This one of many details shows the nicety of arrangements for making the pupils good Morse operators.

"Fritting gerse" is not allowed. Branch lines of the Western Union Telegraph Co., as well as short circuits of new beginners, are connected with this school, so that they may be made familiar with a practical working of a line, and learn what so many pay little if any heed to, the art of using the left hand on the adjusting spring. Electrical works for the rudimentary and higher schools are to be found here, bearing marks of perusal. Two of the graduates of this school are now occupying positions as managers of active working offices, and show their training by their ability to handle the business passing through their hands. So much has been said, and justly too, of these so-called "Telegraph Institutes" throughout the country, which never have nor ever will turn out a practical operator, that when I found this exception I could not fail to notice it.

The Atlantic and Pacific Telegraph Co. inaugurate the new era in management by neatly fitting up the receiving and delivery departments, and making room for the manager's office. A tasty partition of wood and glass keeps the public and employes in their proper sides of the business line. Ample and comfortable writing desks for public use are also provided. The office of the General Manager has been fitted up on the second floor, from whence to the third floor the operating room has been removed. Here they have more commodious and comfortable quarters. The officials and employes of this office consist of the following gentlemen: Maj. R. P. Hammond, General Manager; F. L. Vandenberg, General Superintendent; J. G. Bloomer, Manager San Francisco office; with Messrs. Thos. H. Berry, Con Dwyer, Frank Medina, R. A. Kuhoe, John F. Fitzpatrick and John Milliken, operators; Edwin Reese, receiver; W. F. Berry and Frank Murtha, delivery clerks. I understand the company are building two more wires to Virginia City, to accommodate the increase of stock business, which is simply enormous, keeping two wires of this company and three of the Western Union busy during the rush, which is between 9 A. M. and 5 P. M. They are also extending their wire to Los Angeles, in Southern California, where it will connect with a network of four branch lines already in successful operation. In another letter will give some more of the names of Pacific Coast telegraphers and their whereabouts.

CLIX.

Changes, Resignations and Promotions.—A Newspaper Fight, etc.

ALBANY, OREGON, Feb. 17.

TO THE EDITOR OF THE TELEGRAPHER.

MUTATION seems marked upon all things. To-day "Kenny has resigned" passed over our wire, and as our "ponies" clicked off these three words they were received with sorrow and regret, for Kenny has been our chief for a long time—nearly three years—and during these years he has been the gayest of the gay, and certainly none of the boys can feel it more than myself, for during this time our intercourse has always been pleasant and almost brotherly, for our size created a sort of bond of union between us, as we jointly enjoyed the reputation of being the champion "light weights" on the road—our combined "heft" only bringing down 180 lbs.—whom any ordinary man could carry off under his arm. "We were little—but oh, my!" we made it lively notwithstanding our size. Truly Kenny was one of the boys, and no more will be heard the familiar "Ky." at B., but he will "hereafter until further notice" obligingly attend to the wants of customers in a grocery and provision store in Frisco—his old home, where his parents reside. Farewell, Johnny. May you strike it rich in whatever you engage, and at some future time may Oregon welcome you fondly to her embraces once more.

Will B. Rice, of Albany office, has been promoted chief operator for the O. & C. R. line, succeeding Mr. Kenny. As this gentleman is of a very modest and retiring disposition, the "least said the better," and we'll drop him by saying he remains at Albany, in accordance with his own request, and will at the same time discharge the duties of his new position.

For some weeks past the good people of this part of the "moral vineyard" have been watching a war which is almost as savage as the celebrated Modoc war, but the pen is trying to prove itself mightier than the sword, as it's a newspaper war. For over four years the two dailies at Portland have been taking "press" together, and known as the "Portland Associated," but for a year or two a rivalry has been growing between the papers—the *Oregonian* and *Bulletin*—until at last it has got so bitter it is now the desire of each paper to crush its antagonist. A few weeks ago the former effected arrangements with the "Cal. Associated," whereby they could publish the eastern reports as early as in San Francisco—quite an improvement, surely—at a large increase in cost, the burden of which to be borne by the *Oregonian*, which was to reap the benefits of it to the exclusion of the *Bulletin*, which paper could not obtain these reports. Of course it

was a move to "freeze out" the latter paper, and it was supposed there would be a *cave* soon. The cry of "monopoly" was raised, and as a large majority of our population are Grangers, you can imagine how feverish it immediately became. Instead of the *Bulletin* "caving," it continues to appear "on time" with full despatches, and also the *Oregonian* "specials," saying that "as the *Oregonian* was kindly bearing the sole expense, they proposed to furnish them also," and so it contrives to do; but how these "specials" are obtained is a "conundrum," as the boys say. Suspicions are rife that the "grapevine" telegraph is working good—probably *underground*. How this will end the Lord only knows, but it hardly seems possible for the *Oregonian* to continue long to bear the sole expense, unless it should soon succeed in its game of "freeze out;" but I suppose time will develop this, like many other mysteries.

I hear it rumored that the W. U. propose to put on an "all night" force in their Portland office. This is something they have never had there yet, and I understand it's only for press business. How true it is I cannot say, but my informant was very sanguine and ought to know, if anybody not in the immediate circle does.

Among the recent changes we miss Mr. Chas. E. Parks from Junction. Charley is one of 'em. "Has been into a good many things," like some of the rest of the old Pacific coasters. For many years he held a responsible position as express messenger under Ben Halliday, when he, years ago, was proprietor of the "Overland Stage Co.," prior to the completion of the Pacific Railroad. While discharging his duties in this capacity an attempt was made to rob the "team," and as there was one hundred thousand in treasure aboard, a pretty good haul would have been made; but Charley and the rest staved them off and captured the would-be robbers, but in the *melee* received 27 buck shot into his person—pretty nearly enough for one time—and eventually suffered the loss of a leg from injuries received at this time, which reduced his nervous system so that ever afterwards he was only a wreck of what he had once been. As soon as Ben turned his attention to "railroading" in Oregon, he sent for Charley and gave him the position at Junction, under good pay—showing that Oregon's railroad "King" don't forget his old employes; but Charley, though he ever did the best he could, "couldn't muzzle the thing," as he himself characteristically expressed it. We were sorry to lose him, but climate not agreeing with him or his family he sought pastures new, but we sincerely hope he may have the best of luck in whatever he undertakes. Mr. Geo. F. Craw, an old O. & C. boy, succeeds Mr. Parks at "Jn."

Mr. Hamlin succeeds Mr. Craw at Aurora, and as this gentleman is a first class railroader, that station will swim along nicely. Mr. J. M. Fish is now an operator in this superintendent's office, and not chief operator, as some one erroneously reported to THE TELEGRAPHER a short time since.

In working with "W." at Salem we have to be very deferential—'cos why? Wheeler has a bran new "darter," 10 lbs., first "copy" and first "report" from the matrimonial epidemic which raged so remorselessly some time since in Oregon.

But those last few thoughts perplex me, and I long for my cherished meerscham to soothe my agitated brain, so I will "drop" on my self and "rest."

WEBFOOT.

Profanity of Telegraph Managers.—Criticism of "The Telegrapher."—An Ambitious Operator.

TO THE EDITOR OF THE TELEGRAPHER.

By the article of your correspondent, "Occasional," in your last number, I am led to think his idea of what constitutes "mauliness" less exalted than it should be. Does he think that, if a manager violates a rule and uses foul and insulting language to a subordinate, that subordinate would show "mauliness" in retorting with similar language? Yet that is precisely the meaning his remarks convey. I think "Occasional" would do a service to the profession by giving the name of this scurrilous manager. I can hardly believe that the Western Union Company have in their employ a manager who is guilty of abusing or insulting the men under his authority, as asserted by "Occasional." I do not assert that there are not managers who use profanity. On the contrary, it is a melancholy fact that profanity is one of the two great vices of the male portion of our profession—the other being the use of tobacco. From superintendents to messenger boys those two vices are common to all.

Now, profanity is very wicked, as we have all been taught, and I am not going to defend it. It is a habit which, when contracted in early life, is very hard to reform. But when "Occasional" tells us that the juteut of W. U. Rule 34 was that "ladies might perform service in the same room with gentlemen with-

out subjecting themselves to insult," he is entirely mistaken. Were such the fact, the rule would be felt by all as a standing insult to the male portion of the employes of the Western Union Company. The fact is, that rule, like others relating to the "operating department," was framed only to secure proper discipline in the offices and on the wires of the company, and is seldom strictly enforced, except in cases of flagrant violation of its provisions, the penalty for which is usually an ignominious dismissal from the service. I know a certain telegraph superintendent in New England who is a most genial, good-natured man—kind and obliging to his subordinates, and, in fact, a model superintendent every way, and yet I have heard that man, in a moment of vexation, utter the most original, eccentric, double-distilled-fluid-extract of the article called profanity that I ever heard, and the same gentleman would summarily discharge an operator who should use such language in a dispute over the wires, and justly too.

Considerable feeling has been expressed in this vicinity, as well as by correspondents in your columns, in regard to the course of THE TELEGRAPHER in advocating the automatic system. Some of this criticism has been harsh and unjust. No one can deny the right of the editor to express his views on this or other subjects, but it is the general sentiment, so far as my knowledge extends, that THE TELEGRAPHER, being preëminently devoted to the interests of Morse operators—who, as a body, consider the automatic system inimical to their interests, whatever may be its merits, viewed from a "progressive" standpoint—it would be more in keeping with the professed character of the paper if the personal opinions of the editor on this subject were made subordinate to those of THE TELEGRAPHER as the "operator's paper." Or, at least, that the extravagant and often ridiculous effusions of certain advocates of the automatic system, notably the "Claimant," should receive less space and prominence.

The "Claimant" is doubtless an estimable gentleman, and perhaps a man of genius, but I submit that his talent for producing literary compositions is extremely mediocre, and that his effusions lack two prime necessities—sense and interest. If the irrepressible gentleman must relieve his teeming brain, it would be a relief to your readers if he would, to use a phrase much in vogue just now, "Go hire a hall."

An interesting little story was told me not long ago about a "youth to fortune and to fame unknown," who left the bleak shores of Lake Ontario for the equally desolate coasts of Duxbury Bay, to take a position in the French cable office, and how he struggled to hold his end up, but finally "weakened" and retired "in good order," as the war despatches used to say, and now he is laboring at an interior burgh, and there is a vacancy at Duxbury. It was very affecting, but conveys a moral.

JOHN STERLING.

Severe Atmospheric Conditions.—Afflictions.—Telegraphic Changes.

February 25.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE had nothing to write you about since my last but snow, snowdrifts, and delayed trains, and that is getting too monotonous to even think of. The thermometer has not been on its knees so much lately, but it seems as if the snow would never get settled and stay there till Spring would assist its exit. It is as much of a surprise and rarity to see a train on time in this section, at this time, as it is to have one late in the more favorable seasons of the year. From the date of my last up to the 17th and 20th trains on some parts of the Milwaukee and St. Paul road had not succeeded in getting through, and very few of the roads in Northern Iowa, Northern Minnesota, and Northern Wisconsin have been able to run trains with any degree of regularity.

In a former communication I spoke of the affliction of Supt. Hankinson, of the Northwestern Telegraph Company, in the severe illness of his wife. Although she has in a measure recovered, he has been still more severely afflicted by the death of his sister in Minneapolis a few weeks ago. Vexing afflictions come not singly.

Very few changes occur at this season of the year in this section—one or two only recently. Mr. L. H. Long, of the Northwestern Telegraph Company's Green Bay, Wis., office, has been temporarily relieved until business brightens up again. He is at present visiting his brother at Chicago. This necessitates the manager's taking report there, a job which "M." don't like particularly, although "he's there every time." It is currently reported that Mr. E. B. Jennings, receiving and delivery clerk and assistant operator of the Northwestern Telegraph Company's Minneapolis office, will resign shortly, to go into the hardware business at Sacramento, Cal. He will be very much missed, as he is capable of doing about three men's work.

The Telegraphic Outlook.—Inflated Stocks and their Effects upon Telegraphic Competition.

THE active competition which has recently been developed for the telegraph business of the country, has attracted general attention to telegraph matters. The outlook for the future in telegraphy is being actively canvassed, not only by those immediately interested, but also by the public generally.

In considering the future of telegraphy in this country it is indispensable that the manner in which the capital stocks of the leading telegraphic organizations have been suddenly inflated should be taken into the account. That the nominal capitals of these organizations represent much more than the value of the actual investment, cannot be questioned. In this respect, however, they do not differ materially from other enterprises, which require a considerable amount of capital for their development and conduct. The principle of watering the stocks of incorporated companies has been carried to a ruinous extent in this country, and has imposed heavy burdens upon the people, grievous to be borne.

In this respect our Canadian neighbors have been much more reasonable, and, consequently, telegraph investments there are more remunerative to investors, and the public can be served at more reasonable rates. While in Canada the Montreal Telegraph Company has paid a regular ten per cent. dividend, and the Dominion Telegraph Company, a younger and less extensive organization, seven per cent. to their stockholders for several years past, dividends upon telegraph shares this side of the line have been the exception and not the rule, and this, notwithstanding the more general use of the telegraph and the higher rates charged for telegraphic service.

With proper, careful and economical management there is no reason why telegraphic investments should not pay here as remunerative profits upon the actual capital invested, and the real value of the lines and business. It cannot reasonably be pretended that the forty-one millions of capital, and five to seven millions of bonds of the Western Union Company, or the ten millions of capital of the Atlantic and Pacific Company, represent the real values of the property and business of those companies respectively. The actual price paid by the original investors represent, in fact, but from ten to forty per cent. of the nominal amount. The effect of this inflation, or watering of stocks, is to discredit telegraphic investments, and either prevent

dividends altogether or make them of a comparatively small percentage. It necessitates, also, the maintenance of higher prices for telegraphic service, and creates dissatisfaction on the part of the public, and lays the companies open to attacks from which it is very difficult to defend them. If it were possible to reduce the nominal value of the shares fifty per cent. they would more nearly represent the actual value, and there would be little doubt of the ability to earn and pay regular and satisfactory dividends upon that amount.

It is time that in this country the vicious principle of watering the stocks of large public corporations should be done away with. And another point is of equal importance, and that is that stockholders should look more closely personally to the management of the companies in which they are interested.

We regard the placing of the shares of telegraph companies upon the list of the Stock Exchange as an unfortunate matter for real telegraphic interest. As now managed they are not held for investment, but the proprietorship is changing daily, and those who hold them do not look to the business of the companies for remuneration, but to the fluctuations in quotations from day to day. All sorts of tactics are resorted to to advance or depress the quotations, and the shares are made the footballs of "bull" and "bear" operators, who generally know little and care less as to the real permanent interests involved.

Very recently we have seen measures introduced in Congress affecting the interests of telegraph companies, and it is well understood that the purpose intended to be accomplished was not useful legislation, but the temporary effect which such action would have in Wall street.

We do not know that it is possible now to reform this, but if possible it certainly ought to be done. The telegraph is a matter of universal interest and importance, and it should not be subjected to the manipulation which is inseparable from speculation, and the gambling upon which Wall street lives and thrives.

A Perfect Safeguard Against Conflagration.

THE importance, reliability and value of the system of protection against the spread of conflagrations, introduced by the Automatic Signal Telegraph Company of this city, has been several times referred to in our columns. This company has succeeded in introducing this invention extensively in the offices, stores, warehouses and buildings occupied for business purposes generally, and with most excellent and satisfactory results. It has been the means of the suppression, with merely trifling damage, of fires which would otherwise have undoubtedly proved very destructive.

The latest instance of this kind occurred on Thursday evening, the 4th instant, when a fire was accidentally kindled in the extensive warehouse of Messrs. E. H. Van Ingen & Co., on the corner of Broadway and Broome street. Within a few moments after the fire commenced to burn the circuit was closed in the thermostat, the alarm given at the rooms of the Insurance Patrol, who were thus immediately notified of the location of the fire in the fifth story of the building, and it was at once extinguished by the patrol, the entire damage done not amounting to over ten dollars. Had this fire got well under way it would have been exceedingly difficult to suppress, and the damage, from the valuable character of the building and stock, must have been very heavy.

The following letter to the company, acknowledging the great value of the invention, is appended for the satisfaction of our readers:

"488, 490 and 492 BROADWAY, }
Corner Broome street, }
March 5th, 1875. }

To the Automatic Signal Company: The great value of your invention for the protection of property from fire was signally proved to us last evening, when a fire broke out in the fifth story of our building. Before it had obtained any considerable headway it had announced its existence, through the agency of

your signals, to the Insurance Patrol, who, immediately appearing on the ground, quickly put an end to the danger.

That the inestimable value of your automatic signals will become universally recognized we have no doubt.
(Signed), E. H. VAN INGEN & Co."

We understand that arrangements are being made for the introduction of this valuable system in Boston and other cities, and from its excellent and salutary working in this city we should suppose that there would be no difficulty in securing its favorable consideration wherever valuable property is exposed to destruction by fire. Had it been in operation in Boston, before the fire occurred which devastated so large an area of the business portion of that city, there is no doubt but that disastrous conflagration would have been prevented.

The Telegraphic Situation.

WE are not in a position to communicate anything of an exciting or startling nature in regard to the telegraphic situation. The adjournment of Congress, without legislation upon telegraph matters, has left the telegraph companies at liberty to work out their several plans and arrangements without additional legal interference, and has relieved the telegraph officials from the necessity of spending time and money to counteract efforts to secure the intervention of Congress for or against either.

The Western Union Company is engaged in an effort to secure their title to the quadruplex patent which is about ready to issue. The question is, whether the whole patent shall be issued to the Automatic Telegraph Company, as the general assignee of the great professor of duplicity and quadruplicity, or two thirds to the professor and one third to Mr. GEO. B. PRESCOTT, in the interest of the Western Union Company. It is understood that the decision of the Commissioner of Patents, who has heard arguments for the respective parties, will be given this week. Both parties, as usual, are confident of success.

The Atlantic and Pacific Company is making progress in its new arrangements, and getting matters in more satisfactory working condition. The automatic is in daily and constant use on the lines of this company, and is found to be a great advantage in disposing of its increased and constantly increasing business. No attempt has been made as yet to work it on a through circuit between New York and Chicago, though this will be done before long.

Nothing further has been done in the matter of reduction of rates. It is understood, however, that the A. and P. Company will further reduce on the routes on which the automatic system is worked in due time.

The telegraph wires South, both of the Western Union and Southern and Atlantic Companies, have been considerably damaged by freshets, but are now in working order generally. Business generally is represented to be fair, and the prospects for the future good.

To sum up, we may say that all is quiet along the lines. When anything of interest transpires the telegraphic public will, of course, hear of it through THE TELEGRAPHER.

Speculation in the shares of the Western Union Company is active, and the price has steadily advanced through the week.

To our Correspondents.

FOR the last few weeks we have been much gratified at the renewed and increased interest in THE TELEGRAPHER, manifested by the pressure of correspondence seeking a place in its columns. As a consequence, however, although we devote all the space practicable to the accommodation of our correspondents, some of their favors are compelled to wait, what we presume the writers must consider an unreasonable time, before they appear in print. This is unavoidable, however, and our friends must have patience, with the assurance that their contributions are appreciated, and shall be afforded space as soon as possible.

We don't wish to discourage anybody from writing—the more the better—but we hope that they will endeavor to express their views as briefly as is compatible with clearness. We are especially desirous of receiving contributions of news, personals, etc. Remember that, however familiar certain matters may be to the writer, they are likely to be news to ninety-nine out of every hundred readers of THE TELEGRAPHER, and as such will be of interest. Send us all the news of interest, or likely to be of interest telegraphically, possible; and don't forget to supplement your contributions to the columns of THE TELEGRAPHER by efforts to increase its circulation and the number of its readers.

A Busy Time Ahead.

THE winter which is just closing has been one of unusual severity. It is many years since we have had such a protracted season of extremely cold weather, and it is to be hoped that the experience may not be soon again repeated. The consequence of this continued low atmospheric temperature has been the penetration of the frost deep down in the earth, in many places below the depth at which telegraph poles are set. As the frost comes out of the ground it will be likely to prove very troublesome to the telegraphs, upheaving the telegraph poles, and causing very general disarrangement, and, it is to be feared, causing much interruption to telegraphic communication.

The accumulations of snow and ice are of course very great, and as these are resolved into water again by the advent of spring, there will undoubtedly be experienced very extensive and disastrous freshets, which will add still more to the telegraphic troubles. The intense and steady cold of the last two months has afforded very excellent insulation to the wires, and has concealed faults which would otherwise have been made manifest and removed. These will now appear, and be aggravated by the effects of the changing season; and we fear that for the month to come the lives of many telegraphers, and especially of the linesmen, will be made rather burdensome by this accumulation of difficulties.

That there is a busy time ahead for all who are required to keep telegraph lines in order and successful operation, there can be no doubt.

Of course, every telegraph Superintendent will have considered the approaching difficulties, and have made such dispositions to meet them as is possible with the means provided and at his disposal. Most of them are unavoidable and chargeable to the climate, but they are none the less annoying on that account. They are expensive, also, and the loss in business cannot but prove a somewhat heavy item. However, all concerned must make up their minds to bear the evil with equanimity, and repair the damage as speedily as possible. Lines which were originally poorly constructed, and which have not been properly maintained, will of course suffer the most, but even those which have been most carefully built cannot be expected to escape altogether. The early spring in this climate is always trying to the telegraphs and to the patience of telegraphers, but the present is likely to be even more so than usual; all of which, as it can't be cured, must be endured.

Worthy of Emulation.

THAT the present are hard times has been an excuse and explanation sent in from some of the old friends of THE TELEGRAPHER for not being able to forward to us as large lists of subscribers as usual. We acknowledge the validity of the excuse, so far as it goes, but we are under obligation to a lady telegrapher in Canada for ignoring this plea. By her individual efforts she has obtained and forwarded to us within the last two weeks forty new subscribers, and promises to raise the list up to a hundred before she will rest satisfied with the result of her canvassing on behalf of the telegraphers' organ. This is an indication of what may be accomplished by energy and persistence in a good

cause. Who of the other friends of THE TELEGRAPHER will emulate her example? It should not suffice that the subscription list of THE TELEGRAPHER should be maintained—it should be and may be largely increased. We hope our friends, male and female, in the States are not going to allow themselves to be surpassed in this good work by this energetic young Canadian lady telegrapher.

Removal of the Associated Press Office.

THE office of the Associated Press in this city has been removed from the corner of Broadway and Liberty street to the new Western Union building. The new office is in the eighth story, and is much more spacious and well ventilated than the rooms formerly occupied. It is located in the story above the operating room, which is a great convenience to all concerned.

As the dummy only ascends to the fifth story, those engaged in the Associated Press office are not deprived of their favorite pastime of stair climbing, but cannot fail to be gratified by the consideration that, without any extra labor, they are so much nearer heaven than they could ever hope to be in the old office.

The change of location is a decided improvement, and we doubt not will be fully appreciated by our old time friends and associates, who serve the press as faithful and laborious collectors and dispensers of telegraphic news.

Destruction of the Albany (N. Y.) Western Union Telegraph Office and Contents.

WE are indebted to our attentive correspondent and contributor, "Double Six," for a graphic and interesting account of the destruction of the Western Union telegraph office and the entire equipment by fire, which occurred on Friday evening, the 5th inst. This is the most extensive and complete destruction of a large telegraph office which has occurred since the great Chicago fire. Through the energy and enterprise of the officials and employés, and the great resources of the company, but slight interruption to the business was caused, and new quarters, directly opposite to the former location, were secured and speedily fitted up with new apparatus, batteries, furniture, etc., and business proceeded as usual.

Personals.

MR. H. C. SPRAGUE has been appointed Supt. of Telegraph for the Missouri River, Fort Scott and Gulf, and the Leavenworth, Lawrence and Galveston Railroads in place of Mr. E. B. MCDILL, deceased. His office is at Kansas City, Mo.

MR. CHARLES N. HART has been appointed Supt. of Telegraph of the St. Louis, Lawrence and Western Railroad, with office at Lawrence, Kansas.

The Telegraph.

Dividend of the Western Union Telegraph Company.

AT a meeting of the directors of the Western Union Telegraph Company, held on Wednesday, the 10th instant, a dividend of two per cent. on the shares of the company, for the quarter ending March 31st, was declared payable on and after April 15th.

The San Francisco (Cal.) Fire Alarm and Police Telegraph.

THE Committee on Fire Alarm and Police Telegraph have reported to the Board of Supervisors of San Francisco, Cal., against the adoption of the proposition made to the city by the American District Telegraph Company, to take charge of and work the fire alarm system, for the reason that the City and County Attorney has decided that such a proposition could not be legally entertained.

A New Military Telegraph Line.

Lieut. THEO. SMITH, Superintendent of the Government Telegraph, and Mr. J. B. Smith, of the office in this city, leave this morning for Arizona, to be absent in the Territory two or three months. Lieut. Smith

goes out to superintend the construction of the new line to Apache, in which work Mr. J. B. Smith will also be engaged. We wish them a good time, and hope to see them back again hearty and happy as usual.—San Diego (Cal.) Union.

Foreign Telegraphic Notes.

THE report of the directors of the Telegraph Construction and Maintenance Company recently issued, shows the following excellent financial results of the business, and the condition of the company:

"The accounts for the year show a net profit of £371,381, to which is added £19,359 brought from last year's account, making a total divisible profit of £390,741; of this £22,410 has been appropriated to the payment of an interim dividend of five per cent. on the capital of the company, leaving £368,331 to be dealt with. Of this sum the directors propose to distribute as dividend in cash £67,230, being at the rate of £1 10s. per share, or fifteen per cent., and making, with the amount already paid, a total dividend of twenty per cent. in cash, free of income tax. The directors further propose to distribute £186,750, being £5 per share, represented by fully paid up shares in the Brazilian Telegraph Company, and ordinary shares of the Globe Telegraph Company, making a total distribution of £276,390 in cash and securities for the year, carrying forward to the next account a balance of £114,351."

The total length of the cables actually laid by the company during the year 1874 was 5,973 nautical miles.

The steps taken for extending the system of submarine telegraphy along the West Coast of South America were retarded through unavoidable delay in carrying out the necessary negotiations with the Government of the United States of Columbia, but it is believed that the arrangements will soon be satisfactorily concluded.

Messrs. Morton, Rose & Co., of London, invite subscriptions for an issue of £1,030,000, six per cent. sterling bonds of £100 and £200 each of the Western Union Telegraph Company. The issue price is 87½ per cent. This issue has been authorized to provide means for redeeming the bonds of the company falling due within the present year, to the amount of £4,188,900, so that to that extent the debt of the company is not increased. Interest on the bonds is payable March and September.

A Parliamentary return shows that at the close of the year 1873 there were employed in the United Kingdom 2,472 persons in connection with the telegraphic service on railroads.

The directors of Hooper's Telegraph Works state that, after deducting £10,000 for depreciation of plant and machinery, and £15,000 for depreciation of the two ships, Hooper and Great Northern, there is a profit of £84,308, or, after payment of the sum due to Mr. Hooper, an available balance of £51,529. A dividend of 15s. per share was paid in July last, and another of £1 per share is now recommended (being at the rate of 17½ per cent. per annum), leaving £7,779 to be added to the reserve fund, which is thereby increased to £35,231.

The report of the Indo-European Telegraph Company, to be submitted at the meeting on the 26th ult., recommends a dividend of five per cent. for the year.

The traffic receipts for messages by the Direct Spanish Telegraph for the month of January last amounted to £1,654, against £1,271 for messages in December last.

The fourth International Telegraph Conference is to be opened at St. Petersburg, as has been already announced, on the 1st of June next. Of the twenty-four governments who have joined the convention all have already signified their intention to attend. Twenty cable companies have likewise accepted. From the United States telegraph companies no reply had been received a few days ago. Of States not hitherto represented three have been asked; of these, Brazil has definitely accepted, and favorable replies are anticipated from Japan and the River Plate States.

The total number of messages forwarded from postal telegraph stations in the United Kingdom, during the week ended the 13th of February, 1875, was 342,197—a decrease on the corresponding week of last year of 10,229.

The receipts of the Submarine Telegraph Company for the month of January amounted to £8,573, and for the corresponding month of the preceding year to £8,706.

The cable steamer Sydney Hall, with cable and the electrical staff on board, for the completion of the circuits of the Montevideo and Brazilian Company, in conjunction with those of the Platino Company, has left North Woolwich for the River Plate.

Showing Lowest and Highest Prices each day during week.

Table with columns: Month, Western Union, Atl. and Pac., Amer. Dist., Gold and Stock. Rows for March 4, 5, 6, 8, 9, 10.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each.

For the week ended January 19, 1875, and bearing that date.

158,890.—ELECTRO-THERAPEUTIC BATHS. J. Becker and W. D. Hoffman, Sigourney, Iowa. Filed Aug. 3, 1874.

- 1. The tube G, provided with internal conductor and binding screw, as and for the purpose specified.
2. The doubly adjusted electrodes K K in a bathing closet, as and for the purpose set forth.
3. The evaporating vessel arranged within the closet, and provided with hinged top and nozzle for connection with the tube, as shown and described, to allow a general or special delivery of vapor.

158,928.—TELEGRAPHIC APPARATUS AND CIRCUITS. Merritt Gally, Rochester, N. Y. Filed Jan. 13, 1875.

- 1. The combination, with the telegraphic line A, of the circuit C, with a receiver, a relay, or a repeater, E, and automatic switch for operating the connection between the line A and circuit C, substantially as and for the purposes specified.
2. The combination of the circuit C and a battery, with and connected to the main line on opposite sides of the magnet I, substantially as and for the purposes specified.
3. The combination of the line A and double sets of station instruments, with circuits crossed from side to side in either or both directions, substantially as and for purposes specified.
4. The combined manipulating key and receiver, relay or repeater, consisting of a magnet armature and key lever, substantially as specified.

REISSUES.

6,239.—ELECTRO-MAGNETIC FIRE ALARM TELEGRAPHS FOR CITIES. W. F. Channing, Providence, R. I., and Moses G. Farmer, Salem, Mass. Patent No. 17,465, dated May 19, 1857; extended seven years. Filed Dec. 18, 1874.

- 1. The signal system herein described, consisting of a series of signal stations scattered at intervals through a whole city or town, or any part thereof, and telegraphically connected with a common centre or point, or with each other, by one or more signal circuits, by which means a constant communication may be established and maintained between all parts of a city or town, however extended, and with the centre or centres at which the signal circuit or circuits converge or meet, so that the moment a fire occurs its existence and locality may at once be known at the centre of the system, and efforts for subduing it be properly directed.
2. The alarm system herein described, consisting of a series of alarm stations distributed throughout a whole city or town, or any part thereof, and telegraphically connected with a central station by one or more alarm circuits, by which means a public alarm of the existence and locality of the fire may be given at different points.

6,240.—ELECTRO-MAGNETIC FIRE ALARM TELEGRAPHS FOR CITIES. W. F. Channing, Providence, R. I., and Moses G. Farmer, Salem, Mass. Patent No. 17,355, dated May 19, 1857; extended seven years. Filed Dec. 18, 1874.

The fire alarm telegraph, embracing in its construction the alarm system for striking the number of the district upon the alarm bells, and the signal system for communicating the number of the station at which the fire occurs, to all the signal stations, as well as for communicating an alarm to the central station, as described.

6,241.—ELECTRO-MAGNETIC FIRE ALARM TELEGRAPHS FOR CITIES. W. F. Channing, Providence, R. I., and Moses G. Farmer, Salem, Mass. Patent No. 17,355, dated May 19, 1857; extended seven years. Filed Dec. 18, 1874.

- 1. A signaling apparatus, consisting of an electric circuit, a sounding or recording mechanism, and several automatic circuit breakers adapted to give determinate and different signals, substantially as described.
2. A signaling apparatus, consisting of an electric circuit, a sounding or recording mechanism, and several automatic circuit breakers, adapted to give determinate and different signals, substantially as described, and a device whereby the several circuit breakers, after being put in motion to break or close the circuit for signaling, shall automatically be stopped in position to restore the circuit to its normal condition or to correctly commence a repetition of the signals, as described.
3. A signaling apparatus, consisting of an electric circuit, a sounding or recording mechanism, and an automatic circuit breaker adapted to give determinate signals, and a device whereby said circuit breaker, after the giving of such a signal, shall automatically be stopped in such manner that a signal may be repeated by a direct forward movement, as described.
4. An electric circuit and a circuit breaker, permanently organized with two or more groups of circuit breaking or circuit closing points, the several groups being separated by spaces greater than the spaces separating the individual points of the groups, substantially as and for the purpose described.
5. The combination, with the same electric circuit or dependent circuits, of a manual circuit breaking key for general telegraphing, and an automatic circuit breaker adapted to give determinate signals, substantially as described.

6,244.—ELECTRO-MAGNETIC FIRE-ALARM APPARATUS. M. G. Farmer, Salem, Mass. Patent No. 23,060, dated Feb. 22, 1859; extended seven years. Filed Dec. 18, 1874.

"Village system," wherein signal boxes and electro-mechanical alarms are in same circuit, dispensing with central station. The combination, with same electric circuit, or dependent circuits, of two or more signal boxes, constructed to operate substantially as described, and one or more electro-mechanical alarm mechanisms, constructed to operate substantially as described, as shown and specified.

For the week ended January 26, 1875, and bearing that date.

159,215.—METALLIC TELEGRAPH POLES.—R. D. Radcliffe, Albany, N. Y. Filed Jan. 19, 1875.

The angle or T bars, cores and the exterior bands are interlocked without riveting or bolting, so that they can have no longitudinal movement independent of each other. A metallic skeleton post or pole, comprising the combination of central core pieces, external bands and intermediate longitudinal angle or T bars interlocked or positively connected with the same, by the means described, at required points in the length of the post or pole, to prevent independent longitudinal movement of the bars, as set forth.

MUTUAL CONTRIBUTION PLAN OF INSURANCE,

AT ACTUAL COST, LESS THAN ONE THIRD THE USUAL EXPENSE.

PROTECTION LIFE INSURANCE CO., CHICAGO, ILL.

Western Agents for L. G. TILLOTSON & Co., New York,

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET

or to

L. G. TILLOTSON & CO.,

8 Dey street, sole Agents.

THE FAVORITE.

Price, \$5.00.

Having reduced the price of these standard instruments, we are now prepared to furnish them to amateurs, students, academies, &c., with battery, connecting wires, chemicals, and one copy of "Telegraphy Made Easy," for \$6.50. Will be sent by Express, C. O. D.

Just published, "TELEGRAPHY MADE EASY." Sent to any address on receipt of 25 cents.

Address,

ISAAC HALL,

43 Centre Street, New York,

Manufacturer of Telegraph Instruments.

REPAIRING, JOBBING, &c., AT REDUCED RATES.

THE KENOSHA INSULATOR CO.
TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellent of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO.,
THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES, prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,
KENOSHA, Wisconsin.

Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

Is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDEES made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

The Insulation of Lightning Rods.

THE *Journal of the Telegraph* publishes an article on "Electricity," the object of which seems to be to combat the utility of insulating lightning rods. It says that "the patentees; in their energetic efforts to make a market for their wares, have tried to reopen certain questions which were settled long ago." I infer that one of the questions to which he refers as being settled is that insulating lightning rods is "an absurdity." Now, if that question was settled, and "as indeed Dr. Franklin perceived a hundred years ago," how is it that "in the memory of the oldest inhabitant" that insulation, or its equivalent, the placing of the rod as remote from the building as possible, and with as few attachments as would hold it in place, has been practiced?

If "the most important law of electricity is that it seeks what is called a state of equilibrium," then the means by which it seeks that equilibrium are of some importance also. To these, however, I shall have occasion to refer hereafter.

I can hardly appreciate the proposition which "familarly illustrates the idea of these currents of varying tension by reference to the spectacle of a teakettle or boiler filled with water, which, when first placed on the fire, sends forth from an opening gentle clouds of vapor. As the heat increases the steam rushes out with a spiteful hiss; and finally, when it has acquired sufficient tension, if the means of escape are inadequate, it hursts the boiler with a violent explosion. * * * Hence the insulation of lightning rods is not only an absurdity, but it is also a grave error." If the electricity to which a building is exposed were generated in itself, I could see how "the insulation of lightning rods would be an absurdity," but as the electric discharge usually comes from without, I cannot see how this illustrates the position assumed. Neither can I perceive how "the insulators, to some extent, arrest the flow of currents of rarefied electricity." The rod is only attached to the insulator, without diminishing the size of the conductor, or in any way interposing any obstacle to the flow of the electricity, except the mere contact to it. There is no affinity or attractive force in the insulator to or for the electricity, therefore there can be no arrest of the flow. Then following immediately after the last quotation, it reads, "On the other hand, the insulator amounts to nothing as a barrier against a discharge of lightning, which can pass through it, or leap the short distance between the rod and the building." Here is a plain contradiction in these two sentences. The first declaring that the insulation does arrest the flow, and the next succeeding one declaring that the insulator amounts to nothing as a barrier against a discharge of lightning.

That "the insulation of telegraph wires is frequently referred to by lightning rod men" may be true, as they certainly illustrate the action of electricity as well as it can be illustrated, because it is the same thing upon a smaller scale. It is true that "currents of electricity of low tension are used for telegraphing," but whether it is lower than that which all telegraph wires are constantly, though imperceptibly, carrying off from the atmosphere, is a question yet to be solved. The object of insulating telegraph wires is to secure the passage of all, or as large a portion as possible of the battery current through the entire circuit of the line, that its force or power may be utilized at the most distant point—not to "postpone" its action—and the restoration of the equilibrium, through the whole circuit of the wire as rapidly as possible; and the purpose of insulating a lightning rod is to "promote" the restoration of the equilibrium as rapidly as possible, by preventing the electricity from passing into the building by means of any substance that would give additional conductivity to the charge. It is through the rod that the equilibrium—the most important law of electricity—is effected; therefore, it is of the utmost importance that it should be properly arranged in all its parts, to give free passage to any charge that may come in contact with it. "The relative conductivity power is worth considering, for upon this power depends the safety of the building; that is to say, if iron is used it

must be proportionately larger than copper. In other words, copper being six times a better conductor than iron, the former, one sixth in size, would be equal to the latter six times the size; so that if iron is used it should be six times larger than copper." To my mind the smallness of modern lightning rods is their great fault. They may be large enough to carry safely ninety-nine charges over it, while the hundredth would surcharge them, and not being able to carry the whole charge, a portion would pass into the building by any substance, or even jump the space between the rod and it, thereby causing great destruction to property. Therefore, the first element in a lightning rod should be its size or conducting power. 2d. Its perfect continuity, i. e., equal in all its parts. 3d. A ground connection that shall be equal to the conducting power of the rod. 4th. Well pointed and elevated, so as to lead off silently all the electricity possible.

These are the essentials for a good lightning rod. If the rod be sufficiently large, it may be connected directly to the building without insulation, as the electricity will follow the best conductor; but if the rod is small it should be insulated, as the danger from an electric discharge is much greater from above than from the earth or building.

Saved by Telegraph; or, in the Nick of Time.

BY BEN BREESE.

In the early part of 186— I received orders to report at B—, in the southern part of Pennsylvania, to perform the arduous duties of telegraph operator, ticket agent, and others, which in those days came under one head, and the compensation for which was limited to a very small amount. B— was a county seat, and here were held the courts of the county. I arrived during the closing hours of a murder trial; the man was convicted by circumstantial evidence and was sentenced to be hanged. Great efforts were made to obtain a reprieve, but all seemed to be of no avail. My office was at the depot, nearly a mile from the village and court house, which was obscured from view by a forest for nearly a quarter of a mile. The day of execution had arrived and no reprieve had been received, but the friends of the doomed man entertained great hopes that the reprieve would be sent by telegraph that morning. They had sent a telegram to the Governor and were momentarily expecting a reply. The clock had struck eleven and no reply had been received. I called H., but they had received no message. The hour of the execution was fast approaching; the friends of the doomed man were almost frantic with anxiety and sorrow. They had left the office and given up the last hope, as the execution was to take place at twelve o'clock. I was preparing to leave the office for dinner, when I heard H. calling me. I quickly answered the call. It was now eight minutes of twelve. It was the reprieve! I nervously copied the message, and, not waiting to give "O. K.," rushed madly out of the office without coat or hat, reaching the court yard where the execution was to take place—pushing by the soldiers who were guarding the jail yard, greatly excited, and yelling at the top of my voice, I was quickly admitted by the gatekeeper, and delivered the message to the Sheriff just as he was pinioning the arms of the doomed man.

The execution was stayed, and I received the heartfelt thanks of his anxious friends. A new trial was granted, and the man who was convicted by circumstantial evidence was proved to be innocent by the confession of the real murderer, who, in the first trial, had been the fiercest and bitterest witness in the prosecution. He was a short time afterward hanged. Again we have an instance of the achievements and benefits of the electric telegraph, which have been so often demonstrated since its first introduction by Prof. Morse.

Mr. I. D. Purkis and the Dominion Telegraph Company.

We have received the following for publication:

TORONTO, Feb. 11, 1875.

To the Hon. John McMurrick, President of the Dominion Telegraph Company.

MY DEAR SIR: It is with sincere regret that I feel it due to myself to resign the responsible charge I have held in the company for the past five years.

You and the executive are well aware that the relations between the secretary (Mr. Small) and the writer have been for some months past of a most unpleasant nature; in fact, I may say this has been the case since the time of his appointment, brought about by his meddlesome interference, and otherwise imprudent conduct, while neglecting the duties of his own department.

With a sincere desire to carry out my trust faithfully, and in such a way as to give you and your associates as little trouble and annoyance as possible, I have en-

deavored to work along amicably, and by such supervision as I could give, to keep his department working as satisfactorily as might be under his management. The late protracted investigation must have impressed your mind with the fact that it is only "hoping against hope" to expect the restoration of an amicable feeling. It is true you have fully sustained me throughout the investigation, and endeavored to define more clearly our respective spheres, with a view to lessen the chances of further unpleasantness; but having had cause to withdraw my confidence and respect, nothing can again restore them. The duties of your general manager are not light, and to carry out his important trust successfully, I hold he should have the hearty assistance of the secretary, and that officer should be a gentleman of judgment and discretion, capable and willing to render such assistance, instead of imposing many of his duties on the general manager's department. The manner in which the secretary's department has been conducted has given me a good deal of anxiety and annoyance, and convinced me, at least, of his unfitness for the important position. Holding these views of the secretary (which, I believe, are concurred in by Superintendent Neilson), I cannot, in justice to myself, retain a position which makes me responsible for the general affairs of the company, and I therefore beg to retire, and shall deem it a favor if you can conveniently relieve me by the 30th of April next, and in the meantime I shall do all in my power to be in a position to hand over my trust in the best possible condition to my successor.

Again expressing my regret at leaving, and thanking you cordially for the many kind considerations I have received at your hands, and wishing the company that continued success for which we have ever worked,

I remain, my dear sir,
Your obedient, respectful servant,
(Signed), I. D. PURKIS,
General Manager.

Extract from the minutes of a full meeting of the Board of Directors, held on Wednesday, the 24th day of February, 1875, at the head office of the company:

"The President having laid before the Board the resignation of the General Manager, Mr. Purkis, after full deliberation the following decision was come to:

"It is with regret that the directors feel that no alternative has been left them but to accept the resignation of Mr. Purkis, to take effect, according to his own wish, on the 30th of April next. In taking leave of Mr. Purkis, after a connection of nearly five years, the Board desire to express the kindly feeling which they have ever entertained towards him, and their appreciation of his past services."

The above is a true copy.
(Signed), J. C. SMALL, Secretary."

The Atlantic and Pacific Telegraph Company on the Pacific Coast.—Extensions of the Line.

IMPORTANT improvements have been recently made in the general offices of the Atlantic and Pacific Telegraph Company in this city. The office on the ground floor of No. 507 California street has been renovated and generally altered, to accommodate the necessary business of the company. The receiving and delivery clerks now have their desks on the right hand side upon entering. The partitions which separate them from the main floor are all attractively grained in imitation of oak. J. G. Bloomer, the Manager, has an inviting little private office in the corner. On the left hand side, upon entering, is to be found a row of six desks for the use of patrons of the line. These are divided from each other by small partitions of frosted glass set in frames. The office is altogether very attractively fitted up, and is suggestive of a decided transformation when the old dingy quarters are recalled in one's memory. Major Richard P. Hammond, the General Manager, occupies neat and commodious quarters on the floor above. The operating room is on the third floor. It has also been newly fitted up. Four day operators and one night operator are constantly engaged at work here. The Atlantic and Pacific Telegraph Company is constantly extending its lines on this coast. F. L. Vandenberg is General Superintendent of the Pacific Division. He reports that the company will soon have in operation a new line to Ogden and another to Virginia City—making six eastern wires in all. The company will soon be in telegraphic communication with Los Angeles. A gap between the southern terminus of the Southern Pacific Railroad and San Fernando has to be closed, when the communication will be complete. This will soon be accomplished, and the line will next be extended to San Bernardino.—*San Francisco Chronicle.*

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended February 20th, was 347,108—an increase on the corresponding week of 1874 of 20,612.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Surprise and Indignation at the Acceptance of the Resignation of Mr. I. D. Purkis, General Manager of the Dominion Telegraph Company.

TO THE EDITOR OF THE TELEGRAPHER.

THE resignation of Mr. Purkis, as manager of the Dominion Telegraph Company, is the most interesting topic now under discussion in Canadian telegraphic circles, and is the cause of deep regret both to the stockholders and employes of the company. He resigns on account of serious trouble he has had with Mr. Small, the secretary of the company, whose inefficiency and insubordination annoyed and embarrassed Mr. Purkis to a very serious extent, and put an end to any possibility of that mutual good will and harmony of action, without which it is impossible for two such high officials to work together in the interests of the company. The secretary was formally charged by Mr. Purkis with neglecting his own duties and interfering too much in his superior officer's; with disobedience of orders, and transgressing in many cases his proper official authority, and other grave faults. The Board of Directors fully sustained him in all these charges, and passed a vote of censure upon the secretary, but did not make him resign. Of course, this was not sufficient to satisfy Mr. Purkis, who rightly considers the secretary's conduct highly detrimental to the interests of the company, and knows it is impossible for them to act harmoniously together; therefore, he resigned—the only manly course he could pursue under the circumstances. The acceptance of his resignation occasioned great surprise and indignation among the stockholders, and had a very depressing effect on the stock. Holders who, previous to it, were firm at 108½ came down to 105, while buyers were not offering better than par. The stockholders have entered a protest against the acceptance of Mr. Purkis's resignation, and it is expected that the Board will reconsider the matter. They have placed themselves in a very bad position, and the only way in which they can get out is by inducing Mr. Small to resign, as Mr. Purkis's services cannot be retained on any other terms. His retirement would be an irreparable loss to the company, as it would be almost impossible to secure another man of equal experience and ability. The company is young yet, but has already grown rich, and prospered beyond the most sanguine expectations of its originators and supporters, and it is generally admitted that its unprecedented success is mainly attributable to the untiring zeal and judicious efforts of Mr. Purkis, under whose management it has been brought triumphantly through the many financial and other troubles which once threatened to prove fatal to the enterprise. He has been a telegraph manager since 1849, and his long experience, thorough acquaintance with all the details of the business, splendid abilities, both natural and acquired, sound judgment, energy and application, combine to make him one of the best managers that could possibly be found anywhere. The acceptance of his resignation by the Board of Directors is about the most suicidal policy that could well be imagined, for, while it would be a very easy matter to get a far better secretary than Mr. Small, it will be almost impossible to get another manager as good as Mr. Purkis. It is only natural that great dissatisfaction and indignation should be expressed at the idea of the Executive Committee accepting the resignation of an able and efficient superior officer, and retaining an inefficient subordinate, and the stockholders have not been at all backward about signifying their disapproval of such a step. Personally Mr. Purkis is immensely popular, being affable in his manners, strictly honorable in all his dealings, and in every way fully entitled to "the grand old name of gentleman;" while Mr. Small may be briefly and accurately described as the very reverse of all this.

OBSERVER.

Another Protest Against the Retirement of Mr. I. D. Purkis.

KINGSTON, March 10.

TO THE EDITOR OF THE TELEGRAPHER.

ALTHOUGH I am a regular subscriber for THE TELEGRAPHER I have never before contributed to its columns. But the high esteem I have always manifested for our general manager, Mr. I. D. Purkis, would be hypocritical indeed were I to remain silent in regard to his retirement from the management of this company. It is a well established fact, that by

Mr. Purkis's able management of this company he brought Dominion Telegraph Company stock up from 85 to 110. He brought the company from the very doors of bankruptcy, and placed it in its present prosperous and profitable state. He has the esteem of every employe under him. A more popular gentleman, not only with his employes but also with the public, could not be found; and he is a gentleman who has proved himself irreproachable as a general manager. Still, in the face of all these facts, his resignation was accepted.

The great cry, some years ago, throughout Canada, was "Down with this telegraph monopoly—up with an opposition company and give us reasonable rates." Now, mainly through Mr. Purkis's indefatigable efforts, he has at last succeeded in giving to the country both a strong opposition and low rates; therefore, the people and press (not being ignorant of these facts) have taken the matter up, and with one voice condemn the action of the Board of Directors in accepting his resignation.

Every employe of this company heard the unwelcome news with deep feelings of regret, and hundreds of letters and messages were immediately forwarded to Mr. P. by his employes and the patrons of the company, expressing their regret and tendering him their sympathies. Stockholders and patrons of the company have forwarded petitions to the President, condemning the action of the Board in accepting his resignation, and requesting them to reconsider the matter, and expressing a desire to see Mr. P. immediately reinstated as general manager of the company.

I sincerely hope the matter may yet be satisfactorily arranged, and Mr. P. reinstated, as I am perfectly satisfied (after five years' service under him) another man to properly fill his place cannot be found. Besides, it is very unfair to him to be driven from the company by the causes set forth in his resignation, after working steady a lifetime, and when his aims have just been so handsomely achieved. I hope that Mr. Purkis will still remain at the helm, where he has so successfully managed the affairs of this company in the past.

R. J. EITBECK,
Manager D. T. Co.,
Kingston, Canada.

Regret at the Resignation of Mr. Purkis.

LONDON, ONTARIO, March 9.

TO THE EDITOR OF THE TELEGRAPHER.

THE shareholders and many friends of Mr. I. D. Purkis in this part of the province have heard with surprise and regret of his intended withdrawal from the General Managership of the Dominion Telegraph Company.

The cause of Mr. Purkis's resignation is a difficulty with Mr. Small, the Secretary, who has not performed his duties to the satisfaction of the manager. Mr. Purkis is well known in telegraphic circles, being one of the oldest and most experienced telegraphers in Canada.

It is sincerely hoped that the Board of Directors will reconsider their acceptance of Mr. Purkis's resignation, and not lose the services of one who enjoys the honor of having established the only successful opposition telegraph company yet started in the Dominion.

ELECTRICITY.

Quadruplex.

TO THE EDITOR OF THE TELEGRAPHER.

THE manifold praises of the Edisonian Quadruplex have been on many lips; its achievements, prospective and otherwise, recounted by the press. That gem of latter-day telegraphic journalism, *The Operator*, has lent its (organic) support, and even the careful conservative *Journal of the Telegraph* unhesitatingly endorsed it as an unqualified success in every respect.

Relying on these positive statements, an outside observer, unacquainted with its construction and its intricacies, would be led to have an unbounded faith in its capabilities, as asserted by its supporters, of quadrupling the capacity of a single wire, with equal facility and as perfectly as it is doubled by the duplex inventions and apparatus of Stearns and others.

That the advantages of this invention have been, to say the least, greatly exaggerated by its supporters, is evident to any one who examines carefully the principles on which the system is based, and the mechanical problems involved in the successful application of the same.

One of the most difficult electro-mechanical problems known to telegraphic inventors, viz., "the closing of one circuit through one set of points at precisely the same instant of time another circuit is opened through another set of points," must be accomplished before the present quadruplex can take rank in the list of perfectly reliable improvements in telegraphy.

With our superior American telegraphic talent, the deciphering of broken and almost unintelligible signals

is to some extent practicable, which, with the registering apparatus of other countries, would be impossible.

No contrivance has yet been invented for sending two messages on one wire in the same direction at once, without interfering with each other. Numerous efforts to do so have invariably failed.

I admit that perhaps Mr. Edisou has arrived nearer a practical realization of this idea than any one heretofore. In his method one series of signals are given by increase and diminution of battery influencing a common relay magnet at the receiving station; the other series by reversals of the sending battery producing signals on a polarized relay. The reversing transmitter closes two points before it opens two others, consequently there is a period of time when the sending battery gives no current to the line, necessitating a "breaking up" of signals on the common relay whenever closed during the act of reversal.

This is a difficulty fatal to the transmission of two non-interfering signals in the same direction.

To prevent sending currents from affecting the receiving instruments, Stearns' "Wheatstone Bridge" arrangement for duplex is used. This combination constitutes the salient points of this quadruplex.

Further research may finally overcome the imperfections of the invention. In its present condition it cannot by any means be relied upon, either as to carrying capacity or accuracy. I hazard the prediction that until decided improvements are made in the direction indicated, or a completely new arrangement substituted, free from such glaring deficiencies, the successful working of the system will be found impracticable.

If, as is currently reported, the large sum of \$750,000 was paid for the assignment of the patent when issued, it is only another illustration of the fact that inventions of questionable utility often command more money than those of real merit.

CON SPIRITO.

Defence of the Protection Life Insurance Company.

CHICAGO, March 1.

TO THE EDITOR OF THE TELEGRAPHER.

IT was the thing most remote from my mind, when I sent you the account of the Protection Life Insurance Company's banquet, to give that company a gratuitous advertisement in THE TELEGRAPHER. I merely intended it for telegraph news, but as a correspondent over the *nom de plume* of "One who Knows, not an Insurance Agent," has taken exception thereto, and in so doing given utterance to misrepresentations in regard to that company, I feel that it is my duty to reply, not only on account of my veracity in calling attention to the merits of the company being called in question, but also as an act of justice to the company. The main feature and burden of his complaint seemed to be that the city papers where he is located "contained a telegram from Chicago of still another judgment against the company;" and goes on to state that the suit whereon the judgment was obtained, "with the jury out but five minutes," was brought "by the widow of one of the oldest policy holders of the company." Does this fact, if it be true, warrant the assertion that the company is "a delusion and a snare," as characterized by this writer? and is the assertion that "this is but one of many similar cases with companies who pretend to afford such a cheap insurance to their patrons" calculated to scare any of your readers out of taking a policy in this company? The writer must have a very poor opinion of the business qualifications of the fraternity if he thinks those of your readers who want insurance would take for granted as true the assertions of an unknown correspondent, when they could obtain the names of persons right here in Chicago and elsewhere, of those who have also had experience with this same concern, and who have received every cent of their insurance. A well known insurance company sustained a loss six months ago, by the death of a gentleman in the far west, whose heirs reside in Minnesota. Besides being insured for a large amount in the company mentioned, he also had insurance for large amounts in other companies. As this well known company thought there might be some irregularities in regard to the gentleman's demise, the most rigorous examination into the details was made, and the policy is yet unpaid and will cause a lawsuit. Is this company any the less thought of? When we look at such things without personal prejudice, which is evidently not the case with your correspondent, they look differently. The company that will stand a lawsuit on a doubtful case is much safer to insure in than one which would pay a loss without any proofs of death; and if the Protection has stood a lawsuit and got beat in this or any other case, it is very far from demonstrating that it is an unsafe company to insure in. A life insurance policy, be it ever so simple in its contract between the insurer and insured, is a complicated affair, and its provisions should be well understood before accepting insurance; a question answered wrong, no matter whether through ignorance or knowingly, subjects the policy to forfeiture in

case it is proven that such is the case. I am unable to learn if such a case exists as far as the Protection is concerned, but wish to make it clear to your readers, if such a case does exist, it is no reason why parties who want cheap insurance should give this company a wide berth, as the thousands of losses they have paid, without being forced to do so by law, show that this is no game to fight every loss, as we are continually being told by the anonymous circulars and insurance press of the old line companies, which are put into the hands of members of the Protection at every street corner almost. Any of the fraternity who will take the trouble to send for circulars or papers to the company or any of its agents, or read the remarks of the *Chicago Times* (one of the most independent papers ever published) in regard to the Protection, can be fully satisfied that my former advice "to those who wanted cheap and reliable insurance," was in perfect good faith. With the class of persons who still cling to the antediluvian idea that to insure your life is a direct insult to your Maker, I have no sympathy, nor would I argue a moment with such a person; but to those who are ready to appreciate the benefits of life insurance I am willing to show that cooperative companies do not "steal the livery of heaven to serve the devil in," nor do "they at least raise hopes that are destined to be disappointed;" neither is uncertainty a prominent feature of this class of insurance and everything connected with it—as far as the Protection is concerned, at least. The amount the policy will yield is certain, all policies having been paid in full for the past three years. The assessments are made every month, and adding the ten cents for collection, a \$2,500 policy has cost me from two dollars and forty-three cents to two dollars and sixty-six cents per month; at no time have they exceeded or been less than that amount for a year and a half. I am between 26 and 40 years old. The entrance fee is \$14 for a policy for this amount and \$2 for medical examination; this sum, \$16, being followed the second year and every year afterwards by four dollars yearly dues, which, with the monthly assessment, constitutes the bugbear of "uncertain assessments." Your readers can average this and compare it with the cheapest rates of any life insurance company and see what the difference will be and how favorable the Protection will appear. According to law the insurance companies in Illinois are obliged to deposit securities with the State treasurer of \$100,000. The Protection has \$139,000 deposited and a capital paid up besides of \$200,000. Besides this, every State has its insurance laws, which the Protection has to comply with when it begins business there. The company differs only from other life companies in its way of doing business—hence the opposition of old line companies. The printed papers of the company will explain in regard to all the details, cost of other sized policies, etc. "The tenure of membership" and "the claim to indemnity" is just as certain in the Protection as in any other company. Its losses will not be greater in proportion to its membership than any other company, neither will it cost more nor as much to pay them as in other companies. "He who dies first," as a matter of course, don't pay as much as he that dies last, but if he who dies first had his choice he would rather pay more and live to pay as much as the last one; and when he does die, if he don't die till the last one, his friends get more than he paid in and he don't need it. When we look upon insurance on life as we do insurance against fire, "simply as an investment," not as a "tempting of Providence," etc., then we will begin to be sensible. All the other assertions of your correspondent, such as "the last man receiving nothing," "young paying too much," "old paying too little," "originators of the plan not understanding it," "gotten up to make money," "future will repeat the past," "the plan ultimately will fall to pieces," and that "all who have anything to do with it will be disappointed and deceived," is all "old line" balderdash, as he himself knows. In conclusion, I would say that the officers are men well known for their honesty and uprightness, as any one can ascertain by examination in the proper way.

INSURANCE, AND POLICY HOLDER No. 17,283.

The Telegraphs and Telegraphers of the Philadelphia and Erie Railroad.

NORTHWEST OF PENNA., Feb. 26.

TO THE EDITOR OF THE TELEGRAPHER.

The plan suggested by "Occasional," of Chicago, for getting up communications for THE TELEGRAPHER meets my views, and I will accordingly contribute my mite.

Not having seen any news from this section of the country, I will try and represent the Philadelphia and Erie line by giving a list of the stations, names of operators, etc., along the Middle Division. Telegraph matters are very dull, there being no changes made, but I will commence with Renovo, the terminus and

headquarters of the division. The town is beautifully situated on the north bank of the west branch of the Susquehanna River and between high and precipitous hills. The lines run through a very rough and mountainous country. Here are located the principal shops of the P. & E. road. The train despatching is done by Messrs. W. Irwin, Ed. D. Gardner and Erastus R. McCloskey—working eight hours each. The operators are Messrs. Chas. Utley, H. Garner—working half day and half night (12 hours each)—and P. H. Hayes, the ambitious youth of Rathbun City. He has attained quite a taste for billiard playing, and is a competent judge of a good segar. He works the through railroad and W. U. wires, with hours from 8 A. M. till 5 P. M.

Mr. Irwin is also chief operator, and has the management of the wires over the Middle Division. He is the oldest man on the road, having worked here since the division was first opened by Col. J. J. Lawrence, then Superintendent, in 1864.

Messrs. Gardner and McCloskey were promoted from the ranks within the past few years.

Mr. S. O. Malin, who was train despatcher (nights) on this division several years since, but lately chief operator and despatcher on the Bald Eagle Valley Division, was on the 1st of January promoted to the position of assistant train master on the Baltimore Division, with headquarters at York, Pa. Miss Flora Taggart is operator at Westport, the next station west. J. A. Van Daniker is operator and agent at Keating. Messrs. Chas. F. Golden, days, and Jno M. Given nights, at Round Island.

At Driftwood is the Junction of the Alleghany Valley Railroad, and the office is in a neat two story frame building located at the junction. It is on the second floor and is handsomely furnished. The wires of both roads are in the same office and run by Messrs. David B. Reed, C. W. Fisher and Wm H. Miller, days, and Mrs. S. Miller nights, at Sterling (watering station). Mr. Howard Laughton is day man at Cameron. At Emporium, the junction of the B. N. Y. and P. Railway, there is a night office run by Mr. Jas. L. Miller. At the station are Messrs. Jno. D. Logan, days, and George W. Corion nights; Miss Tina Dobson, days, and Miss Susan L. Chadwick nights, at Rathbun. At St. Mary's (the town of lager beer and pretzels) is Mrs. E. J. Clarke, days, and Mr. Byron F. Burdick nights.

Miss Annie M. Hayes (now the oldest operator on the division) days, and Miss E. A. Taggart nights. Miss Annie McKee is manager of the W. Union office over in the city.

Mr. E. K. Stevens is day man at Johnsonburg. Mrs. A. A. Johnson and her sister, E. A. Abbott, are the operators at Wilcox.

At Kane, the summit of the Alleghany Mountains and the western terminus of the division, are Messrs. Jno. B. Skelly, days, and James M. Fay nights, on the Middle, and Messrs. P. Small and W. A. Atherly on Western Division. Mr. Richard B. Donaldson, "extra artist," is working at Ridgway nights vice Miss Taggart, sick.

Mr. Jas. R. McAvoy, the skilled and obliging "line-man," keeps the wires in good shape on the division. He has been on the road since it was first opened.

With one exception the telegraph offices on this division are separate from the depot buildings, and conveniently arranged for the business of the road.

THE WANDERER.

Telegraphic Notes, Notions, Personals, etc.

CHICAGO, March 8.

TO THE EDITOR OF THE TELEGRAPHER.

We had a terrible storm here and all through the northwest on the 3d; very few roads were able to get trains through on time and some not at all. Since that time we have had alternately a stormy and a pleasant day until Saturday, since when we have had very pleasant weather. Mr. L. H. Long is at present subbing for one of the Northwestern Railroad Company's operators at Fort Howard, Wis., the latter being on the sick list. A great deal of sickness still exists among the fraternity here; "Ed." Whitford, of the W. U. Buffalo wire day force, and Charlie Robison (the old "vet."), of the W. U. night force, have both been down. Charlie's old enemy, the rheumatism, is after him again; he is able to be around with a cane again. I notice our friend "Armstrong," of the W. U. office, again on the street, as smiling and happy as of old, and upon inquiry ascertained his amiable young wife is now convalescent and in a fair way to recover.

"I'll cut you with this razor—I'll cut you deep, honey." Such were the words, in a careless undertone, that reached the ears of the boarders of one of our first class west side hash factories a few afternoons ago. The sounds proceeded from a room occupied by three of our well known "Knights of the Key." It took less time than it takes me to write this, for a goodly number to rush to the door, where, fearless for personal safety, they listened breathlessly

for further manifestations. "Now, what's the use in my taking it? I'll only have to be getting relief every few minutes and make the manager cross." "Well, you must take it; take it now or we'll go for you." "Where's my razor?" At this juncture the crowd could wait no longer, being certain somebody was going to be murdered; while one excited boarder shouted "police," the others forced the door open, which, by the way, was not locked, and found—two of the boys forcing another to take a seidlitz powder on account of some pretended breach of decorum he had committed by some of his witty sayings. The laugh was on the boarders, but they don't understand how operators can find any fun fooling with razors and seidlitz powders, both being quite effective.

It has just come to our notice that Supt. Towler, of the A. & P., is married and has been for some time; don't know how true it is.

There is a great deal of complaint among the W. U. night men about that "darned old noon hour," and it does seem as if some way might be devised so as not to rob the night men of their only recreation, a whole day of rest and recuperation from the toil of the night. I will probably refer to this subject again.

OCCASIONAL.

Appreciation and Patronage of The Telegrapher.—The Electric, Automatic, etc.

CHICAGO, March 3.

TO THE EDITOR OF THE TELEGRAPHER.

"OCCASIONAL" gleans the news so closely in this vicinity that it is hardly worth while for any one else to attempt a letter from the "Garden City," but lest you should construe our silence into non-appreciation of your efforts to furnish a clear, simon pure telegraph journal, devoted entirely to the interests of the fraternity, we throw in our mite. Some forty numbers of THE TELEGRAPHER are taken in this office, read, and what is better, paid for before being read. It has become a thing of rare occurrence to near one operator ask another to lend him his TELEGRAPHER, while previous to the appearance of *The Operator*, but half a dozen copies of THE TELEGRAPHER were taken, and borrowing was the order of the day. *The Electric*, a spicy little sheet published on the 5th and 20th of each month, in St. Louis, by Messrs. J. W. McDouald and Fred B. Moxon, has made its appearance in our midst, Mr. Tierney being the Chicago agent. It is printed on plain paper, is very unpretentious and full of fun; we bespeak for it quite a liberal patronage here if it is wise enough to let THE TELEGRAPHER alone. If not, it may go to rest, with *The Switch*, *Fraternity*, etc., who at their birth seemed to think, as *The Operator*, that they were destined to supplant THE TELEGRAPHER.

Ed. Angell, secretary to manager Swain, of the W. U. office here, is, I am informed, a "single man" again, ready for fresh conquests, having recently been divorced from his second wife, "and yet he is not happy."

The Atlantic and Pacific Company have the Automatic in fair working order here now, but are not as yet working it up to its full capacity.

CONSERVATIVE.

Coming Events Cast Their Shadows Before.

TO THE EDITOR OF THE TELEGRAPHER.

THERE was, at the time President Orton made the assertion that the Western Union Company claimed to own all the patents to be issued upon duplex telegraphy for which applications were then pending, an application on file for nearly one year in the U. S. Patent Office, for a duplex telegraph system so far ahead of even the wildest dreams of the quadruplexionists, that I dare not now venture to offer anything more than a mere hint upon the functions of this new invention. And as, of course, the W. U. Co. would not claim to own anything that is worthless and totally inoperative, even this incomplete skeleton of a description may be of interest to your readers. Without adding any new transmitting or receiving instruments, and without the least change in the instruments now in use in any system of single telegraphy, this new system makes possible the simultaneous communication between any four offices on one line, without any intermediate ground connection; and this, too, with as effective a working current for each office as the best duplex now in use. It is, in fact, nothing less than a

REAL DUPLEX.

The well worked and well managed Indo-European line has obtained—in the year 1874—an increase of 45 per cent. on its receipts, they having risen from £54,897 in 1873 to £79,456. The Government have agreed to reduce the rent payable by the company for the use of the land and cable wire from £12,000 to £6,700 per annum.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, MARCH 20, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE ON APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Activity of Telegraphic Invention.

THAT there is at the present time great activity of telegraphic invention is evident. This has been much stimulated lately by the importance given to such inventions, through the competition that has recently assumed such prominence for the telegraph business of the country. This competition has always existed to a greater or less degree, but until lately it has not, since the consolidation of the Western Union, United States and American Telegraph Companies, under the Western Union organization, been of a very pronounced or important character. The Western Union Company has had things pretty much its own way, and its managers have been inclined to regard their competitors as of not much account, and ready to be "consolidated" whenever it should be considered politic to take them into the mammoth organization.

New elements have recently entered into the contest, which threaten to give that organization a much more vigorous contest than any which it has had to encounter since the United States Telegraph Company was consolidated out of existence.

To both parties improved apparatus has become of vital importance, and, consequently, telegraphic inventors who, for some years past, have been regarded as bores and nuisances, suddenly find themselves in favor, and their claims to notice, recognition and acceptance, listened to with respectful attention. All parties are now desirous of securing the advantages which may be derived from a development of the greater capacity of telegraph lines and apparatus. The fact has become recognized that the party which shall avail itself of these most fully will possess a decided advantage over its competitor or competitors.

That this state of telegraphic affairs affords the opportunity for the inventive talent and genius of the country which has hitherto been wanting, is unquestionable. Those who have, or suppose they have valuable telegraphic improvements to bring out and develop, are not slow to recognize the fact, and accordingly they are pressing forward vigorously with their inventions and improvements. A number of these have already been secured by the Atlantic and Pacific combination; some of them, of course, merely to be shelved and kept away from the Western Union, and others to be tested and adopted if found really advantageous and practicable. Among these stands first and foremost the automatic system, which has been

dragging along for the past five years, but which, under the new auspices, is demonstrating its value and importance. The duplex system of D'Infeville has also been secured by the Atlantic and Pacific and the Southern and Atlantic companies. Other inventions are being tested which promise important results, and unless the Western Union managers shall act with more than their usual vigor and promptness, they will find themselves outwitted by their competitors, whose action is not hampered and retarded by similar entanglements of red tape. The much vaunted quadruplex, upon which the Western Union managers built such "great expectations," is by no means secured to them, the title being in dispute, and not improbably to be eventually wrested from them. All that the Western Union Company is sure of thus far is the duplex invention of Mr. STEARNS, and it is claimed that even this is subject to a prior patent of Mr. MOSES G. FARMER, which that company does not own, but which, if it is what is claimed for it, they will do well to speedily secure.

We do not regard the quadruplex, in its present shape at least, as of anything like the value and importance which has been claimed for it. What improvements may hereafter be made in it we cannot say; but until it is very materially improved we do not regard it as worth the money which is being spent to secure and introduce it.

That the result of all this inventive activity is likely to be the development of further important improvement in telegraphic apparatus, we think is certain. Telegraphy has entered upon a new era, and the telegraphs of the future are no doubt destined to prove an immense advance upon anything which has been witnessed hitherto. If there be less of pure science among the electricians and telegraphers of this country than of Europe, they can certainly demonstrate their superiority to their European brethren in practical development in the telegraphic art.

[From the Scientific American.]

A New Telegraph Alphabet.

To the Editor of the Scientific American.

THE ordinary Morse telegraph alphabet, consisting of dots, dashes and spaces, answers very well when a register is used, and the signals are recorded on paper; but since the sounder instrument has almost entirely superseded the register this alphabet is defective, as the sound of a dash is very much like the sound of a dot with a succeeding space. This fact suggested to my mind the idea of forming an alphabet which would consist entirely of dots and spaces, and thus lessen the liability to mistakes in transmitting messages by sound. I selected an article in a newspaper, ascertained how many times each letter occurred in it, and arranged them in tabular form, placing the letter which occurred most frequently first, thus:

Table showing letter frequencies: E.....154 times, R.....69 times, G.....25 times, V.....14, N.....112, L.....57, F.....24, K.....5, T.....108, C.....52, Y.....22, J.....3, A.....99, O.....52, P.....20, X.....1, I.....82, D.....51, B.....17, Q.....0, S.....69, H.....49, M.....17, Z.....0, U.....40, W.....16

The alphabet was then formed by denoting the first letter in the table by the simplest character possible—that is a single dot; the second one is denoted by two dots, the third one by dot, space and dot, thus:

Table showing letter representations: E - - - R - - - - G - - - - W - - - -, N - - - L - - - - F - - - - V - - - -, T - - - C - - - - Y - - - - K - - - -, A - - - O - - - - P - - - - J - - - -, I - - - D - - - - B - - - - X - - - -, S - - - H - - - - M - - - - Q - - - -, U - - - U - - - - W - - - - Z - - - -

Addison, Mich.

JOHN MILLIS.

Such an alphabet as the above would be very useful for amateur and private lines, and could be worked on a single stroke bell with considerable rapidity as well as on a MORSE sounder. Anybody will learn to read it by sound with very little difficulty. An alphabet on this principle is used in this way on some lines in and about Cincinnati and other western cities. The

alphabet may be arranged in the form of a table, for convenience of reference, as follows:

Table with 7 rows and 6 columns: 1 E T I L H P J, 2 N S C U B X, 3 A O G M Q, 4 R F W Z, 5 D V, 6 Y, 7 K

To transmit any given letter strike first the number of dots indicated by the figure in the left hand column, and then, after a brief pause, the number above it in the top line.

For rapid work, such as ordinary commercial telegraphing, the above alphabet would take more time and render the liability to error greater than it is at present. Most of the errors in telegraphing, other than those from bad copy, are due to the spaced letters, of which there are now but five in the MORSE alphabet, while in Mr. MILLIS's alphabet there are no less than nineteen. But when sent at a moderate rate of speed, the latter is much the easiest of the two to read by sound.—[ED. TELEGRAPHER.]

Literary.

THREE MONTHS ON THE CONTINENT.

WE have received from Mr. W. H. K. GODFREY, of Waterbury, Conn., a copy of a work printed by him for private circulation, entitled Three Months on the Continent. The author in the preface disavows the habit of so many persons who go abroad and then return and write a book. The matter contained in this little volume was originally a hastily written series of letters to the Waterbury American, and is now published in book form at the request of friends, and mainly for private circulation. It is, however, an interesting volume, and the author has no occasion to apologize for its publication, even if it were intended for general circulation.

Mr. GODFREY, in May last, was called to Europe by business engagements, and was absent for three months, during which time he visited a considerable portion of the Continent of Europe, and he evidently travelled with his eyes open, and his observations are recorded in a very clear and interesting manner. He has taken pains to collate a large amount of information in regard to the places visited and the objects seen, and the work will repay perusal.

Appended to the book is a description of a visit to the northwest region of our own country, made by Mr. GODFREY in 1873, and which also appeared originally in the American.

As a writer, Mr. GODFREY is clear and simple in his style, without the straining for effect which characterizes so many amateur literary contributors, and he succeeds admirably in placing before the reader the impressions which are caused by the scenes and places visited.

This little book possesses the more interest for us and for telegraphers generally, from the fact that we were for some years associated with the writer as operator on the old New York and Boston House telegraph line, a business which he retired from many years ago, still retaining however, his regard for the profession, and for those yet engaged in its active duties.

The book is very beautifully printed and bound, and is worthy a place in any library.

The Nondescript Edison Organ's Blackguardism.

WE have received several communications for publication indignantly responding to the filthy blackguardism and falsehoods of the nondescript EDISON organ in its attacks upon THE TELEGRAPHER, its publisher and contributors. Our space is too valuable to be occupied with these, and while we are grateful to our friends for their kindness, we would merely say that, as for the blackguardism, "it is characteristic of the publisher of the nondescript; and as for its

falsehoods in regard to the circulation, etc., of the paper, they are characteristic of his *confreeres* and principal assistants, contributors, and boon companions, especially the great professor of duplicity and quadruplicity, EDISON. They don't injure us or THE TELEGRAPHER, as their animus is well known, as also their falsity.

We have already occupied too much space in replying to the filth of this disreputable publication in regard to ourselves and the paper. We cannot hereafter condescend to notice any *personal* attacks from that source. So the publisher, the professor of duplicity and quadruplicity, etc., can fire away at us to their hearts' content, and to the full gratification of their low lived and contemptible natural instincts and character.

American Fire Alarm Telegraph.

THE merits and reliability of the American Fire Alarm Telegraph System, of which Messrs. GAMEWELL & Co. are the proprietors, are so generally known, and have been demonstrated so thoroughly by many years of practical use in nearly every city of any importance, and in many of the less important cities and villages in the country, that competition has proved practically useless. Even on the Pacific Coast none but GAMEWELL & Co.'s system meets with recognition. The Construction and Maintenance Co., of San Francisco, who are agents for this system, have just closed a contract for introducing it in the City of Portland, Oregon. The City of St. Louis, Mo., has also ordered an additional hundred boxes, in order to render its system more complete and effectual. Other important contracts are nearly closed, which are likely to make the present an active and profitable year for this enterprising firm.

A New Arrangement.

THE friends of Mr. JESSE H. BUNNELL, late of Philadelphia, will be pleased to learn that he has become connected in a practical business capacity with the enterprising firm of L. G. TILLOTSON & Co., of this city. Mr. BUNNELL is well known as a telegraph electrician and inventor of ability, and has heretofore invented, manufactured and introduced many new improvements in telegraph instruments, which have received the approbation of telegraphers generally and become recognized for their practical merit and beauty.

In connection with so extensive and well equipped an electrical establishment as that of Messrs. TILLOTSON & Co., he will have an excellent opportunity for the general introduction of his well known specialties, together with additional results of his experience and inventive skill and talent, which will no doubt prove satisfactory to their numerous patrons, as well as to his personal friends.

The Protection Life Insurance Co.

WE print a communication from Chicago in defence of the Protection Life Insurance Co., and in reply to a former communication over the signature of "One Who Knows." With this communication we close the discussion in the columns of THE TELEGRAPHER, as such a discussion is inferminable, and outside the province of this paper. The pressure upon our columns of legitimate telegraphic matter will not admit of our further departing from our rule of devoting the paper exclusively to telegraphic and electrical subjects.

Personals.

Mr. CHAS. E. BURROUGHS has returned to St. Louis with his bride and bears the affliction nobly.

Mr. JAS. A. MURRAY, of St. Louis, Mo., is off on a month's leave of absence, looking after his farming interests at Adrian, Michigan. James is the fortunate possessor of considerable property in the Badger State.

Messrs. A. E. VAN TINE, T. P. COOK and H. C. MAHONEY, of the Western Union Telegraph Co., St. Louis,

Mo., played a match game of billiards, French carom, at Mussey's billiard parlor, on the evening of the 6th instant, Mr. MAHONEY winning by four points. The game was very close and was watched with much interest by a large crowd of spectators, who frequently applauded when a fine or brilliant play was made. The game was 300 points, and averaged as follows: VAN TINE, 3-19-67; COOK, 4-16-1; MAHONEY, 4-2-7.

Mr. LESTER, of the New York duplex, in the Western Union office, and Mr. FRED McMULLAN, of the Gold and Stock, Chicago, Ill., who have been laid up with the measles, have recovered and are again attending to their duties.

Mr. "WARLEY" COOPER has general charge of the Baltimore and Ohio Railroad General Agent's office, near the corner of LaSalle and Washington streets, at Chicago, Ill., as telegraph operator.

It is rumored that Mr. O. M. STONE, of Chicago, Ill., has been promoted and gone to Baltimore, Md., for the B. & O. R. R. telegraph.

Mr. EMERY has been transferred from Chicago, Ill., A. & P. office to the Omaha, Neb., office, of the same company.

Mr. MAYNARD HUYCK has recently been appointed night manager of the Atlantic and Pacific Chicago office. This is an excellent appointment.

It is rumored that Mr. RUDD, the present day chief of the Atlantic and Pacific Chicago, Ill., office, will go to Detroit in a few days to arrange for the introduction of the automatic system on the lines of the company there. Mr. DAN SWRETT is prominently mentioned as Mr. RUDD's successor.

Mr. FORTIER, of the W. U. Chicago, Ill., day force, who has been confined to his room recently by a severe abscess in the mucous membrane of the mouth, has recovered and returned to duty.

The Telegraph.

District Telegraph Company in San Francisco, Cal.

ARTICLES of incorporation of the American District Telegraph Company were filed March 5th, in the office of the County Clerk, at San Francisco, Cal. The purpose for which the corporation is formed, are: "To erect, maintain and operate in the City and County of San Francisco telegraphic lines connecting the offices of the corporation with the residences, offices and houses occupied by its patrons, and with other points, for the purpose of transmitting fire alarm, police, messenger and other signals; to send and receive telegraphic messages; to maintain and operate telegraphic and signal systems other than its own; or to purchase, lease, or make other contracts concerning the same; to do a private fire alarm, police, delivery and general messenger business; and generally to do everything appertaining to the business of a city telegraph." The Directors are George S. Ladd, James Gamble, Monroe Greenwood, Stephen D. Field and James T. Boyd. The capital stock is \$125,000, divided into 1,250 shares of the par value of \$100 each. It is intended to establish in the city several districts, and to have a central office in each. The estimated length of the telegraph lines is one hundred miles. The amount of capital stock actually subscribed is \$50,000.

Proposed Legislation Compelling Telegraph Companies to put their Wires Underground.

ON Friday last, March 12th, Mr. Daly introduced in the Assembly at Albany a bill to abolish telegraph poles in cities in this State, and put the wires underground. The bill provides that within six months after the passage of the act in all cities of the State containing more than 200,000 inhabitants, telegraph companies shall be required to place their wires beneath the surface of the street or sidewalk; and the use of telegraph poles within the city limits shall cease, and the local authorities in charge of streets, avenues, and all public thoroughfares in such cities shall cause the same to be removed within the same period.

This bill would apply only to the cities of New York and Brooklyn. It is hardly probable that so important an act, and one involving so great a change and such large expenditure of money, will be passed at this session. It requires very careful consideration and perfection, in order not to work injustice to existing companies and interests. The time (six months) within which the change shall be effected, is too short, and in any such act should be extended to at least a year.

We think that it is desirable and inevitable that the wires should eventually go underground in large cities, but we do not wish to see any crude legislation on the subject that will subject telegraph interests to unnecessary inconvenience and expense.

Telegraphic Instrument Test.

A NUMBER of telegraphic instruments have been for some time in operation upon the Government lines between the Capitol and War Department, constructed and arranged upon a plan invented by Mr. Merritt Gally, of Rochester, N. Y. This test of the instruments is being made to allow the Government officials an opportunity to examine the system, which is also attracting considerable attention from parties interested in telegraphic matters. The important feature of this system arises from the fact that at a comparatively little expense, and but little change of instruments, a common telegraphic line, with instruments arranged for single transmission, as per the old Morse system, may be converted into a line for transmitting messages in both directions simultaneously, with ability to drop copy at either, or both of the messages at any or all of the way stations of the line, and that no divided currents are employed, and therefore double batteries and resistance coils are dispensed with. No accuracy is required in the balancing of batteries. In reference to this point, it may be said that the line above referred to has been operation with batteries over 25 per cent. out of balance, and still a margin of over 20 per cent. remained for the adjustment on instruments. The invention, therefore, seems to possess considerable merit, and it is believed that it may be made successful and safe to place even in the hands of the most ordinary operators. Preparations are being made to place Mr. Gally's invention not only on other of the Department lines but also on those of the signal service.

The Atlantic and Pacific and the Western Union Telegraph Companies, as well as others, are also looking into the merits of the invention, with a view to its adoption, should it prove in every way satisfactory.

The most ingenious and perhaps most important instruments exhibited by the inventor are those for automatic transmission, in which the objections urged against the automatic in common use seem to be entirely obviated. The invention is emphatically "automatic," a single operator with a keyboard not only preparing and accumulating the message matter for transmission, but at will transmitting any portion of the same to its proper destination, having perfect control of his entire work, even over a number of lines, while sitting at a single instrument. He also exhibits an instrument which requires no perforated message strip, but by means of a peculiar but simple mechanism accumulates message after message, held within the instrument until such time as the line can be secured, when, by the stroke of a single key, they are sent into the line complete.—*Washington (D. C.) Republican.*

Foreign Telegraphic Notes.

It is not often that a telegraph ship has to pass the ordeal of a military bombardment. This has happened to the Caroline, while laying a short cable on the Spanish coast. The Carlists have driven her from her work, and she has since been engaged in repairing the Lizard cable.

The Standing Committee of the Dominion House of Commons has reported the Marine Telegraph Bill, having first inserted a clause declaring that the Act does not affect any right of an existing company to compensation, if such a right there be, should that company be excluded from the shores of the Dominion.

A telegram from Copenhagen states that the Great Northern Telegraph Company has received a telegram from China, stating that the land line from Foochow to Amoy has been destroyed by persons hostile to the construction of telegraphs. The material was also destroyed or carried away, but the members of the telegraph staff remain unmolested.

Six wires, operated with Hughes' printing telegraph instruments, are now worked, connecting the London Stock Exchange and the Paris Bourse.

The Submarine Telegraph Company have declared a dividend for the six months ending December 31st, at the rate of 16½ per cent. per annum, less income tax, payable on and after March 1st.

The Telegraph Construction and Maintenance Company of London had constructed, at the close of 1873, 37,211 miles of telegraph cable, to which was added 5,973 miles laid in 1874.

The "Sydney Hall" recently left Messrs. Siemens' works at North Woolwich with a cable for the Montevideo and Brazilian Telegraph Company, and would soon be followed by the "Ambassador" with the cable manufactured to replace that lost in the La Plata.

The "Hooper" has successfully laid the cable between Trinidad and St. Croix, the insulation of which is reported to be superb.

The members of the telegraphic staff of Cuba and Puerto Rico have addressed a memorial to the Minister for Transmarine Affairs, complaining that vacancies

arising in those islands are supplied by telegraphists from Spain, and that thus they are deprived of the prospect for promotion.

Telegraphic and Electrical Brevities.

Messrs. FOOTE and RANDALL have sold to the Gold and Stock Telegraph Company all their patents for this country for printing telegraph inventions.

A fire at Gloucester, Mass., on Monday last, burned out the office of the Western Union Telegraph Co. at that place. The instruments were saved.

The dividend of two per cent. on the shares of the Western Union Telegraph Company, declared on the 10th inst., is payable April 15th to shareholders of record on the 20th of March, and the transfer books will be closed from the 20th inst. to April 16.

A Telegraph Manager in Trouble.

Mr. J. FRANK MORRISON, night manager of the Baltimore, Md., Western Union office, has been discharged, for allowing the contents of certain important despatches, which passed between the Presidents of the Erie and the Baltimore and Ohio Railroad Companies, to get into the possession of a reporter of the Baltimore Gazette, and which were published in that newspaper. He has also been prosecuted for misdemeanor, which, under the laws of Maryland, is punishable by imprisonment for three months, or a fine of \$500.

Proposed Legislative Reduction of Telegraph Tolls in Ohio.

IN the Lower House of the Ohio Legislature, on Wednesday last, the 17th inst., a bill was passed to regulate charges for telegraph messages, so as to reduce the present rates about twenty per cent.

Merited.

ON the 10th inst. the following message passed over the O. & C. Railroad telegraph line: "Portland, Feb. 10, 1875—All operators O. & C. R. R.—W. B. Rice has been appointed Chief Operator, vice J. J. Kenay, resigned. His instructions will be obeyed accordingly. Signed—C. D. Failing, Superintendent." Promotion was never more worthily bestowed or more honestly earned. Bill is among the best manipulators of chain lightning, and is the most popular operator on the line. 'Ror for Bill!—The Albany (Oregon) Register.

Obituary.

MR. ABEL GUYOT.

THE Journal Le Havre announces the death of this gentleman, which occurred at Havre on the 9th of February.

From this journal we learn he entered the telegraph service in the humblest capacity in 1853. At the time of his death he was Inspector, having by his merits advanced through all the lower grades to that position.

On account of his able management of the telegraphs, including the Semaphoric system, during the siege of Havre by the Prussians in 1872, he was decorated with the title of Chevalier of the Legion of Honor, a title that is rarely conferred, and only in acknowledgment of the most undoubted merit.

He was a gentleman of high attainments and a member of many of the societies of learning and science.

He was secretary of the Commission de Perfectionnement. This commission embraced some of the most eminent electricians of France, including Gauguin, Blavier, DuMoncel and others.

M. Guyot wrote the reports of this commission upon the various subjects of their investigation—a labor that could be performed by none except a thorough electrician.

It was his report upon batteries that brought to notice the Callaud and its subsequent adoption in France. The first Callaud pattern of the plates that came to this country was sent by him, and his report, which appeared in the Philosophical Journal, was the first introduction of that battery in this country.

Considering that he has always lived in France and been actively engaged since a lad in the telegraph service, he wrote and spoke in English with remarkable clearness, so much so that one would scarcely realize it was not his native tongue.

M. Guyot died of a lingering and painful internal malady, which defied the skill of the most eminent physicians. He was about 45 years of age.

He has been a subscriber to THE TELEGRAPHER for the past eight years.

The Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS—NEW YORK, March 10, 1875.

ASSESSMENT No. 73.

2, 4, 16, 21, 28, 38, 54, 59, 60, 64, 65, 67, 77, 80, 82, 86, 88, 90, 91, 95, 98, 113, 121, 131, 138, 145, 146, 157, 176, 177, 179, 181, 188, 201, 202, 208, 211, 215, 217, 220, 235, 245, 254, 269, 274, 276, 277, 280, 286, 289, 301, 302, 312, 342, 344, 346, 349, 351, 352, 367, 383, 385, 398, 402, 405, 413, 418, 434, 447, 464, 467, 509, 510, 532, 536, 545, 547, 549, 553, 554, 564, 576, 585, 587, 592, 594, 603, 604, 615, 622, 626, 655, 662, 663, 664, 665, 669, 672, 685, 715, 721, 731, 740, 742, 787, 799, 815, 821, 830, 832, 842, 843, 858, 859, 873, 880, 886, 912, 916, 917, 923, 932, 941, 978, 1000, 1013, 1023, 1024, 1038, 1039, 1054, 1104, 1126, 1127, 1143, 1144, 1147, 1154, 1169, 1173, 1175, 1178, 1182, 1183, 1199, 1208, 1232, 1252, 1255, 1260, 1267, 1276, 1282, 1298, 1300, 1304, 1306, 1325, 1329, 1333, 1345, 1357, 1364, 1365, 1368, 1394, 1402, 1403, 1404, 1409, 1410, 1440, 1484, 1485, 1489, 1516, 1517, 1518, 1532, 1550, 1554, 1555, 1568, 1569, 1571, 1572, 1590, 1593, 1594, 1615, 1619, 1623, 1630, 1635, 1652, 1658, 1684, 1687, 1688, 1695, 1708, 1709, 1710, 1713, 1724, 1735, 1743, 1790, 1811, 1812, 1815, 1831, 1839, 1840, 1841, 1852, 1862, 1894, 1901, 1906, 1919, 1943, 1944, 1950, 1965, 1970, 1986, 2019, 2021, 2026, 2027, 2028, 2030, 2038, 2040, 2041, 2044, 2049, 2057, 2066, 2069, 2072, 2082, 2084, 2097, 2119, 2135, 2138, 2150, 2162, 2164, 2172, 2174, 2178, 2180, 2183, 2184, 2185, 2199, 2203, 2204, 2205, 2206, 2212, 2213, 2214, 2221, 2228, 2229, 2233, 2234, 2240, 2241, 2242, 2243, 2244, 2254, 2257, 2259, 2273, 2287, 2289, 2309, 2310, 2312, 2322, 2330, 2331, 2333, 2334, 2335, 2336, 2337, 2338, 2340, 2341, 2342, 2343, 2344, 2345, 2347, 2350, 2354, 2355, 2356, 2360, 2379, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411.

ASSESSMENT No. 72.

New Patents.

For the week ended January 26, 1875, and bearing that date.

159,028—ELECTRO-MAGNETIC DENTAL TOOLS.—Geo. F. Green, Kalamazoo, Mich, assignor to Samuel S. White, Philadelphia, Pa. Filed January 13, 1871.

Drill driven through gearing from the spindle of the revolving electro-magnet, which is mounted on the same frame with the drill. Cam wheel upon drill serves to impart a reciprocating motion to a file, saw or burnisher, which may be attached to the frame.

- 1. The combination, substantially as hereinbefore set forth, of an electro-motor and a dental instrument, upon which it is mounted.
2. The combination, substantially as hereinbefore set forth, in a dental implement, of a permanent magnet, a rotating electro-magnet, and gearing actuated by the rotating magnet.
3. The combination, substantially as hereinbefore set forth, of a dental instrument with an electro-motor and a reversing button mounted thereon, for the purposes described.
4. The combination, substantially as hereinbefore set forth, of the magnets, the socketed spindle, and the casing.
5. The combination, substantially as hereinbefore set forth, with an electro-motor, its driving gearing and casing, all mounted on a common frame of a detachable tool holder, for the purposes described.
6. The combination, substantially as hereinbefore set forth, of a dental instrument, an electro-motor mounted thereon, and a reciprocating tool holder.
7. The combination, substantially as hereinbefore set forth,

of the horseshoe magnet, the rotating electro-magnet and the frame B, for the purposes described.

8. The combination, with the frame of a dental instrument, of the electro-motor, the spindle, the gear wheel and the cam wheel M, for imparting to the tool either a rotary or a reciprocating motion, substantially as set forth.

159,083—ELECTRICAL INDICATORS FOR LETTER BOXES.—Henry R. David, New York, N. Y. Filed Sept. 23, 1874.

The weight of the letter tips the balanced platform, thus closing the circuit to a distant electro-magnetic alarm.

The letter receptacle or box provided with a balanced platform, that is moved by the weight of a letter, in combination with a circuit closer and connectious to a distant alarm or indicating apparatus, substantially as set forth.

A NEW ARRANGEMENT. L. G. TILLOTSON & CO.

have much satisfaction in announcing that they have formed a connection with Mr. JESSE H. BUNNELL, late of Philadelphia.

In addition to their hitherto extensive Catalogue of Telegraphic and Electrical Goods, Mr. Bunnell's inventions—including his Giant Sounder, Champion Learner's Instruments, etc., etc.—will now be manufactured by this house and on sale at their warehouses.

Our new Catalogues will soon be ready for distribution, and we shall continue our discount of 20 per cent. from List Prices on all Telegraph Instruments, including Mr. Bunnell's specialties.

Estimates and equipments furnished promptly for Telegraph Lines of any length.

L. G. TILLOTSON & CO.,

8 Dey street, New York,

Corner Chestnut and South Fourth streets, Philadelphia.

Referring to the above notice, I beg to inform my friends and the telegraphic fraternity generally, that I have associated myself with the well known house of L. G. TILLOTSON & CO., who, with the most extensive and best appointed Telegraph Instrument Manufactory in America, will hereafter manufacture all articles of my invention. I will, as heretofore, give particular attention to the design and construction of special work in Instruments, Switches or large offices, etc., in which departments my experience as a practical telegrapher is always at the service of my friends. I respectfully solicit the patronage of my old customers in my new place.

JESSE H. BUNNELL,

Care L. G. Tillotson & Co., 8 Dey street, N. Y.

MANIFOLD PAPERS.

PREMIUM MANIFOLD PAPER and Transfer Paper (all colors), Agate and Steel Styluses, Palets, etc., for manifold writing. Also,

ROGERS' PRINTED MANIFOLD BOOKS.

Very useful to correspondents desiring to write quotations or other matters on printed forms, saving time and labor. Also,

TRAIN ORDER BOOKS,

Letter Books, Travelling Agents' and Physicians' Prescription Books, for duplicate writing, etc., etc. Large Stock, Great variety.

As Patentees and Manufacturers we can offer inducements to purchasers. Send for Circulars.

H. D. ROGERS & CO.,

22 West Fourth street,

CINCINNATI, OHIO.

Western Agents for L. G. TILLOTSON & Co., New York,

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET or to

L. G. TILLOTSON & CO.,

8 Dey street, sole Agents.

THE KENOSHA INSULATOR CO.

**TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS**

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellent of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO.,

THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES, prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

GEOERGE H. BLISS & CO.,

41 Third Avenue, Chicago, Ill.

CINCINNATI, O.,

Elm St., cor. 5th.

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS—COMBINATION SETS; BOX and POCKET RELAYS.

PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, wire connections above the table.

REGISTERS, with SPRINGS or WEIGHT.

CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.

BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANTFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

THE FAVORITE.

Price, \$5.00.

Having reduced the price of these standard instruments, we are now prepared to furnish them to amateurs, students, academies, &c., with battery, connecting wires, chemicals, and one copy of "Telegraphy Made Easy," for \$6.50. Will be sent by Express, C. O. D.

Just published, "TELEGRAPHY MADE EASY." Sent to any address on receipt of 25 cents.

Address,

ISAAC HALL,

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The **Electro-Mechanical Gong Striker**,
for hose and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

**FIRE ALARM TELEGRAPH
IN THE WORLD.**

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

**FIRE ALARM
AND
POLICE TELEGRAPHS,**

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the
original *FARMER & CHANNING PATENTS*, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of
the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

**EFFICIENCY,
RELIABILITY and
ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, **THREE
CAN BE NO QUESTION.**

*The cooperation of TELEGRAPHERS in securing its in-
troduction into their localities is cordially invited, and
their efforts will be duly appreciated and
compensated.*

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These Instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY,
with Patent Platina Connection, introduced by us eight years
since; also, the ALPHABETICAL OR DIAL TELEGRAPH,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that
will work practically with a single DANIELL cell, a **BATTERY**
that does not require to be taken down but once a year, and the
very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter
and description, is now ready for distribution.

Original Articles.

The Conductivity and Insulation of Telegraph Lines.

BY DAVID BROOKS.

It is often supposed the size of the wire conductor or its conductivity is a measure of its working capacity. When the insulation is unvarying or a constant the strength of current is approximately in proportion to the size of the wire; and, on the other hand, when the conductivity is a constant, the strength of current is increased by increasing the insulation.

The working capacity of a circuit is measured more by the margin or difference between the conductor and its insulation, both being considered as conductors.

Strength of current or strength of signals is not so desirable as action that is free from interference or counteracting effects. In a mechanical sense, force is less desirable than celerity and regularity of movement, conditions incompatible with a low degree of insulation.

In practice the working capacity of a circuit is dependent more upon its degree of insulation than the low resistance of its conductor. For example, a circuit of one hundred miles, with a No. 5 gauge wire for conductor, with poor insulation, has not the capacity of a No. 11 wire with perfect insulation, or the large wire in hard rain has not the capacity of the small wire in dry, cold weather, both being insulated with the common insulators of the country. The margin between the insulation and the conductor in the conditions of the smaller wire is immensely greater than in the conditions with the larger wire.

Leaving out of question the article manufactured by the writer, there is a very great difference in the insulators in use throughout the world as regards their insulating properties in unfavorable weather. In 1867, while on a tour in Europe, standard sets of insulators were procured as specimens from eleven nationalities. In England four sets were obtained, representing the kinds in use by the telegraph companies. During the past eight years these insulators have been used for comparative galvanometrical tests, and the records preserved. Highest among these stands the Prussian, as manufactured in Paris of French porcelain, and the lowest are the English. The highest English is lower than the Swiss glass insulator, which is the lowest of those used on the continent. The best English is more than twenty times below the Prussian. That the standard of insulation in England is very low there is other evidence than these recorded measurements.

Mr. Culley, in his Hand-Book, fifth edition, gives the insulation resistance of two circuits, "better situated as regards insulation," Belfast to Dublin, as 131,300 units each per mile in rain and "working well." Never have I seen so poor an insulation in this country, except for short portions in cities. With the insulators used in England it would appear almost impossible to avoid such a state of affairs in rain. To lessen these difficulties they are obliged to use very large wire conductors—No. 4, Birmingham gauge, on all the main circuits, being employed, and, in some instances, No. 3; weight per mile, 775 and 909 pounds, respectively.

Another means is the use of ground wires upon the posts, to carry the leaking current to the earth and prevent "confusion of signals."

Further, the use of a separate and independent battery for each circuit. In the London office alone there were, in 1873, forty thousand cells employed.

With such an amount of leakage they must necessarily operate on the open circuit system, and this involves the use of a battery wherever transmission is performed. This system has some advantages, but is not economical.

In France and Prussia a different state of affairs exists. Reference is made to these nationalities because their circuits are longer, consequent upon covering a larger territory.

In these countries the large conductors are five millimetres in diameter. The weight of these wires are about 525 pounds per mile, and are called the international lines, because they are worked direct from

capital to capital, distances more than twice the length of the longer circuits in England.

Upon these circuits the Hughes printer is employed. The capacity of these instruments is about twice that of the Morse, or is so rated by the officials of England, France, Prussia and Belgium. Two operators perform with these instruments with one wire as much as four operators in this country with one wire, using the double transmission system.

For the ordinary circuits in France a wire of three millimetres is used; weight, per mile, about two hundred pounds.

In Prussia the ordinary lines are two and a half millimetres in diameter; weight, about 150 pounds.

The officials of these countries, Prussia and France, state they have no difficulty in operating these wires in rain with the Hughes printer at its full speed and capacity. These instruments are used on all the important circuits. In the main office, Paris, seventy-five of these instruments are employed. In London fifteen, and those on the shortest circuits. The reason given for not using them on the longer circuits in England was that they were unable to operate them in unfavorable weather.

The minimum price of a despatch in France and Prussia is about half a franc. It was raised temporarily in France as a means of revenue to provide for the debt incurred with the late war with Prussia. In England the minimum is one shilling, or about two and a half times greater.

There is a commendable ambition in each of these countries to bring the use of the Telegraph within the means of all the people—to cheapen the rates. Can any one give a reason why it is so much more expensive in England, except on account of the poor insulation in that country? The wires in England are more than twice as large as those of the former countries; they cost fully double; it requires twice as many wires and operators to perform the same amount of service. In each of those countries the Telegraphs are maintained as a public convenience and not as a source of revenue; but if we are to believe the statements circulated in this country, the administration of the Telegraph in Great Britain is attended with a very heavy deficit, notwithstanding these greater rates charged for transmission.

In an article recently published by Mr. Culley, Chief Engineer of the British Telegraphs, he refers to the use of wires of large diameter as follows:

"The most decided effect of substituting wire of $\frac{3}{100}$ th of an inch for that of $\frac{1}{100}$ th of an inch (the latter being more extensively used) is the absence of the inconveniences resulting from defective insulation. This advantage has been actually demonstrated many times in practice. Comparing two wires put up between the same cities and equally well insulated, it has been discovered that by means of the large diameter wire the signals are reproduced distinctly, and that the communication is perfect, while in using the wire of small diameter the transmission is more difficult on account of the weakness of the current. The correctness of Ohm's law has been thoroughly confirmed by these experiences."

Ohm's law may be thoroughly confirmed by these experiences, but it is also a more striking demonstration of the expense of poor insulation. $\frac{3}{100}$ th of an inch diameter galvanized wire weighs 800 pounds per mile; a $\frac{1}{100}$ th of an inch diameter wire about 400, or half as much as the former.

In the same paper he states "the longest circuits are from London to Cork, and from London to Aberdeen, which is from four hundred and thirty to five hundred and sixty miles respectively."

The longest circuit of this country, from San Francisco to Ogden, one thousand miles, has a No. 9 wire, but portions running over the mountains are of No. 11 steel. So far as resistance of conductors are concerned, the advantages are in favor of the London Aberdeen line, in the proportion probably of 5 to 1. In England about twenty posts are used to the mile. On the San Francisco Ogden line, twenty-five; say there are twice as many insulators on the latter; as regards number of insulators, this circumstance is in favor of the English line in the proportion of 2 to 1.

We now come to the quality of the insulation. Mr. Culley says on the long circuits the double bell insulator is used. In 1868 a set of these double bells, with Ebonite covered stalks, were placed side by side for galvanometrical tests and comparison with a set of the insulators taken from those furnished for the San Francisco Ogden line. The comparative tests in rain in favor of the latter for the past six years are more than 1,000 to 1. Nor has this San Francisco Ogden circuit during this time been in the least affected by rain. It is in the direct line from San Francisco to New York, and commercially one of the most important circuits in the country.

The defective character of the insulation in England is admitted by every person connected with the Telegraph, but the cause is often stated to be their peculiar climate; very humid and smoky. The rains are very frequent, but they are light rains, the air is seldom

fully saturated, and the rains are of short duration compared to the rain storms of this country. Ordinary insulators in this country in rain are affected proportionately as the air becomes charged with moisture. In the winter months this often occurs, and is notably the case when the ground is covered with melting snow, and the rain is from the South. North-east storms begin with the wind from the Northeast. Usually the wind changes to the East and South and finally clears up with the wind from West or Northwest. During the portion of the storm when the wind is from the Southeast and South, the air is charged to its full capacity, or total saturation. It is during this time that the ordinary glass insulator is most affected. When the storm is accompanied by the wind changing in the other direction, that is from Northeast to North, and finally to Northwest, then the insulation is much less affected, because the atmosphere is seldom charged to over 80 per cent. of full saturation.

With the English insulator the case is different. Five minutes of moderate rain brings it down to its minimum of resistance, a point at which it remains until the weather clears.

In the same paper referred to, of Mr. Culley, he states about 20 per cent. more can be transmitted automatically over a $\frac{3}{100}$ inch diameter wire than a $\frac{1}{100}$ on lines 300 miles in length. (On a line of that length, but of less conductivity than a $\frac{1}{100}$ inch wire in this country and the better insulation, four times as much is transmitted as on the larger wire automatically in England.)

All the later and improved methods and processes, such as automatic and double transmission, require the better degree of insulation, and fail of accomplishing their full measure, more from defects in this particular than any other cause.

The English labor under the disadvantage of a smoky atmosphere, and in that respect have more to contend with than we do. On the other hand, in cities their wires are under ground and out of the influence of such causes. The Belfast and Dublin lines in Ireland are less affected by such causes than the majority of lines in this country. In this country the insulation in the cities is most affected. In Philadelphia the atmosphere is quite clear for a city, especially so when we take into consideration the large extent of its manufactures. The reason of this is the coal used here is the anthracite. It gives very little smoke, but a gas arises from its combustion that produces its effects upon insulators. In this locality an ordinary glass insulator in rain shows a resistance of from four to six million units when measured with a battery of ten cells. In the country, outside of the city, the same insulators in corresponding weather will show a resistance of from sixty to one hundred millions; its insulation appears at least tenfold better. In the city in this locality the glass insulators are clean from exposure to rain; but if we take an insulator from the neighborhood of the gas works—one that is coated with soot—its resistance in rain is less than a million. While such an insulator is much worse than one that is apparently clean, yet the latter are seriously affected. The gases from combustion unite with the moisture of the atmosphere and form an acid solution, and it is a solution of this nature upon the insulator which conducts in an immense degree compared to the pure rain of the country. The great difference in the resistance of the pure rain water of the country and that collected in the cities is a measure of the impurities contained in the latter. These impurities, in some instances, increase its conductivity hundreds of times.

In Pittsburgh two miles of line, about sixty common glass insulators, in rain, gave an insulation resistance of less than a million units per insulator. These insulators were up not two years and were coated with soot.

The patent insulator is not affected by these conditions. It is as repellent of acids as of moisture. It can be used to immense advantage for the insulation of wires in cities. To simply insulate the wires in the cities in this country will raise the total insulation of the lines a hundred per cent. or more.

It is about seven years since the present insulator was introduced. There have been more than a hundred certificates given of its performance, and not a single complaint of its insulating qualities. But its merits are not rested upon the opinions of those who have used them. If they do not fully and completely protect the good working of lines from the effects of humidity, rain, smoke, &c., in any climate or country, there will be no charge for their use.

Scene

on St. Louis and Cincinnati Duplex, on evening of March 16th, "MC," at "A" and "NO" at "C":
C. Calling—"a a a."
A. Answer—"I I I a."
C. Keeps on calling.
A. Continuous answering, "I I I a."
C. Finally splutters "Oh! come over on this side; there is but one man here."

Important Decisions of the Commissioner of Patents.

In the matter of the applications of Thomas A. Edison, assignee, &c., No. 94, 95, 96, 97, 98, 99 and 100, for Letters Patent for alleged "Improvements in Duplex Telegraphs," filed September 1, 1874.

(The Commissioner recites the history of the applications, assignments, &c.)

THE issue before the Commissioner is to whom shall the patents be granted? In determining this question the Commissioner must be guided entirely by the record. He has not the authority of a court to go outside the record to consider evidence as to outstanding equities. The only question he can decide is, Who on the record possesses the legal title to the inventions? He must issue the patents accordingly, if the requirements of the office in such cases provided have been complied with.

In the investigation of this matter, I have come to the conclusion that it is not necessary for the Commissioner to determine whether the assignment from Edison to Harrington, dated April 4, 1871, covers these inventions or not. However this question may be determined finally, there is no evidence that the inventions described in the applications were in existence at the time that this instrument was executed. This is not even claimed by Harrington; he has simply said there is no evidence, they were not then in existence.

But in a court of equity one of the first requirements made of Harrington would be to prove affirmatively that Edison had perfected these inventions when he executed the assignment of April 4, 1871. In the absence of such proof the probabilities must guide. These are all against the existence of the inventions at the time. The applications were filed more than three years after the date of the assignment. The first record made by Edison, in the Patent Office, in any way connected with these inventions, was sometime in 1873, when he filed his first caveat relating to duplex telegraphy. It is also worthy of notice in this connection that Edison is a very fertile inventor, as the great number of patents obtained by him within the last few years conclusively shows. These applications extend a series, commenced not long ago, to the number of one hundred. It must be remembered, too, that there has been great activity in inventions relating to telegraphy for a number of years past, and sharp competition has existed between inventors of various improvements. It is incredible, under these circumstances, that an inventor like Edison would allow such valuable improvements to lie three or four years after completion without applying for patents. In the absence of positive evidence on this point, I must follow the presumption, which is so strong in this instance as to amount almost to a certainty, that the inventions described in these applications were not *in esse* when the agreement was made between Edison and Harrington. If, then, this deed included these inventions in unmistakable terms, no legal title in them passed thereby to Harrington; the instrument can have the force of an executory contract only. *Gibson vs. Cook*, 2 Blatchf., 144; *Curtis on Patents*, 4th ed., Sec. 183, n. 2, p. 206.

The legal title to these inventions, then, was entirely in Edison at the time he executed the assignment to Prescott, and he alone had the right to convey any interest in the inventions or patents granted therefor. This right he exercised with all due formality, when, in 1874, he conveyed an entire half interest in the inventions to Prescott. Whether this was done in violation of an outstanding contract is not material to the present discussion. Prescott became the legal assignee of Edison, and, upon the execution of the assignment of 1874, Edison and Prescott became the possessors of the legal title to the entire inventions.

Edison is now estopped from contradicting his deed of assignment to Prescott. It is hardly necessary to cite authorities on this point, and I will only refer to *Reusselaer vs. Kerney, et al.*, 11th How., 297, and *Bowman vs. Taylor*, 1 Webster's Patent Cases, 292. It may be alleged, however, that the same doctrine should be applied to the deed of Edison to Harrington, of 1871, and that then the rule that an "estoppel against an estoppel setteth the matter at large" would operate. But an estoppel arises alone upon a recital of a particular fact. "There is," said Lord Tenterden, delivering the judgment of the court in *Doe D. Jeffreys vs. Bucknell*, 2 B. and ad. 278, "a want of that certainty of allegation which is necessary to make it (the deed) an estoppel." Lord Holt lays it down, in *Salby vs. Kidley*, 1 Show., 59, that *general recital* is not an estoppel, though recital of a particular fact is. *Doe vs. Oliver*, 2 Smith's Leading Cases, Howe and Wallace's notes, 7th ed., 610.

The deed in question contains no recital or description whatever of any particular invention or patent then in existence. It is vague in its terms and executory in its nature; and for the latter reason, as well

as for its uncertainty, an estoppel cannot be considered as arising thereupon. *Doe vs. Oliver, ibid.*, 620.

The discussion of this case might rest here, I believe, in the perfect certainty that if the necessary formalities have been observed the Commissioner must necessarily order the patents to issue to Edison and Prescott. But I am still more strongly confirmed in this opinion by the fact, as I believe, that Prescott is the owner of some interest in these inventions, whatever effect may be given to the Harrington contract. If a Court of Equity shall hereafter carve out a two thirds interest in the patents granted, and give it to Harrington, the deed of Edison to Prescott will still take effect upon the lesser interest if the grantee chooses to enforce it. 1 *Suydam on Vendors*, 347; *Brown vs. Jackson*, 3 *Wheaton*, 453; *Waters vs. Travis*, 9 *Johns.*, 450; *Turnbull et al. vs. Weir Plough Co.*, 7 *O. G.*, 173.

Whether in this contingency Prescott can enforce the contract to the full extent of the one third interest remaining in Edison, or whether the terms and conditions of the grant were such that it can be enforced only to the extent of one half of Edison's remaining interest, is not material to this discussion. Upon the record before me Prescott, in my opinion, has an indefeasible right to some interest in the inventions described in these applications. This fact makes the necessity of joining Prescott with Edison as the sole possessors of the legal title to the inventions still stronger.

The only question left is to determine whether the assignment to Prescott is in such form as to authorize the Commissioner to issue the patents to Edison and Prescott, as assignees of the former. On this point it is only necessary to say that the assignment is in the very words of the form which has been sent out by the Patent Office for years past in its yearly official edition of Rules of Practice. The practice has been invariable for years past to issue patents to the assignees whenever assignments in this form are put on record prior to the issue. I see no reason whatever for departing from this rule in this instance. In the absence of any decision by a higher tribunal invalidating patents thus granted, I think the Commissioner should follow the practice which, so far as my knowledge extends, has never been questioned heretofore.

The applications are remanded to the principal examiner, and the patents will issue to Edison and Prescott, as assignees of Edison.

March 20, 1875.

JNO. M. THACHER,
Commissioner of Patents.

The Female Operator Discussion Useless and Unprofitable.

TO THE EDITOR OF THE TELEGRAPHER.

OF all "weary, stale, flat and unprofitable" discussions, that on "Why Women should not be Operators" seems to me the most senseless. I commend to "Nihil Nameless" the example of Mrs. Partington attempting to drive back with her mop the surging flood of the Atlantic ocean from her kitchen floor. Lady operators are an established fact, and whatever may be our views of the "sphere of woman," we may as well accept the situation, and drop that subject. I say let the dear creatures have all they can do of the work, and all they can get of the pay. The former will be large enough, and the latter small enough, I'll warrant.

The present condition of our social system demands more opportunities for women. Marriage, as an institution, is, according to statistics, on the decline, and women *must* live. Already they are pushing their way into nearly every trade and profession—law, medicine, book-keeping, and the coarser trades—even agriculture (see a late number of the *Atlantic Monthly*, January, I believe), and why not telegraphy? It is a neat occupation, and eminently feminine. What can be more pleasing than to see a corps of pretty girls industriously at work at their several desks? One has, perhaps, a slight frown on her brow—"Oh, such horrid writing." Another is laughing at some remark that fellow at A—has made. A third has just told some one to "wait," and, with her key open, proceeds to cut up and demolish an orange. Another has a "tidy" nearly completed. Still another is writing a note to some one in the "gentlemen's room," and so on, and yet "Nihil" wants to make out that the darlings are soiling their spotless purity by this occupation! "Nihil's" talk about "half savage railroad men" is all bosh, and he knows it. Women need not necessarily emi-

grate to Texas or the frontiers of civilization to practice the profession. And as for railroad men in the Middle, and Eastern, and many Western States, a large experience with them has taught me that, dirty, rough and uncultivated as they are, a more generous, good-hearted class of men does not breathe, nor a class who have more respect for their mothers, wives and sisters, or would quicker resent and punish insult or ill treatment offered to a woman in their presence. That is the stuff our Northern and Eastern railroad men are made of, and "Nihil" offers a gratuitous insult to a class of men who are intimately connected with the telegraph department of most of the railroads in the land.

Then, too, could anything be more ridiculous than his argument that because contact with pitch is defiling, therefore contact of human beings with each other in social intercourse must be so? Yet that is precisely his argument against "Aliquae's" remark, "contact with others is refining." But it would require too much space to point out all his misrepresentations of correspondents from whom he quotes. One more instance. He quotes from "Jo," "Young ladies, members of large families, do not care to stay at home wasting their lives in unproductive idleness"—and proceeds to ask, "Why need they be idle?" The meaning of "Jo" is too obvious to require explanation, yet "Nihil" deliberately ignores it, and gives the words "unproductive idleness" a meaning to suit his own narrow argument. True young ladies need not be idle in the common meaning of the word. There is always house work, or fancy work, or sewing to occupy her time, but these occupations contribute little if anything to the cost of her maintenance, which must come from the labor of the father or brother. Feeling that she is a burden to him, she longs for some means to earn her own livelihood, and until that means is possessed she feels that her life is being wasted in unproductive idleness.

"Nihil's" arguments throughout are most illogical and unreasonable. Either his ignorance is most profound or his willful misunderstanding of the obvious meaning of "Aliquae," "Jo," and others, amounts almost to malice.

"Nihil" goes out of his way to exalt the Puritan character. This was quite unnecessary, as all that could be said in favor of his and my ancestors has been said by far abler writers, and the fact remains that those ancestors were a cold, austere, and bigoted people, with little charity for the erring, and none for those who differed in religious belief. They sacrificed the love which should bind the family together to a harsh sense of religious duty—bringing up their children in fear instead of love. Their God was a God of wrath, not of love. They could baulk men like Roger Williams, and those who will read Hawthorne's "Scarlet Letter" will get an idea of their treatment of the weak and sinful. Is it to be wondered at that it is among the descendants of that race, in that same New England, that the opposite extreme of liberalism and infidelity has its strongest seat in our day?

But to return to "Nihil." Until he can bring forward better arguments against femininity in telegraphy he will do well to hold his peace.

JOHN STERLING.

"Nihil Nameless" Annihilated.

TORONTO, March 8.

TO THE EDITOR OF THE TELEGRAPHER.

"Now that my action is entered and known to the whole world," is the way Mrs. Quickly is represented as putting it on a certain occasion when she brought an action against Sir John Falstaff. "Nihil Nameless" seems to take the same modest view of his own importance; fondly imagines that the whole telegraphic world is looking at his doings and reading his sayings, lost in wondering admiration of his sublime sentiments and brilliant way of expressing them. The delusion is manifest. The whole world had more interesting subjects than Mrs. Quickly and her "action" to think about in those days; and the telegraphic world of to-day has a great many more interesting subjects than even such a wonderful literary phenomenon as Nihil to devote its attention to. Because three lady operators flattered the dear youth's vanity by taking the trouble to show the falsity of his assertion that telegraphy is an unsuitable occupation for women, he straightway takes credit to himself for having "uncorked the vials of the fair," and brought down upon his head the accumulated wrath of all the lady operators in the land. If he imagines there are only three lady operators in the land, surely his sad forebodings about the weaker sex monopolizing the profession are rather premature and uncalled for. Inspired by the grandeur of his theme, he waxes eloquent and even poetical; informs us that he hears the mutterings of thunder in the heavens; the sky is overcast, the lurid lightnings are flashing, and the tempest is upon him. It may be on account of my stupidity in not knowing how to adjust, so as to get a proper view of the terrible scene, but for the life of me, I can't see where the tempest comes in. The lurid lightning

must surely be a freak of his too vivid imagination—the muttering of thunder must be the echo of that last domestic storm he had with Mrs. Nihil, who perhaps learned the “black art” of sending and receiving messages before making a conquest of him, and in consequence is “sadly deficient in *culinary* culture and economy.” So far as my observation goes, his “mild tort” was answered by toots equally mild, though perhaps more effective; am inclined to think that the ladies are not quite so lavish in their expenditure of “accumulated wrath” as to pour it out on such trivial occasions; don’t suppose they would have taken the slightest notice of his feeble war whoop but for the fact of its coming out in such a highly respectable paper as THE TELEGRAPHER. The conceit of some of the “Lords of Creation” is simply marvellous. But what a grand thing imagination must be when it enables its happy possessor to hear “terrific blasts” and “clashing of arms,” and “notes of battle borne on air,” which are quite inaudible to ordinary ears. A terribly brave man must Nihil be, and of a warlike turn of mind, for although perfectly well aware that “rivers of ink will flow” (original idea, that), and though “thousands of innocent ‘coming men’ will lose their scalps,” he valiantly declares his intention of speaking his opinion before retiring; and he proceeds to do so in a way that, in his own estimation at least, cannot fail to convince his fair opponents. It might if the simple fact of his making an assertion proved it to be true and infallible. But dogmatic assertion is not always conclusive reasoning; making a simple declaration is not always establishing a fact; therefore, I may be pardoned for saying I fail to see the force of his arguments, which strike me as being weak and illogical. (I know Nihil will admire that last sentence, because it is built in his favorite style of literary architecture—on exactly the same plan as his own pet sentence, “change is not always improvement,” &c). He goes to work systematically, and, metaphorically speaking, takes up each of his fair victims in turn, and gives her “a good setting down;” but I’ve no doubt they will survive it, and show their ability to defend themselves (if they think it worth while, that is), and come out in the winning side after all, in spite of the redoubtable Nihil.

Last winter we had a man from Cincinnati working here, whose proud boast it was that he could do more loafing in less time than any other man in the office, and he proved his right to the claim so effectually that he soon got “marching orders” for a more genial clime, where the natives would be better able to appreciate his peculiar talents than we industrious Canadians are. His fellow citizen, “Nihil Nameless,” can, without fear of contradiction, claim the equally proud distinction of being able to use more and bigger words to express fewer and smaller ideas than any other aspirant to literary fame whose letters have graced the columns of THE TELEGRAPHER. Although his best article is so terribly long, he does not advance any *new* arguments, but reiterates and enlarges upon his old ones with an ingenuity and perseverance worthy of more general appreciation.

My friendly remarks are made from a very laudable motive—in the cause of humanity. If Nihil’s last outburst were passed over in silent contempt he would probably mistake indifference for conviction, and in consequence, grow too conceited to live, or, at least, to see his fellow operatives live comfortably with him.

He pathetically complains that he has been so unfortunate as to incur (undeservedly, of course) the displeasure of both his own and the opposite sex. Well, I feel for him, but hope he will be able to find consolation in the thought that genius always thrives best when trampled upon, and if he continues to espouse such a very unpopular cause, his genius will be quite likely to get enough of the necessary stimulant to bring it to a glorious development. As he himself once informed us, ’tis impossible to crush the irrepressible “Nihil Nameless!” DOR.

After the Fire.—Telegraphic Notes and Personal.—A New Defect in the Quadruplex.

ALBANY, March 23.

TO THE EDITOR OF THE TELEGRAPHER.

OUR new quarters in the Exchange building are very comfortable and convenient; any further description of them is hardly necessary, as everything is arranged temporarily, in anticipation of another transfer, which it is hoped will take place on or before the 1st of June.

The Exchange is to be demolished in the course of a few months, to furnish a site for the new Government building. It is rumored that another story is to be added to the Museum building, which will probably be a French roof of corrugated iron, surmounted by a tower; this is, however, mostly conjecture, nothing definite having been decided upon as yet.

The A. and P. are to occupy the first and third floors of No. 444 Broadway, two doors above the old W. U. office, as soon as repairs are completed.

A receiving office has been opened by the W. U. in the ladies’ waiting room of the N. Y. C. and H. R. R. depot, the operating being done in “Da” office; to accommodate this business three loops have been built connecting the depot with the main office.

The river at this point is in unusually bad condition, and lively times are anticipated when the spring freshet takes place. The ice is from two to three feet thick, and the cables, carrying twenty-seven working wires, were frozen solid in the ice at the shore ends, but have been cleared as much as possible by cutting it away; nevertheless, serious results are feared in case of a sudden break up.

Mr. Fred. H. Lawrence, an old Albany telegrapher, and late Superintendent of Telegraph for the Leavenworth, Lawrence and Galveston Railroad, has returned to Albany, and has been appointed chief clerk to S. E. Mayo, General Ticket Agent of the A. and S. and R. and S. divisions of the Del. and Hud. Canal Co.

Mr. H. S. Morse, another old telegrapher, formerly Superintendent of Telegraph for the Albany and Susquehanna Railroad, but more lately Superintendent of the above road, has resigned, and is succeeded by Mr. C. D. Hammond, late train despatcher for the R. and S. Railroad, at Troy.

Mr. Joseph Angell has been appointed Superintendent of Telegraph for the Del. and Hud. C. Co., with headquarters at Albany; division extending from Binghamton to Montreal.

Daly’s bill, introduced in the Assembly some time since, provides that “within two months after the passage of this Act in all cities of the State containing more than 200,000 inhabitants, telegraph companies shall be required to commence the work of placing their wires beneath the surface of the street,” etc., the work to be finished and poles entirely removed “on or before the 1st day of January, 1877,” and to be under the supervision of the city officials.

I unintentionally omitted to mention in my last the valuable services rendered by our popular manager, Mr. J. H. Rugg, on the occasion of the late fire. The following, from the *Sunday Press*, is a well merited compliment:

“Manager Rugg, who was appointed to his position but a short time since, had his executive abilities put to the test very promptly by the late fire, and he has proven that he was the right man put in the right place. He restored the office to working order within a few hours after its total destruction, and now he has constructed an entire new office, embracing all the multitudinous paraphernalia of a telegraph office. He has in the Exchange building a suite of rooms which are as capable of service as were those in the Museum building, and those were the accumulations of years. Such energy is worthy of special note.”

During the week succeeding the fire Chief Engineer McQuade and Justice Clute were engaged in a searching investigation as to its origin. Several witnesses were examined in connection with the case, but nothing was elicited which would justify a suspicion of its being the work of an incendiary. Notwithstanding this fact, Chief McQuade, Assistant Clute and the Fire Commissioners feel convinced, from the surrounding circumstances, that the premises were set on fire. Being unable to go further, and having nothing upon which to base even a suspicion, a further investigation was abandoned.

Another serious defect in the quadruplex was discovered here yesterday. It was found impossible to work it up to its full capacity while the Callaud battery was frozen up solid. I offer this for the benefit of those who are so eagerly watching for defects, and who are so blind to anything of value in the system.

While one party are perhaps over estimating the value of the system, the other are running quite to the other extreme. It seems strange that there remains no one disinterested enough to treat the subject fairly and squarely. I have yet to see an article on this subject which does not bear on its face the stamp of prejudice toward one side or the other.

DOUBLE SIX.

The Proper Points for Lightning Rods.

CHILLICOTHE, O., March 17.

TO THE EDITOR OF THE TELEGRAPHER.

IN your issue of March 13th, appears a communication from “Occasional,” of Chicago, who, while speaking of the late meeting of “The American Electrical Society,” takes occasion to comment upon my article, read before the society, and in doing so, seems to have unintentionally misrepresented certain parts of the article. He quotes me as saying, “That instead of fine pointed rods, the tops of the rods should be blunt, and present more attraction for the electrical cloud than the building, by being placed a great deal farther above the building than at present arranged.” I said nothing of the kind. On page 4 the following passage occurs: “Blunt points might be used more than sharp ones, but I think a rod extending three or four feet above a building, being a good conductor itself, and having a

perfect connection with the earth, would not be fused off until it was no higher than the building, while the present generation existed.” This is all I said about rods being extended above buildings. I did not say that rods should end in blunt points to present greater attraction, etc. I think it makes very little difference whether the points are blunt or sharp. That is not a vital point. Sharp points offer greater attraction than blunt ones. I don’t think a fine point is necessary, and consequently don’t believe in paying two or three dollars apiece for them when blunt ones are just as good. When a building is charged by induction, the shape of the points of the rods does not enter into the consideration. It is only when a direct discharge occurs that the points become matters of importance. Fine points will collect a greater amount of electricity from the atmosphere than blunt points. But the point I made was, that if the rods were sufficient conductors, and had perfect connections with the earth, electrical discharges would follow them to the earth, because electricity follows the best conductors. If the rods are better conductors than the buildings themselves, they (the rods) will get the greater part of the discharge, regardless of the form or shape of their points. If the rods are not better conductors, they had better be removed.

I did not entirely overlook the point noticed by Mr. Summers, although I did not give it the mention it deserves. On page 16, the following occurs:

“It may be safely accepted as absolutely certain, that any building having rods, such as ordinarily used, extending from its projecting points to the earth, and there connected with gas or water pipes; also, being in connection with metallic roofs, spouting, etc., if there be any, is perfectly safe from the effects of lightning.” I. N. MILLER.

A Gay and Festive Telegrapher.

TO THE EDITOR OF THE TELEGRAPHER.

I’VE been thinking, as how idle better write something for your paper. Em. say’s as bow she know’s it would please you and the “Boys” to hear from me. Em. helps me to spell when she’s not busy. She says that some times I leave out *letters*. she’s “8” today and can’t help me. So your kind and indulgent readers must excuse me if I make any mistakes. I reckon, as how ime not much of an “Operator” kause I cant do “Gramar and Algebra” and it troubles me a little to *write free* on account of a *Wart* on my Thumb, where it *wiggles* when the Pen’s agoin. I read THE TELEGRAPHER, and felt bad when I seen that “piece” about “Grammar and Algebra.” Kause ide just about made up my mind to be a *star*. My name is—hold on, I want to say some more afore I sign—ide give the Boys a “puzzle,” but I might “Kick the Bucket” or git up and git, and leave a *blank* that would be hard to fill in—kause its a good’n. I worked the following out of an old cigar stub I saw on the floor—

- Three fourths of a cross..... T
- A circle complete..... O
- A perpendicular with two semicircles to meet. B
- An erect angle standing on two feet..... A
- Two semicircles..... C
- “ “..... C
- And “another circle complete”..... O

Grand Total.....Tobacco.

This is “DISTRACTION OF MORTIFICATION” on the Brain.

If the Editor fetches this out, I may write again. For * * * * * *Ime gay and happy Boys—you bet your boots I am—*

That’s a good song that I got up, but I can’t let it out just now. I hear “K 2” after me, so ime off. Excuse a sudden *pucker*. OLD CROSS-ARMS.

Cheap Galvanic Battery.

A CORRESPONDENT of the *Scientific American* describes a battery which was set up by an Englishman in his employ two years ago, and which he has used ever since. It consists of a cylindrical glass vessel, eight inches deep, and about the same in diameter. On the bottom of this vessel a circular sheet iron plate is placed, with an insulated wire extending from the iron plate over the top of the jar. This plate is covered to the depth of one or two inches with sulphate of copper. Another iron plate is suspended above the sulphate of copper, and soft water is poured in until the upper plate is covered to the depth of one or two inches. Thus made up and the circuit completed, the battery will come up to its power in two or three days; but if needed to work at once, an eighth of an ounce of sulphuric acid should be added. The plates are arranged horizontally one above another, and both are of iron. If the upper plate is a quarter of an inch thick it will last a year. These iron plates work well, and can be had everywhere at a trifling expense.

The Title to the Quadruplex Patents.—Decision of the Commissioner of Patents in Favor of Mr. Geo. B. Prescott.

THE devious ways and complications with antagonistic interests, which are characteristic of the noted professor of duplicity and quadruplicity, are constantly bringing his quondam friends before the public as contestants for their presumptive rights in his so-called inventions. The latest development of this character is the contest before the Commissioner of Patents in regard to the title to certain patents applied for by T. A. EDISON for improvements in duplex or quadruplex telegraph apparatus. The history of this matter has not as yet been published, and a brief statement of the facts will be of interest.

During the summer of 1874 experiments were made on the lines of the Western Union Telegraph Company of these devices for a quadruplex or double duplex system of telegraphy. The results obtained were considered so satisfactory that it was given out officially and unofficially by the managers and officers of the company as a remarkable success, and as likely to prove of great importance and value in the future operation of telegraphs by increasing the capacity of the wires for the transmission of signals. As is usual in such cases, the advantages claimed for the quadruplex were, to say the least, fully as great as the facts warranted.

For what were at the time considered adequate considerations, and at the earnest request of EDISON, MR. GEORGE B. PRESCOTT, the Electrician of the Western Union Company, with the knowledge and consent of the managers of the company, entered into partnership with EDISON to bring out and further develop the inventions. Having been warned of the characteristics of EDISON, and the probability that at a certain stage of the business he would, upon some pretence, or without any pretence, go back upon him and the company if his inventions were really of any value, MR. PRESCOTT took the precaution to have regular articles of agreement drawn up, which were duly entered into and executed on the 19th of August, 1874. By this agreement the patents when issued were to be assigned equally to said EDISON and PRESCOTT, the applications therefor being specified as numbered 94, 95, 96, 97, 98, 99 and 100.

In this agreement and assignment it was stipulated as follows: "Third. That neither of said parties will sell, assign, or otherwise dispose of the whole or any part of his interest in said invention, or letters patent

therefor, or any of them, without the written consent thereto first obtained of the other party."

It is further alleged that at and subsequent to this date PRESCOTT and EDISON were negotiating with the Western Union Telegraph Company for the sale and purchase of these inventions, and that on the 10th of December, 1874, EDISON received from that company \$5,000 on account of the purchase, although the price had not been definitely fixed. It is further alleged that on the 30th of December following EDISON and PRESCOTT proposed a sum as full compensation, which was subsequently and before any withdrawal of the offer, accepted by the company.

About this time, however, EDISON, characteristically, entered into negotiations unbeknown to his partner, PRESCOTT, with Mr. JAY GOULD, and on the fourth of January executed a Power of Attorney to that gentleman, giving him power and authority (irrevocable) to sell, assign, transfer and set over unto any person, persons or corporation, his right, title and interest, etc., in these inventions. Having thus disposed of his rights to two antagonistic parties, EDISON was seen no more at the office of the Western Union Company, and the efforts of Mr. PRESCOTT to obtain an interview with his quondam partner, the great professor of duplicity and quadruplicity, from that time until now have been unavailing.

On the 23d of January Mr. GEO. HARRINGTON, the President of the Automatic Telegraph Company, and partner of EDISON in inventions for automatic and fast telegraphy, applied to the Commissioner of Patents for the issue of the same patents to himself and EDISON, two thirds to the former and one third to the latter. This application was made under certain articles of copartnership between said EDISON and HARRINGTON, entered into October 1st, 1870, and a general assignment and power of attorney executed on the 4th of April, 1871, by EDISON, covering all his inventions in automatic and fast telegraphy.

This application of Mr. HARRINGTON was accompanied by a letter from EDISON of the same date, in which he states that the arrangement with Mr. PRESCOTT was made under an erroneous impression, and withdrawing the request for the issue of said patents to himself and Mr. PRESCOTT, and uniting with Mr. HARRINGTON in his petition.

It was under these circumstances that the question of title arose, Mr. PRESCOTT naturally objecting to being thus summarily ousted from his rights, and claiming that the patents should be issued to himself and EDISON, as requested in the original application.

The question to be decided by the Commissioner was not as to the equities of the several parties, but as to the *prima facie* title to the patents. Mr. HARRINGTON claimed that the double duplex or quadruplex was a *fast* system of telegraphy, and, therefore, included under the general assignment to him from EDISON of a two thirds interest in all such inventions and patents issued or to be issued to EDISON.

It was denied on the part of Mr. PRESCOTT that the quadruplex could properly come under the designation of *fast* telegraphy, as it did not increase the speed of transmission over any single circuit, but merely increased the capacity of the wire, by enabling four sending and four receiving operators to use it at the same time.

To substantiate this claim numerous extracts from THE TELEGRAPHER, *Scientific American*, *Journal of the Telegraph*, and other scientific and telegraphic publications, reports of the American, Western Union, National and Automatic Telegraph Companies, scientists and inventors in this country and Europe, etc., were submitted to show what the meaning generally attached to the term *fast telegraphy* is.

It was also argued that the assignment to Mr. HARRINGTON, the inventions not having been made at the time it was executed, did not transfer any right touching the inventions, and could not confer any *legal* title to them, and that EDISON "being still possessed of all the rights he ever had to them on August 19,

1874, he transferred an interest to PRESCOTT, who took immediately a *legal title* to be half owner in the letters patent when issued."

We have not space to give all the points made in the case, nor is it necessary for a proper understanding of the premises. The Commissioner of Patents has rejected the later request of EDISON to issue the patents to himself and HARRINGTON, and has decided that the previous assignment to PRESCOTT of a half interest is valid, and will be recognized so far as the Patent Office is concerned. The patents are not yet ready to issue, and may not be for some time, as, we understand, there are some questions of interference yet to be decided.

Mr. PRESCOTT and the managers of the Western Union Company naturally feel much gratification at this decision of the Commissioner in their favor. It is true that this does not necessarily settle the matter, as it yet can be taken into the courts to determine the equities of the several parties, but it necessitates the opponents of Mr. PRESCOTT and the company commencing the proceedings and first establishing their case as plaintiffs. Whether any further action is intended we are not advised.

All that the great professor of duplicity and quadruplicity seems to have accomplished is to divest himself of all interest in these patents. He acknowledges in his letter to the Commissioner that he had sold two thirds of his invention to Mr. HARRINGTON, and his agreement with Mr. PRESCOTT, which the Commissioner holds to be valid, at least so far as the title is concerned, disposes of a half interest to that gentleman; after selling one sixth more than the whole interest he disposes of the balance to Mr. JAY GOULD as his attorney. The question, therefore, as to who owns the quadruplex, is a conundrum which will afford a good field for legal ingenuity to solve. The only point which seems to be entirely clear is that EDISON has no interest in it. The ability of the professor to get parties who may deal with him into a mesh of legal complications is unquestionable, and we should suppose would greatly encourage his *numerous* friends—the fortunes of each of whom he is always ready to assure, as he takes them up one after another, and sometimes, as in this case, several of antagonistic interests at the same time. Great is the professor! Who is his prophet?

President Orton Goes to Europe.

MR. WILLIAM ORTON, President of the Western Union Telegraph Company, was erroneously announced by the city newspapers to have sailed for Liverpool on Saturday last. This was an error. He had engaged passage for that day but postponed his departure, and will sail to-day. We understand that Mr. ORTON goes out on business of the Western Union and International Telegraph Companies mainly. During his absence he will contract for a new cable for the International Company, to be laid between Key West and Punta Rasa, Florida, which, when laid, will duplicate the entire telegraph system of the International Company. That company now has two good cables between Key West and Cuba, and also two cables between Key West and Punta Rasa, but the old cable is very defective and requires to be replaced.

It may not be generally known that the Cuba Submarine and the West India and Panama Telegraph Companies have a submarine telegraph system in operation which connects all the West India Islands and the Isthmus of Panama. A second line has been laid over a portion of this route, and the system extends to South America. A message can now be sent to Brazil, for instance, by this system of lines, and by the Western Union and International, without the necessity, as heretofore, of being first sent to Europe. All that is required to duplicate the communication between the West India and South American telegraph system is an additional cable between Key West and Punta Rasa, about 120 miles in length, and this will be laid as soon as it can be made and sent over.

The Floods and the Telegraphs.

AS WE suggested as probable, two or three weeks ago, the telegraph companies are experiencing a good deal of trouble and interruption from the spring floods and freshets, consequent upon the accumulations of ice, which the very severe winter has caused in the streams throughout the country. It seems somewhat absurd to speak of floods and freshets when the mercury sticks uncomfortably near the bulb of the thermometer, and, as we write, see from our window a thick snow storm in progress—the sixth, we believe, since March commenced.

A week or ten days ago, however, a few days' thaw and heavy rains partially broke up the ice, which gorged at several places, and caused a great destruction of bridges, railroads and telegraph lines, and property generally. The return of arctic weather suspended this for the time, but it is likely to be renewed with additional damage before long.

It keeps to'egraph officials and linemen very busy, and postpones any active operations in construction of additional lines until matters become more settled.

Although at the South the ice does not interfere with the lines, that section is being visited with tornados and floods, which are about as damaging to the telegraphs, and makes it difficult to keep the wires in successful operation.

However, all things have an end, and in a few weeks we shall probably be complaining quite as vigorously of the heat, dust and drought. Thus is constantly illustrated the truth of the old saying, "Man never is—but always to be—blessed."

Brooks' Patent Insulators.

WE would call attention to the new advertisement on the last page of THE TELEGRAPHER of the BROOKS Patent Insulator. The superiority of these insulators has been demonstrated by extensive use in this country and Europe. These insulators are now being manufactured largely in England by Messrs. SIEMENS BROS., and are sent to all parts of the world with the most satisfactory results. Mr. SIEMENS says, in a letter to Mr. BROOKS, that "every report from them is highly flattering."

The principal objection to these insulators heretofore has been the increased first cost; but, as will be seen from the advertisement, Mr. BROOKS has made a very considerable reduction in price, which will no doubt add to their popularity and the demand for them.

Personals.

Mr. JERRY BORST, recently of the A. and P. Company, New York, has accepted a position on the regular night force with the Western Union, at the corner of Broadway and Dey streets.

Mr. E. S. RISDON, who resigned at Duxbury, Mass., a few months since, to take charge of his father's estate in Philadelphia, on the death of the latter, returns to the profession now, having accepted a position on the W. U. night force, corner Broadway and Dey streets, New York.

Mr. O. F. STOW has resigned his position on the W. U. night force, corner Broadway and Dey streets, and returns to Cleveland, Ohio, to engage in other business.

Mr. WILLIAM D. WEST, formerly of the Western Union office at New Orleans, is working for a private telegraph line at Quarantine, La.

A. G. THOMPSON, W. U. telegraph, St. Louis, Mo., has resigned, to accept appointment as Purchasing Agent and Travelling Auditor of the St. Louis and Southeastern Railroad office at St. Louis.

Mr. M. S. BACON, of Houston, Texas, has been appointed Manager of the Western Union office at Nebraska City, Neb.

Mr. JAS. C. DE LONG has been transferred from the Marshall, Texas, to the Shreveport, La., Western Union office.

Mr. FRANK LEAHY has been appointed operator in the Supt's office of the O. and C. R. R., Portland, Oregon, vice Mr. J. M. FISH, resigned.

Mr. J. H. WOODRUM, agent and operator at Gervais,

Oregon, O. and C. R. R., has resigned on account of ill health.

Mr. H. D. HAMLIN has been transferred from Aurora to Gervais, Oregon, O. and C. R. R., as agent and operator, vice Mr. WOODRUM, resigned.

Mr. S. B. HENDEE has returned and been reappointed agent and operator, O. and C. R. R., at Gervais, Oregon.

Mr. CHARLES H. DAVIS, late of Elmira, N. Y., but more recently of the Western Union office at Duxbury, Mass., has accepted a position as second press operator (nights) in the Worcester, Mass., office of the same company.

Mr. E. D. L. SWEET, General Manager of the Pacific Division of the Pacific and Atlantic Telegraph Company, is in New York for a few days.

Mr. W. C. HUMSTONE, formerly Sup't of the City Division of the A. and P. Telg. Co., has been transferred to the Pacific Division, and has gone to Detroit, Mich., where he will make his headquarters for the present.

The Telegraph.

Additional Facilities of the Pacific and Atlantic Company.

THE Atlantic and Pacific Telegraph Company have recently made an arrangement under which they now operate all the wires over the route of the Oswego and Midland railroad. They have heretofore had one wire in use on that route, but under the new arrangement they come into possession of two wires, the whole length of the road, and a third wire on certain sections. This will give them an additional outlet in case of interruption of the wires on the other routes, and is a material increase of the facilities of the company.

Resignation of Superintendent D. H. Bates, of the Western Union Company.

MR. D. H. BATES, Superintendent of the district of the Western Union Company which is generally known as the New York and Washington district, has resigned that position, and retires voluntarily from the service of the company. His resignation takes effect April 10th.

The Superintendent of the San Francisco Fire Alarm Telegraph Exonerated.

THE majority of the Finance Committee of the Board of Supervisors of San Francisco, Cal., to whom had been referred for investigation certain charges made against Mr. Greenwood, the Supt. of the Fire Alarm and Police Telegraph, after examination, reported, exonerating him from the same, but disapproved of his granting leaves of absence of two weeks to the employes, thus weakening his force, without consultation with the Fire Alarm Committee.

After the Telegraph Poles.

IN the Board of Aldermen of this city on Thursday last a draft of a resolution was offered by Alderman Billings to have the telegraph poles removed and the wires laid underground. He stated at length their inconvenience and danger, and suggested that the work be completed within one year from the passage of the ordinance, under a penalty of \$25 fine for each pole left standing after that time; and that an appropriation be made for the removal of all of the poles used by the police department, the same to be removed within one year after appropriation is made; and that all due care be taken that no damage be done to water or gas pipes, and that citizens be as little inconvenienced as possible.

Referred to the Committee on Streets.

Foreign Telegraphic Notes.

THE Central American Telegraph Company announce that they have received information to the effect that the line from Para to Cayenne and Demerara, as also the lines from Trinidad to Saint Croix and Porto Rico, have been successfully completed, thus giving direct telegraphic communication between Brazil, the West Indies, and North America. These lines will, in accordance with agreements, become the property of the West India and Panama Company.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended the 27th of February, 1875, was 350,846—an increase on the corresponding month last year of 21,600.

The Eastern Extension (Australia and China) Tele-

graph Company's traffic receipts for the month of February last were £16,415, against £17,706 for the corresponding month of 1874.

The traffic receipts of the Eastern Telegraph Company for the month of February amounted to £32,765, against £31,084 for February, 1874.

The traffic receipts of the Western and Brazilian Telegraph Co. for messages for the four weeks ended February 26, amounted to £8,842.

The number of messages sent by the lines of the Cuba Submarine Telegraph Co. during the month of February was 2,079, estimated to produce £2,200, as against 683 messages producing £478 in the corresponding month of last year.

The directors of the Brazilian Submarine Telegraph Company have declared an interim dividend for the quarter ending December 31st, of 2s. 6d. per share, or 5 per cent. per annum, free of income tax, payable on the 25th inst.

It is announced that the support already received from the shareholders of the Anglo-American Telegraph Company for a division of the stock is large and influential. The requisition list will close on Monday next, at noon. With respect to the proposal to divide the stock, the directors of the company have, it is understood, expressed their opinion that it is undesirable that such a division should take place.

The traffic receipts of the Great Northern Telegraph Company for the month of February amounted to 256,146fr., against 293,206fr. last year, and its total traffic receipts 1st January to 28th February, to 522,167fr., against 617,672fr. last year.

The traffic receipts of the Direct Spanish Telegraph Company (Limited) for February were £1,104, against £1,654 in January. The Lizard and Santander cable was interrupted during the whole of February.

The Secretary of the Direct Spanish Telegraph Company announces that the communication with Spain via Santander is restored, and that the cable is again open to public traffic.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended March 6, 1875, was 352,293—an increase on the corresponding week last year of 15,314.

The Great Northern Telegraph Company's traffic receipts for the month of February last amounted to 256,146fr.; last year to 293,206fr. Total traffic receipts from 1st January last to the 28th February, 1875, 522,167fr.; and for the same time last year, 617,672fr.

The receipts of the Submarine Telegraph Company for the month of February, 1875, amount to £8,246, against £8,344 for the corresponding month of 1874.

The Duplex in France.

The *Telegraphic Journal* of March 1st says:

"Mr. Stearns is in Paris busily applying his duplex system to the Hughes printing apparatus, which is the favorite instrument in France, Morse being nowhere. He has been very successful between Paris and Versailles, Rouen and Havre. Mr. Stearns is sure to be successful anywhere, for he certainly is one of the ablest practical electricians of the day. It is very gratifying to see how his success, and that of his countrymen generally, fail to produce the smallest symptom of national jealousy in England. Truly, in telegraphy Anglo-Americans form but one nation."

Released from Imprisonment.

MR. JOHN L. McCLELLAND, the telegraph operator who was convicted of criminal negligence in allowing two trains to collide at the Bergen cut of the Pennsylvania railroad, has been discharged from jail, the Board of Chosen Freeholders having remitted the fine of \$200, which he was unable to pay.

Organization of a Telegraphers' Club.

THE following report of a meeting of the telegraphers of New York and vicinity, for the purpose of organizing a Telegraphers' Club, was intended for publication last week, but was not received in time.

Pursuant to the notice published in THE TELEGRAPHER of March 6th, between twenty-five and thirty telegraphers and telegraph clerks met in the auditor's office of the Western Union Telegraph Company, corner of Broadway and Dey streets, on the evening of Tuesday, the 16th inst. This was an adjourned meeting of the Ball Association, the object of which, as has heretofore been stated, was to consider the feasibility and advisability of organizing a permanent association of the telegraph employes of New York and the adjoining cities.

The minutes of the previous meeting of the Ball Association were read and approved, after which a general discussion took place as to the feasibility of forming a Telegraphers' Club for social purposes, etc., to be composed of telegraph operators and clerks connected with the telegraph business in New York City and vicinity. After a general interchange of the views of those present on the subject, the opinion being unanimous in favor of such an organization, a draft of a Constitution and By-laws was read by Mr. James Lyman.

A list was then opened for signatures of persons desiring to become members of the organization, all present enrolling their names for that purpose. A permanent organization was then effected, under the name of "The Telegraphers' Club of New York and Vicinity."

The initiation fee was fixed at \$5, and \$1 per month as monthly dues from each member.

Messrs. Theo. Williams, E. A. Leslie, and Chas. of Newark, N. J., were appointed a committee to solicit operators and clerks of the several telegraph companies to join the club.

On motion, the consideration of the Constitution and By-laws was postponed until the next meeting, with the exception of the article relating to the election of officers, which was adopted.

The election of permanent officers of the club was then had, resulting as follows:

- President, D. W. McNerny.
- First Vice-President, Thos. Brennan.
- Second Vice-President, E. A. Leslie.
- Corresponding Secretary, J. A. Ashurst.
- Financial Secretary, G. W. Sawyer.
- Treasurer, James Lyman.

Board of Trustees.

Messrs. M. W. Doren, G. D. Merrill, W. H. McEnroe, E. C. Boileau, J. W. Burham, L. B. McCarthy, W. S. Williams, C. L. Chase and P. V. DeGraw.

The appointment of committees was deferred until the next meeting. The meeting was then adjourned until Thursday evening, the 25th inst., at eight o'clock P. M., in the same place.

It is the desire of all concerned, in organizing this club, to have it understood that it is not a "Western Union" club, but a telegraphers' club, and all telegraphers and telegraph clerks are eligible to membership, and all such were invited to attend the meeting on Thursday evening last and enroll themselves as members.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended February 2, 1875, and bearing that date.

159,460.—AUTOMATIC AND AUTOGRAPHIC TELEGRAPHS AND CIRCUITS. William E. Sawyer, Washington, D. C. Filed October 19, 1874.

1. The combination with a main line of a series of transmitting styles, a commutator, by which the transmitting styles are brought into circuit *seriatim*, and one recording style, substantially as set forth.

2. The combination of a main line, a series of transmitting styles, a commutator, and one recording style.

3. In a chemical telegraph, the combination, with transmitting apparatus, comprising a series of transmitting styles and a commutator of a receiving apparatus having but one recording style, which distributes the impulses gathered into circuit by the commutator.

4. The method of signaling and recording signals, consisting of concentrating into the line at the transmitting end, by means of a commutator, the impulses proceeding through a series of transmitting styles, points or rollers, in certain relative positions, and distributing said impulses at the receiving end by relatively changing the positions of the recording or marking style or styles during the passage of said impulses, so as to deposit an impulse at the same relative point upon the receiving paper as the transmitting style from which such impulses proceeded occupied upon the message transmitted, by which means the commutator and recording styles at the receiving end corresponding to the transmitting commutator and styles are avoided.

5. The combination of a main line, a series of transmitting styles, a commutator consisting of a series of contact pieces or

rollers in groups or divisions, a function of which series, groups or divisions, is to place the transmitting styles in circuit *seriatim*, and one recording style for each such series, group or division, substantially as shown and described.

6. The combination, with a line of a receiving apparatus in which recording style or styles pass across the sheet, strip or roll of receiving paper, each style moving in one direction, instead of vibrating back and forth, thus drawing actual or imaginary lines across the sheet, strip or roll of paper, instead of lengthwise of it, substantially as set forth.

7. The combination in a receiving apparatus with one or more recording styles of mechanism for giving the style or styles a continuous motion, or a motion in one direction transversely of the paper upon which the message is recorded, substantially as set forth.

8. The combination, with mechanism for imparting motion to transmitting or receiving apparatus, of an air receptacle and valvular passages for the purpose, first, of driving the mechanism, and then of checking or bringing it to a stop, substantially as shown and described.

9. The combination, with the metallic drums and their shaft, of a cam for producing a longitudinal reciprocation of the drums, as set forth.

10. The combination, with the metallic drums, of the rocking frame, the electro-magnets and circuit connections for giving a reciprocating rotary motion to the drums, as set forth.

11. The combination, with the metallic drums and their shaft, of the rocking frame, the electro-magnets and circuit connections, and a cam for giving a simultaneously longitudinal reciprocating and a reciprocating rotary movement to the drums.

12. The combination, with a main line and its battery, of an induction or an electro-magneto-electric apparatus, the current induced by which serves to electrically bridge a break or lessen a resistance in the circuit in which it flows, as set forth.

13. In a chemical or copying telegraph the method of obtaining an insulating writing surface upon a metallic surface, consisting of transferring the lines of writing first formed in a prepared ink upon paper to a metallic surface lithographically, or by fixing the paper to the metallic surface, and washing off from the metallic surface either that portion of the message paper which is blank, or that portion which is covered by the lines of writing, as set forth.

14. The method of treating the received message, consisting of subjecting the paper to a bath, and thus removing any discoloration excepting the electrolytic discolorations, as set forth.

15. The combination of a line with an induction coil or coils and a mechanical circuit changer, for the purpose of clearing a line of tailings independently of the transmitting apparatus or process, substantially as shown and described.

159,869.—ELECTRIC BURGLAR ALARMS. H. E. Walter, Richfield Springs, N. Y. Filed July 7, 1874.

When the circuit is broken a "blocking piece" supports the weighted armature when desired, and prevents it falling back and releasing the clock work. The blocking piece is operated by a switch lever outside the box, and indicates by a tell-tale whether the armature is supported or not.

The blocking piece *m* and the tell tale *o*, in combination with the armature lever *k*, electro-magnet *f*, switch *s*, and clock work alarm, substantially as and for the purposes set forth.

Married.

BALDWIN—LARCOMBE.—At Martinez, Cal., March 6, 1875, Mr. B. BALDWIN, Manager of the Western Union Telegraph office, Pacheco, Cal., to Miss FLORA LARCOMBE, assistant in the Martinez, Cal., W. U. office.

PARMALEE—FISHER.—At the residence of the bride, St. Louis, Mo., March 16, 1875, by Rev. Father Tobin, of the Cathedral, Mr. EDWARD L. PARMALEE, of the Western Union Telegraph Co., to Miss LOTTIE FISHER.

Eddie, your friends all wish you and yours long life, prosperity and happiness, and a little "Parm" to pull your silky locks.

MUTUAL CONTRIBUTION PLAN OF INSURANCE,

AT ACTUAL COST, LESS THAN ONE THIRD THE USUAL EXPENSE.

PROTECTION LIFE INSURANCE CO.,

A NEW ARRANGEMENT.
L. G. TILLOTSON & CO.

have much satisfaction in announcing that they have formed a connection with Mr. JESSE H. BUNNELL, late of Philadelphia.

In addition to their hitherto extensive Catalogue of Telegraphic and Electrical Goods, Mr. Bunnell's inventions—including his Giant Sounder, Champion Learner's Instruments, etc., etc.—will now be manufactured by this house and on sale at their warerooms.

Our new Catalogues will soon be ready for distribution, and we shall continue our discount of 20 per cent. from List Prices on all Telegraph Instruments, including Mr. Bunnell's specialties.

Estimates and equipments furnished promptly for Telegraph Lines of any length.

L. G. TILLOTSON & CO.,
8 Dey street, New York,

Corner Chestnut and South Fourth streets, Philadelphia.

Referring to the above notice, I beg to inform my friends and the telegraphic fraternity generally, that I have associated myself with the well known house of L. G. TILLOTSON & CO., who, with the most extensive and best appointed Telegraph Instrument Manufactory in America, will hereafter manufacture all articles of my invention. I will, as heretofore, give particular attention to the design and construction of special work in Instruments, Switches or large offices, etc., in which departments my experience as a practical telegrapher is always at the service of my friends. I respectfully solicit the patronage of my old customers in my new place.

JESSE H. BUNNELL,
Care L. G. Tillotson & Co., 8 Dey street, N. Y.

MANIFOLD PAPERS.

PREMIUM MANIFOLD PAPER and Transfer Paper (all colors) Agate and Steel Styluses, Palets, etc., for manifold writing. Also,

ROGERS' PRINTED MANIFOLD BOOKS.

Very useful to correspondents desiring to write quotations or other matters on printed forms, saving time and labor. Also,

TRAIN ORDER BOOKS,

Letter Books, Travelling Agents' and Physicians' Prescription Books, for duplicate writing, etc., etc. Large Stock, Great variety.

As Patentees and Manufacturers we can offer inducements to purchasers. Send for Circulars.

CINCINNATI, OHIO.

Western Agents for L. G. TILLOTSON & Co., New York,

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,
No. 40 WEST EIGHTEENTH STREET
or to
L. G. TILLOTSON & CO.,
8 Dey street, sole Agents.

THE KENOSHA INSULATOR CO.

**TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS**

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellant of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO.,

THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES, prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading Dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

GEOURGE H. BLISS & CO.,

41 Third Avenue, Chicago, Ill.

CINCINNATI, O.,

No notice will be taken of anonymous communications.

Explanatory.

TO THE EDITOR OF THE TELEGRAPHER.

In my communication to you, in your issue of the 20th of March last, anent the resignation of Mr. Purkis, there is one expression which I wish to explain, as I find that some of your readers take from it a different impression from what I intended it to convey. In describing Mr. Small as being the reverse of affable in his manners and honorable in his dealings, I did not mean to imply that he was unfair, or at all dishonest, or anything of that sort, but simply that he lacked that frankness and nobility of mind which made Mr. Purkis so popular. To the best of my knowledge and belief Mr. Small is perfectly honest in his business relations—if he were not, it is scarcely likely he would hold the high position he does in such a good and reliable company as the Dominion is. My letter was not written on account of any personal spite, but for the sake of keeping your readers posted in regard to interesting events in telegraphic circles here; and my remarks on Mr. Small were only meant to express the view most of the company's employes seem to take of his conduct.

OBSERVER.

Meeting of the American Electrical Society.—Sad Affliction of a Telegraph Supt.—Telegraphic Notes, &c.

CHICAGO, ILL., March 20.

TO THE EDITOR OF THE TELEGRAPHER.

THE regular meeting of the American Electrical Society was adjourned on last Wednesday evening until the third Wednesday in April. Mr. Elisha Gray was expected to be present to explain his Telephone to the members of the Society, but he was unexpectedly called away from the city a few days previous to the meeting, and could not return in time. This was a great disappointment, as a large number of the members were in attendance. As there was no business of particular importance to come before the meeting it was adjourned as stated above.

Mr. R. H. Hankinson, Assistant Supt. Northwestern Telegraph Company, was in Chicago on the 9th, and visited the different telegraph offices of our city. He was on the way to Grand Rapids, Mich., to take his wife home, she having, it was thought, so far recovered as to be taken home; but she suddenly had a relapse, and died while Mr. H. was on his way from Chicago to Grand Rapids. Her remains were taken to Minneapolis, Minn., and buried the following Sunday. Mr. H. has the heartfelt sympathy of the fraternity at large in this his second and greatest bereavement—he having buried his sister in Minneapolis a short time ago, as was recently stated by "North West" in your columns.

I understand some of the boys in the W. U. office tried to "put up a job" on McRobey a few nights ago, by getting Mac on the printer book and having "Sam" Wallace "sush" him as only "Sam" knows how to do, "but it wouldn't wash." Mac put it down in fine style for a few minutes, when he "smelt dot miece," and turned the laugh on the projectors of the scheme.

Col. Baldwin, a jolly, gray haired old gentleman, who had done some effective military telegraph service during the late "unpleasantness," paid the W. U. office a visit recently, and was shown around by Mr. Summers. Mr. Baldwin is now in the gas business.

I am credibly informed that the Western Electric Manufacturing Company are putting up an addition to the switch board in the W. U. office here, and that very soon gravity batteries will take the place of all the acid batteries in use in the Chicago office. I hope to give a more detailed description when all is complete and settled.

A good deal of well founded complaint is made by operators on account of the shape of the chairs they are obliged to use. They are made with the chair seat lower at the back than in front, and the arms on the chairs prevent the chair from being pulled up close to or under the table, so that there is no support for the operator's back. A chair for a telegrapher to work comfortably in should be as high, if not higher at the back part of the seat than in front, and if with any arms at all on it only enough to brace the back of the chair. Then it could be drawn up until the body would be brought close to the table, and the operator, either receiving or sending, could lean back and rest as he worked, and not be obliged to curve his spine in order to bend over far enough to get to his work, and have no support to his back. The front legs of the chair should be a great deal shorter than the back ones, and if any "pitch" at

all to the seat of the chair, it should be forward. A cheap, common wooden kitchen chair would be far preferable, made in this way, to the costly arm chairs now in use.

The days of snapper sounders being over as a novelty, the rage now is to ascertain how many words you can form out of the letters spelling your name. "It's lots of fun."

The recent heavy snow north of us has made sad havoc, delaying trains, breaking wires down, etc. Some of the roads have been blocked for a whole week.

The time of year for trying the "Boys'" patience is fast approaching. We had a few days' siege of it recently—dark, cloudy and damp, and everybody out of humor.

One of the Benedicts who got an order for "a lot of *Baby wood*" instead of "*Baby food*" is excusable, as I suppose, as he has no "sonnders" of his own yet, but "*Relay*" I think it's too "*Rich*."

OCCASIONAL.

The Telegraphers of the Pacific Coast.

SAN FRANCISCO, CAL., March 15.

TO THE EDITOR OF THE TELEGRAPHER.

SOME changes having been made in the following offices recently, will give the force now in each: Virginia, Nev., Western Union, George Serf, manager; Sam. Rankin, chief operator; David Crawford, John Morison, W. H. Murphy, A. B. McCoy, A. McPhee, and H. H. Smith, operators. The Atlantic and Pacific force comprise Mr. W. S. Bender, manager; N. L. Boydston, H. M. Bennett, and Samuel Kimbeer, operators. Gold Hill, Nev., Western Union office is managed by Mr. Samuel W. Chubbuck, assisted by Thomas Booth. Sacramento, Atlantic and Pacific force, Chas. M. Cogan, manager; M. W. Wilder, chief operator; H. L. Pray, H. C. Marks, T. P. Lee, operators. The Western Union force consists of John P. Allen, manager; John Leach, chief operator; John Egan, night chief; George Pardon, John B. Bennett, B. C. Shearer, G. W. Jackson, Miss Godah Coles and Miss Alice Kearney. We hear that Mr. John Egan, who now holds a commission as second lieutenant in the Sarsfield Guards, was attached to the Major General's staff during the Lieutenant's recent visit to this city. "He have a *sword*," but somehow was omitted in the reception tendered to King Dave, of the bread and ham islands; but it is understood one of the Lieutenant's highly embossed cards has been forwarded to the American Minister at Honolulu, to be presented to His Highness Kalakaua, with Doc's "73" attached.

In Southern California recent changes place the following gentlemen as herein mentioned: Mr. T. Hunt relieving Mr. W. R. Barker at Los Angeles, as assistant; Mr. Chas. J. Shepard being still in charge of the office as manager. The Atlantic and Pacific Company have opened new offices at Anaheim, where he who styles himself "Count" Alexis de Parwinhoff, "a Russian exile, who eschews tobacco, but not "caviare," may be found; "they say" he's quite a ladies' man; J. J. Ashe, at Wilmington; J. K. Banks, Downey City; J. T. Gifford, of Norwalk; L. E. Mosher, Elmonte; W. H. Moulthrop, Sparta; R. L. Eames, San Fernando; Thomas McAffery, at Los Angeles, as chief operator. Four lines radiate from this office, and all being extended (with a fifth in prospect), keep Mr. McAffery very busy. Many of the above mentioned names will be found at present on your subscription list. Of those not now subscribers, but admirers of the telegraphers' paper, many are waiting a chance to get a two dollar greenback in exchange for the coin they use. Post-office orders are cashed at par in New York still; so don't be afraid to "chip in" your "mite," ladies and gentlemen.

These ladies have been appointed to take charge of the City Line offices of the Western Union Telegraph Company: Miss "V." Storer at Front street, corner Sacramento; Miss Merrit, Washington street; Miss Ware, at Cosmopolitan Hotel; Miss Littlejohn, at the Grand; Miss Bryant, at the Occidental; Miss Nicol, at corner Fourth and Townsend streets. They all contribute toward keeping the only gentleman, Mr. John A. Smith, at the Market street office, as embarrassed as a young lady without pias.

P. S.—No swearing on this line. CLIX.

The Great Western Railroad Telegraph.

KINCARDINE, March 10.

TO THE EDITOR OF THE TELEGRAPHER.

NOT having seen anything in THE TELEGRAPHER from this part of the country, I send you these few lines. Corresponding, in my opinion, is not one of the best things to do in this world. In fact, I would rather be sitting in a cosy room smoking my pipe and reading THE TELEGRAPHER than to be writing. But the case stands this way: if I don't write and let our friends

on the other side of the line know we are still among the living, no one else will, seemingly. I think it a great shame that some one more capable does not take it in hand to correspond for THE TELEGRAPHER regularly, and I sincerely hope that in future some good, responsible person will take note of this, and correspond regularly hereafter.

Business on the Great Western Railway has been very rushing this winter; but on the Wellington Grey and Bruce and Southern Extension branches of the G. W. R. business has been at a stand still for the last few days. This is owing to the immense quantity of snow which has accumulated and completely blocked the roads. The company are doing their utmost to clear the roads, and in a few days we may expect a big rush of business once more.

Palmerston is our despatching office, and here there are three as good operators as ever slung lightning. This is strong language, but, nevertheless, true. Messrs. A. B. Munson, "Mu," and J. R. Brand, "J," day dispatchers, and Mr. Shirk, "W. S.," night despatcher, are operators who are not to be despised. They are kept very busy, and it's amusing to hear them complain about the weather at times.

"J." the other day mildly remarked to me that he was sick and tired of weather and everything else (no wonder, the line having been down for three or four days). I merely answered him, saying, have patience, old man, Job had patience, and things will be all right in the spring. To my surprise, he offered to bet me a V that Job never learned telegraphing, and still more, never could. As I am not a betting man, I took a back seat, and listened to "Mu" giving a ping operator a piece of his mind. When "Mu" gets in this mood you have got to stand and bear it the best way you can, as he never does this without a good cause or reason. But he is looked upon by all operators who work under him as a kind and obliging operator. With these few remarks I will close, hoping that in the course of time I shall hear more remarks from the operators in Canada, through THE TELEGRAPHER, than heretofore.

BENZIN.

Telegraphy Adapted to Females.—Female Operators Welcome.

TO THE EDITOR OF THE TELEGRAPHER.

I PRESUME it is not in the slightest degree necessary for me to state here in the beginning that this is my first attempt, for you will doubtless arrive at that conclusion long ere you have finished this *attenuated* piece of literature; but the truth must be told at all times, and I state this for the benefit of the limited few, who, otherwise, might be enraptured with my eloquence, and ascribe this production to the pen of "Oney Gagen," or some other among the more fluent spoken of our friends. For the benefit of those who do not appreciate this effort, I will state that I am not at all sensitive, and any attempt made to ridicule or malign will be utterly futile.

I have read THE TELEGRAPHER with a great deal of interest lately, and among the articles in which I have been particularly interested are the replies of the ladies to "Nihil Nameless."

It is to be regretted that "Nihil" had not spoken his thoughts long before, and thus the sooner have called forth "Lady" and Jo." to refute his statements in such a charming manner.

I fully coincide with "Lady" as to the influence exerted upon gentlemen operators who work in company with ladies, and cannot help wondering in what portion of this "wicked world," and among what manner of citizens, "Nihil's" lot could have been cast that he should so underestimate the value of the refining influence of the "gentler sex."

In regard to his wish that in future women should not learn telegraphy with intention of following it as a means of livelihood, I am not prepared to state whether it is for their interest so to do or not; but comparing salaries of "lady operators" with those received by women who are engaged in other employments, should think our business, if not exactly suitable, at least not unsuitable to them; this, however, it would, perhaps, be better to refer to the ladies themselves, as they certainly should be the best judges in such matters.

While I am about it I may as well speak of one thing concerning "female telegraphists" which has troubled me for some time, and which I have always considered extremely unjust.

I believe that even in my brightest days I was never considered a prodigy of brilliancy, and this may be the reason why I never could understand why a lady operator, quite equalling, if not excelling men in ability, should receive two thirds as much salary. I do not write with the expectation of doing any good, but could wish, for the benefit of the "weaker sex," that the question might be agitated. Methinks the ladies could plead for themselves right manfully in this cause. Surely "the laborer is worthy of his hire," but reverse, and it reads, "her hire is unworthy of the laborer," which we think applies here exactly.

A man is better able to withstand the long hours of weary, confusing labor which operators in general have to endure, and if by patient, unswerving perseverance, the woman becomes a first class operator, and does the work quite as well as the man, and we think, is rather more to be relied upon, should she not receive quite as much pay? We think so; but as I said before, my powers of understanding are limited, and, perhaps, some of our more enlightend brethren might satisfactorily explain this. It is my humble opinion that we cannot get too many ladies into our ranks; and for one I say, "Ladies, come one, come all!"

That which has been previously discussed through the columns of your paper in regard to the average social and moral standing of operators, as far as my own personal knowledge and acquaintance extends, is dolefully true, and it appears to me that matters in this respect get no better very fast, so let us have more girls to give tone to our business, and let them have larger salaries, please! ZERO.

An Application from a Plug.—A Well Deserved Compliment.—Telegraphic Notes and Personals.

St. Louis, Mo., March 9.

TO THE EDITOR OF THE TELEGRAPHER.

The following letter was received by Mark Crain, chief operator, Kansas City, Mo.:

"New Hartford Ills March 6th 1875 to mr telegraph operator.

allow me to Drop you A few lines Asking information i am out of A Situation and Would like if you Can Give me Some information In Regard to work. if you Can cite me to an office or night work i will Pay you well for your Trouble. if you can Do anything for Me Please communicate With me at once And oblige Yours respectfully

J. K. d.

oPerator."

It is evident that the author of the above is fresh from college.

Thermometer still hovers around 35 degrees above. No deaths have been reported from spring fever as yet. Tom. W—— is a likely victim, unless Miss V. at "Ch" can hurry him a little.

The American District have reduced Box rent from \$2.50 to \$2 per month.

The appointment of Col. R. C. Clowry, Assistant General Superintendent, is a very deserved compliment to that gentleman. No man has done more to advance the interests of the Company than Mr. Clowry. He is a zealous and hard worker. The Colonel's district now embraces Missouri, Kansas, Texas, Colorado, New Mexico, Arkansas and part of Nebraska and Louisiana. B. F. Woodward, Denver, Colorado, and L. C. Baker, Little Rock, Arkansas, are Mr. Clowry's assistants. A slight reduction in the force at Dallas and Honston, Texas, was necessary, but I understand that these men will be provided for as soon as an opportunity offers.

Mr. I. McMichael is still Mr. Clowry's chief clerk, and E. H. Brown, Esq., continues to be the able and efficient manager here, and approves the boys' "due bills" in a manner very gratifying to them.

C. Dougherty is C. N. D. man, and has charge of the gold and stock department, which has become a very prominent feature of St. Louis.

John A. Hobbs and A. E. Haquette, for many years receiving clerks, have resigned and gone into business for themselves. Messrs. Halloban and Guignon are their successors.

In Texas the grass is high enough for grazing purposes, and the trees are resuming their foliage. C.

Resignation of Manager Swain, of the Chicago, Ill., Western Union Office.

CHICAGO, ILL., March 26.

TO THE EDITOR OF THE TELEGRAPHER.

We were very much surprised this morning to hear it rumored that Mr. F. C. Swain, manager of the operating department of the Western Union Telegraph office in this city, would sever his connection with that company the first of April. Of his future plans we are not apprised. Mr. Swain's retirement from the position he has held so long is a great surprise to the telegraphers in this section, and various rumors (too idle to mention at present) are afloat as to this sudden change. A number of gentlemen have been named as his permanent successor, but it is as yet not known outside official circles who it will be. Upon inquiry, I find that none of the Western Union operators seem to know what changes will take place. I am quite reliably informed, however, that Mr. C. H. Summers will assume the duties, at least temporarily. This resignation will doubtless cause a number of changes, and a great deal of anxiety will exist until

it is settled as to who will "ascend the throne," and then no doubt the disappointment of some who seek the place, and of some who really expect it, will be as great as is the anxiety now to know who the "happy man" will be. As far as I have conversed with the W. U. operators, a majority of them would seem to favor the appointment of Mr. Felton, the present manager of the other departments, as manager of the operating department, in conjunction with his other duties; and Mr. George York as assistant in charge of the operating department, and Mr. Sholes in charge of all the circuits as first chief operator. This represents no doubt the wishes of the day force to a large extent, as Mr. York is well known as one of the most perfect gentlemen in the business, easily approached, yet firm and decided when occasion requires, while no better man can be found to manage circuit, tell the real qualifications of an operator, or be all over the operating room attending to everything at once without confusion than Mr. Sholes. Of course the night men have their choice, and think that Mr. Maynard would fill the chair as acceptably, if not more so, than any one else. His qualifications are too well known as a man of all work to necessitate any eulogy from me, while the advancement of Mr. Springer to the position of night manager, if that place is vacated by Mr. Maynard's promotion, would be hailed with satisfaction by a very large majority of the "night hawks." Probably the only operators who will be benefited at all by any change made will be some of the old night men who have been anxiously looking forward to the increase of business in the spring as the time when the extra men now on duty, and new ones yet to come, would take their places on the night force, and they be advanced (according to merit and priority of application for day work) to positions on the day force. As this will probably occur, no matter who is appointed manager of the operating department, it is of little moment to the rank and file of the fraternity working for that company, so that he is a good man, and they can afford to wait. OCCASIONAL.

Death of Alfred C. Mapes.—A Veteran Telegrapher.

St. Louis, Mo., March 27.

TO THE EDITOR OF THE TELEGRAPHER.

At two o'clock on the morning of March 23d, Alfred C. Mapes, a veteran telegrapher, well known throughout the West, died at his residence in Wyandotte, Kansas. He had been engaged in the business for the past fifteen years, and was a very efficient railroad man—a fact recognized by the officials of the Mobile and Ohio Railroad Company, who promoted him to the position of train master and dispatcher, which he faithfully filled for a long time subsequently. Mr. Mapes accepted a superintendency of the Missouri Pacific Railroad and telegraph lines, with headquarters at Sedalia, Mo., but resigned owing to its necessitating his absence from Wyandotte. Other positions of honor and trust were declined for the same reason. The deceased owned a homestead in Wyandotte, and preferred having charge of the train running from that place to Leavenworth to promotion, as it enabled him to devote his time to his family. He had been sick for about five weeks, and died from the effects of congested chills. In the death of "Al. Mapes" telegraphy has lost one of its most estimable members, and one whose career those entering upon the profession might profit by imitating.

He was universally respected by all, having endeared himself to every one by his uniform courtesy and kindness. The funeral took place on the 26th inst., and his remains were followed to the grave by a large number of his friends from Kansas City and other points. C.

Telegraph Business should be Suspended on the Sabbath.

DETROIT, MICH., March 26.

TO THE EDITOR OF THE TELEGRAPHER.

It has often occurred to me, and has been the cause of much surprise on my part, why some of the contributors to THE TELEGRAPHER have not ventilated their ideas on the subject of working Sundays, which we all, to a certain extent, have to perform. (I refer more especially to night men). I can't see the justice in paying day men who work Sundays three and four dollars per day extra while night men have to perform Sunday duty, whether they want to or not, without receiving any extra compensation. Why cannot telegraphers, as well as men engaged in other professions or trades, have one day to themselves? Telegraph offices were not kept open on Sunday before the war, and now that peace reigns, why not close them? I should think that telegraph companies, looking at the subject even in an economical light, would close their offices on that day, for it seems to me that it can not pay them, in large offices especially. But the

question is, would they not get the business which is handed in by customers on Sunday either Saturday night or Monday morning? I think they would, and thus save a great deal of money now paid for extra Sunday service. If an executive order from the Presidents of both the large companies should be issued closing all offices on Sunday, or else have stated hours for that day, say from 8 to 10 A. M. and 4 to 6 P. M., the public would soon conform to the new arrangement, the companies would make just as much money as they do now, and operators would hail the change with gladness. Some will say, but the newspapers must have the press despatches, and the War Department requires signals. In reply I would say a large number of newspapers do not publish Monday morning, and if they could get along before the war why not now? Besides; there is very little report transmitted Sundays—not enough to pay for doing it. As to signals at night, if operators were relieved of all other Sunday work, I think they would not grumble at having to work about an hour for that purpose. I would like to hear from some of your numerous correspondents on this subject and see what their views are on the same. NIGHT MAN.

My First Message.—Personals, &c.

PHILADELPHIA, PA., March 23.

TO THE EDITOR OF THE TELEGRAPHER.

It was in the fall of 1870 (if my memory serves me right) when my "big brother" was operating for the old Delaware River Telegraph Company, that at a certain village along the line of said company he received a message for a party living several miles in the country, which required immediate delivery. He procured a horse and went on his mission, as he was not blessed with a messenger, nor did the business ordinarily require the services of such an individual, and left me in charge of the office until his return, as I had managed to learn how many dots and dashes belong to the different letters, but I thought, as many do at the present day, that "I knew all about it." I was not idle long, however, but heard "A" office call me, and timidly I replied, and he sent a message once, twice, thrice, and I think even six times; then I gave him a short rest, and commenced to spell out all the words I could, but nevertheless I had to make him "Ga" a number of times at different places, and still I was unable to make out the message, and as he repeatedly asked for O. K. I finally gave him the desired O. K. to make him "shut up," and so he did, but was totally unable to make out the message (for, of course, we had a paper machine), and I stamped, cried, and I am afraid, swore around in the office for about an hour in a manner fearful to behold; but after dashing away my tears and taking a little fresh air, I was able to decipher about half of the message, and hastily prepared that part and started on the way to deliver what I had of it, but was nearly overwhelmed with joy to notice the arrival of that brother of mine, and in a hurried explanation told him the facts, and he read and copied the message off and started me with it in double quick time. After that I commenced to pay more attention to the art, and am now what I "are."

No doubt the operators of the old Delaware River line (now W. U. No. 36) and those that worked on 36 wire during the time Miss Maggio Duff, "M," was operator at Catauqua and Bethlehem, will be pleased to know her whereabouts. She is still following her "trade" on the city line at Broad and Coates streets, in this city, and is as lively and talkative as ever. Not having much to do with the machines, she has ample time to entertain her numerous friends and visitors who chance to pass that way, and I would advise any one wishing to spend a few hours pleasantly to call on her, but not all at once, as her office is not large enough to accommodate many at a time.

I also recently made a call on Miss Selover, who is working the city wire at 1,330 Girard avenue, where she occupies a large, commodious and pleasant office, and is generally to be found busy doing something or other. Many of her friends take advantage of her present position and call on her, as she can continue with her wax work or other labors and at the same time have a pleasant chat with them.

I noticed in the communication signed "Z. Y. X.," which appeared in THE TELEGRAPHER several weeks since, the author forgot to mention the most important individual of our line, it being our most worthy Superintendent of the telegraph, Mr. R. Yerkes, whose office is at Front and Willow streets, and who has for many years past occupied that honorable position.

Times are slowly recovering with us, but we look forward to a more genuine revival ere many months have passed. EX-PROF.

Answer to Correspondent.

IGNORANCE.—The wire mattress being sufficiently insulated by the wooden legs of the bedstead, the danger of being affected by lightning, of a person sleeping upon it would not be increased.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, APRIL 3, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an *extra copy free*.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

Back Numbers of The Telegrapher Wanted.

OUR supply of copies of the current volume of THE TELEGRAPHER, Nos. 446 for January 30th, and 449 for February 20th, are already exhausted, and we would be under obligations to any of our subscribers who do not keep files of the paper for binding, that may have these numbers, or either of them, on hand, if they will forward them to this office. The postage necessary to be prepaid on those papers, to insure their transmission, is two cents for each.

We regret to be obliged to ask this, but the demand for these numbers has exhausted the supply.

The Proposed Legislation in regard to Telegraph Lines in Cities.

THE opposition to the continued encumbrance of the streets of this and other large cities by huge, and generally unsightly telegraph poles, is taking shape in proposed legislation, which shall compel telegraph companies to remove them and adopt some subterranean system for their wires.

The Act introduced by Mr. DALY in the State Assembly at Albany, and an ordinance introduced recently in the Board of Aldermen of this city, both of which are now pending, are intended to compel telegraph companies within a certain time to remove the poles and conduct their wires beneath the pavements of the streets.

These are being strenuously opposed by the Western Union and Gold and Stock Telegraph Companies and other telegraph interests, and we scarcely think will be adopted at present.

That some radical change is necessary is evident; what it shall be, how secured and carried out, are questions easily asked, but not so readily answered. Naturally the telegraph companies are opposed to being forced to make the requisite change, which will be costly, and to which it must be conceded there are some very plausible objections.

In this connection, it is curious to recall the fact that nearly twenty years ago the then existing American Telegraph Company desired to bring its wires underground from the upper part of the city, but were utterly unable to obtain permission from the municipal authorities to do so. Their application for such permission was pending some time before the Board of

Aldermen, and was finally rejected, and the company compelled to continue the use of poles for conducting its wires through the streets of New York. Had the desired permission been obtained, the experiment of subterranean city telegraph wires would have been tried, and, if successful, all the wires would eventually have gone underground in this city, and probably in all other large cities in the country.

The number of telegraph wires at that time was very limited, and the necessity for putting them out of sight and reach was not so apparent as it is now. In the then condition and stage of development of electrical science in its application to telegraphy, it is doubtful whether the plan would have met with the immediate success which was anticipated, but the probability is that eventually some practicable plan would have been developed, and the difficulties encountered would have been overcome.

Now New York streets are crowded with telegraph poles, to the number of which constant additions are being made, and the roofs of the houses and other buildings in some sections of the city are crossed and recrossed by telegraph wires, and ornamented with telegraph fixtures of every available kind and description. The enormous development of private telegraph lines which at the time referred to were entirely unknown, the lines for reporting financial and commercial quotations, etc., have greatly complicated the matter, and have created very powerful interests in opposition to any legislation which shall force these wires from their present more or less lofty elevations and place them, at great cost and trouble, beneath the feet of the public.

While we have held that some change must inevitably take place, yet we are not in favor of crude and hasty legislation on the subject. It is a matter which should be carefully considered, and definite action should be deferred until experiments can be made to determine what plan can be adopted which shall secure the public and private interests. It is claimed that some of the instruments cannot be successfully worked on underground lines, on account of the static charge which is developed when wires are either submerged in the water or buried in the earth, for more than a very short distance. In 1853 the writer was in England for the purpose of assisting in introducing the House Printing Telegraph instrument on the subterranean wires between London and Liverpool. It was found impossible to work the instrument at all on these wires, the breaking and closing of the circuits being so rapid that, on account of the static charge, the wires could not be discharged with sufficient rapidity, even on a circuit of fifteen miles. The company having no aerial lines upon which to work them, the attempt to introduce the House Printer was finally abandoned. It is this static charge which necessitates working submarine telegraph cables slowly, and with apparatus and batteries specially devised for the purpose. It remains to be demonstrated how much wires placed underground for from one to ten miles would be affected, and what the effect would be on the ordinary working of telegraph instruments on such wires.

While, therefore, in our opinion the time has come when this matter should be fully investigated, with a view to ultimate action, we hope that no hasty or inconsiderate legislation will be adopted. We do not write especially in the interest of telegraph companies, but in that of the public as well, which certainly will not be advanced by subjecting telegraph interests to a heavy tax before the preliminary investigations have been made, and the questions which enter so essentially into the practicability and nature of any changes which are to be made have been settled. Let the matter be considered carefully, intelligently and thoroughly, and, as preliminary to a final decision, let us ascertain what system of subterranean wires will best answer the desired object.

Mrs. PARTINGTON declares that she does not wish to vote, as she fears she couldn't stand the shock of the electrical franchise.

Spring at Last.—Telegraphic Prospects.

THE winter of 1874-75 will be memorable hereafter for its length and severity. For the past four months we have had almost unintermittent Arctic weather, and in most sections of the north, east and west this has been accompanied by heavy and numerous snow storms. All things have an end, however, and this winter is at last over and spring is fairly inaugurated. In the course of two or three weeks more the frost will be entirely out of the ground, the snow mostly resolved into water, the spring freshets over, the damage to telegraph lines generally repaired, and preparations commenced for the work to be accomplished during the ensuing six months.

The prospect appears to be favorable for much more work being done this year in construction and reconstruction of telegraph lines than in 1874. It is known that the Atlantic and Pacific Telegraph Company contemplate important additions to its present system of lines during the coming season; the Western Union Company will probably also be obliged to undertake considerable reconstruction, and make some additions to existing facilities. Both companies feel the necessity of strengthening their position as much as possible, and the Atlantic and Pacific Company has much to do in order to make it what its present managers intend it shall be, an effective competitor with its principal rival for the telegraph business of the country.

We hope that in building additional lines, or reconstructing those already in existence, care will be taken that the errors of the past shall not be repeated, but that they will be superior to the generality of lines heretofore erected in this country. The best material and insulation is the cheapest in the end. If fast telegraphic systems are to be worked, it is essential, in order that their advantages may be fully realized, that lines of adequate conductivity, with good insulation, should be provided. The success of fast systems of telegraphy depends much more on the conductor than is generally recognized. With a conductor of inferior capacity and inadequate insulation, it is idle to expect that any system can be worked effectively and economically. The time is, or should be passed when any sort of a line that will, under favorable climatic conditions, permit the transmission of telegraphic signals, should be regarded as good enough. The best is none too good, and will be found the most economical in the end.

The revival of business, though gradual, seems to be progressing, and there is promise that telegraphers will, before many months have passed, find more demand for their services. The supply of operative talent is, however, fully equal to any probable demand for some time to come, and we do not think there is any necessity for the multiplication of so-called telegraph schools, colleges or institutes. There are enough new members being constantly initiated into the profession in the regular way, to render unnecessary any stimulation of the supply by extraneous efforts or means.

The Marine Telegraphs Bill of the Dominion of Canada.

THE bill which was passed last year by the Parliament of the Dominion of Canada, regulating Marine telegraph enterprises in the Dominion, subject to the approval of the Crown, which was withheld on the ground that it was a matter which should be decided by the local government, has been reintroduced, and despite the opposition of the Anglo-American Company, has passed both Houses of Parliament in substantially the same shape, and at last advice it was pending in the Lower House on some minor amendments made by the other House.

This bill will not affect the rights of the Anglo-American Company in Newfoundland, as that Province is not included in the Dominion Confederation, but if it finally becomes a law, it will probably necessitate the removal of the cables of that company which are within the Dominion.

Delay of Publication of Reports of Commissioners to the Vienna Exposition.

CONSIDERABLE anxiety having been manifested among readers of the THE TELEGRAPHER to obtain the reports of the Telegraphic Commissioners at the Vienna Exposition, we have made inquiries to ascertain the cause of the great delay in their publication, and learn that it is owing to the fact that a number of the subordinate reports, among which is that of Mr. R. B. LINES, have not yet been received at the State Department. A very complete report by Mr. DAVID BROOKS has been on file for more than a year, but cannot be published till the other Commissioners are heard from.

Renewal of the Attempt to Complete the Direct United States Cable.

A NEWS despatch from London states that the *Faraday* will sail to-morrow, April 4th, at the latest, to renew the attempt to complete the laying of the Direct Cable. It is to be hoped that this attempt will be successful, and that before the end of the present month the cable will be completed and in successful operation. The misfortunes which have thus far attended it have placed this enterprise under a cloud, and have delayed its completion for six or eight months beyond the time when it should have been accomplished.

Centennial Chimes Galop.

WE have received from the composer, Mr. J. H. MILLIKEN, of the Western Union, Boston, Mass., telegraph office, a new musical composition entitled *Centennial Chimes Galop*, published by OLIVER DITSON & Co., the well known publishers of that city.

Our musical critic pronounces it a very good production—much better than the average of such compositions. As Mr. MILLIKEN is a telegrapher, it will naturally gratify the profession that one of its members should display ability in so difficult an art as that of musical composition.

Protection from Atmospheric Electricity.

THE season of electrical atmospheric disturbances, thunder storms, etc., is at hand, and the question of lightning arresters becomes a prominent one among telegraphers. Every telegraph instrument, cable, etc., should be protected by a good lightning arrester. One of the best of these is the Globe Lightning Arrester, manufactured and sold by Messrs. F. L. POPE & Co., of No. 38 Vesey street, New York. These cheap, simple, yet effectual protections against damage by surcharge of the wires by atmospheric electricity, should meet with a large sale during the coming season.

New Advertisement of L. G. Tillotson & Co.

THE new column advertisement of Messrs. L. G. TILLOTSON & Co., which appears in this number of THE TELEGRAPHER, will be found of interest to all who have occasion to purchase telegraph and electrical apparatus and supplies. With characteristic enterprise, this firm is adding to its already very complete stock new and valuable specialties, which will be found mentioned and described in the advertisement. The inducements which they offer to telegraphers and others are very liberal.

New Catalogue and Price List of the Western Electric Manufacturing Company.

THE Western Electric Manufacturing Company of Chicago, Illinois, have issued a new catalogue and price list, which will be forwarded on application to the company.

It is a neat and concise little book of 36 pages, giving complete information in regard to the various instruments and apparatus manufactured and sold by this enterprising company. In addition to the price list, the pamphlet contains tables of the weight, diameter and gauge numbers of copper and iron wires, and notices

and descriptions of the most important specialties of which the Western Electric Company has charge.

Personals.

Miss LITTLEJOHN has been transferred from the Grand Hotel to the main office Western Union Telegraph Co., San Francisco, Cal.

Miss J. A. NORCROSS has been appointed Manager of the Grand Hotel Western Union Office, San Francisco, Cal.

The address of Mr. WILLIAM DONOVAN, who was operator for the Franklin Telegraph Co. at Manhattanville, N. Y., and Bethel, Conn., in 1867 and 1868 is desired. Any person knowing the same, will oblige by communicating to the Editor of THE TELEGRAPHER.

Mr. GEORGE D. BELDEN has been appointed Chief Train Despatcher of the Rensselaer and Saratoga Railroad.

Mr. HOWSER, from the New York office of the Atlantic and Pacific Telegraph Co., has accepted the position in the Chicago, Ill., office of the same company, made vacant by the resignation of Mr. JOHN KENNY, of the night force.

Mr. SUNNY, of the A. & P. New York office, has accepted a position on the day force of the Chicago, Ill., office of the same company.

Mr. D. E. SWEET has been appointed to fill the vacancy in the position of Chief Operator in the Chicago, Ill., A. & P. office caused by the transfer of Mr. RUDD, to Detroit, Mich.

Mr. "CURT" MESERVE is working "extra" for the W. U. Co., at Chicago, Ill.

Mr. L. H. LONG is subbing for the Chicago, Rock Island and Pacific R. R. at Peru, Ill., and expects soon to go to Moline, Ill., on the same line.

Mr. WILLIAM ORTON, President of the Western Union Telegraph Company, sailed on Saturday last in the Inman Steamer, City of Chester, for Liverpool, accompanied by Mrs. JESSIE and Miss ALICE ORTON. He goes out principally on telegraph business, and expects to be absent about two months.

The Telegraph.

By Cable.

THE PARADAY NEARLY READY TO RENEW THE ATTEMPT TO LAY THE DIRECT CABLE.

LONDON, April 1, 5 A. M.—The Siemens Brothers' cable steamer Faraday has refitted and is now coaling at Gravesend. She will sail on Sunday, the fourth instant, at the latest, to complete the work of laying the Direct Atlantic Cable.

FAILURE OF AN ENGLISH TELEGRAPH CONTRACTOR.

LONDON, March 31.—William Thomas Henley, telegraph engineer and contractor, has failed. His liabilities are \$2,500,000.

Proposed New Telegraph Company.

AN Act of Incorporation has been passed by the Virginia Legislature chartering the Old Dominion Telegraph Company. The capital is to be \$500,000, in shares of \$50 each. The incorporators are Messrs. Frederick B. Hubbell, Edwin Fitzgerald, R. H. Logan, C. H. Smith, James D. Patten, D. S. Pollock and John A. McCaul.

The company is authorized to construct telegraph lines from any point on the waters of Chesapeake Bay and its tributary streams to any points within the State, and build all necessary branches. The Act passed the House on Friday, March 26th, and the Senate on Saturday, the 27th.

Foreign Telegraphic Notes.

THE Fourth International Telegraph Congress will meet on the first of June at St. Petersburg, in conformity with the decision arrived at in the Roman Congress. The Russian Government some time since forwarded invitations to the twenty-four States which have adhered to the Convention, and to twenty Submarine Telegraph Companies. With the exception of the United States, all have accepted. Brazil, the Argentine Republic, and Japan, are the new States which will be represented at the Congress, which is expected to last forty days. The private companies have only a consulting voice, the official representatives of States alone having the right to vote.

Mr. Charles Burton, Director General of Telegraphs

for the Argentine Republic, and Honorary Secretary of the Society of Telegraph Engineers, has just left England on his return to Buenos Ayres. During his sojourn in England he has been making himself familiar with its telegraph system, and on his return will probably be able to introduce some improvements into the Argentine working. He contemplates introducing the duplex system.

Dr Stephan, the head of the Post-office of the German Empire, has been directed to take charge provisionally of the Telegraph Department, with a view of amalgamating the two departments, as has been done in Great Britain.

Fatal Accident at New Western Union Building.

ON Thursday afternoon of last week Richard Finley, a messenger employed by the New York Associated Press, was instantly killed by being struck on the head by the elevator in the Western Union Telegraph Office, corner of Dey street and Broadway. The boy was standing on the third story of the building, and put out his head between the slats of the door and looked down to see if the elevator was coming up. Unfortunately it was coming down, and before he could get his head back it struck him and cut the entire upper portion of the skull off. The elevator was at once stopped and the boy picked up, but he was dead and his brains were scattered over the floor. It has been the intention of the company to have a wire screen across the doors, as the boys are in the habit of sounding the annunciator to fool the engineer and see the car run up. The father of young Finley came to the Twenty-seventh precinct station house late in the afternoon, where the body was taken, and identified it. He gave his residence as East Eighteenth street, near First avenue.

The Western Union Telegraph Company Censured.

AN inquest was held on Tuesday last by Coroner Croker in the case of the boy, Richard Finley, who was killed by an elevator in the Western Union Telegraph building on the 26th ult. It was shown that the approaches to the elevators were all in an unfinished state, doors not yet having been erected on the various floors at the apertures of the elevator wells.

The jury rendered the following verdict: "We find that Richard Finley came to his death by the negligence of the Western Union Telegraph Company in not having the doors of their elevator properly secured."

At the conclusion of the examination the father of the boy expressed his determination to at once sue the Western Union Company for damages.

Destruction of a Telegraph Line in China.

ON January 22d a mob attacked the laborers on the telegraph line from Foo Choo to Amoy, at the town of Twang-Tao, and destroyed the poles, interrupting the work.

It is generally admitted that the attack was incited by the authorities, who have waited till the line reached a point where it would be at their mercy. No redress is possible, the work having been commenced in defiance of the wishes and without the full permission of the provincial government.

The Governor of Amoy has refused permission to lay a telegraph line between that town and the foreign settlement on Kulang Island, in the harbor.

Monument to Galvani.

THE *Fanfulla*, speaking of the meeting held for erecting at Bologna a monument for the illustrious physicist, L. Galvani, says that the designs given in were twenty-three in number, the jury deciding in favor of the young Roman sculptor, Ceneetti. The artist has selected the culminating point of the scientific life of Galvani, in which the immortal Bolognese is attentively watching the electric phenomena manifested in the movements of the frog. The expression of the face and of the whole body reveal the anxiety of the man of science, and the emotion produced by a great discovery.

Suicide of a Telegraph Operator.

A SPECIAL despatch to the *Cincinnati Commercial* from Toledo, Ohio, states that W. W. Blain, telegraph operator, aged 27, and unmarried, committed suicide on the 10th inst., by taking morphine. The deceased lost an arm and foot some ten years ago, and had long been very despondent.

A good name will wear out; a bad one may be earned; a nickname lasts forever.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended February 2, 1875, and bearing that date.

159,394.—APPARATUS FOR CONTROLLING WAY COCKS OF WATER PIPES BY ELECTRICITY. W. A. Crawford, Terre Haute, Ind. Filed May 6, 1874.

Fall in temperature to freezing point causes thermostat to close circuit to electro-magnet, controlling devices acting both to cut off flow of water and to empty the exposed pipe.

The combination, with the plug of a way cock, and means for rotating the same, of a metallic thermometer, a galvanic battery, an electro-magnet, wheel, lever and stops, all constructed and arranged to operate substantially as and for the purpose set forth.

159,401.—FIRE ALARM SIGNAL BOXES. Geo. Floyd, Cincinnati, Ohio. Filed November 21, 1874.

A swinging guard plate upon the inside of the cover is normally held away from the keyhole by a pin projecting from an arm attached to the winding arbor. When the arbor is turned the pin is withdrawn from contact with the guard plate, and the withdrawal of the key allows the guard plate to swing and cover the keyhole. Key cannot be again inserted until the signal has been sent, and the arm and pin return to their normal position, thus pushing away the guard plate.

1. The combination of Master wheel C, stop wheel D, arbor G, arm H, brake I, V, spring b, and any suitable clock work and circuit wheel, when adapted to be set in motion with a key, T, or its equivalent device applied through an opening, a', in the cap, cover or door of the box, substantially as herein explained.

2. The guard plate L', pivoted to the inner side of the door or lid of a fire alarm signal box, and adapted to close the keyhole of the box being operated, and to unclog the same by the return of the mechanism to its normal position, substantially as herein explained and illustrated.

3. The combination of arm H, attached to arbor G of the signaling mechanism, projection N, and bell crank K L L', pivoted to the inner side of the box door A', for the purpose set forth.

For the week ended February 9, 1875, and bearing that date.

159,664.—TELEGRAPH APPARATUS.—M. Gally, Rochester, N. Y. Filed Nov. 2, 1874.

Through the keys messages can be set up on the wheel G ready for transmission.

1. In a telegraphic instrument, a number of electrical conductors or contact points, adjustably attached to a suitably revolving or otherwise moving base, and capable of being arranged and rearranged to represent different letters, words, or collections of words for automatic transmission, in combination with a circuit closing or breaking device, substantially as and for the purpose specified.

2. The combination, with the adjustable conductors G, of manipulating keys, each key making by its action an arrangement of a sufficient number of the conductors to produce the letters represented by such key.

3. An accumulation of arranged conductors, representing an accumulation of message matter to be thereafter transmitted, the same conductors admitting of a rearrangement for other message matter, substantially as specified.

4. The combination, with the adjustable conductors G, of the restoring cam D, for restoring the conductors after having been used, to prepare them for a rearrangement, substantially as specified.

5. The combination, with the adjustable conductors G, of the stop C, to prevent the wheel M from turning, except at such times as the conductors are moved out of contact, substantially as specified.

6. The wheel M, provided with adjustable conductors, in combination with propelling weight K, substantially as and for the purpose specified.

7. The connector F, having a detent, J, in combination with magnet H, operated by means of a reversed current, causing the movement of the connector at any desired time after message matter is accumulated by the arrangement of the conductors upon which it is to act, substantially as specified.

8. The connector F, constructed with conducting faces of different dimensions, for producing a variety of signals, when connecting with conducting points arranged in different positions in its track, substantially as specified.

For the week ended February 16, 1875, and bearing that date.

159,771.—TELEGRAPHIC SIGNAL BOXES.—W. H. Sawyer, New York, N. Y. Filed Dec. 4, 1874.

Through the intervention of rods G' H' I', motion is communicated to a winding arm, D, which in turn operates a coiled mainspring. The play of the lever is limited by stops placed at different distances from its fulcrum.

1. The combination of the winding arm D, train of wheel work C C' C'', transmitting wheel B, and lever F', substantially as herein specified.

2. The combination of motor train and circuit breaking or transmitting wheel with lever F', rods G' H' I', and links g h i, substantially as and for the purpose specified.

3. The combination of the dog E with the lever F', the former

so arranged with reference to the latter and with the winding arm D as to permit the former to engage with the latter after a complete signal has been transmitted, but at no other time.

4. The dog E, in combination with the stationary spring e and stop d, substantially as herein described.

The stops g' h' i', in combination with the lever F' and links g h i, substantially as herein specified.

159,894.—TELEGRAPH SOUNDERS.—Jesse H. Bunnell, Philadelphia, Pa., assignor to Patrick, Bunnell & Co., same place. Filed July 31, 1874.

1. In combination with an armature lever, a stroke screw, located midway, or near midway, between the end thereof and the armature, substantially as and for the purpose set forth.

2. In a telegraph sounding apparatus, the arch located underneath the lever in the line of the direction of the swing of the lever, substantially as and for the purpose set forth.

3. The combination, with the sounder lever A, of the arch G H, substantially as and for the purpose set forth.

4. The lever A, stroke screw B, and arch G H, combined and operating substantially as and for the purpose set forth.

5. The lever A, carrying the stroke screw B, the arch G G' H, and hollow base C, constructed, combined, and operating substantially as and for the purpose set forth.

Died.

RILEY.—At Cincinnati, Ohio, March 17th, 1875, of consumption JAMES RILEY, aged 27.

Obituary.

JAMES RILEY.

TREAD lightly, for he sleepeth. The bright and beautiful morning of the 17th of March, 1875, was in part typical of a soul that went to meet its Maker. "Poor Jim," we say; but why poor? Richer by far we think him now than he has ever been. There are but few persons in or around Cincinnati who are identified with the business of telegraphy that have not seen and known James Riley, the cheery repairman; the neatest of wire workers, and as gentlemanly a man as we have ever had. Faithful, hard working and good natured, he was always welcome met. Full of life and fun, loving and dntiful to his family, and beloved by us all.

His death was anticipated; for long ago it became painfully apparent to his friends that consumption had him in its grasp, and that it was but a question of a little time when he should pass the confines of our earthly border. But a little over a year since and "Jimmy" married; then his happiness seemed complete. A year rolled round, and, alas! his beloved wife was dead. Following the wife to heaven was a little bright eyed cherub, whose tiny tongue had not yet reached liping time. Thus heret, poor Riley failed but faster. This morning, peacefully, quietly, as a Christian warrior, he laid his armor down. "Well done, thou good and faithful servant; enter into the rest prepared for thee by the Lord."

This tribute, Jamie, from one friend will be echoed in the hearts of many loving ones. "He was a man, take him all in all, such as we shall not soon see his like again." "Requiescat in pace." S.

Cincinnati, March 17.

MANIFOLD PAPERS.

PREMIUM MANIFOLD PAPER and Transfer Paper (all colors) Agate and Steel Styluses, Palets, etc., for manifold writing. Also,

ROGERS' PRINTED MANIFOLD BOOKS.

Very useful to correspondents desiring to write quotations or other matters on printed forms, saving time and labor. Also,

TRAIN ORDER BOOKS,

Letter Books, Travelling Agents' and Physicians' Prescription Books, for duplicate writing, etc., etc. Large Stock, Great variety.

As Patentees and Manufacturers we can offer inducements to purchasers. Send for Circulars.

Western Agents for L. G. TILLOTSON & Co., New York,

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular Pioneer Cheap Telegraph Instrument has recently been improved and a Straight Lever Key placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and is still the leading telegraphic apparatus of its class.

They are furnished at the following popular prices:

Single Instruments, with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50
Two sets of Instruments, etc., 12.00

A NEW ARRANGEMENT.

L. G. TILLOTSON & CO.

have much satisfaction in announcing that they have formed a connection with Mr. JESSE H. BUNNELL, late of Philadelphia.

In addition to their hitherto extensive Catalogue of Telegraphic and Electrical Goods, Mr. Bunnell's inventions—including his Giant Sounder, Champion Learner's Instruments, etc., etc.—will now be manufactured by this house and on sale at their warerooms.

Our new Catalogues will soon be ready for distribution, and we shall continue our discount of 20 per cent. from List Prices on all Telegraph Instruments, including Mr. Bunnell's specialties.

Estimates and equipments furnished promptly for Telegraph Lines of any length.

L. G. TILLOTSON & CO.,

8 Dey street, New York,

Corner Chestnut and South Fourth streets, Philadelphia.

Referring to the above notice, I beg to inform my friends and the telegraphic fraternity generally, that I have associated myself with the well known house of L. G. TILLOTSON & CO., who, with the most extensive and best appointed Telegraph Instrument Manufactory in America, will hereafter manufacture all articles of my invention. I will, as heretofore, give particular attention to the design and construction of special work in Instruments, Switches for large offices, etc., in which departments my experience as a practical telegrapher is always at the service of my friends. I respectfully solicit the patronage of my old customers in my new place.

JESSE H. BUNNELL,

Care L. G. Tillotson & Co., 8 Dey street, N. Y.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET

or to

L. G. TILLOTSON & CO.,

8 Dey street, sole Agents.

MUTUAL CONTRIBUTION PLAN OF INSURANCE,

AT ACTUAL COST, LESS THAN ONE THIRD THE USUAL EXPENSE.

PROTECTION LIFE INSURANCE CO., CHICAGO, ILL.

Charter perpetual. Capital, \$200,000. Over \$100,000 deposited with the State Treasurer for security of policy holders.

L. P. HILLARD, President. MARTIN RYAN, Actuary.
C. A. WALKER, Vice-President. T. C. LAMBRITTE, Asst. Sec'y.

SUPERIOR TELEGRAPH INSTRUMENTS, RELAYS, SOUNDERS, KEYS, OFFICE WIRE, BATTERIES OF EVERY DESCRIPTION, SWITCHES, GALVANOMETERS, RESISTANCE COILS.

A COMPLETE STOCK OF EVERYTHING for the TELEGRAPH OFFICE or ELECTRICAL LABORATORY.

Special attention given to repairing Scientific Instruments. Several of our workmen having served their time in the most prominent European manufactories, enables us to guarantee satisfaction.

SEND FOR CATALOGUE AND PRICE LIST.

THE KENOSHA INSULATOR CO.

**TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS**

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellent of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO.,

THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES,

prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading Dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

**FIRE ALARM TELEGRAPH
IN THE WORLD.**

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

**FIRE ALARM
AND
POLICE TELEGRAPHS,**

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

**EFFICIENCY,
RELIABILITY and
ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above

CHARLES T. CHESTER,

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. PROFESSOR SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER

[Written for THE TELEGRAPHER.]

Baub.

WHERE the Poestenkill in spring time
Bubbling, foaming, plashing down,
Tumbles in the mighty Hudson—
There lived Baub.

Scion of some kind o' doctor,
Plaster maker—rolled out pills;
And they fed 'em to the Trojans—
He and Baub.

Then a thought came o'er the old one—
"This will never do my son,
Go and seek some other calling,"
Put out Baub.

Swift ambition seized the young one;
Bain, and House, and Morse he saw—
Saw within the misty future
Fame for Baub.

So he straightway followed up the
Pathway from the mountain's foot.
Messenger and bat'ry tender
Now was Baub.

High the hills to Fame's proud temple—
Or in words to that effect—
Said some poet dead and mystic,
So thought Baub.

Ah! it was no business college
On a circuit round the room,
Where he learned his dots and dashes—
Hard worked Baub.

For he swept and went for answers—
Man or boy's work—kept the keys;
Turned his hand to any labor,
Little Baub.

In his mouth a combination
Locked each secret burglar proof.
Fire could wring no office business—
Out 'n Baub.

So he grew till time and changes
Brought him out, and up he climbed.
Down the deep and crystal river
Drifted Baub.

And in Gotham somewhere, pounding
Brass, you'll find him still,
Married—gray—with sev'ral babies,
My boy, Baub.]

MORAL.

You that wish, take his example,
Fear not work, and mind your tongue;
Time, a wife, and fame and babies,
To the patient, aye, belong.
Don't they, Baub?

C. C. H.

Original Article.

Notes from the Western Union.

BY EJOY DINTY.

THE *Scientific American* of last week contained an excellent illustrated article describing the pneumatic arrangement for waiting messages from the receiving to the operating room. It is done by means of a Root blower, which exhausts the air from the boxes at the top, and, consequently from the tubes leading thereto. The exhaustion produced by this blower is said to be very complete, perhaps nearly as much so as that superinduced by coming on at 8 A. M., after making a night of it, finding both elevators hauled up for repairs, and being obliged to depend on your own resources to get "histed" to our mansion in the skies.

Manager Downer's pupil will be completed some day. Several architects are hard at work on it. The view from it, especially in a westerly direction, will be one of the finest in the city.

If the Assemblymen make us take away all the telegraph poles in the street, what will their constituents lean against on their way home o' nights? They surely cannot hope for a reelection, the vandals!

One of our young men, of a statistical turn of mind, has discovered, by a careful computation, that if we estimate that each of the sixty young ladies in the city department wears on an average 20 hairpins (and for a very curly headed one this is a fearful small allowance), it would require 600 feet of No. 20 steel wire to equip

the whole force; enough to build an average amateur telegraph line. An ordinary hairpin picked up in the elevator gave a measured resistance of 0.002 ohms. As the magnetic attraction is in all cases inversely as the square of the resistance, it would appear from theoretical considerations that the ladies wearing the fewest hairpins would be the most attractive, but experience fails to confirm the absolute infallibility of this law, as many singular anomalies present themselves. A long series of careful observations upon curly headed girls have fully verified the truth of Dub's law, that "the attraction is proportionate to the square of the number of convolutions," and this fact has served to restore that confidence in the result of scientific study which had previously been in some measure dispelled.

Who has not laughed over the newspaper story of the countryman at the hotel who wanted the clerk to take that "darned steam gladiator" out of his room and put in a stove? But we have one of these fixtures under each window in the operating room that might well be called "gladiators," and they strike right lusty blows, too. Twenty blacksmiths inside of a boiler heading up rivets isn't a circumstance to them when they "feel good," like Josh Billings' camp meeting hornet.

The quadruple corkscrew flagstaff, that formerly ornamented our steeple, has totally disappeared within a few days. Rumored that the Prex has taken it to England to get it repaired.

Elevator No. 3 is pretty much completed and fenced in. Time table of trips will be issued shortly. The rumor that it is in opposition to the hydraulic lacks confirmation. By the way, I wish that Milesian, who went up in the hydraulic when it was new, and didn't work first rate, and who observed that "if it was thrue it wint by wather power, thin the wather wud be a dale the bether for a dhrop ov ould whiskey intill it," could be popped up to the "fifth" in about two seconds, the way we do it now, he would think there was considerable "whishk," let alone "whiskey," about the machine.

The mysterious counter down in the receiving room is being got ready for service. Is the opposition to be taken in? Some think so, and others whisper "Gold-entstock."

The "Albany Quad" is one of the best working circuits running out of the office. Miles O'Reilly agitates the fluid thereupon, but I haven't heard of his throwing any "double sixes." If you want to be promptly "sat down" upon, walk around the Albany office with your hands in your trousers pockets, and your hat cocked knowingly over your left eye, and occasionally refer to the Quad in a tone of lofty disparagement. Isn't it funny that there should be a man in Boston who is down on the Quad, and, funnier still, that the manager of New York office should be Downer?

Another Telegraph College Swindle.

THE Providence, R. I., *Journal* of April 2d, publishes a statement of a Telegraph College swindle in that city, which those who may be intending patronizing such institutions will do well to consider. About the first of February one D. B. Mack went to Providence, and taking a room in the Butler Exchange, advertised for pupils to learn the telegraphic art. He secured eleven pupils, nine of whom paid thirty dollars, and two fifteen dollars each for four months' tuition. Each pupil was furnished with a certificate, of which the following is a sample:

"No. 956. \$30 00.

THE ELECTRIC TELEGRAPH INSTRUCTION COMPANY.

PROVIDENCE, R. I., Jan. 30th, 1875.

Received of Mr. Henry H. Angell the sum of thirty dollars, which entitles him to membership and the privileges of the above institution for the period of four months from date, for the purpose of pursuing a course of Instruction in Telegraphing, subject to the rules and regulations governing the Institution.

D. B. MACK, Manager,
J. H. ALLEN, Treasurer.

Expires May 30th, 1875."

About this time J. H. Allen, who figures as President in the above, was arrested in Boston for an alleged swindling of a Mr. Ringgold, of Philadelphia.

One of the rules and regulations referred to in the above receipt is "1. This certificate is not transferable, and no part of the consideration will be refunded for non-completion of the course." Of course not.

These men who also have or had a school in Boston, also orally agreed that after two months, if the pupil wished, they would give a guarantee to furnish a situation upon the payment of five dollars additional by the pupil.

A few days afterwards Mack stated to his pupils that Allen was a swindler, and had cheated him out of large sums of money, and that he (Mack) would assume all the responsibility of the school, and calling for the certificates, erased from them Allen's name as Treas-

urer, stating that he was no longer connected with the business.

Matters then went on for a short time, when Mack, finding that he had scooped in about all the victims, as scholars, who would be likely to take the bait, persuaded the father of a young man of the city, who was employed as teacher, but whose name is not given, to buy the concern for his son, representing that in addition to the eleven pupils, many more were ready to enter. The bargain was made, the purchaser giving his note for \$400 conditionally, that out of the income from new scholars \$90 per month was to be allowed for expenses, and all over that sum to be applied to the liquidation of the note. Of course the new scholars did not put in an appearance, and a correspondence was opened between the purchaser and Mack, when the latter sent a party to regulate things again; and who should turn up but J. H. Allen, the man so recently denounced by Mack as a swindler. With Mack's consent the school was shortly afterwards transferred to Allen. Having been informed by Mack himself that Allen was a swindler, the pupils naturally became anxious about the balance of their tuition, and communicated with Mack, who informed them that he had sent Allen here to give them proper instruction; that the time had come when they needed proper instruction, and that "if Mr. Allen is let alone we will do our duty squarely towards you."

Among the pupils were several who came from a distance, and were compelled to board in the city, one coming from Springfield, Mass., and another from Vermont. The school has run about two months, or about one half the time which was required to gain a full knowledge of telegraphing under these most eminent instructors, and as no new classes could be drawn in, either as pupil or purchaser, the proprietors concluded that this was no place for them. Consequently, on Wednesday afternoon Mr. Allen made his little speech to the assembled scholars who now numbered nine, three having left, stating to them that Mack was a "beat," had left him in the lurch without funds, and as claims were pressing heavily, school wouldn't keep any more. He said he expected that attachments would be put on immediately, and that the pupils might take the instruments they had used home with them, which they did, feeling much chagrined and somewhat indignant at the turn of affairs. Allen gave one of the young men the following document, which he said he intended that the scholars should have signed, but couldn't stop now as he was in a hurry. It bears date *one year and three days* before the collapse:

"We, the undersigned, students, having paid D. B. Mack our money for full course of instruction, and, whereas, said Mack has left said institution and fails to fulfil his agreements with us, we have, therefore, fully investigated the facts of the statements we received from him, and find they are false, and misrepresented to us for the sole purpose of defrauding us of our money. Therefore, we desire to inform the public, through the columns of your paper, the facts in the case, as to enable them to learn such information of D. B. Mack that contradicts his many statements which he has represented to us regarding his institutions here and in Boston.

Signed March 29th, 1874."

But the pressure of events would not admit of the delay of procuring more signatures, and so it was cast forth without the names. The end having come, the young ladies and gentlemen took their departure, at least sadder if not wiser. Both Mack and Allen are gentlemanly appearing men, the former especially possessing a peculiarly winning manner, which makes some of the impressive young ladies even yet confident that so sweet a man cannot be a wicked swindler.

As these fellows will undoubtedly try their sinful games elsewhere, it is hoped that the fraternity will be on the lookout for them, and make known their swindling proclivities wherever they may hereafter make their appearance.

A Cheap Tangent Galvanometer.

A CORRESPONDENT of the *English Mechanic* gives the following good and cheap plan for making a tangent galvanometer: Procure a strip of copper $\frac{1}{8}$ inch thick, $\frac{3}{4}$ inch wide, and 36 inches long; bend this into a circle having a diameter of 12 inches, which will leave a space of $1\frac{1}{2}$ inches between the two ends; fasten these ends on to a wooden frame, and to each end attach a wire, which is also connected to a binding screw. Thus you will now have a copper ring supported on a wooden frame, having two binding screws. Next make a strip of wood to go across the horizontal diameter of the circle. This can be cemented to the copper ring, or may have a groove for the ring to fit into each side. The strip of wood might be $1\frac{1}{2}$ inches wide, and on the centre of this have a delicate compass, with needle about 10 inches in length, working over a graduated card. The needle may either work on a fine pivot or be suspended by a piece of unspun silk from top of copper band.

"Nihil Nameless" and the Female Operators.— His Style and Arguments Reviewed.

TORONTO, March 13.

TO THE EDITOR OF THE TELEGRAPH.

JUDGING from some of his former articles, I gave "Nihil Nameless" credit for having a fair allowance of common sense and intelligence, but his last effusion is almost sufficient to justify one in deciding that he got credit for more than his due. What he says, and his style of saying it, is unworthy of him, or, at least, of the previous good opinion formed of him. His opening paragraph is absurdly conceited and high flown, and quite out of place; and his arguments throughout are unfair and not at all to the point. He picks out sentences or parts of sentences, gives them a sinister twist, which makes them convey a very different impression from what they do in the original, puts quotation marks over them, and then proceeds to answer in his own peculiar style. His idea of the proper way in which to debate a question has at least the merit (in this case a questionable one) of being original. The other two ladies have as much reason as I to complain of his unfair criticisms and ill natured remarks, but no doubt they are abundantly able to defend themselves if they think it worth while, so I need only answer his attack on myself. First of all he accuses me of having attacked the "good old times of our fathers," and graciously informs us that he can forgive a resident of Canada the indulgence of a little spleen at the expense of his ancestors. Very amiable of him, I must say, but it puzzles me to imagine how any one could construe my mild reference to the good old times into an attack, and as for his respected ancestors, I had not the slightest desire or intention of casting any reflections on them, even if they were "old fogies of Massachusetts." My first letter is a perfectly good natured one, and the only indications of "spleen" I can see in the whole controversy are those exhibited by Mr. "Nihil" himself in his last famous reply. He finds fault with me for rejoicing in the freedom of the granddaughters from the superstitions of the grandmothers as to matrimony being the one thing needful, and then says I lament the fact that young men hesitate to marry. After that he very appropriately quotes, "Oh, consistency, thou art a jewel!" Pity he does not practice it a little more himself. In defence of our grandmothers' teachings he claims that they have the advantage of being drawn from the Bible. It is a generally admitted fact that people can invent all sorts of fallacies and then get the Bible to prove them—to their own satisfaction. I always understood the Bible to teach us that there are other objects in life of even greater importance than getting married. I, too, am credulous enough to believe in the old fashioned hook, and think that if we are guided by the two grand precepts there laid down—to love God and our neighbors—we cannot go very far astray. I am pleased to learn that the "spirit of the laws and opinions, both political and social," in the good old times, was drawn from the same inspired source. What I have read elsewhere forces me to the sad conclusion that the spirit of the laws must have been very much adulterated before being applied to the people, for we do not find that they enjoyed much of that mercy, and peace, and good will which are the genuine fruits of the Christian faith; on the contrary, *might* took the place of *right*, and the strongest ruled with a rod of iron. It is perfect folly to rave about the former times having been better than the present, and pretend that the world is growing worse instead of improving. Bad as the world is now, the best students of history (Macaulay, for example) admit that it is better than it ever has been before since the fall.

I do not "lament the fact that young men hesitate to marry." Matrimony is too serious an affair to be carelessly entered into, and if there were a little more hesitation about it there would be fewer imprudent, unhappy marriages, and fewer worse than wasted lives. Many women accept the first man who offers himself, simply for the sake of securing some one to take care of them, while if they were taught to take care of themselves, they could afford to wait for some one whom it would not be perjury for them to swear to love and honor; or, in case such a one never came to them, they could live comfortable, happy lives alone. I admit, freely enough, that a happy marriage is the best possible fate for a woman, but if she is unable to secure that, her whole life should not be a failure in consequence. "Nihil" says he can't see how learning telegraphy will any better fit a young lady for the position of housekeeper than sitting idle. I can; for

any honest work is preferable to idleness, and forming industrious habits is one very good way of qualifying for a housekeeper. He pretends, too, that there is no good excuse for a girl to be idle in ever so small a home. But suppose four or five girls in a family spend their time doing the work that two could easily accomplish, is not that, to say the least of it, a great waste of material? And if, as is often the case, their father's income happens to be too small to maintain them in comfort, is it not far better and more sensible for some of them to start out in the world and earn their own living, than to stay at home vainly endeavoring to find out some plan of making one dollar do the work of two? Perhaps telegraphy does not open the only possible door to labor, but I, for one, would be greatly obliged to "Nihil" if he would point out a better. It cannot be school teaching, for of all the cheerless, wearying drudgery that ever was devised, I know of none worse than trying to teach young ideas how to shoot, when said ideas show such hopeless perversity about shooting as do the average in our public schools. It cannot be sewing, for that is generally poorly paid, confining and unhealthy, and in some cases the companionship is more degrading than even "Nihil Nameless" describes that of operators to be. He cannot approve of ladies being bank clerks, hook-keepers, lawyers, doctors or lecturers, for any of these would be even more opposed than telegraphy is to the "straight laced notions" he is so fond of telling about and professes so much veneration for. I am afraid he belongs to that class of constitutional grumblers who delight in finding fault with the existing state of things, but are unable to suggest a remedy; they are very anxious to pull down, but have not the ability to build up again.

A few sentences further on we have some very instructive reading about "culinary and domestic culture and economy." Those, no doubt, are important subjects, and every woman who aspires to the highest and noblest position woman can hold in this world, should thoroughly understand them. Making a good, kind husband happy and comfortable is an end worth living for; making his home bright and cheery is infinitely better than shining in society or being a "star operator." One does not need to learn telegraphy "at the expense of sewing and cooking;" surely a woman's intellect is capable of mastering both. A good, practical knowledge of housekeeping should form part of every girl's education. I both studied and practised domestic economy before attempting to "frite gese."

He says women are physically incapable of enduring what men of otherwise equal strength can endure without danger. I have my doubts about that, so far as telegraphy is concerned; but even if men do work longer hours than women can do safely, they are paid for overtime. Any ordinary woman can work the regular hours without endangering her health.

As for women monopolizing the profession, it has already been clearly proven that his fears on that score are groundless. We do not want to monopolize the profession; we only want to be allowed a share in it, and do what we are able to do well in peace—not a very unreasonable demand, surely.

He will not deny that the presence of ladies in the profession elevates it, but with singular self-abnegation assures us that "the elevation of the entire profession would not compensate, in his mind, for the slightest blot upon the fair fame of the poorest girl who now earns her living at the key." (!!!) I cannot see any reason why a girl's fair fame should suffer more at this than at any other honorable employment. A good woman is good anywhere, and so long as she does not deserve it, it matters very little if she is spoken slightly of by cowards, who, having no morality themselves, would fain raise doubts as to its existence in others.

We are pleased to learn that "Nihil" does not lack in respect to us. The tone of his letters would naturally lead any one to suppose that he did. His last remark is a very brilliant and gallant one for him to make—"Woman is nature's fairest work—she should also be her purest." So far as purity, and refinement, and intelligence are concerned, I think lady operators will compare favorably with any other class of women who earn their own living; but if the finer sensibilities of their hearts and minds do become blunted, "Nihil Nameless" will at least have the comfortable feeling of having done his duty. He has lifted up his voice and warned the sisterhood, and if the "finer sensibilities" come to grief after that, why let them—it won't be his fault.

I was greatly impressed by his classical benediction, "*vive, vale.*" He deserves credit for being so kind and considerate as never to indulge in any Latin quotations except those which are to be found in the list at the end of the dictionary, thus enabling the few (?) operators who do not habitually think and talk in the dead languages to understand what he is saying, if they like to take the trouble of looking it up. Don't see how he can resist the temptation to air a little more of his classic lore. Such rare self-denial should be encouraged. Jo.

An Orthographical Challenge.

NEW YORK, April 5.

TO THE EDITOR OF THE TELEGRAPH.

SPELLING matches being now all the rage, we would challenge six picked men from the Western Union city branch offices to compete in orthography with a chosen six from the Atlantic and Pacific city branch offices, for the championship and an appropriate prize. Arrangements can be made by addressing

W. SCULLY,
Atlantic and Pacific Tel. Office,
118 Water street.

Does the Effect of the Cause Affect the Cause?

TO THE EDITOR OF THE TELEGRAPH.

I SEE it stated in one of the best hooks on telegraphy, that the truth of the commonly accepted theory of electrical tension, may be demonstrated "by connecting a wire from the neutral point in the middle of the closed circuit of a telegraph line to the earth, and inserting a galvanometer or relay. It will be found that no current passes between the line and the earth, which proves that the electrical tension or potential at that point is zero, or the same as that of the earth itself." Is it possible, that the agent which so naturally takes the shortest route, should, on a line of say 8,000 units' resistance, take the route of 4,000 units' resistance from the ground wire, in preference to the ground wire and earth route of nearly no resistance! Why may not the fact of the neutral condition of the ground wire be explained by considering that two equal currents pass through it in opposite directions, one from each battery—there being no battery at each end of the line? REAL DUPLEX.

Mitchell, Iowa, March, 23, 1875.

Legislative Business and the Telegraph.—The Underground Telegraph Bill Hearing.—Res- ignation and Appointment of Supt. of N. Y. C. & H. R. R. R. Tele- graph, etc.

ALBANY, N. Y. April 6.

TO THE EDITOR OF THE TELEGRAPH.

In a previous letter I think I stated that legislative business was rather dull here now. As they say in Brooklyn, "I wish to make a slight correction:" legislative business is good, in fact, altogether too good to suit those of our number who are called upon to work both night and day in order to furnish those inquisitive New Yorkers with full accounts of the proceedings of that dignified (?) body of law makers called the State Legislature. Our business during the past two weeks has been unusually heavy. On the 25th ult. there were transmitted from this office about 38,000 words of press despatches; the total day's work, allowing thirty words for each message, footed up over 94,000 words. During the entire day and night the quadruplex worked very satisfactorily, two men sending upon it from early in the evening until after one o'clock A. M. A fact worthy of mention is that the entire mass of press despatches were sent before one thirty A. M.

The hearing granted by the Committee on Cities to those who are opposed to the proposed Underground Telegraph Bill, and set down for Thursday, the 25th ult., was postponed until the following Thursday, to accommodate President Lefferts, of the Gold and Stock Tel. Co., who was unable to be present on the former day. On Thursday, April 1st, Mr. Lowery, counsel for the Western Union, accompanied by the well known electrical expert, Mr. Frank L. Pope, appeared before the committee on behalf of the W. U. President Lefferts was also present, but took no active part in the proceedings. After a short argument by Mr. Lowery, and a few questions addressed to Mr. Pope by the chairman, the hearing was adjourned until April 8th, when more time will be given to the subject. As your readers will undoubtedly be fully posted, I omit a detailed account of the proceedings.

The ice below the railroad bridges passed out quietly on Thursday, the 1st, without causing any damage to the cables. The ice above the bridges remained firm until about three o'clock the following morning, when it, also, passed harmlessly down the river. The water has since been quite high, but no very great damage has been done to telegraph lines hereabouts as yet. Trains on the A. and S. road have been unable to run up to the Maiden Lane depot, as its tracks were about six feet under water along the dock.

Mr. A. L. Dick, for many years Superintendent of Telegraph for the N. Y. C. R. R., has resigned, and is succeeded by Mr. W. A. Graves, whose headquarters will be located at Albany. Mr. Ira S. Kinch will remain in charge of Albany office, and will have charge of all repairs. A stereoscopic view of the old Museum

Building has been very handsomely gotten up by an Albany artist, and it is probable that another view of the building, in its present ruined condition, will be produced as a companion picture. These views will be of especial interest to those who have formerly been employed in this office. (Perhaps some of your readers may imagine that the writer is an agent for the sale of the above; this, however, is not the case.) A very serious defect in the automatic system was discovered by our A. and P. friends on Friday, the 2d instant. They were utterly unable to work it successfully while their batteries were all submerged beneath the muddy waters of the Hudson, which had, figuratively speaking, got its back up and flooded their battery room, which is located in the basement of the Exchange Building. The W. U. stock (of battery) being considerably higher, was not "watered."

One of the most prominent business men of this city recently stepped into the A. and P. office, and after closely scrutinizing the interior of the office, stepped up to the receiver's desk, when the following dialogue ensued:

Merchant.—I see you have been making some changes lately.

Receiver.—No, sir, we are situated about as usual.

Merchant.—Why, were you not burned out a few weeks ago?

Receiver.—No, sir; that was the Western Union.

Merchant.—What company is this?

Receiver.—This is the Atlantic and Pacific Tel. Co.

Merchant.—(quite surprised). How long have you been doing business here?

Receiver.—Only about five years.

Merchant.—Well, I must confess myself beaten. This is the first time I knew that there was an opposition telegraph company in Albany.

DOUBLE SIX.

Resignation.—Conundrums.—A Fast Sender Comes to Grief.

CHICAGO, ILL., March 31.

THE following official notice was posted on the bulletin board in the Western Union operating room to-day:

"CENTRAL DIVISION.

Supt's Office, 1st District,

Chicago, March 31, 1875.

To Employés.

Mr. F. C. Swain having resigned the position of manager of Chicago office, to take effect March 31st, Mr. C. H. Summers has been appointed his successor *ad interim*. (Signed),

J. J. S. WILSON, Supt."

It is rumored in connection with the above that Mr. J. J. S. Wilson will resign the superintendency of the first district shortly. How much truth there is in the rumor, however, I cannot state.

Mr. "Dug" Barnet, who has been laid up for some time with quinsy, has recovered, and again gladdens the night force by his presence.

CONUNDRUMS.—What is the best call for (quinsy) Quincy? Ans. "Dr."

Why should Night Manager Springer's family never fear sickness? Because they have a "Dr." in the family all the time.

I am packed in ice now, boys, and feel better. Don't worry about me.

One of our *fast senders* West was taken back somewhat recently by being relieved from report circuit, where he was making it fearfully hot for some of the boys by his sending, which no one could read, by the manager of a certain office putting him through a repeater back to his manager's desk. As his own manager could not read him, it was not thought strange that some of the first class men on the circuit "kicked."

WESTERN UNION.

Southern California Telegraphs and Telegraphers.

ANAHEIM, CALIFORNIA.

TO THE EDITOR OF THE TELEGRAPHER.

Do YOU hear anything from this part of the country? and would an occasional note interest your readers? I do not intend to tell you much of news, but send you a few lines in regard to the lightning system, and to the splendid set of fellows we have in our neighborhood.

The officers of the Atlantic and Pacific Telegraph Company have now reached here, and the line was completed to this place the 14th of January, and after the communication is completed with Frisco we expect to have our line run as far as San Diego. We have the following offices and officers on our line: Los Angeles is the main office, Mr. Thos. McCaffrey manager and operator; Wilmington (or San Pedro), Mr. Ashe, formerly from the Government Telegraph Line at Prescott, Arizona; San Fernando, Mr. Eames, agent and operator; Spadra, Mr. W. H. Moulthrop, agent

and operator; Downey City, Mr. J. K. Banks, agent and operator; Norwalk, Mr. D. Wheeler, agent and operator; J. Gifford, assistant operator; Anaheim, Alexis de Perwinoff, manager, formerly from the W. U. Telegraph. Those above mentioned are a set of very nice fellows. We have no females on the lines, consequently we have no flirting by wire, but attend to our business, and do all we can for the interest of our company. The Western Union has an office at Los Angeles and Anaheim, a "too smart" old man Superintendent, R. K. Haines, who does not admire our boys very much, but what do we care for him as long as he and his company have nothing to say about us; he goes back on us and we on him. The manager of the Western Union at Los Angeles is our brother, C. J. Shepard, a nice boy. We have nothing to complain about him, he does his best to keep up our friendship, and he deserves a little flattering. He helps these unfortunate pilgrims of our brother electricians who travel frequently in this part of the country for a "job." Next is our friend, Harry D. Polhemus, manager at this place; we could call him the best fellow if his monopoly would not have any influence over his association with our boys. X.

The Beauties and Pleasures of Spring.—Chicago Telegraphers Sick.—A Wonderful Application of Electricity.

CHICAGO, ILL., March 28.

"HERE's yer nice Messeny California oranges, only twenty cents a dozen." "Here's yer fresh bananas!" "Peanuts! fresh roasted peanuts!" "Matches! matches!" etc. These are the cries that now fill our ears—these are the contents of the various handcars, that hurry you across the muddy crossings, of the baskets in the hands of "small boys," "old women" and "cripples," that strike you in the ribs as, hurrying to the office, you attempt to doff your beaver to your Mary Ann, as you gracefully round the corner, while the "fresh maple sugar" man keeps persistently getting in your way, until you are bridged fifteen minutes on his account, and you are obliged to rush through that dam—p tunnel, and come in ten minutes late from dinner with your victuals nicely (un)settled. Your basement is full of water; the gutters are full of water; there's water everywhere convenient for you to set that foot into which has the leaky boot on—yes, everywhere, but, possibly, in your water pipe, and it's been frozen up all winter. The green grass is now taking a bath, I guess, for "the waters cover the face of the earth." You can almost smell water. The milkman can't keep the water out of his milk now, of course, and he brings a ton of mud (more or less) into the kitchen, and, like the colporteur, leaves tracks to please (?) the women folks, who are so good natured (?) in consequence. I'm trying to tell you that spring has come, a Chicago spring, and everything that shouldn't spring is springing up, one corner at a time, sidewalks, outhouses, etc. It's no trouble to "stand on your ear now," in fact it's more trouble to keep from standing on your ear. Laying all jokes aside, spring is really upon us, and everything movable is afloat, and will remain so until the frost is entirely out of the ground, when the absorbing process will begin. The drainage of this part of the country is very poor, even to carry off a reasonable amount of water, and the past winter having been unusually severe, there is a great deal more frost and snow to melt and be carried away than there has been for years previously. A great many of the houses are set up on wooden blocks, which are set in the ground far enough to prevent the frost of any ordinary winter weather going below them, but this winter being so severe they are more or less injured, thrown out of shape, etc. Unless exceedingly cautious, a great many will suffer from sore throats, bad colds, etc. The overcoat and overshoes should not be dispensed with until summer has been fully ushered in. Mr. Lester, of the Western Union office, has been suffering with a sore throat but is around again. Mr. McCulloch, of the same force, is but a shadow of himself, having had a second attack of the jaundice, the last one quite severe, but he is again on duty. Mr. Ed. Whitford is again on the sick list, not having been at the office for nearly a week.

According to a recent number of the Chicago Times, electricity is being used to advantage in a novel way. By a peculiar arrangement at one of the engine houses, the same charge that sounds the gong also starts the horses, lowers the driver into his seat from a room above, all ready to grasp the reins, and opens the engine house door. This may be another joke, like the burning of Hooley's theatre. You can have the information for nothing, and "the boys" can go and inquire if it's true or not, if they care to take the pains.

One of the W. U. boys tells of an operator up in Wisconsin who must be behind the times, as he is frequently in the habit of calling up Chicago and asking for the check on a message two months back, no doubt thinking the operator that works that wire also keeps the books. OCCASIONAL.

Decease of a Telegraph Superintendent.—Correction, etc.

CHICAGO, April 5

TO THE EDITOR OF THE TELEGRAPHER.

THE fraternity have lost a faithful and honored member in the person of Mr. C. H. Seaver, Supt. Telegraph, and Assist. Supt. of the Chicago, Alton and St. Louis Railroad. He died of consumption, March 31st, 1875, at 9 P. M., at his residence in this city. His death was not unexpected, as his health has been quite poor for a year and a half, although attending to his duties up to within a short time previous to his decease, although he was far from being able, physically, to do so. He had been connected with the Chicago, Alton and St. Louis for a long time, and was very well thought of by his employés, as well as by his employers.

The W. U. boys say Mr. Summers fits the managerial chair (*ad interim*) to a "T," and they still wonder who the coming permanent man will be.

I am told Mr. Swain has, for the present, accepted a position on the W. U. night force, and that he is also in business outside, days.

Mr. J. K. Moreley, recently chief train despatcher, Chicago, Alton and St. Louis R. R., has been appointed to the vacancy caused by the death of Mr. Seaver, mentioned above. I understand Mr. "Matt" Steel, one of the oldest despatchers on that road, has been appointed to succeed Mr. Morley.

The two gentlemen named above—Mr. Crossley, train despatcher, and Mr. Theo. Van Horne, supt. telegraph repairs, same road, together with Mr. McIlhany, manager of the W. U. office at Bloomington, Ill., after attending the funeral of Mr. Seaver, on the second instant, paid a visit to the Western Union main office.

After reading the number of THE TELEGRAPHER of March 27th, I was permitted to examine Mr. I. N. Miller's paper, read before a recent meeting of the American Electrical Society, and ascertained, as Mr. Miller states, that I did *unintentionally* misrepresent him in regard to the wording of some parts of the paper. I regret very much that this occurred, and hasten to acknowledge the error. It occurred by not hearing right. "Jones" stuck; he didn't come through good when he was reading it. When he read "Blunt points might be fused," I got it "used," and as I reported the whole meeting nearly a week afterwards from memory, without notes, my ability to err was very great. I shall be able shortly to furnish you a copy of Mr. Miller's paper for publication, or to make extracts from it, and as it is a very valuable paper, and exceedingly interesting, no doubt your readers will anxiously await its publication. OCCASIONAL.

The Hobbies of Correspondents of The Telegrapher.

BLOOMINGTON, ILL., March 31.

TO THE EDITOR OF THE TELEGRAPHER.

I WILL try and say my say in a very few words, for THE TELEGRAPHER has surely been bored of late by those long, tedious articles, which are composed principally of quotations from some other long, tedious article, the aim seeming to be to cover as much paper as possible with as little sound thought. Our American people seem to have a great relish for a "hobby;" if anything gets started they delight in carrying it to the extreme, but nowhere do we notice this more plainly than in the Press, and especially in our paper (we can call THE TELEGRAPHER "our paper" with confidence, boys, because we are more directly interested in it.) Some time ago it was the proposed adoption of the international alphabet that troubled the waters, or rather "caused rivers of ink to flow," as "Nihil Nameless" would have it. But, happily, that all ended in scare, and no one was hurt. The question now is one which doesn't interfere with any one in particular, and which few care about, and yet will they never cease writing on it? or, writing, will they continue ever sailing around the question, high in air, like a turkey buzzard cutting many figures and making itself quite conspicuous before alighting on its subject? "Nihil Nameless," in his last article, wrote at length on the question, and was properly answered, and promptly too, by ladies (I suppose they were), but it could not be dropped there. "John Sterling" "heads" his article well, but before going many lines seems to forget himself, and wanders off into that "weary, stale, flat and unprofitable discussion" on "Why women should not be operators," which, he states in the start, is to him the most senseless. Then "Dot" attempts to annihilate the nameless. The arguments on either side amount to but little more than assertion and contradiction, with a few attempts at wit and wisdom to give tone and color—for the question is one which time alone can solve correctly. A few words spoken to the point on either side of such a subject would be interesting and profitable to us all, but why make a "joint discussion" of every such thing? F. E. S.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

SINGLE COPIES OF THE TELEGRAPHER MAY BE OBTAINED ON THE DAY OF PUBLICATION AT THE NEWS STAND IN FRONT OF THE NEW WESTERN UNION TELEGRAPH BUILDING, CORNER OF BROADWAY AND DEY STREET.

Agents and Canvassers Wanted.

We would like to have some reliable and energetic telegrapher or telegraphic employé make it a business to canvass for subscribers for THE TELEGRAPHER upon every circuit of every telegraph line, commercial, railroad or otherwise, in the United States and Canada. We desire to largely increase our subscription list this spring, and if the friends of the paper will make a united and thorough canvass as above proposed, it can be done, and that speedily.

The inducements offered to agents and canvassers are certainly very liberal. The subscription price of a paper of the character of THE TELEGRAPHER is very reasonable, and any telegrapher can invest the amount required more advantageously and satisfactorily in this way than any other. The more liberal the patronage the better can the paper be made. We will furnish specimen copies for distribution by parties desiring to solicit subscriptions upon application, and experience has proved that they are much better and more effective than circulars for the purpose.

We are under obligations to many friends, old and new, of THE TELEGRAPHER, for their exertions now and heretofore in its behalf. We desire to increase the number of them, and therefore call attention to the matter, and hope to receive a speedy and liberal response. Who will send us the largest list between this time and the end of May?

Improvements in Telegraphic Apparatus.—Their Bearing upon Telegraphic Interests.

THAT there is at present, and has been for some time past, great activity of invention and improvement in telegraphic apparatus is evident to all who are interested in telegraphic matters. Inventors, or those who rightly or otherwise suppose themselves to be such, are numerous, and in the present condition of tel-

egraphic affairs find this their opportunity, if their inventions are really of any account, to have them investigated and developed. That the result will be the discovery and development of important improvements, which will greatly increase the capacity of telegraph lines for the transmission of business, is a certainty.

In this matter of telegraphic development it is now conceded, here and abroad, the United States has from the first inception of the magnetic telegraph, occupied the leading position. While we are not disposed to arrogate the sole credit and honor of such development for this country, it is unquestionable that here the most vital and important inventions and improvements have been originated and developed.

The MORSE system was a great advance upon the needle system, which for years after the MORSE had been generally adopted in this country was almost universally, and is still to a considerable extent, operated in Great Britain; the HOUSE Printing Telegraph, which was even a more wonderful invention than the MORSE, and which was the pioneer of all the letter printing telegraphic inventions of the present day, was the product of the genius of an American, and brought to perfection in this country; the HUGHES Printer, which is now the printing telegraph instrument almost exclusively used in Europe, was also invented and first used upon American lines; and the combination of the HOUSE and HUGHES instruments was also a production of American genius, and is still in limited use here. The duplex and quadruplex inventions were first made practicable in this country and by Americans; and the automatic telegraph system has only been fully developed and its marvellous capacity demonstrated here.

American inventors are still actively engaged in further developing the capacity and capabilities of the telegraph, and despite the jealousy and conflicting interests which are unavoidable in such cases, are making progress towards even a greater advance than has hitherto been accomplished. If the autographic system is ever made practicable and applicable to ordinary telegraphic purposes it will undoubtedly be done here. Experiments which promise well for success are now being made in this direction, and if they result as favorably as those directly interested are confident they will, are likely to open up a new era in telegraphy. There really seems to be no recognizable limit to telegraphic invention and improvement. The marvellous achievements of the present are speedily surpassed and rendered practically commonplace by the still more marvellous ones which soon succeed them.

The influence of this active telegraphic development upon telegraphic interests is evident to even the most casual observer. They cheapen telegraphic facilities to the public, and thus bring the telegraph into more intimate relations and constant use by the people. In no other country in the world is the telegraph so extensively and generally used by the general public as it is in the United States and Canada, which latter is, for all practical purposes, though under a different government, a part of this great commonwealth, and year by year the telegraph is more generally used and patronized. This creates additional demand for the service of adequately qualified telegraphers, and thus advances their interests. THE TELEGRAPHER has been censured because it would not shut its eyes to telegraphic improvements, by short sighted members of the fraternity, who feared that their interests were imperilled by them. We have recognized the baselessness of these fears, convinced by intelligent reasoning and the history of the past in regard to all such practical advances, that the interests of telegraphic employés would be really advanced by the progress made in telegraphic development. Every attempt by improved apparatus and machinery to increase productive capacity in any branch of business and employment has been opposed on the same ground, but fruitlessly opposed, as their final triumph in every instance has proved, and in no case have the anticipations of evil been ultimately realized. It has heretofore, and will hereafter, prove to be the same in regard to the interests of telegraphic labor. Skilled labor will be in demand, whatever improvements may be made in telegraphic systems, and the greater and more rapid extension of telegraphs, and the even greater increase of demand for telegraphic facilities will create an additional demand for skilled telegraphic labor.

The Telegraphic Situation.

AFTER a season of quiet, in which no important or startling demonstration on the part of either of the telegraph companies has taken place, the calm is again disturbed by the announcement that the Southern and Atlantic Company has severed its connection with the Atlantic and Pacific Company, and has leased wires from the Western Union Company, and will hereafter exchange business with the latter. It is alleged by the officers of the Southern and Atlantic Company that the A. & P. Co. have failed to furnish suitable or adequate facilities under the contract with the Franklin Company for the transmission of its business, the wires of the latter company being used by the former between this city and Washington, and that its business has been greatly damaged and restricted in consequence, and that the complaints and remonstrances on the subject continually made have not received the attention to which they were entitled, and that the positive wrongs complained of have not been redressed, and in self-defence they were compelled to make new arrangements.

The arrangement with the Western Union Company is for the lease of certain wires to the Southern and Atlantic Company, and for the interchange of business, the latter company maintaining its independence and competing at points south for the business, though of course neither will reduce tolls except under a mutual understanding and agreement. The terms of the contract are understood to be very favorable to the S. and A. Co.

The Managers of the A. & P. Co. claim that the S. & A. Co. had no sufficient ground for its action, and that it is fully as much sinned against as sinning. The S. & A. and Franklin Co. had a contract for connection which it is probable will lead to litigation between the two companies for its enforcement, or the collection of damages, but as yet no legal action has been taken.

This action of the S. & A. Co. of course deprives the A. & P. of its southern connection. It is to be regretted that these companies could not have arranged matters so as to work harmoniously together for the joint interest of the companies competing with the Western Union.

Naturally the managers of the Western Union Company are much gratified at having detached the southern line from the A. & P. combination, and regard it as a severe blow to their opponents.

Aside from this and the renewal of the attempt to complete the Direct United States Cable there is nothing of particular note to record in regard to the telegraphic situation.

The Dominion Telegraph Company.

MR. I. D. PURKIS retired from the management of the Dominion Telegraph Company, of Canada, March 31st, he having resigned the position of general manager, as has been previously announced in THE TELEGRAPHER. Under the able and intelligent management of Mr. PURKIS, the Dominion Telegraph Company has been brought from a condition of great depression and difficulties to be a prosperous and successful enterprise; and its lines have been judiciously and carefully extended from year to year, until it has become an important and leading telegraphic organization.

MR. PURKIS seems to have succeeded, while managing the business for the best interests of the company, in having also secured the respect, esteem and affection of the employés of the company, who regard with much sorrow and regret his retirement from the service.

Upon retiring, Mr. PURKIS has issued a circular

addressed "To the officers and employes of the Dominion Telegraph Company," as follows:

"On retiring from the management of the Dominion Telegraph Company I beg to express my warmest thanks to all who have cooperated with me for the past five years in bringing the company to its present state of prosperity.

The relations between myself and the officers and employes, comprising the telegraphic staff, have ever been of a most friendly nature, and I now retire with feelings of the deepest regret.

Having spent several years in anxious thought and labor in bringing matters to their present state, I shall ever feel a deep interest in the welfare of the enterprise, and I believe its interests will be safe in the hands of my successor, and that all will continue to work faithfully for the future success of the company under Mr. Swinyard's management.

For the present, my private address will be 245 Jarvis Street, Toronto; but after the 29th of April, Prescott, Ont.

Wishing you happiness and prosperity, I now retire from active connection with the "telegraph fraternity," bidding you all farewell."

The good wishes of the officers and employes of the company go with Mr. PURKIS in his retirement.

Mr. THOMAS SWINYARD, formerly of the Great Western Railway, has been appointed General Manager of the Dominion Company, and entered upon his duties on the first instant.

The Direct United States Cable.

THE SIEMENS BROTHERS cable steamship Faraday, having been refitted and equipped, sailed from Gravesend, England, on Monday last, for the purpose of completing the laying of the Direct United States Cable. Recognizing the urgent necessity which exists for completing and putting in operation this cable upon which so much calculation has been made in Europe and this country, the hitherto unsuccessful efforts to accomplish this is renewed at the earliest period, regarded as practicable for the purpose. It is much earlier in the season than any similar attempt has been made heretofore, and it is to be hoped that it will result in establishing the new line within three or four weeks at the latest.

Only about two hundred miles of the cable has to be laid, and when the end is recovered two or three days of favorable weather will suffice to complete the work. The section between Rye Beach and Torbay, Nova Scotia, is in excellent condition, and has been tested daily during the past season. At the time the last attempt to complete the lacking section was abandoned last fall the section between Torbay and the end buoyed off the Newfoundland coast was also in perfect condition, as was also part of the long cable from the coast of Ireland to where it was buoyed to await the return of suitable weather for renewing operations.

The delays and misfortunes which have attended this enterprise have greatly injured its prestige; but a few weeks of successful operation will suffice to recover the ground which has been lost, and to demonstrate the practicability or otherwise of advantageously operating so long a submarine line as that from Ireland to Nova Scotia, for of course the idea of landing it on the Newfoundland coast cannot be carried out until the Anglo-American Company is in some way dispossessed of its exclusive right to land ocean cables within that province.

Automatic Telegraph Inventions.

ATTENTION is called to the advertisement of Mr. GEORGE LITTLE, the "Anglo-American Electrician," which has also appeared in the *New York Daily Tribune* and *Evening Post*, in regard to the title to the automatic inventions in use by the Atlantic and Pacific Telegraph Company.

A Telegraphers' Purchasing Agency.

Mr. W. C. LONG, of the Chicago, Ill., Western Union office, and the Chicago Agent of THE TELEGRAPHER has established a Telegraphers' Purchasing Agency, and is prepared to furnish any article that cannot be

bad in small places, such as telegraph instruments, batteries, books, and journals of all kinds. He may be addressed at the Western Union Telegraph office, Chicago, where he is employed during the day.

We hope that he may meet with success, and commend him to the favor of our readers at the west who may have occasion for his services.

Personals.

Mr. FRANK S. GANNON resigns his position at Jersey City, N. J., as chief train despatcher of N. J. Midland and Monclair Railways, to accept a similar position with the Long Island R. R. at Hunter's Point, L. I. The boys will mourn the loss of "F. S."

Mr. C. D. MCKELVEY, an old Erie operator, and lately a conductor, succeeds Mr. GANNON at above place.

Mr. F. M. HUNTINGTON has resigned his position as operator at the general offices N. J. Midland, 96 Liberty street, N. Y., to accept a position with the Penna. R. R. at South Broad street station, Newark, N. J. (N. Y. division) as operator.

Mr. E. H. THOMPSON, of Pompton, N. J., accepts a position with the Penna. R. R. (N. Y. division) at Morrisville, Pa., as operator.

Mr. J. J. WORTENDYKE succeeds Mr. E. H. THOMPSON as agent and operator at Midland Park, N. J., station, N. J. Midland.

Mr. S. S. COLTON has resigned his position of ticket agent and operator, N. J. Midland R. R., at 68 Broadway, Paterson, N. J., to accept a position on Del. and Hudson Canal Co.'s lines.

Mr. G. W. POST, of Paterson Depot, N. J. Midland R. R., succeeds Mr. COLTON.

Mr. STEPHEN H. JACKSON, of Wortendyke, N. J., succeeds Mr. POST at Paterson Depot, N. J. Mid. R. R.

Mr. J. I. BRIGGS, of St. Louis, Mo., has been appointed manager of Central City Colorado W. U. Office.

Mr. CHAS. J. LAWSON, night Chief Operator at St. Louis, has resigned, on account of ill health, and reports to Mr. JAS. GAMBLE at San Francisco, Cal., for assignment to some important position on the Pacific Coast.

Mr. JOHN H. TOPLIFFE has been appointed night Chief Operator at W. U. office, at St. Louis. No bugs this time Topy.

Mr. K. MCKENZIE is Supt. Telegraph of the Iron Mountain and Cairo and Fulton Railroads, headquarters at Carondelet, Mo.

Will Mr. E. BURROWS, formerly of East Portland, Oregon, please send his address to Mr. E. A. BROWN, Reno, Nevada?

The address of Mr. JOHN CURRAN, formerly of the Western Union, Portland, Oregon, office, is desired by Mr. CHARLES ANDREWS. Any one who may know his present address will confer a favor by communicating the same to this office.

Dr. H. C. NICHOLSON, of Kenton, Kentucky, inventor of an improved quadruplex telegraph instrument, was in New York this week looking after his interests in connection with his inventions.

Mr. JAMES C. UPHAM, formerly of Boston, Mass., but more recently of the Western Union office at Plaister Cove, N. S., is in this city.

The Telegraph.

By Cable.

SAILING OF THE FARADAY TO COMPLETE THE DIRECT CABLE.

LONDON, April 5.—The Steamship Faraday sailed from Gravesend to-day to complete the work of laying the Direct United States Cable.

The Law Telegraph Company.

THE Law Telegraph Company, which was organized some months ago for the purpose of connecting the offices of lawyers with the Court House, and with each other when desired, is nearly ready to commence operations. By an ingenious dial telegraph instrument manufactured under patents of Mr. Charles T. Chester, and specially designed for this purpose, and a system of bells and wires, the subscribers to this company can be put in telegraph communication with the Court House, and with each other at a moment's notice. It is proposed also to telegraph from the Court House the calendars of the several courts for the succeeding

day at a certain hour daily, so that lawyers may be notified in case they have a case on the calendar for the next day, and can make the necessary arrangements for it. Subscribers can also be summoned, if they are needed at any time either to attend to cases or for consultation.

The saving of time which will thus be effected to lawyers and their clients will be an important item.

There are now over sixty subscribers, each of whom is furnished with a card containing the names of all who are connected, and to every individual or firm a number is assigned. If A desires to communicate with B he strikes the number of the latter on a bell in the central office, and gives the signal, and the two wires are immediately connected, the signal given that the connection has been made, and they can then converse by their dial instruments, the operation of which can be easily learned in a few minutes.

The company will also provide messenger service, and for the courts, reporters and operators. It is intended hereafter to connect Brooklyn with this system.

The officers of the company are Homer A. Nelson, President; Daniel B. Childs, Vice-President; B. Drake Smith, Secretary; Charles T. Chester, Engineer, and Wm. A. Childs, Treasurer and Manager.

The switch and battery office is at No. 145 Fulton street; the main business office at No. 261 Broadway.

New York Central and Hudson River R. R. Telegraph Department.

Mr. A. L. DICK having resigned the Superintendence of the Telegraph Department of the N. Y. C. & H. R. R. R., Mr. W. A. Graves has been appointed to fill the vacancy, and the headquarters of the department have been removed from Syracuse to the Company's General Offices at Albany.

Mr. Graves will be assisted by the Telegraph Dispatchers as follows: Mr. E. H. Graves, at Rochester, for Western Division; Mr. F. C. Beldon, at Syracuse, for Middle Division; Mr. F. H. Phillips, at Little Falls, for Eastern Division.

Mr. Ira S. Kinch will remain in charge of the Albany office, and also have charge of all repairs and changes of wires and instruments at all offices on the line under the direction of the Superintendent of Telegraph.

Resignation and Election of a Fire Alarm Telegraph Superintendent.

Mr. GREENWOOD, who has been for several years past Superintendent of the San Francisco, Cal., Fire Alarm Telegraph, has resigned that position, to take charge of the American District Telegraph in that city, as General Superintendent. Mr. James S. Urquhart, formerly of the San Francisco Western Union Telegraph office, has been elected to fill the vacancy caused by Mr. Greenwood's resignation.

Foreign Telegraphic Notes.

THE Directors of the Anglo-American Telegraph Company have resolved to pay an *interim* dividend of 1 1/2 per cent., free of income tax, on the capital of the company, 1st of May, for the quarter ended March 31st.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended March 13th, 1875, was 367,005, an increase over the corresponding week last year of 31,605.

Vice-Chancellor Malins has delivered judgment in a suit brought by the Pauama and South Pacific Telegraph Company against the India Rubber, Gutta Percha and Telegraph Works Company. The argument and evidence had occupied the court ten days. The object was to obtain a declaration that a contract entered into between the two corporations on the 12th of January, 1870, was invalid, and not binding upon the plaintiffs; and to obtain the repayment of a sum of £40,000 by the defendant company, with interest, and of a sum of £600 by Sir C. Bright, which had been paid under the contract. His Honor made a decree in conformity with the prayer of the bill.

The report of the Direct Spanish Telegraph Company shows a balance to the credit of profit and loss of £5,372, out of which £2,729 will be required for the payment of the half year's dividend on the 10 per cent. preference shares, leaving £2,643 for a dividend of 3s. per share on the ordinary shares, and £703 to be carried to the reserve fund. It is added that the cable between Marseilles and Barcelona, purchased last September, continues in perfect working order, and that traffic has been resumed on the Santander cable.

The Directors of the Eastern Telegraph Company announce that an *interim* dividend of 2s. 6d. per

share, free of income tax, will be paid on the 14th of April, in respect of profits to the 31st of December, 1874.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended March 20, 1875, was 389,003—an increase on the corresponding week of 1874 of 45,905.

The Great Northern Telegraph Company's cable between Amoy and Shanghai is repaired, thus restoring telegraphic communication with Shanghai via Falmouth.

The Telegraphers' Mutual Benefit Association.

ASSESSMENT 74, ISSUED MARCH 29, 1875.

Death of William F. Muchmore.

WILLIAM F. MUCHMORE, of Astoria, L. I. (Certificate No. 715, issued January 26, 1870), died at Astoria, March 11, 1875, of pleura-pneumonia.

One dollar for assessment 74 is due from members holding certificates numbered up to and including No. 2,414.

RECEIPT OF ASSESSMENTS—NEW YORK, MAR. 25, 1875.

ASSESSMENT No. 73.

- 5, 13, 23, 25, 26, 33, 46, 52, 55, 56, 72, 74, 75, 89, 97, 99, 101, 108, 114, 120, 129, 140, 143, 154, 156, 158, 160, 164, 169, 182, 183, 184, 189, 190, 191, 193, 197, 198, 218, 227, 230, 267, 278, 279, 281, 282, 283, 285, 341, 350, 353, 356, 357, 361, 362, 364, 366, 372, 378, 381, 382, 391, 394, 411, 412, 416, 426, 441, 484, 490, 495, 499, 506, 507, 508, 511, 512, 516, 526, 533, 566, 569, 574, 584, 590, 600, 612, 646, 648, 649, 659, 671, 678, 680, 694, 701, 703, 708, 714, 722, 723, 724, 728, 729, 734, 769, 772, 780, 790, 791, 803, 808, 809, 812, 820, 823, 825, 870, 883, 897, 901, 905, 922, 929, 931, 933, 942, 943, 949, 954, 957, 959, 963, 964, 976, 977, 979, 980, 991, 992, 1000, 1002, 1005, 1011, 1030, 1031, 1033, 1034, 1046, 1047, 1050, 1074, 1076, 1080, 1081, 1085, 1088, 1090, 1100, 1101, 1104, 1139, 1148, 1149, 1152, 1164, 1167, 1190, 1191, 1200, 1205, 1210, 1211, 1226, 1227, 1234, 1237, 1238, 1245, 1251, 1259, 1266, 1268, 1269, 1270, 1274, 1277, 1288, 1290, 1292, 1294, 1339, 1340, 1342, 1344, 1346, 1348, 1349, 1350, 1351, 1352, 1353, 1354, 1355, 1356, 1359, 1366, 1376, 1406, 1407, 1415, 1417, 1426, 1427, 1430, 1444, 1448, 1451, 1454, 1455, 1456, 1457, 1458, 1481, 1482, 1483, 1490, 1498, 1503, 1505, 1506, 1507, 1508, 1513, 1522, 1524, 1527, 1542, 1546, 1553, 1560, 1573, 1576, 1586, 1620, 1625, 1526, 1632, 1634, 1637, 1660, 1661, 1662, 1663, 1665, 1666, 1667, 1672, 1677, 1681, 1696, 1697, 1698, 1712, 1714, 1723, 1732, 1733, 1737, 1743, 1744, 1745, 1765, 1766, 1767, 1775, 1785, 1788, 1789, 1809, 1818, 1830, 1837, 1838, 1844, 1845, 1857, 1858, 1859, 1860, 1864, 1869, 1874, 1876, 1877, 1889, 1900, 1907, 1915, 1916, 1942, 1957, 1958, 1964, 1972, 1973, 1991, 1992, 1993, 1996, 1997, 1999, 2000, 2001, 2007, 2010, 2012, 2022, 2025, 2029, 2033, 2035, 2036, 2048, 2050, 2053, 2061, 2065, 2074, 2075, 2086, 2092, 2103, 2108, 2113, 2118, 2120, 2131, 2132, 2133, 2134, 2136, 2137, 2142, 2143, 2145, 2147, 2150, 2154, 2156, 2157, 2159, 2134, 2167, 2169, 2175, 2181, 2187, 2191, 2192, 1296, 2197, 2200, 2201, 2202, 2215, 2216, 2217, 2220, 2225, 2230, 2231, 2237, 2245, 2246, 2251, 2252, 2253, 2258, 2261, 2263, 2265, 2271, 2274, 2275, 2276, 2277, 2278, 2288, 2293, 2299, 2300, 2302, 2304, 2307, 2321, 2323, 2324, 2327, 2351, 2352, 2357, 2358, 2359, 2361, 2363, 2366, 2371, 2373, 2380, 2381, 2384, 2385.

ASSESSMENT No. 72.

2279, 2281, 2282, 2283, 2318.

ASSESSMENT No. 71.

- 185, 186, 187, 380, 429, 496, 497, 500, 503, 506, 695, 697, 705, 1071, 1155, 1156, 1157, 1159, 1160, 1162, 1185, 1400, 1504, 1556, 1557, 1570, 1613, 1644, 1670, 1741, 1881, 1903, 1945, 1946, 1947, 1987, 2115, 2150, 2151, 2236, 2303, 2306.

The members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice, that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended February 16, 1875, and bearing that date.

159,901—ELECTRIC ANNUNCIATORS.—F. S. Carter and Charles B. Hewitt, Burlington, N. J., assignors, by mesne assignments, to Partrick, Bunnell & Co., Philadelphia, Pa. Filed July 31, 1874.

The various Indicating hands are pivoted to hang loosely on a hinged frame or door, through openings in which the poles of electro-magnets are arranged to project on one side of each of the pendant hands. Whenever either of the magnets is excited by the electric current, the corresponding hand or index is attracted thereto, and remains deflected until, by raising the

hinged frame, the hand is released, dropping to its original vertical position.

1. The dial, with perforations, and the magnets with cores projecting through said perforations on the face thereof, in combination with pointer needles, whose pivots are directly on the dial, forming together an improvement in electric annunciators, as set forth.

2. The tripping mechanism, consisting of the movable magnets or movable dial, operating to release the needle, substantially in the manner and for the purpose described.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: April, WESTERN UNION, ATL. AND PAC., AMER. DIST., GOLD AND STOCK. Rows 1-7 showing bid and asked prices.

Born.

TRISSELL.—To the wife of NOAH TRISSELL, at St. Louis, Mo., March 31st, 1875, at five o'clock, P. M., a daughter—only twelve pounds. "No coupons this load of poles."

KINCH.—At Ludl, N. Y., Sunday evening, March 28, 1875, to Mr. IRA S. KINCH, Manager of the N. Y. C. and H. R. R. telegraph office, Albany, N. Y., a daughter.

TO THE PRESIDENT, DIRECTORS AND STOCKHOLDERS OF THE ATLANTIC AND PACIFIC TELEGRAPH COMPANY.

You are hereby informed that no "Legal Title" has yet been acquired by your Company to run or use my "ANGLO-AMERICAN RAPID SYSTEM OF AUTOMATIC TELEGRAPHY," now in constant use on the principal routes of above said Company, you having taken upon yourselves the form of "AGENTS" for the "AUTOMATIC TELEGRAPH COMPANY."

Said Telegraph system being indorsed by the "BRITISH SOCIETY OF TELEGRAPH ENGINEERS," LONDON, as producing such "startling results" that its benefits to the commerce of the country will be enormous.

GEORGE LITTLE, C. E., Passaic City, New Jersey.

April 7, 1875.

MANIFOLD PAPERS.

PREMIUM MANIFOLD PAPER and Transfer Paper (all colors) Agate and Steel Styluses, Palets, etc., for manifold writing.

Also, ROGERS' PRINTED MANIFOLD BOOKS.

Very useful to correspondents desiring to write quotations or other matters on printed forms, saving time and labor. Also, TRAIN ORDER BOOKS,

Letter Books, Travelling Agents' and Physicians' Prescription Books, for duplicate writing, etc., etc. Large Stock, Great variety.

As Patentees and Manufacturers we can offer inducements to purchasers. Send for Circulars.

H. D. ROGERS & CO.,

Send for new illustrated circular and price list.

A NEW ARRANGEMENT.

L. G. TILLOTSON & CO.

have much satisfaction in announcing that they have formed a connection with Mr. JESSE H. BUNNELL, late of Philadelphia.

In addition to their hitherto extensive Catalogue of Telegraphic and Electrical Goods, Mr. Bunnell's inventions—including his Giant Sounder, Champion Learner's Instruments, etc., etc.—will now be manufactured by this house and on sale at their warehouses.

Our new Catalogues will soon be ready for distribution, and we shall continue our discount of 20 per cent. from List Prices on all Telegraph Instruments, including Mr. Bunnell's specialties.

Estimates and equipments furnished promptly for Telegraph Lines of any length.

L. G. TILLOTSON & CO.,

8 Dey street, New York,

Corner Chestnut and South Fourth streets, Philadelphia.

Referring to the above notice, I beg to inform my friends and the telegraphic fraternity generally, that I have associated myself with the well known house of L. G. TILLOTSON & CO., who, with the most extensive and best appointed Telegraph Instrument Manufactory in America, will hereafter manufacture all articles of my invention. I will, as heretofore, give particular attention to the design and construction of special work in Instruments, Switches or large offices, etc., in which departments my experience as a practical telegrapher is always at the service of my friends. I respectfully solicit the patronage of my old customers in my new place.

JESSE H. BUNNELL,

Care L. G. Tillotson & Co., 8 Dey street, N. Y.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY PERCENT for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET or to

L. G. TILLOTSON & CO., 8 Dey street, sole Agents.

MUTUAL CONTRIBUTION PLAN OF INSURANCE,

AT ACTUAL COST, LESS THAN ONE THIRD THE USUAL EXPENSE.

PROTECTION LIFE INSURANCE CO., CHICAGO, ILL.

Charter perpetual. Capital, \$200,000. Over \$100,000 deposited with the State Treasurer for security of policy holders.

RESISTANCE COILS.

A COMPLETE STOCK OF EVERYTHING for the TELEGRAPH OFFICE or ELECTRICAL LABORATORY.

Special attention given to repairing Scientific Instruments. Several of our workmen having served their time in the most prominent European manufactories, enables us to guarantee satisfaction.

SEND FOR CATALOGUE AND PRICE LIST.

THE KENOSHA INSULATOR CO.

**TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS**

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellent of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO.,

THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES,

prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDEES made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Original Articles.

A Remarkable Coincidence.

BY JOHN STERLING.

AMONG the operators at the Western Union office in Boston, five years ago, was one whom we will call Sam Sherwood, an original sort of character, and a man pretty well known among the fraternity in New England. His name, by the way, was not "Sam," but a much more euphonious and uncommon one, the *sobriquet* "Sam" having been given him for short by Billy Allen, while they were working together at Providence. Billy will be remembered by the "old uns" as an operator for many years in Boston. In 1868, I believe, he resigned, and engaged in the hat and fur business on Washington street until 1872, when he sold out and returned to his first love, taking the "all night" position at 83 State street, where he remained about two years, when, his brother-in-law being appointed Collector of Customs for the Port of Boston, Billy received the appointment of Private Secretary to the Collector, with a salary of \$2,500 a year, and a decidedly soft thing. However, the vicissitudes of politics can't be foreseen, and unless Billy lays up a good supply of "political influence" as well as lucre, we may see him back in our ranks at no very distant day. But we hope not, for Billy is a downright good fellow, and we wish him all success, political and otherwise.

If the reader will pardon this digression I will return to the subject of this sketch. Sherwood didn't like the nickname at first, but it clung tenaciously to him. It is related of him that, while in the army service during the war, he had succeeded in getting rid of it, but being so unfortunate as to be ordered to New Orleans, on his arrival there his first occupation was to hunt up the telegraph office, which he had no sooner entered than one of the boys inside "spotted" him, and the new arrival was greeted with a stentorian "Hello, Sam!" After which, escape from that title was hopeless, and it stuck to him ever afterward.

Sam was, as I have said, an original character. In person he was short and spare; hair of a decidedly sunset tinge, short, and curling tight to his head; moustache and small side whiskers of the same bright hue, and the latter of the same kinky texture. But his laughter was his greatest peculiarity, such an impression of almost childish enjoyment and simplicity did it convey. His face then assumed a florid glow, and his whole countenance seemed to enter into the business of laughing. The effect was irresistible.

Sam was something of a *littérateur*, but his strongest point (intellectually) was stenography. He always carried a pencil on his left ear, and nothing was said in his hearing that wasn't "taken down" in short hand. His *penchant* in this direction amounted to a passion, and it is even said of him that he has been known to incite strife and contention between messengers and office boys in order to take notes of the rapid "chin" that ensued.

When I commenced I only intended to relate a singular coincidence which occurred to me not long ago.

I was sitting in the smoking car one afternoon, on my way from Philadelphia to New York, when a man entered at the rear door, passed by me and sat down a few seats ahead. I thought he looked strangely familiar. I could not see his face, but that curly red hair and side whiskers reminded me at once of my whilom associate, Sam. I observed him for some time, then removed to the seat next his and continued the scouting. Finally, happening to turn his head, I saw the florid countenance, moustache, side whiskers and all, of my friend Sam! Making allowance for the change which three or four years might have wrought, I thought it must be him, and hesitating no longer, I touched his shoulder. "I beg your pardon, sir, but isn't your name Sherwood?"

"Yes, sir, that is my name;" but in a deep bass voice which never could have belonged to Sam. However, I continued, "You are not a telegrapher?" No, he was not. I then explained the wonderful resemblance he bore to a former acquaintance of mine of the same name, when he informed me that his brother, John Sherwood, was an operator in a western

city, but that he knew of no other telegrapher bearing his family name.

The conversation thus commenced was kept up until reaching Jersey City, where, after his proffering a choice *espanola*, which, of course, no operator could have refused, we parted, he to take the Desbrosses st. ferry up town, and I the Cortlandt street, to wander around in search of old telegraphic acquaintances down town.

Was it not a strange circumstance—that of meeting this man as I did, with such a striking resemblance to my former acquaintance—a resemblance extending even to a similarity of names, though the name Sherwood is by no means a common one? I thought so, and made a note of it in my diary, from which the facts given above are drawn.

We should not Judge from Appearances.

BY EAU DE QUAY.

ONE fearfully hot day in July, a few years ago, a personage appeared before the Chief Operator's desk, in the "Queen City" office, and inquired for that official; on being told that he was then "in the presence," the stranger introduced himself in this wise: "I'm an operator, out of money and out of a job; can you give me a situation?"

Before replying, the worthy Chief took an inventory of the applicant, which ran about as follows: slouch hat, shirt guiltless of washing for a month, no vest, a sadly dilapidated coat, pantaloons (supported by one suspender) short enough to show stockingless ankles, while his feet were encased in an ill fitting "pair of mismated shoes;" the man himself was a rather good looking young fellow, but evidently much the worse by reason of rough experience.

"Have you ever had charge of an office?" was asked when the survey was completed. Well, yes; have had some experience, and can do a little something, I think, answered the "Old Timer" somewhat carelessly. "All right—let's see what you can do; go over and answer that call and clear up business on that string—then I'll see what we can do for you."

By this time three or four operators in that vicinity were deeply interested; smiles and rib pokings were exchanged, while the O. T. seated himself and answered. Distant office commenced a lot of "thrus" at a pretty lively gait; stranger commenced fishing for a stub of a pencil, which was finally raked from the depths of his pantaloons pocket, but was minus a point; turning to the interested audience, he politely requested the loan of a knife, with which he carefully put a working margin on the Faber, returned the knife with thanks, picked up a clip and turned in time to meet the Chief, who saluted him with "Say, if you intend taking this business, you had better be about it."

"I'll tend to it," was the laconic reply, as he commenced copying the first while the seuder was at "Sig." for the third; the stub flew across the page at such a rate that when sender finished his seventh, receiver was ready with his "O. K.," after which, with a few premonitory "i's," he proceeded to return the compliment, and the way he made "Morse" fly was a caution to scoffers; he kept on, sending and checking at the same time, until the books were clear; then, in answer to his inquiring look, the Chief merely remarked "Guess I want you; step this way if you please;" and put him in charge of a set, leaving him with instructions to "wax 'em."

The parties who witnessed the performance were dumbfounded, but soon made it convenient to make the acquaintance of the stranger, and tender to him their fellowship and good will; the same evening, through them, he had replenished his scanty wardrobe, and appeared neatly clad at his post next day, having a little of the necessary lucre left over stowed safely away in his pocket. His reform commenced there, and to-day he is one of the best electricians in his native State, and enjoys a post of trust and honor in the W. U. service. He sometimes tells this story, but always suppresses names—it being only accidentally discovered that he was the hero.

"Here! Jim, tell ——— to send up oysters for eight," was his acknowledgment that it was "on him."

Electric Light for Lighthouses.—Report of a Senate Committee Unfavorable to the Lighthouse Boards.—Claim of the Board that the Electric Light has Proved a Failure.

ON the 23d December last the Senate passed a resolution directing the Committee on Appropriations to inquire into the condition of the Lighthouse Board. A report and bill unfavorable to the Board were printed, but were not adopted. The Committee on Commerce reported against the bill, and the matter was dropped. Among the charges made in the report

against the Lighthouse Board was one alleging "that the Lighthouse Board does not investigate and keep pace with the improvements made in lighthouse illuminants and other means for improvement in lights." In reply to this charge the Secretary of the Treasury says: "It is sought to be maintained by specifications that the Board does not introduce into our service the electric lights, such as are in use in France and England, for which decided advantages are claimed. On the authority of an executive document, Senate No. 54, being Major Elliott's report relative to his tour among the lighthouses in Europe, it appears from a report upon the French electric light of La Herve, by M. Quinnette de Rerhment, that though of a stronger brilliancy it is very costly both to establish and maintain; that it is extremely liable to get out of repair, in which case special experts are obliged to come from Paris to put it again into operation, and that during four years it was extinguished 21 times, for periods varying from three minutes, besides being out for a few seconds every night.

It appears that there are only eight electric lighthouses in the world; that they were erected as experiments, and that it is by no means certain how the experiments will result. The Secretary of the Treasury closes his discussion of the subject by saying, however, "that the Lighthouse Board stands ready to introduce it whenever it may be found advantageous to do so, and Congress sees fit to appropriate the necessary funds." It was known at the date of the Secretary's letter that while theorists held the electric light in high estimation, practical men who were at the head and had the direction of lighthouse affairs of the various countries in Europe, were beginning to find such difficulties in the way of a successful, economical and uniform use of the electric light that they were beginning to contemplate its abandonment. Unless some great improvement is made in the method of its exhibition, it seems now as if no more lighthouses will be illuminated on this principle, and that those which now depend on it will gradually have substituted for electricity some other illuminant. The Treasury Department has received "a notice to mariners," dated "Trinity House, London, March 11, 1875," from which it appears that certain changes are making at Dungeness Lighthouse, in the English Channel, and that later in the season the main light will be altered from electricity to the most powerful form of oil light, and the red light to the westward will then be shown from the lantern, instead of, as now, from a window beneath it. There will then, consequently, be no white light in a westerly direction between the bearing of the west from the lighthouse and the land.

By order. ROBIN ALLEN, Secretary.
—New York Tribune.

Fire Alarm Apparatus.

OUR Fire, Water and Gas Committee, to whom was entrusted the procuring of an alarm to be communicated to the water works house and Mr. Gambles' room from the police office, gave the contract to Mr. John Atkinson, train dispatcher of the Midland Railway, and we are now in possession of a system exceedingly simple in construction, but most admirably adapted to its requirements. It consists of an electric communication between the above mentioned places, and so easily worked that any one can give an alarm. In the water works house there is a battery of seven cups, which works the apparatus. In the police office a small box is set in the wall. This contains the signaling apparatus. The signal is made by pressing a small button inside the box. This makes the circle complete and attracts a hammer which strikes a bell simultaneously in each of the three places every time the button is pressed. It is the intention to adopt a code of calls, so that after an alarm of fire signals for the supply of water can be given from time to time as required, during the continuance of the conflagration. The signal is so arranged that every time a pressure is made in the police office it will ring a bell there, so that if the little bell does not ring it is an indication that there is something wrong, and an alarm cannot be given; but so long as the bell in the police office strikes, the person giving the alarm may rest assured that the apparatus is doing its duty. Mr. Atkinson's system has given every satisfaction, and the committee express themselves well pleased, and the cost is trifling in comparison to the amount of benefit gained—Mr. Atkinson's charge being \$85, and the extras but a few dollars more.—Port Hope (Canada) Times.

Jay Gould at Home.

A FRIEND of mine, says a correspondent, had an interview with Jay Gould the other day at his own house, and there are some who may be interested to know how the operator lives, and by what methods he works. His house is on Fifth avenue—a corner house, with a bay window, fairly opposite the Windsor Hotel—nothing remarkable about it in any way.

The door is opened to visitors by an unusually plain and stupid looking Hibernian female (it is said he dare not have a smart colored man for fear he would learn too much), and persons whom he meets on confidential terms are invited to the front basement, which is smoking room and office. It is here, in this room, that he transacts business, bears stocks, breaks up combinations, and performs those daring acts which separate him from the mass. In this basement are four telegraph machines, controlling eleven wires, through which he communicates with Wall street with infinitely greater ease than if he was upon the spot. With these wires he can do as much in one hour as he could in Wall street in two days. Besides, he doesn't dare to go into Wall street—his face would be watched by a hundred jealous, argus eyes, and inferences drawn which would prove a constant source of annoyance.

Storms and Damage to Railroads and Telegraphs.—New W. U. Battery Room and Batteries.—Changes in the W. U. Office.—Inspection and Description of a New and Successful Railroad Signal.

CHICAGO, April 12.

TO THE EDITOR OF THE TELEGRAPHER.

WE have been having quite spring like weather for the past week until Saturday, P. M., when it grew colder, and a cold rain set in and continued during Saturday night and all day Sunday up to this morning. North of us they have had hail storms and very little pleasant weather. Many of the railroads have been seriously inconvenienced by the heavy rains, which in some instances washed away bridges and telegraph poles, destroying communication. Some parts of the St. Paul and Sioux City Railroad have been impassable for nearly a week, the telegraph lines being down upon that route for about the same length of time, necessitating the transmitting of the business around by this route.

In a recent communication I spoke of the W. U. battery room undergoing repairs preparatory to dispensing with the Grove batteries in use there. These repairs have been completed, and the Grove batteries are among the things that were. There are now in use nearly two thousand cells of gravity battery of the Callaud pattern, the stands arranged with shelves reach clear to the ceiling, nearly forty feet, and to make the taking care of it an easy matter, half way up a floor has been laid which is reached by a flight of open back stairs. The wood work has been nicely painted a clear white, and the iron work a deep black. It is the neatest battery room I have ever seen. The electricians have taken the precaution to paint the inside of each jar about an inch and a half down from the top; this will allow an evaporation of the liquid to that depth before being renewed without discoloring the jar, as has been the case with this kind of battery heretofore. A large enough force has been placed in charge of the room to keep everything in working order.

The battery which stood in the hall-way has been moved into the battery room. This doing away with the Grove battery is considered by the operators as a very judicious move, as a great deal of complaint was made last summer when it was necessary to have the doors and windows open on account of the fumes of the battery room, which, if not injurious were at least unpleasant to their olfactories. Some twenty or more batteries are now used instead of eight or nine; the old upright part of the switch is used for putting on battery, while a clamp or spring jack switch has been placed under the old switch to switch wires to instruments. The chief operators can now switch on any wire without the knowledge of the operator, detect "shirking," fighting, circuit, etc., or call an operator to answer somewhere else in the room; in fact the chief operator can have everything before him without running all over the room after it. No trouble can be occasioned now by operators handling battery plugs, as many were in the habit of doing, despite the orders forbidding such conduct. The new switch is the same as that used at New York, Cincinnati, and other large offices of the company.

I understand electrician F. W. Jones, assisted by Mr. Hopkins' efficient corps of repairers, has run and labelled all the office wires over. Quite an underta-

king, when it is taken into consideration that it all had to be done without interfering with the transaction of the business of the office. A great many of the wires have been placed on tables in different parts of the room in such a way as to expedite business in the best possible manner. The change throughout is one with which all are satisfied, and reflects great credit on those who planned it.

The commotion occasioned by so many changes on the first has subsided, and the operators in the Western Union office here are not backward in expressing themselves as highly pleased with Manager Summers, and hope he will be prevailed upon to retain the management permanently.

A number of electricians and telegraphers were invited by Mr. S. C. Hendrickson, of the Electric Railroad Signal Co., to accompany him on Saturday last to South Park Crossing, on the Illinois Central R. R., to witness the operation of the new crossing signal, manufactured and put up by that company. The crossing is about seven miles out from the city.

On our arrival at South Park we found the signal in successful operation. It had previously been critically inspected by the officials of several of our railroads, and they are seriously discussing its adoption. There could be at least a hundred of these signals used to advantage on the different railroads leading out of Chicago, at the principal crossings, and danger to life and limb would be materially lessened in the Garden City by their general use.

It would occupy too much space to give a detailed description of its operation. The gong, which is a very large and loud one, is started ringing whenever a train is within half a mile of the crossing on either side of it, by the depression of the rail, to the side of which is fastened a "key" in the shape of a large iron bar, that would puzzle "Jeff" Prentice even to bend if it stuck on him. This key bar being depressed strikes a connecting bar above, which upon the least touch sets in motion the gong, and locks the current, so to speak, in such a way that it is not necessary for the key bar to touch the connecting bar again to keep the gong ringing until the engine crosses the crossing, when by depression, as in the former instance, it shuts off the gong provided another train does not follow close enough to strike the starting bar again; and the gong will keep ringing as long as there is a train on the track between the starting and cut-off bar. As soon as the train strikes the starting bar, a large white signal outside the office is changed to red (besides ringing the gong) and a small signal inside the office changed in the same manner, notifying the operator or agent in charge as well as parties outside that a train from one way or the other is approaching. The gong can be heard and the signal seen (condition of location being favorable for latter) for nearly a quarter of a mile. All that is necessary to use the signal on any number of tracks is to put an extra bar on each track wanted to signal for. *Underground wires seem to be a success* in working this signal (your city electricians to the contrary notwithstanding). Ahem! does that sound right? But without jesting this is so—all the connections are underground. OCCASIONAL.

A Caustic Response to the Critics.—"Nihil" not yet "Annihilated."

CINCINNATI, O., April 4.

TO THE EDITOR OF THE TELEGRAPHER.

"The elvish page fell to the ground,
And shuddering muttered, 'Found! found! found!'"

WHAT now shall I do? What avenue of retreat is left unclosed? How shall I save the scattered remnant of my forces from utter annihilation? If I was hard pressed before, I am now surely routed, horse and foot, infantry and dragoons. The arguments which have been thrown in have raked me fore and aft, crippling me from keel to skysail. My guns are disabled; my magazine empty; my rudder crippled; my men killed. Nothing can save me from unconditional surrender but the fact that my flag has been shot away. Nothing remains for me but to *howl* my "feeble war whoop," and go down beneath the foaming waves to become food for the fishes. Valiant "Sterling" has unsheathed his exalber in the fray, and rushes to the battle with all the ardor of a young esquire who goes to win his belt and spurs. I admire the enthusiasm he manifests, but am seriously alarmed lest he overheat his brain and bring on a "spell" of *information*. Such powerful and prolonged mental efforts as that in which he pictures the office manned by a "corps of lady operators, industriously at work at their several desks," it will not do to risk often. One has perhaps a slight frown on her brow, "Oh, such horrid writing!" Another is laughing at some remark that fellow at A has made. A third has just told some one to *wait*, and with her key open proceeds to cut open and demolish an orange. Another has a tidy nearly completed. Still another is writing a note to some one in the gentlemen's room, and so on. Now, I must admit that such arguments

as these are utterly unanswerable, and I lay down my pen in despair. The wonder of it all *now* is that they are like all great inventions, they are so *simple* I marvel that I did not think of them at first. I use the word *simple* with its *common* meaning. I would suggest, however, in kindness to him, that he is "Wasting his sweetness on the desert air," in lavishing his prodigal verbosity on so irresponsible a party as me. He could make his name a national possession, by just turning his talent towards legislation. The way in which he disposes of "unprofitable idleness," is truly masterly. I cry, "Hold! enough!" He says, (by way of argument) "there is always housework, or fancy work, or sewing to occupy her time, but these occupations *contribute little, if anything, to the cost of her maintenance.*" Shade of Murray!

Again, "Nihil goes out of his way to exalt the Puritan character. This was quite unnecessary, as all that *could* be said in favor of his and my ancestors has been said by far abler writers. And the fact remains that those ancestors were a cold, austere and bigoted people," etc. The italics are his, the capitals mine. Heaven knows I did not intend to say anything about his ancestors nor anybody's else than my own. The gods protect me from the wrath of his, who were so cold and so austere, and so, etc.; who had so "little charity for the erring," etc. I suppose that all that saves their recreant progeny is the fact that they *are* cold. As for Roger Williams, I've read his history and sympathized with him till I think I've discharged any debt I may owe his *memory*. And, after all, I am not able to say that Roger may not be better off as regards fame than he would have been had he been permitted to preach his heretical doctrines in quiet to his Boston friends. If so, then he has profited by their bigotry, and has no right to complain. John refers to agriculture as one of the *coarser trades*. I should be sorry to think so. His remarks about the good natured, good hearted, courteous railroaders are *good*. Let the record be put in evidence and marked "Exhibit S." He speaks of my course as indicative either of profound ignorance or malice. That is a *strong* argument. I think I shall follow his advice and hold my peace hereafter.

Miss "Dot," who seems to adopt a new *nom de plume* with every new contribution, would seem to be somewhat nettled, and, like the "fretful porcupine," flings barbed quills in all directions. She finds fault with me for magnifying "three lady operators" into such an expression as "all the lady operators in the land." I beg pardon, "Dot."—I have only "uncoiled the vials of three ladies' wrath." She scourges me unmercifully for speaking of hearing thunder and seeing lightning. Pardon once more; my senses were bewildered. Maybe I *saw* the thunder and *heard* the lightning. The sky was not overcast; it was perfectly clear, or there was no sky. There was just a great hole where the sky is for *other* people. I assure her there was *no tempest*, never had been. "The elements subsided to a quiet calm"—showed no evidence of tumult or disturbance. She says "It may be on account of my stupidity in not knowing *how* to *adjust* so as to get a proper view of the terrible scene * * * for the life of me I can't see where the tempest comes in." Perhaps the difficulty lies in the fact that she never takes the pains to *adjust high* enough, nor to explore *any* territory beyond the *dead level* traversed by her line. Let her examine the laboratory where electricity performs its tempestuous feats. She hasn't been "up where the thunder sleeps." That's the trouble. "Rise up, William Allen!" Rise up, "Dot!" But stop; perhaps she was so "well set down," so firmly fixed, as it were, that she *can't* rise.

Mrs. Nihil being yet a creature of the future, I cannot say what arts she may have learned. Possibly the black, and blue, and white, and red arts all combined in one grand color, for aught I know. "She doesn't suppose that the ladies would have taken any notice of my feeble war whoop, but for the fact that it came through so respectable a paper as THE TELEGRAPHER." One for herself, and two for you, Mr. Editor. Fact, too, and the more I think over it the more I wonder that so insignificant an article as mine should have found its way into your columns. Were you suffering from temporary aberration? It is generally supposed that in a first class paper, such as we agree in believing yours to be, no second or third rate matter can find its way. What inference then am I to draw concerning things? Why, either that your paper, being a first class paper, my contribution must be very fair, or it would not have been published; or else, granting the contribution to have been miserable (and I believe it must have been, because she says so, and because she *asserts* it is so), the paper must be of correspondingly low grade, either one may be *true alone*, but *both* cannot be true together. Is that logic, or is it folly? It seems she loses herself in admiration of the imagination which enables me "to bear sounds of battle borne from afar, not audible to *ordinary ears*." Is it possible that the lady has been a reader of *The Plug*, and remembers some of the dignified titles heaped upon me by that respectable sheet? If

she was she will remember that one of them entitled its owner to EXTRA-ordinary cars. (Plug inserted offered in evidence and marked "Exhibit A.") "He takes up each of his fair victims in turn, and gives her a good setting down, * * * but I've no doubt they will be able to defend themselves (if they think it worth while)." It seems that thus far they have thought it worth while to come down "like a thousand bricks." She refers to a man from Cincinnati who "could do more loafing in a given time than any man in the office." Very good; no doubt true. Her assertion does carry conviction. Her's to state, mine to believe. For fear she will next (if aggravated) say that all Cincinnati operators are "of that ilk," I shall not discuss the point; and did I not know that for me to assert is (in her mind) to cast a doubt upon truth, I would tell how I once, during the "late unpleasantness" served in the same company with two Canadians, from Toronto by the way, who could do more shirking, eat more RATIONS, take more quinine and DO LESS DUTY than any other two men in the regiment. I did not suppose them to be specimen Canadians, but judging by her standard of judgment I suppose they must have been. I recollect, now I think of it, to have read of a certain rebellion gotten up by the Canadians some years ago. It was designed to be a revolution, but Britannia placed her foot on it and smothered it in—was it three days, or three months? About the quietest little rebellion I ever read of. You will observe I do not make the statement; my assertion would be of "no consequence," but I refer her to the history of the event. She next says that I, your modest correspondent, "can use more and bigger words to express fewer and smaller ideas than any other correspondent of THE TELEGRAPHER." Being a modest man, as aforementioned, and not wishing to take all the praise!—being also generous and ever ready to divide, I will share this honor even with "Dot." Honest "injun," share and share alike. She says in her next line, "His best article is his last, and in it he advances no new arguments, but reiterates the old with an ingenuity and perseverance worthy of more general appreciation." Queer logic; no new arguments, all old hash, and yet best article. No appreciation. Never mind "Dot." To have gained even one reader so attentive to the details of my dull article as "Dot" has been, so shrewd and clever, and above all, in Canada, has been more than I could have expected, and I sleep quietly the sleep of the just. She then empties another broadside at me to take the conceit out of me, lest I should grow so conceited that my fellow operators might not be able to live with me! Thank you; I desire to be "very humble." I do not want to be proud nor lifted up, nor exalted, nor elevated, nor conceited. She "feels for me." At last! at last! she encourages me, she flatters me, she felicitates me. "Genius will thrive when trampled upon." How thankful I ought to be. I feel almost constrained to quote Phillips in his speech in parliament concerning Napoleon Bonaparte, "Such a medley of contradictions, and, at the same time, such individual consistency of character were never united in the same woman, without a model and without a shadow." But I'll not do it, I might spoil a third class article, and make it second or even first rate. I'll close.

NHIL NAMELESS.

Chicago Western Union Notes.

CHICAGO, April 9.

TO THE EDITOR OF THE TELEGRAPHER.

YOU ought to see our new switch board and battery room and get a pass from the Superintendent and inspect our office. The broken glass in the partitions in the tables is being taken out and being replaced by new. The woodwork of the switch board has been varnished, window straightened, water closet enlarged, and we are to have the walls calomined, and a new lunch room for the boys is to be provided—the girls having a nice one already. In fact Mr. Summers' reign seems to be inaugurated by a general fix-up all around. I understand from reliable authority that the noon hour for us poor "night hawks" is to be abolished, and we are to come on instead at 5.30 P. M. every day. Suppose the day men won't like this, but they have had the best of it long enough now, and we say God speed the day when the noon hour shall be no more. The mighty continue to fall "let 'em drop gently;" we feel good as "summers" approaches, and we go "swain" back and forwards now—ain't that a good pun?

Ed. Whitford is working round till he gets strong enough again to "tackle" the Buffalo wire. "Hawes" Long (i. e. L. H.) goes back to Green Bay as report operator again next week; he has been doing extra service here in this office some time.

Six days out from New Orleans; that's the kind of a "condenser" we have got now; it's George R. Etemiller, he's on the extra force here. "Ed." Doval from Galveston, Texas, and "Fred." Goodrich, an old veteran, are also working on the extra force. Charlie Thayer still manages to keep up on report, although

that "moustache" and those side whiskers do pull down pretty heavy.

Some of the boys suggest a spelling match, and ask Mr. Parker to be one of the captains, because he spent an interim *ad interim* in writing the notice of Manager Swain's resignation. Guess if some of you fellows had as much to do and think of as Mr. Parker has when Superintendent Wilson is sick you'd spell worse than that. By the way, the "Colonel" is able to be out again. We are all glad to see him. WESTERN UNION.

The Violations and Violators of Western Union Rule No. 34.

TO THE EDITOR OF THE TELEGRAPHER.

MY article in regard to violations of W. U. Rule 34 was not in the number directly preceding No. 452, of March 13th, as John Sterling erroneously informs us, but in No. 449, of February 20th, and I want to say to the gentleman that my "idea of what constitutes manliness" is not less exalted than it should be, nor do I think that by calling attention to the violation of that rule I should be construed to have less exalted ideas of what is generally termed manliness than John Sterling, or any other man. How any one who carefully examines that article can arrive at the conclusion that my remarks conveyed the impression that it would be manly to retort by using the same kind of language, I am at a loss to know.

After quoting the rule I wished to call attention to in that article, I proceeded in a sarcastic manner to dwell briefly upon the subject matter, and illustrated the article by an actual scene which had been reported to me. It is conceded by intelligent thinkers, readers and speakers, that sarcasm is, as it were, a two edged sword in the hands of the writer or speaker using it, and very often will call careful attention and criticism to subject matter which would merely attract but passing notice when treated otherwise. As my intention was good, and the interpretation of said intention clear to a careful reader, I offer no apology for presenting the matter as I did.

Now, what course will our friend Sterling advise an employé to follow, provided he should be treated in the manner indicated in my former remarks upon this subject, granting that it is not manliness to retort in the same manner as addressed. Whether manly or not, would it not be as efficient a manner of bringing the matter to the notice of the higher powers to retort, be suspended, have a hearing and settle the matter, as to quietly swallow the insult and say nothing about it? Now, John, I don't offer this as a remedy, but merely as a suggestion: what is your advice? You think "Occasional" "would do a service to the profession by giving the name of the scurrilous manager." Well, now, "Occasional" has no desire for notoriety in this respect, although he is willing to do all in his quiet way he can to benefit the profession, and will endeavor in the future, as in the past, to point out defects of those in authority, as well as of the subordinates, still he don't wish to become notorious. But I'll tell you, Mr. Sterling, what I'll do. I will give the names of several managers whom I have heard such accusation against to the editor of THE TELEGRAPHER, and if you desire to do the profession the service you wish me to perform, and propose to do it in good faith, the editor of THE TELEGRAPHER can reveal them to you. This can be followed by the names of some of the parties thus abused. Their names could be given to the General Superintendent or Manager, and they summoned before him, and after being assured their positions would not be endangered by a truthful disclosure of the treatment they received, I have not the slightest doubt but that your incredulous mind would be disabused of the impression that there are no managers who abuse or insult the men under them, after you heard their story. When it comes to the rights of the case, however, I honestly claim that an employé has as much right to disobey Rule 35 as a manager has, and that rules are made for the observance of all employés, from "President" to "messenger boy," and by signing the pay roll and accepting their salary they contract to do so. It seems, Mr. Editor, that I have "trod on Sterling's corns" in my interpretation of that rule, and it is evident he don't think "ladies" were thought of as telegraph operators when the rule was framed. We don't all see those things with the same eyes, and his interpretation of the rule is very good, but don't you think he might have quoted me correctly? I asked the question "was it not evidently the intention, etc.," "but ladies and gentlemen might perform service in the same room in any office of that company, and not be obliged to listen to profanity, obscenity or other ungentlemanly language?" He makes me say that the intent of that rule was "that ladies might perform service in the same room with gentlemen without subjecting themselves to insult." By dropping those two (obnoxious?) words "ladies and," and making my interpretation read "that gentlemen might perform, etc.," probably my interpretation would be acceptable to the "haters" of "female telegraph operators." Who knows? OCCASIONAL.

The West Wisconsin Railroad.—An Old Timer on His Travels.

EAU CLAIRE, WIS., March 3.

TO THE EDITOR OF THE TELEGRAPHER.

CAN you explain why we so seldom hear anything through the columns of THE TELEGRAPHER from telegraphers west of Chicago?

We have been having a good deal of severe weather, and railroading generally in the west has been done under serious disadvantages. Upon this road time passes smoothly, because there is nothing else to do. Our trains are run through on time, but no mail is received because all eastern trains on connecting roads are either suspended or laying out in snow drifts. Without flattery I can say that our (the West Wisconsin) road has made the best time of any road in the northwest; in fact trains were laid out but two or three times this winter on its own account, and then a few hours' extra labor sufficed to get things righted.

We are, perhaps justly, in this locality, favored with the visits of "timers" of long standing. I must tell you of our last experience in this line. He was a clincher! This time he came from Texas; had been in all kinds of other "biz.;" was on a move to see the boys, and had left Houston with a cool sixty dollars in his belt; went over to St. Louis to have a game, but didn't like it and vamosed that rauche with little love and less money. He arrived here no one knows how or when, answers to any name, especially when called up to "take suthin' fresh'n" although claiming Jim as a maiden "sig."

Naturally and gracefully he could lean to the bar for assistance, feet and legs almost inextricably tangled, and narrate his life experience. First, he was in Arizona "tendin' bar," and before his auditors had an opportunity to forget who was doing the talking, Jim would have reached Dacotah, and be engineering a stage horse for board and bed.

His wearing apparel consisted of a good boot and an old gaiter; his pants were kept up by an attachment formed with his coat some time before. Upon one occasion he was going to display his muscle, but recollecting that his undergarments only comprised a shirt bosom ingeniously fastened to his collar he "let up," and concluded to postpone the exhibition. We all felt for that boy, because his was a hard lot indeed. He was found garments, etc., and with blessings and good wishes for the future, he departed, and was seen no more. FRENCHY.

An Operator in Accord with "Nihil Nameless."

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE read with great interest the communications of "Nihil Nameless," and the replies to the same. However, I must still side with "Nihil," having found no argument brought up by the other party strong enough to change my opinion. I hope "Nihil" will again favor us with an article on the same subject, and also hope he will indulge in no personal criticisms, as some of his latest opponents have done. CENT. PA.

Magnetic Railway Rails.

M. HRYL, engineer of one of the German railways, in a recent report upon the special section under his charge, calls attention to the development of magnetism in the rails. He says: "I have observed that all the rails are transformed at their extremities, after they have been placed in position a few days, into powerful magnets, capable of attracting and of retaining a key or even a heavier piece of metallic iron. These rails preserve their magnetism even after they have been removed, but they lose it gradually. When in position, however, the magnetism is latent, only becoming free when the chairs are removed, and disappearing again when they are replaced. Hence it is necessary to assume that two opposite poles come together at each junction, and that each rail is a magnet, the poles being alternately reversed throughout the line. This production of magnetism in the rails examined is undoubtedly attributable to the running of the trains, and to the shocks, friction, etc., thereby produced. The hypothesis of electric currents, induced or direct, must be rejected, since it is negated by experiments upon the subject made with suitable apparatus. Although the interest attaching to the fact above stated is at present purely scientific, it is not impossible, says the Franklin Journal, that the magnetism thus developed may exercise an influence actually beneficial upon the stability of the roadway, increasing the adherence to the rails and the friction. It is possible, also, that the magnetic currents may be stronger at the moment of the passage of the trains than either before or after. If this be so the observations may acquire a still higher practical importance.

Signs of Spring—The lightning rod men on the road.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, APRIL 17, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.
ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

SINGLE COPIES OF THE TELEGRAPHER MAY BE OBTAINED ON THE DAY OF PUBLICATION AT THE NEWS STAND IN FRONT OF THE NEW WESTERN UNION TELEGRAPH BUILDING, CORNER OF BROADWAY AND DEW STREET.

Back Numbers of The Telegrapher Wanted.

OUR supply of copies of the current volume of THE TELEGRAPHER, Nos. 446 for January 30th, and 449 for February 20th, are already exhausted, and we would be under obligations to any of our subscribers who do not keep files of the paper for binding, that may have these numbers, or either of them, on hand, if they will forward them to this office. The postage necessary to be prepaid on those papers, to insure their transmission, is two cents for each.

We regret to be obliged to ask this, but the demand for these numbers has exhausted the supply.

Is a Government Telegraph System to be Surreptitiously Established?

AS is well known, the most energetic and persistent efforts to obtain the assent of Congress to the establishment of a Government telegraph system in this country have been ineffectual. The sense of Congress, and of the large majority of the people has been against it, and although urged by a former Postmaster General and endorsed by the President, the repeated attempts to establish a Government telegraph monopoly have come to naught. The scheme is not now nearly so strong as when first presented and persistently pushed by Mr. E. B. WASHBURN, when a Representative, but now Minister to France. The more the subject has been investigated and discussed the less favorably it has been viewed, until even the most urgent of its advocates have conceded the impracticability of obtaining popular or Congressional endorsement.

What cannot be directly accomplished may, however, sometimes be brought about indirectly, and it is in view of what has thus been indirectly done that we ask whether a Government telegraph system in this country, after having been practically repudiated by Congress and the people, is to be surreptitiously established? The suggestion will doubtless surprise our readers, who are not aware of what one Government official has succeeded in doing in this matter.

Our readers are more or less familiar with the de-

partment of the United States Army known as the Signal Bureau. The head of that Bureau is officially entitled the Chief Signal Officer of the U.S.A., but is popularly known as "Old Probabilities." We do not propose to criticise or impugn the value and importance of the signal service to the country. We are disposed rather to give it our support in its legitimate operations, but we do not approve the efforts which the Chief Signal Officer is apparently making to establish indirectly, in connection with his service and under his management and control, a Government telegraph system.

Let us see what he has already accomplished towards this. He has succeeded in obtaining authority and appropriations to build, and has built and put in operation a telegraph line from Seaville to Peck's Beach, N. J., ten miles long; a line from Sandy Hook to Barnegat, fifty miles long; a line from Rockport, Mass., to Thatcher's Island Light, 3½ miles long, of which a mile and a half was cable; and a line from Norfolk, Va., to Cape Hatteras, one hundred and thirty-seven miles long. He has built of the Texas and Arizona line 550 miles, from San Diego, Cal., to Prescott, Arizona, on the Pacific coast, with a branch to Tucson. This line was, on its completion, thrown open to commercial business, and it is understood has done a good business from the start. The Texas line, with its branches, is to be 1,200 miles long, and as the Chief Signal Office has already embarked the Government in the regular telegraph business, the whole will undoubtedly be opened to public commercial use.

In his last annual report the Chief Signal Officer announced his purpose to build telegraph lines on all the Lakes, and on the Pacific Coast, on that portion of the Atlantic Coast not yet covered by Government lines, and between all the military posts in the interior of the Continent. When the enormous extent of these lines constructed and proposed is considered, it is evident that there is an ulterior purpose which has thus far been concealed from the public. When this extensive system is completed the people will find that the Government is already largely engaged in the telegraph business, and the argument will then be urged that private competition with the Government lines should not exist, and, having gone so far, it will be plausibly urged that the final step should be taken, and the telegraph, like the postal business, become a Government monopoly.

We call attention to this matter now, because it is in time for Congress to check the practical development of the telegraphic schemes of the Chief Signal Officer, before the Government is irretrievably committed to a business which the public has no disposition to confide to its care and management. The telegraphic interests of the country should be aroused to this danger, and should resist the further progress of the plans for embarking the Government and people of the United States in a business which they desire and intend shall remain under private management, as the best and wisest under our system of administration.

It is to be presumed that Congress at the next session will engage in a good deal of investigation, and we think that in no direction can Congressional investigation be more wisely and profitably directed than in that of the purpose of the Chief Signal Officer of the United States Army to establish a general telegraph system.

The Telegraphic Situation.

WE were enabled last week to give to the readers of THE TELEGRAPHER a correct, and the only correct statement which has yet appeared, of the new arrangement of the Southern and Atlantic Telegraph Company, by which its connection with the Atlantic and Pacific and Franklin lines was dissolved, and a contract entered into with the Western Union Company for connection, loan of wires, and exchange of business hereafter. We are informed that the new arrangement is working well and advantageously, so far as business is concerned, and the managers of the S. and A. Company express themselves satisfied with the change. Under this arrangement, independent offices have been es-

tablished by the Southern and Atlantic Company at Washington, D. C., 609 Pennsylvania Avenue; Baltimore, Md., corner South and Water streets; Philadelphia, Pa., corner Chestnut and Front streets. The office in the Cotton Exchange building, corner of Hanover Square and Stone street, in this city, is also maintained as an independent Southern and Atlantic office. We understand that hereafter the Southern and Atlantic Company will, in addition to the business on their lines south of Washington, receive and transmit local business between New York, Philadelphia, Baltimore and Washington.

The annual meeting of the Atlantic and Pacific Telegraph Company will be held on the 27th and 28th inst., at the executive offices, 193 Broadway. The changes which have taken place and are proposed in the organization, plans and purposes of the company, will probably require consideration by the stockholders, and, therefore, the meeting will occupy two days.

The programme of extension and addition of lines and facilities of the Atlantic and Pacific Company, although not completed sufficiently to make the publication of details as yet advisable, is understood to be quite extensive and comprehensive, and will be made public in a few days.

The contest in regard to the title to the patents for which applications of EDISON and PRESCOTT are pending for the quadruplex inventions, is not yet finally decided. Mr. HARRINGTON has appealed the decision of the Commissioner of Patents that the patents shall issue to EDISON and PRESCOTT, to the Secretary of the Interior, the only instance, we believe, in which this has been done, but which he has a right to do under the law. The hearing took place on Thursday last, at Washington, Senator CONKLING appearing for PRESCOTT, and General B. F. BUTLER for the appellant. We hope to receive some information in regard to this hearing before the present number of THE TELEGRAPHER goes to press.

The Ohio Legislature and the Telegraphs.

A YEAR ago the Ohio Legislature appointed a committee to investigate the subject of railroads and telegraphs in that State.

That committee, after very thoroughly investigating the subject, have recently made their report, of which the following, in regard to the telegraphs, will be of interest. The bill regulating telegraph charges on the lines in that State which passed the House, failed in the Senate.

The committee say in regard to telegraph companies:

"Not only have we found little if any complaint against telegraph companies in a correspondence of seven hundred letters, but many of our correspondents speak in the most favorable terms of their management and the accommodation they afford. The Western Union Company own and operate the principal lines in Ohio. Of its financial management we know nothing. It seems, at times, to have absorbed its rivals and taken their places, but whether by means other than fair does not appear, and the just presumption is, and ought to be, that the taking in process has grown out of the fact that the business of the country does not or has not required two or more lines. It is only natural that one great business enterprise like this should desire to have a monopoly of the business.

The opening up of the long lines of telegraph in new and sparsely settled districts is attended with enormous expense, and meets little present return. But the question of one or more companies must, we think, be left to the laws of supply and demand. Legislation has done its part when it keeps open the door to admit competition, and places no obstacles in the way of new companies, and offers no better or special facilities to old ones. The Western Union Telegraph Company is a corporation under the laws of New York, but it seeks and enjoys certain rights, privileges and franchises under the legislation of Ohio; and hence, in return, we do not hesitate to hold that legislation may regulate, within reasonable limits, its charges and the details of its management. There is, however, one serious difficulty in the way of this, even if it were demanded, and that is the fact that the lines of a telegraph company are entireties, covering the whole country, crossing State lines, and forming a network of the States. Hence, for one State to attempt to regu-

late prices would be a most complicated undertaking, and one difficult of accomplishment. The net profits of telegraph stock from Ohio business have been for years small, or at least moderate, and, since the testimony taken by us the Western Union has reduced its rates very materially, whether with a view of breaking down its present apparently formidable rival, and then again advancing rates, or to meet a demand so urgent for cheap means of communication, we do not know. We hope and believe the latter is true, and it is significant that, at a time when this company has made this material reduction in the cost to the people of intercommunication, Congress should have seen fit to double the rates of postage on many of the classes of mailable matter. It may yet be found that to private enterprise and private skill will be remitted the whole business of mail and news carrying.

We think the telegraph companies might make some changes in the details of their business, as, for instance, we do not think the receipt they give for messages ought to be used. It is calculated to mislead, and give to the companies undue advantage. It ought to be simple, plain and unambiguous. Yet no man has complained to us of it. From these, and many other considerations, we do not believe that legislation at this time is demanded or prudent, and we do not suggest or favor any. The power we have, that is clear; but its exercise is not demanded."

The Female Telegraph Operator Question.

WE print this week another communication from our Cincinnati correspondent, NIHL NAMELESS, in response to the castigations which his previous efforts have drawn down upon his devoted head from those who do not agree with him in regard to the propriety and advisability of females engaging in the business of telegraphing. It must be conceded that NIHL has received sufficient punishment, if punishment were deserved, for his heretical ideas on this subject, and sufficient provocation to reply caustically to his assailants, and it must be confessed that he strikes back *manfully* in his own defence and in vindication of his views.

We are willing to give a reasonable amount of space to the discussions of this question, although, as females are in possession of an interest in the business which they are not likely to relinquish, however trenchant may be the arguments or forcible the admonitions of NIHL and those who agree with him in his ideas, we scarcely think that it will amount to much, practically. We only ask that our correspondents will moderate the length of their communications on either side, and condense their ideas within the space of not more than a column each.

Women engage in the telegraph business for the same reason that males do, generally, that is, to get a living by their labor. We do not suppose that either would be likely to follow it long merely for the gratification and amusement afforded. As every person who is born, (and for being thus brought into existence, we do not suppose that any one will consider the unfortunates personally responsible) may reasonably demand a right to earn a living, whether male or female, in the most advantageous manner possible, we do not see how females can properly be debarred from their share of the labor and emoluments of telegraphy. It is certain that those now engaged in it will not withdraw until something better offers, and we fear that others will persist in seeking a livelihood by the same means. The abstract question of the adaptability and propriety of telegraphic employment for females may be an interesting subject for discussion—the practical question was decided in favor of the women long ago, and that decision we hardly think it possible to reverse.

Telegraphic Litigation.

It is perhaps natural that telegraph companies, as well as individuals, should be disposed to maintain what they consider to be their rights by resort to the law to enforce them. Legal proceedings are always expensive, more especially so where corporations are concerned, and the results by no means certain. As a celebrated lawyer once remarked, if there was one thing which the Deity could not foreknow or foresee, it was the verdict of a petit jury.

The present telegraphic complications are, it is un-

derstood, likely to result in an encouraging—to the legal fraternity—crop of lawsuits. The quadruplex will probably be the object of one or more suits. The conflicting claims to automatic inventions will probably eventually get into the courts. The lease of the Franklin telegraph lines to the Atlantic and Pacific Company is now the subject of litigation in Massachusetts, the minority of the stockholders having commenced equity proceedings to set aside the lease, and to have a receiver appointed. The A. and P. Co. threaten legal proceedings under its contract through the Franklin Company with the Southern and Atlantic, which the latter has terminated, as stated last week in THE TELEGRAPHER, and made a new one with the Western Union Company, and so on, with new complications and additional causes for legal action being constantly developed.

However encouraging the prospect may be to the lawyers, the expenses will be something appalling for stockholders to contemplate. Why would it not be wise to establish some tribunal similar to the Court of Arbitration, which has been put in operation in this city and which is said to be working exceedingly well, for the decision of telegraphic questions and disputes? There is no doubt but that it would be fully and constantly employed, and its decisions would probably be quite as satisfactory—to the successful party at least—as that of more elaborate and expensive legal proceedings.

Appointment of Mr. D. H. Bates, General Manager A. & P. Telegraph Company.

AS was previously announced in THE TELEGRAPHER, Mr. D. H. BATES, Superintendent of the Sixth District of the Southern Division of the Western Union Telegraph Company, retired from the service of that company on Saturday last, the 10th inst. He has been appointed General Manager of the Atlantic Division of the Atlantic and Pacific Telegraph Company, and has entered upon the duties of his new position.

The employes on Mr. BATES' late district manifested their regard and appreciation of him by presenting to him on his retirement a handsome gold watch and chain, and also presented to his wife a very handsome service of silver. There was no formal presentation ceremony, it being deemed more appropriate and in better taste to omit the usual speech making on this occasion.

Mr. BATES' experience and ability as a telegrapher and telegraph Superintendent will enable him to serve the Atlantic and Pacific Company advantageously and creditably. The position to which he has been assigned is an important and responsible one, and has been temporarily filled by Mr. A. B. CHANDLER, in addition to his other onerous duties.

Deserved Promotion.

Mr. JAMES MERRIHEW, who has for several years past been the Manager of the Philadelphia office of the Western Union Telegraph Company, has been appointed to fill the vacancy in the position of Superintendent of the New York and Washington District of that Company, made vacant by the resignation of Mr. D. H. BATES, who has resigned to engage in the service of the Atlantic and Pacific Telegraph Company.

We congratulate both the company and Mr. MERRIHEW on this well deserved promotion. The new Superintendent is an old and experienced telegrapher, amply qualified to discharge the duties of the position with credit to himself and advantage to the company, thoroughly familiar with the district, and personally affable and popular. It is a promotion and appointment eminently fit and proper to be made.

THE REASON.—Many persons are desirous of knowing why Western Union stock has advanced. They probably have not heard that the great professor of duplicity and quadruplicity is no longer supplied with funds from the Western Union treasury.

Personals.

Mr. "MON." SMITH, who, some months ago, resigned the position of day report operator in the Chicago, Ill., Western Union office, to engage in phonographic business, is now travelling with Prof. FOWLER, the phrenologist, reporting his lectures.

Mr. ISAAC A. WRIGHT, for several years in the lightning rod business, an old veteran who used to "frite gerse" on the Oil Creek Railroad in Pennsylvania, has settled down in Kansas City, Mo., as bookkeeper for one of the largest manfactories of agricultural implements in the west.

Mr. JAMES PETTIT, of the W. U., Chicago, Ill., office, who had been ill for several days, has recovered and returned to duty. During his illness he was appointed Assistant Manager of the W. U. Board of Trade office, Chicago. This is a deserved compliment to one of the oldest and best men in the company's employ in this section.

Mr. ED. ANGELL, formerly secretary to Manager SWAIN, and pay roll clerk, has resigned, and takes a position on the day force of the Chicago, Ill., W. U. office.

Mr. CYRUS COBB has been appointed secretary to Manager SUMMERS, and pay roll clerk of the Chicago, Ill., Western Union office. Mr. COBB was one of the oldest chief operators in that office.

Mr. ED. WHITFORD, of the Western Union, Chicago, Ill., office, who has been suffering from the effects of a cold, is able to be about again, although not yet entirely recovered.

Miss M. CARPENTER, Manager of the Western Union telegraph office at Woonsocket, R. I., has resigned the position, and returns to her home at Tabor, Iowa, to rest for a season.

Mrs. PARKER, formerly of Nova Scotia, has been appointed Manager of the Woonsocket, R. I., Western Union office.

Mr. W. K. MORLEY has been appointed Superintendent of Telegraph of the Chicago and Alton and St. Louis Railroads, in place of Mr. C. H. SEAVER, deceased.

The Telegraph.

By Cable.

TELEGRAPHIC COMMUNICATION BETWEEN SANTIAGO AND HAVANA RESTORED.

HAVANA, April 14.—Telegraphic communication has been reestablished between Havana and Santiago de Cuba.

Removal of the Gold and Stock Telegraph Company.

THE Gold and Stock Telegraph Company is rapidly moving its offices from No. 61 Broadway to the new Western Union building, corner of Broadway and Dey street. The entire fourth floor of that building will be occupied by the Gold and Stock Company. When the removal is completed we shall publish a more detailed description of the new quarters and arrangements.

The Commercial News Department was removed to the new building at the same time that the Western Union Company moved from 145 Broadway. The Executive Department is now established in the new offices, and the Private Lines Department has also been transferred.

The entire work of removal and transfer of the wires is expected to be completed in about ten days.

Two rooms, those now occupied for that purpose, will be retained at 61 Broadway for the use of the inspectors and for receiving complaints, the location being more accessible from the financial centre, in which so considerable a portion of the business of the Company is concentrated.

The removal of such an immense institution as the Gold and Stock Company has grown to be, with the changes necessary to be made in the great number of wires employed, is a laborious, troublesome and costly operation, and all concerned are to be sincerely congratulated that it is so nearly accomplished.

The American District Telegraph in San Francisco, California.

THE American District Telegraph system has been introduced in San Francisco, California. March 29th, a communication was presented to the Board of Supervisors from the American District Telegraph Company, asking that permission be granted to run separate telegraph wires from their office to each

engine house within the limits, and to the fire alarm telegraph office, for the purpose of transmitting fire alarm signals, and that the Fire Department be authorized to recognize and respond to such signals under certain arrangements, as follows: "We will furnish cards to each engine house and to the fire alarm office, showing the precise location of each of our boxes and its number. Upon the receipt of a fire alarm from one of our boxes, we will instantly transmit it to the nearest engine house to the scene of the fire, or to any other which may be designated by the Chief Engineer of the Fire Department. That engine will proceed instantly to the fire, and then if it is found that more help is required, the firemen will send in a second signal from the street box and call the whole Fire Department to the spot. In this connection we beg to say that, in addition to notifying the nearest engine house, we shall also despatch our own private firemen to the fire, and telegraph the Underwriters' fire patrol, who have arranged to respond instantly to our fire calls. It is anticipated that, under this arrangement, most of the fires signalled from our boxes will be extinguished without calling out more than one engine.

(Signed,) JAMES GAMBLE, President."

Telegraphic Forgery on the Bank of California.

AN operator of the name of Charles Crowley, who was in the Colusa office last January, sent a telegraphic dispatch, to which he signed the name of Wm. P. Harrington, Jr., for \$1,200 on the Bank of California, which he went down and drew himself. The forgery was not discovered until a few days ago, when Mr. Harrington found that his books would not balance with those of the Bank of California; and on examining the items charged to him, he at once knew that he had sent no check by telegraph at that date. On making an examination in the telegraph office he found a message written for \$1,800, to which his name was forged. It is probable that he thought that amount too steep, and that about \$1,200 was as much as he could go without suspicion. The forger stopped around the city for some time after he drew the money, and was spurring it pretty heavily, but he is now "where the woodbine twineth." Mr. Harrington always writes a copy of such messages the same day, and a failure to receive such advice should have put the bank on its guard. We suppose, of course, that the loss will have to be borne by the Western Union Telegraph Company.—[Colusa Sun, March 27th.

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS UP TO AND INCLUDING APRIL 13, 1874.

ASSESSMENT No. 74.

- 4, 8, 16, 21, 28, 29, 53, 56, 58, 61, 64, 67, 76, 77, 86, 88, 90, 95, 103, 113, 121, 122, 131, 134, 138, 143, 145, 146, 157, 176, 177, 179, 181, 201, 202, 208, 211, 217, 235, 244, 257, 267, 269, 276, 277, 880, 289, 301, 312, 342, 346, 352, 367, 383, 385, 394, 402, 405, 406, 413, 414, 416, 425, 434, 463, 464, 467, 509, 516, 526, 532, 536, 546, 547, 548, 549, 553, 564, 577, 579, 587, 594, 604, 615, 626, 649, 671, 672, 691, 721, 731, 740, 742, 769, 787, 815, 830, 832, 843, 856, 858, 859, 871, 886, 912, 915, 917, 922, 923, 932, 941, 952, 995, 1001, 1011, 1013, 1024, 1039, 1054, 1055, 1081, 1088, 1090, 1126, 1147, 1154, 1169, 1173, 1178, 1182, 1183, 1199, 1208, 1225, 1232, 1252, 1267, 1276, 1282, 1300, 1306, 1325, 1329, 1333, 1345, 1357, 1358, 1368, 1394, 1398, 1402, 1403, 1404, 1409, 1410, 1412, 1440, 1444, 1453, 1484, 1489, 1503, 1516, 1517, 1518, 1554, 1560, 1568, 1569, 1571, 1572, 1615, 1619, 1630, 1632, 1635, 1652, 1728, 1729, 1732, 1735, 1790, 1815, 1817, 1831, 1852, 1862, 1869, 1894, 1900, 1901, 1906, 1911, 1913, 1914, 1944, 1957, 1965, 1970, 1986, 2019, 2021, 2027, 2029, 2030, 2036, 2044, 2049, 2066, 2082, 2083, 2097, 2135, 2164, 2174, 2178, 2181, 2190, 2191, 2194, 2195, 2197, 2201, 2203, 2213, 2214, 2223, 2224, 2228, 2229, 2233, 2240, 2241, 2243, 2257, 2259, 2263, 2269, 2273, 2275, 2277, 2285, 2287, 2288, 2310, 2312, 2322, 2330, 2331, 2333, 2334, 2335, 2336, 2337, 2341, 2343, 2345, 2347, 2350, 2354, 2355, 2356, 2360, 2367, 2371, 2378, 2382, 2386, 2389, 2400.

ASSESSMENT No. 73.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended February 23, 1875, and bearing that date.

160,009—ANTI-INCORUSTATION BATTERIES FOR BOILERS.—John F. Donohoe, Springfield, Mass. Filed July 6, 1874.

The battery for use in boilers, consisting of a spiral of copper wire partially incased or imbedded longitudinally in a base of zinc, substantially as and for the purpose shown and described.

160,120—ELECTRO-MAGNETS.—M. A. Rice, Pent Water, Mich. Filed December 28, 1874.

The combination of two or more bars and an insulated coil, one leg or arm of each bar being arranged within the coil, and one exterior to it, in such manner as to make two or more magnets in one coil, substantially as specified.

160,152—EARTH BATTERIES.—Jas. C. Bryan, Philadelphia, Pa. Filed January 27, 1875.

1. The improved voltaic earth battery, consisting of the metals A B, partially embedded in the sulphur C, as herein set forth.
2. The combination, with the voltaic earth battery and the primary coil, of the series of magnets forming the magneto-electric battery, substantially as herein described.
3. The combination, with the voltaic earth battery, magneto-electric battery and primary coil, and the secondary coil F, substantially as herein set forth.

160,153—MACHINES FOR BENDING HORSE SHOE MAGNETS.—Jas. C. Ryan, Philadelphia, Pa. Filed September 8, 1874.

The rod is entered (gaged by R), and the lever bends into staple shape; the levers are then brought down, carrying the ends into the grooves, giving the finishing bend.

The arrangement, construction and combination of the upper centering traveling lever A, the rear lever B, the carriage C, roadway D, front levers G G, with their flanges J J, grooves K K, guides N N, and centering gauge R, as herein described, and for the purposes set forth.

REISSUE.

6,296—METHODS OF SENDING AND RECEIVING MESSAGES SIMULTANEOUSLY OVER THE SAME TELEGRAPH WIRE.—M. G. Farmer, Salem, Mass. Patent No. 21,320 dated August 31, 1858; extended seven years. Filed Feb. 18, 1873.

Combines with duplex telegraph a continuity preserving key.

1. The combination, with a double transmitter, of a device which shall preserve the continuity of the main circuit, by closing one branch or path thereof, which was previously open, at the same time, or slightly before that it opens another branch or path that was previously closed.
2. The combination of such a continuity preserving device with an equating circuit which shall hinder the associate relay or other receiving instrument from responding to the action of this transmitting key or device, unless assisted by the action of some other independent transmitting device.
3. In combination with instruments for sending and receiving messages simultaneously upon one wire, a key or device, arranged to transmit signals by reversing the direction of the main battery current, without interrupting the continuity of the main circuit.
4. The combination of a continuity preserving key with a battery for transmitting signals to a distant station, and a relay or receiving instrument for receiving signals at the same time from a distant station.
5. In instruments for the simultaneous transmission and reception over one wire, the combination, at each station, of an accessory magnet or coil, an accessory battery, the necessary main circuit magnets, and batteries with the means of reversing the direction of the current of the main batteries, substantially as set forth.

For the week ended March 2, 1875, and bearing that date.

160,271.—TELEGRAPH SOUNDERS AND RECORDERS.—Daniel F. Leahy, Portland, Oregon. Filed July 17, 1874.

Adjustable recording pen attached to sounding bar. Paper passes over a concave plate, so as to spring slightly under the pen, and not interfere with the movement of the sounder bar.

1. The adjustable pen E, provided with the inking attachment P and the supplying trough Q, in combination with sounder N, substantially as and for the purpose set forth.

2. In combination with the sounder N and pen E, the concave plate H, substantially as and for the purpose set forth.

160,374.—MECHANICAL TELEGRAPH SOUNDERS.—Martin F. Westmann, Cherry Hill, N. J. Filed May 19, 1874.

"Snapper sound," the sound being produced by the snapping of a "buckle" or dent in the spring.

1. A mechanical sounder, composed of an indented elastic metallic strip, A, and a base, B, the strip being attached to the base at one end while the other end is free to move, substantially as and for the purpose herein specified.

2. The sounder base B, having inclosing sides, b b, or their equivalent, substantially as and for the purpose herein specified.

3. The finger guard C on the end of the metallic sounder strip A, substantially as and for the purpose herein specified.

Born.

COATES.—At Albany, N. Y., Tuesday evening, April 13, 1875, to Mr. Orville A. Coates, operator Western Union, Albany office, a son.

Died.

TUBBS.—In Chicago, Ill., March 25, 1875, Mrs. MARIA TUBBS, wife of Mr. F. H. Tubbs, Superintendent of Telegraph for the Chicago, Burlington and Quincy Railroad, aged 38 years and 1 day.

The deceased was a member of Grace Presbyterian Church, of Chicago, and for many years connected with the church at Galesburg, Ill., to which place her remains were taken. A large concourse of friends attended the funeral services at the Second Presbyterian Church of Galesburg. The services were conducted by the pastor, assisted by the Rev. Mr. Ely, who made the funeral address. The deceased was a devoted wife and mother, the sunshine of her home, and a sincere Christian. "Blessed are the dead that die in the Lord."

SAWYER'S BATTERY TOP.

(Patent applied for.)

JAR RENDERED ABSOLUTELY AIR TIGHT.

NO EVAPORATION. NO MORE OIL.

Send for circular and price list.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET

or to

L. G. TILLOTSON & CO.,

8 Dey street, sole Agents.

THE KENOSHA INSULATOR CO.

TELEGRAPH COMPANIES and TELEGRAPH CONSTRUCTORS

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellant of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO.,

THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES,

prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

L. G. TILLOTSON & CO.,

General Eastern Agents.

GEORGE H. BLISS & CO., 41 Third Avenue, Chicago, Ill.

CINCINNATI, O., Elm St., cor. 5th.

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS—COMBINATION SETS; BOX and POCKET RELAYS. PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, wire connections above the table.

REGISTERS, with SPRINGS or WEIGHT.

CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.

BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular Pioneer Cheap Telegraph Instrument has recently been improved and a Straight Lever Key placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and is still the leading telegraphic apparatus of its class.

They are furnished at the following popular prices:

Single Instruments with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, - - - \$6.50 Two sets of Instruments, etc., - - - - - 12.00

Send for our new Circular and Price List.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the **UNITED STATES and CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES and the DOMINION of CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDER** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

A Sharper Foiled by a Telegrapher.

BY BRUCE LYON.

THE following incident was related to me, a few days since, by an old friend whom I had not seen for a number of years, as an episode of New Orleans life before the war, and subsequent political complications had well nigh ruined this the fairest and most luxurious city of America.

He began by stating that, for some months previous to his arrival in the Crescent city, he had been working in Monroe, a small town in the northern part of Louisiana, the office being a relaying point for southern Arkansas and western Texas business. Becoming tired at last of the monotony and quiet of rural life, he applied for and obtained a situation in Galveston, Texas, and it was while waiting in New Orleans for a steamer to convey him across the Gulf that the following adventure occurred. Perhaps it would not be inappropriate for me to mention in this connection, that my friend boasted with no little pardonable pride, the fact of his having worked in nearly every large office in the country, and an experience thus gained has many times proved of incalculable benefit to him in his numerous and extended wanderings.

There are few telegraphers who have travelled extensively that have not become thoroughly conversant with life in all its various phases, and to that class belongs the subject of this sketch, who though the most quiet gentlemanly person imaginable, is withal a "thoroughbred" in the strictest sense of the term. It is a grand mistake to think that none deserve this title but the man who drinks liquor, swears loudly, and walks with a swagger. On the contrary, it is your cool, calculating man of the world, whose conduct, outwardly at least, is irreproachable, and who being dependent in a great measure upon his wits for a living, is too shrewd to lessen his only capital in life by a course of dissipation that can only result in utter ruin, leaving him at last to battle with the world a bankrupt in purse and in health.

"It was the night before *Mardi gras*," said my friend. "The city was crowded with strangers, nearly a hundred thousand in number, drawn thither to witness the novel and interesting features of carnival day. Feeling somewhat fatigued with my rambles through the city, I concluded to retire early that I might rise in the morning better fitted to enjoy the excitement and dissipation which would extend far into the night of the following day. For this purpose I entered the hotel—I was stopping at the St. Charles—and receiving the key of my room from the clerk, stood idly watching the immense crowd that filled the halls and vestibule, before proceeding up stairs. Suddenly a hand was laid on my shoulder, and turning round I was confronted by an individual with whom I had become acquainted at the Ouachita House, in Monroe.

His name, as he entered it upon the hotel register with a flourish, was J. Francis Sylvester. His ostensible occupation speculating in cotton, but as far as my observation extended, his time was chiefly spent in smoking cheap cigars, relating threadbare stories and cursing the negroes about the place in true cavalier fashion.

Meeting him at this time, and in a place where my acquaintance was so limited, it is natural that I should have been pleased to see his good natured countenance once more, and I greeted him with the warmth of an old friend.

After a few moments' conversation he informed me that for the first time in his life he had that day purchased a ticket in the Louisiana State lottery, the drawing of which occurred daily, and understanding further that the tickets were void unless presented within twenty-four hours, he concluded late as it was, to call in and satisfy his curiosity! Not that he expected to draw anything, but just out of curiosity, you know, and concluded his remark with the request that I would accompany him. My fatigue being forgotten in the pleasure of seeing a familiar face, I signified my willingness, and a few minutes later found us walking arm in arm up street, chatting pleasantly about our mutual acquaintances in Monroe. Suddenly stopping

in front of an unpretending two story frame building on Bank street, Sylvester hastily ascended a narrow stairway leading from the pavement, and opening a door on the left, a flood of light burst forth almost blinding me with its dazzling brilliancy. Mechanically following my guide, I found myself in a large square apartment furnished with a magnificence and profusion that far exceeded anything I had ever seen, or in fact, heard of, except in the pages of some Eastern romance. From a handsome bronze chandelier, suspended from the centre of the room, was diffused a soft subdued light, in striking contrast with the richness of the tapestry, the magnificence of the furniture, and the elegance of the carpet, in which our feet sank to the ankles at each step.

The appearance of the whole apartment betokened a lavish display of wealth, and an oriental voluptuousness unknown to we cold northerners of less luxurious habits and æsthetic tastes.

On one side of the room was placed a long table, covered with a green cloth, on which were painted figures and symbols, around which were grouped a party of some twenty men, the majority of whom representing the better class of society: some standing, some sitting, but all with their eyes fastened on the table, behind which sat a man whose face might have been carved in marble, so strong and unchangeable it seemed.

The room was quiet as death; so quiet indeed that the silence was almost oppressive. The only sound that broke the stillness was the voice of the man facing the crowd, who from time to time repeated in a low, cold monotone, 'Are you all ready, gentlemen?'

The very waiters who glided noiselessly about the room, bearing trays filled with the choicest liquors and segars, spoke not a word, but performed their duty at the slightest beck or nod, and seemed, but for their power of motion, to belong to the several groups of stately standing in different corners of the room. I realized my position at once. Judging from my very respectable appearance that I must be the possessor of some wealth, and doubtless believing this to be my first flight from the parent nest, Sylvester saw in me a good pigeon to be plucked, and had, therefore, with the same motive that prompted the sudden friendship between Bill Nye and Ah Sin, led my willing footsteps to this gilded palace of sin for the sole purpose of obtaining possession of my (supposed) lucre.

In short, my boy, I had been systematically 'roped' into one of the most notorious faro banks in New Orleans, which, as a friend of mine SLANGILY expresses it, is a place where men of a sporting disposition assemble to fight the tiger in his green baize jungle. Turning round to Sylvester I remarked with some asperity, 'This is not a lottery office! This is a faro bank.' 'By Jove!' he drawled out, with well feigned astonishment, 'That's so, but since we're here let's try our luck just for fun, you know.'

"I politely but firmly refused, alleging as the best excuse my ignorance of the game, my general bad luck in all games of chance, and principally my conscientious scruples, 'for you know,' I added, with a slight tinge of sarcasm unnoticed by my *cicerone*, 'we plain countrymen are less hardened in sin than you gay butterflies of fashion, who live in a world of frivolities.'

'Sylvester smiled complacently, and bowing his acknowledgment of the compliment, proposed an adjournment to the street, 'where,' said he, 'we'll get another segar and then find that place sure.'

"Satisfied that no harm could result from it, I concluded to accompany him, feeling somewhat curious as to what course he would next pursue. Walking up St. Charles street, Sylvester inquired of a rather rakish looking individual standing in the doorway of a billiard saloon, the location of the Louisiana State lottery office. To our surprise (?) we learned that the object in question was directly overhead, and, guided by the obliging stranger, we were soon ushered into a small, dingy back room occupied by two men, both deeply engaged in a conversation that was immediately suspended as soon as our arrival became known. There were no signs visible as to the nature of the game, but business being evidently dull I felt that I would not long be kept in ignorance, nor was I. Approaching the elder of the two men, a dark, swarthy individual, Sylvester drew from his pocket a ticket, which he laid on the table before him. Glancing carelessly at the number, his companion opened a small book, and running his eye hastily over a column of figures inquired, 'What name?'

'Sylvester.'

'J. Frank Sylvester?'

'Yes, sir.'

'Fifty dollars,' he muttered in a low tone, opening at the same time a drawer, and taking therefrom two twenty and one ten dollar gold pieces.

After his noisy demonstrations of delight had subsided, Sylvester expressed a desire to learn the *modus operandi* of the drawing.

'The drawing,' said our informant, 'takes place each day at 12 and 4 o'clock. We have twelve blocks which are numbered from one to six inclusively. The

blocks are placed in a glass wheel; they are then well shaken in the presence of the ticket holders, and are then drawn forth and placed on a table by a negro boy, blind from his birth. For the better purpose of conveying my idea, I have here a condensed and simplified form of the whole arrangement,' and suiting the action to the word he threw over the table a green oil cloth, neatly divided in little blocks about an inch square, and numbered from one to seventy-two inclusive. It was a game that I had seen on every fashionable course, and at every fair I had ever attended. The fascinating and money making (for the dealer) game of hanko.

Sylvester immediately suggested that we invest ten dollars apiece in tickets, triumphantly pointed to the fifty dollars he had just won as an evidence that fortune, the fickle jade, had at last smiled upon me, and I needed but to stretch forth my hand to secure the glittering prize. I, however, doggedly refused, and though he played several times, winning, perhaps, twenty or thirty dollars, I still declined, though all the while congratulating him upon his good luck. Finding me still blind to my best interests, these kind-hearted gentlemen, with the charitable view of lining my pockets with shekels, devised for my benefit another and still more money making scheme. Drawing from the table a pack of cards, Mephistopheles—I can think of no other title so appropriate—selected therefrom a jack, king and queen.

Human endurance could stand no more! I had been 'roped in' to a game of faro, had sat calmly smoking a segar while listening to the oily tongued manipulator explain the process of winning seventy for one, by risking my money in an innocent game of hanko, but when he began throwing three card monte, 'a very popular game with young gentlemen,' as he expressed it, I kicked. Turning round to Sylvester I quietly remarked: 'My friend, allow me to give you a word of advice that may be of service to you in your future operations. Do not trust too much to appearances; they are apt sometimes to deceive you. You thought from my abstemious habits, and from having formed my acquaintance in the backwoods that I must of necessity be a flat; on the other hand, I took you for a thoroughbred. The mistake was mutual. Good night.' And walking to the door I descended the stairs.

Thus ended my first but by no means my last adventure in New Orleans, and if any of my less travelled readers are enabled to profit by my experience, I will feel that my labor has not been in vain."

The Anglo-American Telegraph Company.

THE half yearly report of the directors of the Anglo-American Telegraph Co., to the shareholders, states that in accordance with the wish expressed by the proprietors at the last two meetings, the directors agreed that a report and accounts should be presented half yearly, and as a final settlement of this question they propose—1. To hold two meetings in the year, in the months of April and October. 2. To publish no accounts or receipts at any other period of the year. 3. To pay interim dividends quarterly, whenever the revenue of the company enables them properly to do so. The total receipts from the 1st January to 31st of December, 1874, including a balance of £9,089, carried over from last account, amount to £713,018, which, with the renewal fund of £254,947, now carried to revenue account, amount together to £967,966. The total expenses of the year, including those of laying the new cable and income tax, amount to £614,282. Three quarterly dividends at the rate of 5 per cent. per annum, free of income tax, were paid in 1874, absorbing £262,500, leaving a balance of £91,183, from which a final quarterly dividend, at the like rate of 5 per cent. per annum, has since been paid, amounting to £87,500, leaving a balance of £3,683 to be carried forward to next account. The falling off in the traffic receipts in 1874, as compared with 1873, amounting to £62,918, is to be attributed to the depression of the American trade which existed more or less during the whole period. The directors regret that they have been unable to recommend the declaration of a higher dividend than 5 per cent. for the year ending 31st December, 1874, but an examination of the accounts will show that a larger payment would have been extremely imprudent. It may be urged, and with some show of reason, that unusually large sums have been taken from revenue and spent upon new works; but unless the capital of the company were enlarged for this purpose, which the directors consider most undesirable, the course pursued was inevitable; and the directors believe that their policy in this respect will meet the approval of the proprietors. The proper figure at which to fix the tariff has long been the subject of anxious consideration by the directors. Large customers and many of the proprietors have frequently represented to the directors the expediency of keeping up the rate at 4s. per word; and although all the experience obtained has shown that the present rate, combined with this company's system of charging by the word

is one which offers the greatest facilities to the public, consistently with making reasonable profits for the proprietors, still, in view of competition at an early date, the directors resolved to reduce the tariff to 2s. per word from the 1st of May next. The contract for the construction and laying of a fifth cable, announced in the last yearly report, was duly and efficiently carried out by the Telegraph Construction and Maintenance Company. On this occasion the cable was laid from Newfoundland to Valentia; the operation was perfectly successful throughout, not a hitch of any kind having occurred. The Great Eastern and her consort the Hibernia started from this country on the 9th August; arrived at Heart's Content, Newfoundland, on the 23d August, and after the shore ends had been laid, the Great Eastern commenced paying out the cable towards Ireland on the 26th August, and arrived off the Irish coast on 6th September; the final splice was made on the 8th September, and the laying of the 1874 cable was thus completed in thirteen days. The new cable, both in point of insulation and carrying capacity is the best yet laid across the Atlantic.

Severe Affliction of Supt. F. H. Tubbs.—The Accident on the C. B. & Q. R. R.

CHICAGO, ILL., April 15.

TO THE EDITOR OF THE TELEGRAPHER.

SUP'T F. H. TUBBS, of the Chicago, Burlington and Quincy Railroad, has been severely afflicted recently by the death of his estimable wife, which occurred on the 25th of March. Verily in his case it can be said prosperity and adversity go hand in hand, he having recently been appointed Superintendent of the road, in connection with his duties as Superintendent of Telegraph. Mrs. Tubbs died very suddenly, if I am rightly informed, of paralysis. Mr. Tubbs' grief has been considerably augmented by the painfully fatal accident which occurred on the Burlington and Missouri branch of the C. B. & Q., on the fourth instant, in which a number were killed and wounded. The accident occurred near Tyrone, Iowa station. Although, of course, Mr. Tubbs is in no way responsible, still he feels deeply grieved at its occurrence. The *Chicago Times* of the 5th took occasion to severely censure the road for employing an inexperienced boy as operator at Tyrone station, stating that after the accident occurred the operator fled to the woods, and has since not been heard from. The Burlington, Iowa, *Hawkeye*, denies the truth of these statements in every particular, stating that the young man was twenty-three years old, sober and reliable, and had been in the business over six years. The *Hawkeye*, while in no way excusing the negligence, pays him a compliment in regard to the nerve and pluck he exhibited in sticking to his post for two days, until properly relieved, doing the telegraphing of the road with a coolness that was wonderful, when he knew the fatal consequences his one act of carelessness had wrought. It was not hard heartedness either that caused him to act so coolly, as ever and anon tears of sorrow found their way to his eyes, sorrow for those thus bereaved, but they were dashed away and his work renewed. As far as I can ascertain, the manner of giving the orders was much at fault, as after getting an order to the conductor of one of the passenger trains to stop at Albia, Iowa, for the freight trains, he neglected to deliver the other order to wait for the passenger train with which it collided. Now it seems it would have been much better, when it was found necessary to give a second order, to have recalled the first, and given but one order, which should have held this passenger train for the other, and also directed it when to pass the freights.

In our younger days when we were instructed in the difficult and responsible duties of train despatching, it was understood to be a very careless thing to run a train that *did not have the right of way* against one that *did have the right of way on a flag and hold order*, to an agent and operator, with no intervening telegraph office to stop either train in case of just such a case of neglectfulness. It were far better to delay a train an hour than take any such risks. If the conductor and engineer had already seen both orders, and repeated back their understanding of the order in regard to the passing of the passenger, as well as of the freights, and received the despatches O. K., then the fact of the operator's not handing them the order in regard to the passenger train, and only giving them the order in regard to the freights, should place the blame entirely on his shoulders; in fact not at all, as the fact of the conductors and engineers having signed such an

order would be conclusive proof that they knew its contents, without having a copy of the order, which is generally kept only as a proof until the end of the trip, to show that the orders of the train despatcher have been obeyed. So, looking at this matter in any reasonable light, it will be seen the operator was not wholly to blame. I understand that ere long a meeting of train despatchers and superintendents will be held in this city, to discuss the matter of train despatching, and try, if possible, to remedy some of the evils of the system.

Mr. George H. Bliss has sustained a severe affliction recently in the loss of his mother-in-law, an estimable lady, who died about a week ago, and two of his children are now lying quite ill with scarlet fever.

OCCASIONAL.

The Other Side.

TO THE EDITOR OF THE TELEGRAPHER.

ONE afternoon not long ago I left the office and went to my boarding place, feeling very tired and worn, and somewhat gloomy. My day's work had been very hard, and the mental and physical strain severe. At the dinner table my landlady, in the course of her conversational deluge, remarked something to the effect that "didn't so many lady operators injure the business of telegraphing for gentlemen?" I made some impatient reply which, if I remember rightly, was in substance, "No! They are such confounded plugs they cannot injure anything—but our tempers and prospects for future happiness." But inwardly I was annoyed by the thought that many little cracks and crevices were filled with the gentler ones, and many of my profession of the sterner sex were out of employment who might otherwise be absorbed, leaving better openings for myself and others if we choose to select them.

For a moment I wished woman would choose some other occupation than mine; I cared not what it might be. She might teach school or work in factories, or adopt the legal profession or the medical; or she might work upon farms or in blacksmith shops if she were strong minded, or lecture, or do anything she pleased and retain favor in my sight if she would only let alone telegraphy. For a moment I was so much absorbed with this thought that the next four or five topics touched upon by my landlady were unheeded and unheard by me. But after I had retired to the rest and quiet which awaited me in my own room I came back to my more generous self, and saw how unreasonable I had been and how unjust in my thoughts.

Now, methinks there are a goodly number of my brother operators who feel just as I did for a single moment, many of them write to THE TELEGRAPHER about it, except that they put on a different aspect and another coloring. They do not say that it is because the ranks of telegraphers are crowded that they wish ladies would let the business alone; but they moralize and try to urge those who have already become our sisters to back out because they might become contaminated by associating with such as themselves—and so they might. They try to urge ladies not to learn to telegraph, because it is a hard and thankless task, and one has to associate with desperadoes and villains, and cut-throats. Then they become affecting and adulterate their ink with a manly tear or two, and sob that they had rather see the whole race of man go to the dogs than know of a single lady hearing one harsh or vulgar word. One correspondent has thus sobbed through three or four whole columns, and told us of his fear that woman will do some outrageously extravagant and highly improper thing yet, if she continues in the telegraph ranks—something to bring a blush to the cheek of our intelligent and refined American people. There are all kinds of excuses offered by this class of correspondents to show why woman should not practice telegraphy, and not one word given of hope, sympathy or encouragement to the hundreds of frail creatures who are obliged, in many cases, to resort to it to earn their own living—who become telegraphers not for the glory of it as many strong and robust young countrymen do, but because actual necessity frequently compels them to as a means of obtaining a livelihood, and, perhaps, giving assistance or support to an invalid family.

These occupiers of space in your columns do not object to the "sturdier sons of toil" learning, nor do they withhold the hand of cordial welcome from the young scapegrace who does not deserve a position nor need to work for a living, but who learns the art that he may go away from home, and have the "fun" that he cannot indulge in where he is better known.

I do not believe I have ever known a young lady to work at telegraphing for the mere pleasure of it, who did not need to, but was abundantly well able to get along without. In truth I believe that most lady operators are obliged to pursue their calling, or find another.

It has been represented in a letter published in these

columns that, for ladies to be associated with men of a less delicate touch of refinement—men who, perhaps, may have never known the gentle influences of mother or sister—would be to sacrifice woman, and leave man untouched and unmoved. I do not believe this is so. I believe, to harness the dark and discolored with the bright and pure is to give us a finer degree of beauty and finish, and a higher order of purity and excellence. Corrupt as it is, there is very little of humanity that is like the filth in the gutter, capable only of besmearing and soiling that with which it comes in contact. However degraded a human wretch may be, there is still something that may be washed and cleansed. For woman to assume the task of lifting up and making better and nobler men of her fallen brothers, need not be to plunge her own guilelessness in the slime of degradation and sin. It is my belief that the bright and beautiful things of life, in its every phase, are given us to improve that which is dark and uninviting. They are given for our good, and should not be kept as in a glass case, for fear of injury, nor should their light be hidden under a bushel, but it should be permitted to shine forth, illuminating the dark places.

As for my individual self, I am in need of better influences. I can also speak for many of my acquaintances. Were we favored with them we should appreciate them, and I am sure it would not be a casting of pearls before swine. I have felt rebuked many times at what some of the sisters have said of smoking. I smoke, and frequently sit with my feet upon the table. Yet, were there ladies present, I should do neither. In another instance my case is like hundreds of others. I was early denied the bettering influences of a beloved mother and lamented sisters. I entered my career at a tender age, and the teachings of childhood constitute the insecure foundation for the principles of my manhood. For such the influences of virtuous woman avails much.

We Americans are proud of the pliancy which intelligence, education and free thought gives to all our social customs. We have very few foyisms which savor of antiquity. If it was customary a century ago for young ladies to spin and weave, or otherwise employ themselves, and remain under their father's roof, it does not imply anything now. As has been quoted: "Times change, and we change with them." If young ladies can find fields of usefulness and activity elsewhere than at home, let not the old customs debar them from entering them.

To deal plainly and honestly, I believe selfishness has prompted the remarks of one who has spoken before. There is so much lack of pliancy and logic in all his arguments, and his whole tenor is such, that I think this belief is justified. It seems to be a common error of many to think that telegraphy is properly the vocation of men, and belongs to them. To disabuse our minds of this, and to consider woman's right to it equal to our own, is one of our first duties.

In conclusion, let me urge the importance of telegraphers reforming in those respects which characterize most fully the telegraph operator. The noxious ideas and principles which are instilled into the telegraphic student, and grow as he advances in knowledge of and age in the art, ideas which tend to create a feeling of hostility and strife towards every one who is striving to accomplish what he is, principles which have the effect of repelling each individual member of the great fraternity from the rest, and which affects the whole body, like some great centrifugal force that rends it asunder, casting forth each man as a separate fragment—these principles which, I repeat, characterize telegraph operators, and make them peculiar to other craftsmen, should be purged and cleansed away.

O. H. KAY.

The N. Y. & O. M. R. R. Operators, Northern Div.

IN THE WILDS OF JERSEY, March 20.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE made an unintentional mistake in not commencing with the Supt. of Telegraph of the New York and Oswego Midland Railroad, but he being so far away from the southern end of the road escaped my attention. Mr. Wm. H. Weed, whose office is at 111 Liberty street, N. Y., is Supt. of Telegraph, and also Gen'l Passenger Agent of the same road, and, consequently, does not have much time to attend to telegraph matters. For this reason he is not heard much on the line. He is a young man, but of good business tact; he was the first Supt. of Telg. the Midland had, but on account of his extra duties the position was offered Mr. Joseph Angell, then chief operator of the Erie Railway (the operators' friend—Mr. A. I mean, not the Eric), who accepted and entered upon the discharge of his duties.

When the N. Y. & O. M. R. R. failed, the receivers consolidated the office of Supt. of Telg. with that of Gen'l Passgr. Agent, again putting Mr. Weed back to double duty; and Mr. A., not being provided for by the Co., left.

Many an operator on both Midlands mourns his loss, and would be only too glad to see him back. Some of the operators would have made him a present on his retirement, but the failure of the company made beggars (very nearly) of a good many, and for the benefit of those who have lost sight of "A." we will say that he has been in some way connected with the building of the new A. & P. lines between Chicago and Omaha, which having been finished, he has again returned to New York.

Mr. John O'Connor, who is operator at Mr. W.'s office, "W. H.," has been appointed managing operator of the Midland Wire No. 2, vice Mr. Chandler, who returns to the Gen'l Frt. Agt's office as an assistant.

"O. C." has his hands full, as the company requires duplicates of all freight waybills from every station sent by telegraph to "W. H.," something which I have never before heard of being done on any railroad in the U. S., and I have worked for many both east and west. This sort of business greatly obstructs a large amount of paid business which otherwise would find its way over the Midland wires, thus the receipts are steadily decreasing. I will continue my letter with Mr. J. B. McCall, "M.," Train Despatcher, Southern Division, with office at Norwich. Mac is a gentleman in every sense of the word, and to strangers his slowness of speech and dry remarks are quite comical; he has but little to do on account of the small number of trains on his division.

Mr. J. B. Beasley, "J. B.," is night despatcher for the Southern Division under Mr. McCall. He hails from Monticello, N. Y., and was formerly day operator at Middletown.

Mr. John F. Mackie, "J.," is Sup't Northern Division, with headquarters at Norwich.

Mr. H. J. Henderson, "H.," is despatcher and division operator of the Northern Division. H. is an old Erie man, and what in the world made either him or Mac come over to such a road we cannot understand.

Mr. W. C. Hartigan, "W.," is asst despatcher at Oswego, has very little to do, with nominally a good salary, but he, like all the others on this road, don't get their money very often. They are living in hopes.

Mr. A. D. Peck, "K.," is operator at Norwich on No. 2 wire, and does all the repeating for "W. H." office, New York, which business is really immense, as the majority of all the business from "W. H." goes via "N." office, and is from there distributed to points on all branches and divisions. K. has but one arm, but gets along very well and is improving every day, because "O. C." rushes them and he has to take them on the fly. We understand he hails from Summitville.

At the city office in Norwich, we find Mr. Ailsworth, who has but little to do now-a-days. Times at "R. N." are not as good now as they were a year or two ago, when the Midland was in a flourishing condition and full of life; but alas! what an inglorious end of a great undertaking! The road is in the hands of receivers, and at present writing things look blue and discouraging. The boys are preparing for their funeral, their lives are in the hands of the Legislature of New York State.

A bill has been sent to the Legislature for "exemption of taxes on N. Y. & O. M. R'y," but it is believed by all that it will never pass. In case it does not pass, then the road will be closed and sold under the hammer.

At North Norwich we find a young lady operator who hails from Michigan, Miss Ada Travis, "V."

Michigan is a good State to bail from, as your correspondent can testify, but then I am not a "Wolverine" by birth.

Mr. A. Sheppardson, "S.," holds out at Smyrna as agent and operator. At Earlville we shall find the beautiful Miss Lillie Craudall, "C."

At this point the Syracuse & C. Valley R. R. branches out to Syracuse. George is "Hankin" around the office at Smith's Valley—he dropped down from Walton, N. Y. "F. B." is night man at Sy., but on pleasant afternoons they say Frank is *Bowin'* the girls around.

And still they come! Miss Mattie White, "W.," holds the reins at Eaton.

At Morrisville Mr. F. L. Griswold, "F.," does double duty; the same with Mr. C. A. Storrs, at Munnsville.

At Oneida Community, Mr. J. B. Neilson, "N.," is agent and operator; he comes from Oswego. At Oneida we find a gentleman who has held the position of ticket agent and operator for 3 years, Mr. A. M. Downing, "D." Mr. C. C. Ingersoll, "C.," holds forth here as night man. A night position as operator on this road is a very easy one, not much work. At the A. and P. office in Oneida we find a man of many positions—that of manager, operator, etc., and proprietor and clerk of a tobacco and cigar store, and news room—which positions he has held for eight or ten years. This remarkable gentleman's name is Mr. S. D. Baldwin, "B." He has, besides the A. & P., the three midland wires.

At North Bay Mr. C. S. Luce, "C.," does double duty. At Cleveland Mr. Christy C. Hartigan, "C.," is night

man and Mr. A. W. Whitney, "W.," from Mexico, N. Y., is agent and operator. Mr. S. W. Hall, "N.," does double duty at Constantia—ditto Mr. E. L. Kimball, "K.," at Pennellville.

At Fulton Mr. F. H. Jones, "H.," is ticket agent and operator. Fulton is one of the many pretty villages of the State of New York.

At Oswego, the northern terminus of the road, Mr. Hugh Coats, "M. C.," from Fulton, is day man, and Mr. W. L. Waugh, "W.," also from Fulton, is night man. At the Oswego shops, office Mr. Jerry Hartigan, "Hn.," is operator.

The Utica branch leaves main line at Smith's Valley, running to Utica. At Hamilton we don't find King Kalakaua but we find King Frank, "F.," who is operator only. At Bronckville Mr. Geo. E. Groves, "G.," does the regular double duty, as they usually do on this road. At Oriskany Falls pretty Miss Allie Wilcox is operator. At Deansville Mr. O. E. Talbot, "O.," is agent and operator. At Franklin Iron Works Frank L. Esmay, "F. Y.," is operator. At Clinton Mr. J. T. Euin, "J.," is agent and operator. At New Haven Mr. Wm. Chlore, "R.," is the operator. At Utica we stop with Mr. J. W. Blood, "B.," who is operator. The Rome branch leaves Utica branch at Clinton, after which the first telegraph office is at Clark's Mills, where Miss Hattie Rasbrook, "R.," throws lightning around promiscuously. At Westmoreland Mr. J. T. Becknell is agent and operator. At Rome Mr. Fred Weed, "F.," brings up the rear as operator.

The Auburn branch leaves the main line at Norwich; it formerly ran to Scipio Center, near Auburn, but a short time ago that part as far east as Corlandt was given up to N. Y. and E. R. R., and later on that part as far east as De Ruyter was given up to same road, which leaves but a few miles from Norwich to "D. E." The first telegraph station out of Norwich is Otselie, where Mrs. Nellie Tallett, "N.," is operator and her husband agent.

Sim Crumbs, "X.," runs things at Beaver Meadow. Wig-and, John, see "X. N.," is the agent and operator at Truxton. Mrs. Frank Steadman, "M. C.," is operator at McLean. At "D. E.," the terminus, we stumble into the office "upside down without care," when I am saluted by Sile Blanchard with "Hello! you old hairpin, you, when did you drop down? Come up to our city to see the ball race and horse play I reckon, don't it?" And all this was said in one breath, and the way he shook my paws knocked the breath so far out that your correspondent will not be able to write any more for the next six months. P'S AND Q'S.

A Domestic (Stone) Local Sounder.—Personals.

CHICAGO, ILL., April 19th.

TO THE EDITOR OF THE TELEGRAPHER.

ALTHOUGH the world ceases to exist at twelve o'clock to-night, according to the second adventists' theory, I must write from *outside* this mundane sphere and tell you the news. We had sixteen different kinds of weather every day last week (more or less), especially Saturday, when it snowed, sun shone, thawed and rained all in one breath, almost.

Our friend, O. M. Stone, of the Baltimore and Ohio R. R. Line, has another local sounder in his domestic circuit. This is the second one of the male persuasion. It arrived on the 12th inst. He came yelling "down with the passenger rates," and "O. M." went right down and just treated the boys and telegraphed the new comer's arrival to his friends. Mr. Northway, formerly of the C. & N. W. R'y Telegraph, but more recently travelling for a wholesale clothing house, has returned to his first love, and can be found at the Lake street depot of the Baltimore and Ohio Railroad pounding brass as of yore.

Charlie Meeker, of the Western Union main office, has been promoted from "check boy" to a position as operator on the Metropolitan lines, main office. This is a deserved compliment to a faithful and intelligent young man.

Mr. C. W. Baldwin has resigned his position as operator at Onarga, Ill., on the Ill. Central R. R. telegraph, and goes to Osborue City, Kansas, to engage in the drug business for himself. Mr. Baldwin is one of the few young men who leave hosts of friends and no enemies behind him. During his former years of continuous service at Onarga, he has always been found faithful to duty and an efficient operator. The company will not soon find his equal. Success attend him. OCCASIONAL.

Winter Lingering.—A Receiver for the Northern Pacific R. R.—A Plug Factory.

TO THE EDITOR OF THE TELEGRAPHER.

ANOTHER cold snap in this section has done considerable damage. Winter lingers in the lap of spring very complacently. The "old cuss," why don't he "git"—young summer wants to embrace spring, but she's either fickle or else has taken pity on the old man, and won't

cast him off for a warmer hearted swair. Well, that'll do for an introduction.

An order passed over the lines of the Northern Pacific Road Saturday, notifying the officers, agents, &c., that the company with all its property had passed into the hands of a Receiver, Gen. Cass, of N. Y., and that the business would be carried on as usual until further notice.

Mr. "Judd" Thompson has succeeded "Jo" Unwin as report operator (nights), at Keokuk, and, of course, bought "Jo" out in the "plug factory" there that "Jo" was running in connection with some second class commercial college. Guess you never heard of this "plug factory" before; well, it don't amount to much, but it's a plug factory nevertheless, and "Judd"—well, the boys all say he's too nice a boy to be connected with any such institution, and a great many of them think he only bought "Jo's" interest because "Jo" got "let out" a little short. Let us hope such is the case, and then none of the first class of the fraternity will be found engaged in such disreputable business.

NORTHWEST.

Another Telegrapher Commits Matrimony.—A Conundrum.

CHICAGO, ILL., April 16th.

TO THE EDITOR OF THE TELEGRAPHER.

YEOU orter see "Eph." Martin! whew! he's the proudest man on the night force here. He's done it! yes, he's mard—I mean married—can't find out the lady's name, but is right where "Eph." boards, and the house is all furnished, and they have gone to housekeeping as suug as you please. "Eph." gives you his left hand to shake now, his right one is—is tired! shook most lame.

Can you tell us why some of the boys go out and carouse all night, catch a cold, then go "snortin'" round next day smelling a tincture of chloroform and iodine, "blowin'" about having the catarrh. That's the kind of rheostats those day-men are. We don't understand it, and we night-hawks want to know how we can play off too. WESTERN UNION.

An Explanation Desired.

MINGO JUNCTION, OHIO, April 17th.

TO THE EDITOR OF THE TELEGRAPHER.

SOMETHING occurred on this line recently that is a mystery to me, and of which I would like an explanation if it can be given.

A few days ago, during a rain storm, I connected the main wire with a common local sounder, and it worked perfectly. Our line (the Cleveland and Pittsburg) is 94 miles long. In fair weather I have often tried the same thing, and could get no effect on the magnet. This seems strange to me, for in bad weather we can scarcely get a word on the relay. Why should a local sounder under such conditions work better than the ordinary relay? LOCAL.

Answer to Correspondent.

CHAS. NEWCOMBE.—It will be necessary to be able to read and write the Spanish language to obtain a position as operator on Mexican lines. Can't give you other information asked for, but you could probably obtain it from Don Pedro Murphy, Sombreteto, Zacatecas, Mexico.

He Wooded and She Wouldn't.—A Remarkable Story of how Two Loving Hearts were made One.

A YOUNG man, who is connected with one of the telegraphic companies of this city, left on the morning train of the S. P. R. R. Co., in company with relatives and friends, for San Jose, where he was, at two o'clock in the afternoon, to be united in the holy bonds of wedlock to a young lady, who is one of the belles of the Garden City of Santa Clara Valley.

The match, it appears, was brought about by the parents of the young girl, who, although she promised to marry the telegraphist, did not love or care for him, as her heart was given to a nice young man who is engineer of a locomotive on the S. P. R. R.

By previous arrangement, the lady who was to have become the bride of the telegraphist left her parents' home yesterday morning, boarded the train drawn by the locomotive of which her lover is engineer, and arrived in this city, where the engineer met her at the depot, and in a very short time procured a license and made her his wife. It is fair to presume that the telegraphist was a little disappointed.—*San Francisco (Cal.) Daily Morning Call.*

THE Hawkeye Telegraph Company of Iowa appears in the *Annales Telegraphiques* under the rather effectual disguise of "la compagnie télégraphique Haw Keyes."

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, APRIL 24, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE ON APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an *extra copy free*.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

SINGLE COPIES OF THE TELEGRAPHER MAY BE OBTAINED ON THE DAY OF PUBLICATION AT THE NEWS STAND IN FRONT OF THE NEW WESTERN UNION TELEGRAPH BUILDING, CORNER OF BROADWAY AND DEY STREET.

Back Numbers of The Telegrapher Wanted.

OUR supply of copies of the current volume of THE TELEGRAPHER, Nos. 446 for January 30th, and 449 for February 20th, are already exhausted, and we would be under obligations to any of our subscribers who do not keep files of the paper for binding, that may have these numbers, or either of them, on hand, if they will forward them to this office. The postage necessary to be prepaid on those papers, to insure their transmission, is two cents for each.

We regret to be obliged to ask this, but the demand for these numbers has exhausted the supply.

Telegraphic Inventions and Improvements, and the Telegraphic Fraternity.

IT may be received as an established fact that telegraphers, as a class, are conservative as regards improvements in telegraphic apparatus and improvements. This is very fully demonstrated in the prejudice generally existing among them against the introduction of the automatic telegraph system. This prejudice arises in great part not so much from objections to the introduction of such improvements abstractly considered, but from a disinclination to depart from the usual and accustomed modes of telegraphy, and more especially from the anticipation that their general introduction and adoption will decrease the demand for telegraphic labor.

The quadruplex inventions, so called, have met with less opposition than the automatic, for the reason that it is evident that the number of operators required will be increased rather than diminished, and that in the transmission of business the system does not vary essentially from the regular MORSE system. So limited has been the introduction of the quadruplex in actual use hitherto that the fact has not become generally recognized and understood that a better class of operators will be required to work it successfully than are needed in telegraphing on single wire circuits.

It is, perhaps, inherent in human nature as usually developed to dread a change from ordinary conditions and circumstances, and this is no less true of telegraphers than of any other class. Despite this fact real improvements will make their way, and will ultimately establish themselves, however great may be the prejudice against them, and however determined may be the opposition they encounter.

And it would be well for those who suppose their interest will be injuriously affected by the introduction of telegraphic improvements to recollect that such anticipations in other departments of business, and labor have uniformly failed of realization. The demand for service in any department has been increased rather than diminished by the introduction and general adoption of improved processes for doing the work.

In the case of the telegraph, a very serious problem has presented itself, and one the practical solution of which is becoming imperative. It is how the rapid increase of telegraphic business, temporarily checked, perhaps by the business depression which has prevailed since the fall of 1873, but which is likely soon to be renewed more energetically than before, is to be accommodated. It is evident that there is a limit beyond which it is not possible to go on increasing remuneratively the number of wires, costly to erect in the first place, and a constant expense to maintain and keep in order after they are erected. Obviously there is but one practical and effective solution of this problem, and that is to develop more fully the capacity of the wires for the transmission of telegraphic signals. The question then resolves itself into the best and most efficient method of doing this.

The introduction of the duplex apparatus, which was derided by Western Union officials and declared by them valueless, but subsequently adopted and as extravagantly lauded by them as it had previously been derided, was an important step in the right direction. It is evident however, that the duplex does not fully solve the difficulty. In process of time the quadruplex was brought forth with a grand flourish of trumpets, as the great telegraphic invention and discovery of the age. We have no desire to belittle the value of this invention, but it has not yet been demonstrated that it is calculated to work the revolution in telegraphy that has been claimed for it. As we understand, specially favorable conditions as regards conductors and weather are requisite to enable the quadruplex to be advantageously worked, and that under such favorable conditions not to exceed the capacity of three wires is obtained by the employment of eight operators. No doubt the quadruplex is susceptible of further improvement and perfection which may simplify its operation and increase its capacity. We are speaking of it only as it is at the present time.

It cannot be questioned that the automatic system increases the available capacity of a wire to a much greater degree than any system of telegraphy which has as yet been practically introduced. We are not unmindful of the objections which have been urged against it, and do not question the force of some of them; but, on the whole, we believe that, with the automatic system properly worked on good lines, more business can be accomplished at less relative expense than by any other in use. And as we have before argued, the interests of the telegraphic fraternity will not be injuriously affected by its general introduction and use. It seems to us that there is only one more step to be taken to render the telegraphic system as perfect, and to utilize the wires as fully as is possible. That is the practical development of some autographic, as well as automatic, system of telegraphy. This has been sought for diligently for many years, and the time seems nearly ripe for its development. How soon such a system will be perfected of course it is impossible to predict, but within the last two or three years we think substantial progress has been made in this direction.

That the telegraph business, marvellous as has been its development within the last twenty-five years

is to experience a still more marvellous development in the future we are convinced. That telegraphic improvements will inure to the benefit of the telegraphic fraternity as well as of the general public we are equally convinced. That they will be adopted, however great may be the prejudice on the part of the fraternity they may have to encounter, is as certain as anything can be. We desire, therefore, that telegraphers shall consider the matter intelligently and dispassionately, and not regard as antagonistic to their interests those who recognize the fact that the world moves, and, by making known the changes which are inevitable, prepare them for future conditions of telegraphic service, rather than seek favor by flattering their prejudices and attempting to conceal or ignore the facts.

The Quadruplex Telegraph Patents.—The Right of Appeal to the Secretary of the Interior.

—Decision of Secretary Delano.

THE controversy in relation to the widely celebrated Quadruplex Telegraph patents has assumed a new phase. It will be remembered that the invention was claimed by MR. GEO. A. HARRINGTON, President of the Automatic Telegraph Company, by virtue of a previous contract with EDISON, the inventor, although the latter had assigned it to himself and MR. GEORGE B. PRESCOTT, which assignment was duly recorded in the Patent Office. The decision of the Commissioner of Patents that the patent should be issued to EDISON and PRESCOTT, as assignees of EDISON, and the grounds on which his decision was based have already been published. The Patent office is a bureau of the Interior Department, and this led some sharp attorney of the GOULD-HARRINGTON-EDISON combination to conceive the entirely novel and original dodge of making an application to the Secretary of the Interior to overrule the decision of the Commissioner of Patents. The question came up for hearing on Thursday, April 15th, before Secretary DELANO. MR. J. H. B. LATROBE appeared for HARRINGTON, Senator ROSCOE CONKLING and MR. J. HUBLEY ASHTON for PRESCOTT, while EDISON was most appropriately represented by Gen. BENJ. F. BUTLER, and also by MR. LEONARD MYERS, ex-M. C., and late chairman of the House Committee on Patents. MR. BUTLER insisted that the whole case should be re-opened, and new evidence introduced, in the shape of affidavits from his client, etc., in order to show that the decision of the Commissioner was erroneous. He read EDISON'S contract with HARRINGTON, and then his contract with PRESCOTT, and then his contract with J. GOULD, in order to show him his poor but honest client had been robbed by a series of "wicked partners." He contended that the patent should issue to his client alone on the ground that, whatever may have been his arrangement with MR. PRESCOTT, it was in the nature of a partnership, which had been dissolved by the withdrawal of MR. EDISON without his having received a dollar from MR. PRESCOTT for any interest in it. The patent should not be granted to Messrs. EDISON and PRESCOTT conjointly, as the Commissioner of Patents recently ordered, but that it should be issued to EDISON, leaving any equities which might be claimed to exist by virtue of assignments to be adjudicated by the courts. Senator CONKLING replied at once, raising the question of the Secretary of the Interior's jurisdiction over the matter. He contended that the decisions of the Commissioners of Patents are absolutely final as to all purely executive questions. He denied that the Secretary of the Interior had any jurisdiction whatever over any questions relating to patents. He showed by the records of the Department that in no instance had an application of this kind ever been granted, even if made, which was doubtful. There was no such appeal established or permitted by the statute, or by the rules and regulations of the Patent Office.

Gen. BUTLER replied, contending that the Secretary was responsible for a paper which went out under his signature, and that therefore he should direct the action of the Commissioner. In all judicial proceed-

ings relative to a patent there was an appeal to the Supreme Court of the District of Columbia, but in executive matters none except to the Secretary. He cited from Supreme Court decisions, and the usages of the patent office in relation to assignment to sustain his point. He claimed that the Commissioner had done his client an injustice, which he asked the Secretary to correct. The Commissioner had felt obliged to make his decision upon the facts shown on the records of the office. He claimed that the records were not sufficient, that the Secretary should go behind the records and admit further evidence.

Mr. LATROBE followed, arguing that the question of novelty or of invention goes to the Supreme Court, while that of ownership goes to the Secretary. He wanted the patent issued to HARRINGTON, according to his contract with EDISON.

Mr. ASHTON insisted that if the Secretary was to sit as a court of appellate jurisdiction, that he must decide the case upon the record as presented to the Commissioner; that new evidence could not be introduced into the case. The hearing lasted from twelve o'clock until nearly half past six.

The following is the decision of Secretary DELANO:

It is the practice of the Department to sign without inquiry all patents that are sent up from the Patent Office with the signature of the Commissioner attached before they are presented. As far as I know, it has been the practice of the Office from time immemorial; I cannot say to the time whereof the memory of man runneth not to the contrary, etc. My memory only dates back to the day of Secretary Ewing.

The records of the Department, as has been well asserted by the counsel, show that applications to the Secretary to withhold his signature to these patents have been very rare, if one has ever been made. Nevertheless, I am very clearly of the opinion that when my attention is called to the facts of a case, and my judgment is that a patent should not be issued, it would be my duty to withhold my signature from the patent. But I think good practice requires that my opinion should rest upon the case as presented to the Commissioner, and therefore I should not be inclined, I think, under any circumstances, to direct the introduction of other evidence than that which was before the Commissioner. Certainly in this case, at this stage of it, I should be unwilling to give an order for the taking of testimony for its continuance as the counsel upon one side of the case have asked.

Now, as to whether, in my judgment, I shall or shall not deem it my duty upon the case, as it is before me, to sign or withhold my signature from the patent, I shall express no opinion. It will, perhaps, be time enough to express an opinion when the papers are presented to me for signature; but, if the counsel will rest the case upon its present argument, when I reach it by the presentation of the patent I will decide it. If they wish to argue that question farther, at an early day I will hear it, if they agree upon the time. So that, virtually, if I make myself understood, I decline to grant either of the motions that have been submitted to-day; either to dismiss the case or continue it, and allow additional testimony to be taken in it. I recognize the fact that to the Commissioner is entrusted, in the first instance, the duty of examining and deciding upon all questions that arise before him in his office, and are presented to him, but I am unable to bring my mind to the conclusion that it would be my duty to sign a patent because in his best judgment he had directed it to be issued, if I, on the evidence in the case as presented to me, should be of the opinion that his conclusions were clearly and distinctly erroneous. I do not say anything about what I should do in a doubtful case.

I do not desire to express any opinion at present in any other terms than those I have used, namely, that if the facts in the case, as presented by the record sent by the Commissioner to me, should satisfy me that it was wrong to issue a patent, I certainly could not conscientiously attach my name to it. I distinctly reserve the expression of and opinion in reference to my convictions as to whether this patent should or should not be issued. I am inclined to think that in no case should I undertake to direct the Commissioner as to his future proceedings after I had determined to withhold my signature from a patent presented.

In conclusion Secretary DELANO notified the counsel of all parties interested that he would allow fifteen days for the preparation of printed arguments on the merits of the case on the record; after which ten days' further time will be allowed to counsel to file replies to each other's briefs.

A Candidate for the Big Leather Medal.

The following dispatch from Washington, which appears in the *Springfield Republican* of April 20, must have been contributed by the agent of the Society for the diffusion of useless misinformation:

WASHINGTON, Monday, April 19.

The quadruplex telegraph case is again before Secretary Delano, that official claiming the right to revise and reverse the action of the Commissioner of Patents. Edison was the patentee, but a joint application for the patent was made by Edison & Prescott. Edison withdrew from the firm and sold his claims to the Automatic Telegraph company; Prescott sold his to the Western Union. The Commissioner of Patents having decided in favor of Edison as sole patentee, Mr. Delano is appealed to to overrule. Senator Conkling appears for the Automatic, and denies the Secretary's jurisdiction; Gen. Butler for the Western Union. Mr. Delano allows 25 days for the presentation of arguments.

As a slight correction of the above, it may be noted that the case was not *again* before Secretary Delano, it being the first time this or any other patent had ever been carried before him in this manner; also that he did not set up any claim to revise and reverse the Commissioner's action. A joint application for the patent was not made by EDISON & PRESCOTT. EDISON did not withdraw from the firm, nor sell his claims to the Automatic company, but to the Western Union. The Commissioner of Patents did not decide in favor of EDISON, but against him. Senator CONKLING did not appear for the Automatic, but against it, nor did General BUTLER appear for the Western Union, but for EDISON and against the Western Union, so far as they may be supposed to be interested in the success of Prescott's claims. Otherwise the statement is not essentially inaccurate. It reminds one of the savans of the French Academy, who were getting up a dictionary, wherein they defined a crab as "a small red fish, which walks backward." On submitting this definition to CUVIER, the celebrated naturalist, the latter remarked: "Gentlemen, the crab is not a fish, it is not red, and it does not walk backwards; with these exceptions your definition is sufficiently accurate!"

The Underground Telegraph Bill.

WE are informed that the Committee of the Assembly of this State, to whom was referred Mr. DALY'S bill requiring telegraph companies to put their lines in New York City and Brooklyn underground within a specified time, are unanimously opposed to reporting it favorably.

Personals.

Mr. C. K. HAGE, formerly operator in the N. C. Railway office at Harrisburg, Pa., has been appointed operator in the General Supt's office of the Philadelphia and Erie R. R., at Williamsport, Pa., *vice* Mr. J. M. McCASKEY, resigned.

Mr. HARRY SCHALK has been appointed day operator in the Division Supt's office, Eastern Division of Philadelphia and Erie R. R., to work the through wire. He was formerly night operator in the same office.

Mr. ALLEN D. SMITH has been appointed night operator in the Division Supt's office, of the Eastern Division P. & E. Railway.

Mr. C. T. SKINNER has been appointed day operator at Allen's, P. & E. Railway, *vice* Mr. J. F. BARKY resigned.

Mr. CHARLES F. KISSINGER, formerly agent at Selin's Grove, for the S. & L. R. R., has been appointed extra operator on the Eastern Division of the P. & E. R. R.

Mr. CHAS. F. GOLDEN, day operator at Round Island, has been transferred to Johnsburg, *vice* Mr. EUGENE K. STEVENS, who has accepted a position in the night office of B., N. Y., & P. Junction, in place of Mr. J. L. MILLER.

Mr. HOWARD LAUGHTON, formerly operator at Cameron, Pa., has taken the position of day operator at Round Island, Pa., on the P. & E. R. R., made vacant by Mr. GOLDEN.

Mr. J. L. HERRON has been appointed agent and operator P. & E. R. R., at Cameron, Pa.

Mr. H. C. ROBINSON, formerly assistant manager of the Philadelphia, Pa., Western Union office, has

been appointed manager in place of Mr. JAMES MERRIEW, promoted to Superintendent.

President ORTON, of the Western Union Telegraph Co., arrived at Liverpool on the 7th inst. in excellent health.

The Telegraph.

Opening of the Southern and Atlantic Company in Boston.—Improvement of the Quadruplex.

THE Southern and Atlantic Telegraph company have opened an office at No. 27 Devonshire street, Boston, of which Mr. Joseph A. Elms, heretofore an operator of the Western Union office, has been appointed manager. The S. & A. Co. lease a line from Boston to Washington, D. C., from the Western Union company, as a part of the arrangement between the two companies. It is also rumored that the S. & A. Co. lease from the Western Union a line from Boston to Portsmouth, N. H., to connect with the direct cable. No. 31 is the wire between Boston and New York which has been turned over to the S. & A. Co. by the Western Union. Of course this new combination gives rise to all sorts of reports in regard to the future operations of the two companies, especially in connection with the new cable.

The quadruplex, through the ingenious improvements of Mr. Gerritt Smith, Assistant Electrician of the Western Union company, is now stated to be a success beyond a doubt, the four sides working perfectly, and at as high rate of speed as four single Morse circuits. The feasibility of working the combination printer on the quadruplex has been demonstrated by trials between Boston and New York, and it is understood that the two printer circuits are hereafter to be worked on one wire.

Foreign Telegraphic Notes.

THE report of the Brazilian Submarine Telegraph company shows that the total earnings for the half year were £60,027, and the working expense £10,463, leaving £50,164 as profit, which, with £2,586 (the net profit before the 1st July, 1874), makes a total of £52,751. First and second interim dividends, amounting to £32,500, have been paid, leaving, after deducting £439 for income tax, a balance of £19,811 to be carried forward.

The Channel Islands Telegraph cable, belonging to the British postal telegraph system, repaired only a few months ago, is again broken. The break is supposed to be nearer to the Guernsey shore than the last one; and it is probable that, owing to the difficulty of obtaining a suitable cable ship, some little delay may be experienced in carrying out the necessary repairs, if, indeed, it be not found necessary to renew a considerable portion of the cable. Telegrams will, as on former occasions, be conveyed as speedily as possible by the mail steamers from Weymouth and Southampton, and, of course, the route by way of France is still open for telegrams by wire over the whole distance.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended March 27, 1875, was 332,257, a decrease of 27,285 on the corresponding week of 1874.

The suspension of Mr. W. T. Heuley, of Woolwich, the telegraph engineer and contractor, is alleged to be owing to the loss of the La Plata.

The number of messages passing over the Cuba Submarine Telegraph during the month of March was 2,686, estimated to produce £2,700, as against 889 messages producing £908 in the corresponding month of last year.

Telegraphic communication is now established between all the important cities in Japan.

Advices from Shanghai, China, of March 17th, state that work on the Fuchas telegraph line continues to be interrupted, and considerable additional property of the company has been destroyed by mobs.

The ordinary half yearly meeting of the Anglo-American Telegraph company was held April 9, in London, when the report of the directors was adopted. At the extraordinary meeting, which was subsequently held, to consider the propriety of dividing the stock into preferred and deferred, no resolution upon the subject was submitted, it being understood that the directors had a majority of proxies in opposition to such proposal.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended April 3, 1875, was 375,821, an increase on the corresponding week last year of 61,048.

It is reported from St. Petersburg that at the coming Telegraphic Congress the question will be raised

of special treaties for preserving telegraph wires in time of war, or, in other words, of their neutralization.

At a meeting of the directors of the Globe Telegraph and Trust company the following interim dividends have been declared for the quarter ending the 18th inst. On the preference shares 3s. per share, being at the rate of 6 per cent. per annum, and on the ordinary shares 2s. 6d. per share, being at the rate of 5 per cent. per annum.

The directors of the Eastern Extension (Australasia and China) Telegraph Company have resolved to declare a final dividend of 4s. per share, making, with the three interim dividends already paid, 6½ per cent. for the year ending 31st December, 1874, free of income tax, carrying forward to reserve fund £32,839, making a total reserve of £75,453.

The directors of the Western and Brazilian Telegraph Company have declared an interim dividend of 5s. per share for the quarter ending the 31st of March last, payable on the 15th inst.

The traffic receipts of the Direct Spanish Telegraph Company for March, 1875, amounted to £1,475, against £1,104 in February.

The traffic receipts of the Eastern Telegraph Company for the month of March, 1875, amounted to £33,285, against £31,899 for the corresponding month of 1874.

The traffic receipts of the Eastern Extension (Australasia and China) Telegraph Company for March, 1875, amounted to £18,730, and for the corresponding month last year £19,530.

The receipts of the Submarine Telegraph Company for the month of March, 1875, amounted to £9,289. The receipts for the corresponding month of 1874 were £9,561.

The half yearly meeting of the Mediterranean Telegraph Company was held on March 9th at the London Tavern. The report stated that the cables and land lines of the company had been maintained in perfect order, and so remained, at a small outlay. The directors recommended the payment of the usual half yearly dividend on the 8 per cent. preference stock of the company, less income tax, and of a dividend at the rate of 3 per cent. per annum on the ordinary share capital, free of income tax, payable on and after the 15th inst., which would leave £501 to be carried to the reserve fund. The Chairman, in moving the adoption of the report, said the traffic had fallen off very considerably from the competition of the Eastern Telegraph Company. They had hopes that some of the lines contemplated would enable them to make a better show by the next meeting. There was a talk of some lines being constructed that would be beneficial to the company. Their line to Modica was laid down sixteen years ago, and was now in excellent order. The report was adopted.

The Direct United States Cable.

At the ordinary general meeting of the shareholders of the Direct United States Cable Co., recently held in London, the chairman, Mr. Edward H. Lushington, after explaining the present condition of the cable, the causes for its non-completion, etc., as expected, said:

"While we have to deplore the delay in the completion of the cable, the time has been profitably employed by the board for the benefit of the company. In the first instance, we have endeavored to keep our expenses as low as possible. Staff has been engaged with the provisional condition that an increase of their salaries would not commence until the cable was actually in working order. We have engaged agents, and have been occupied with the formation and consolidation of business connections in the United States and elsewhere, which we trust will bring us in plenty of work as soon as our cable has been laid. We have hired premises immediately opposite the Stock Exchange in Throgmorton street, which have already been fitted up with instruments, and where our staff are daily employed in working these instruments. We have got a line constructed from the post office authorities direct from Throgmorton street to Bollinskelligs Bay, to join our submarine cable, then via Nova Scotia to New Hampshire, and from New Hampshire we have laid lines direct into our office in New York. Our office there is as favorably situated for business as is our office in London."

Quadruplex Funds Distributed.

It is said that a young man named Fox, employed by Edison & Murray, of Newark, N. J., has departed with \$500 in cash belonging to the firm. The professor will evidently have to sell the quadruplex once more to replenish his finances.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended March 2, 1875, and bearing that date.

160,402.—SOLUTIONS FOR CHEMICAL TELEGRAPH PAPER.—Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. Filed June 1, 1874.

The solution for chemical telegraph paper, prepared with ferricyanide of potassium, substantially as set forth.

160,403.—SOLUTIONS FOR CHEMICAL TELEGRAPH PAPER.—Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. Filed June 1, 1874.

The solution for chemical telegraph paper, prepared with tannin and hydrosulphuret of ammonia, substantially as set forth.

160,404.—SOLUTIONS FOR CHEMICAL TELEGRAPH PAPER.—Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. Filed June 1, 1874.

The solution for chemical telegraph paper, prepared with tincture of logwood, substantially as set forth.

160,405.—ADJUSTABLE ELECTRO-MAGNETS FOR RELAYS, &c.—Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. Filed July 29, 1873.

The variable resistance *b*, placed in a shunt circuit, in combination with an electro-magnet for equalizing action of the current in the electro-magnet and dispensing with the spring adjustment, as set forth.

160,442.—PRINTING TELEGRAPHS.—Adolphus A. Knudson, Brooklyn, N. Y. Filed August 18, 1874.

Improvement in Knudson's Patent No. 140,143. Type-wheel escapement, controlled by rapidly alternating pulsations. Prolongation of current allows extended poles *l k* to attract armatures *n m*, one accomplishing the printing, the other straining spring *u* to furnish the power to turn type-wheel.

The combination, in a printing telegraph instrument, of two magnets in one circuit, and a polarized armature between them operating the escapement, a printing or impression lever receiving motion from a lateral core and armature, and self-winding mechanism receiving its power from lateral cores and another armature, substantially as set forth.

160,495.—ELECTRIC MOTORS.—D. Williamson, Greenville, N. J. Filed Jan. 8, 1875.

Upon a sliding sleeve on the fly-wheel shaft are two disks, the cut-away portions of which oppose one another. These disks allow conducting pieces, each connected with its magnet and attached to swinging arms, to come into contact at proper times with a metallic disk connected with one pole of the battery. When the disks are in position, so that the swinging arms rest upon both disks, the machine comes to rest, and, according as one or the other of the disks revolves under the swinging arms, the revolution of the shaft is to the right or to the left.

1. The cushions or bumpers *d* in combination with the magnets and armature levers, substantially as and for the purpose specified.

2. The cams *L L'*, attached to the adjustable slide *K*, in combination with rollers *n* or equivalents, as and for the purpose described.

3. The cams *L L'*, arranged as described, in combination with the slide *K*, arms *m*, rollers *n*, springs *t*, and bars *s*, substantially as and for the purpose set forth.

4. Two or more cross-bars, *s*, in combination with the fixed insular device *k* and *h'* and the sliding cams *L L'*, whereby the currents are completed and broken, dispensing with all friction, for the purpose herein described.

5. The magnets *D1, D2, D3* and *D4*, and levers *E1 E2*, in combination with pitman *G1 G2*, crank *d*, and pin *b* and shaft *B*, all as and for the purpose herein described.

REISSUE.

6,318.—ELECTRIC RAILWAY SIGNAL APPARATUS.—Henry W. Spang, Reading, Pa. Patent No. 141,395, dated July 29, 1873. Filed Nov. 12, 1873.

Uses Geissler tubes for night visual signals.

1. A Geissler tube, or its equivalent, illuminated by electricity, in combination with a track or railway switch circuit-closer, for general railway signal purposes.

2. In combination with a track or railway switch circuit-closer, a visual signal illuminated by an induced electrical current.

3. In combination with a railway signal apparatus and a track or railway switch circuit-closer, a visual signal illuminated by an induced electrical current.

For the week ended March 9, 1875, and bearing that date.

160,739.—HYDRO-ELECTRIC LAMPS.—Wm. H. Zimmerman, Chestertown, Md. Filed Jan 11, 1875.

Lamp is lighted by a flame of hydrogen gas, which is itself ignited from a platinum wire rendered incandescent by passage of electric current. The gas generating reservoir forms the base of the apparatus, and a frame extending from it supports on one side the battery for generating the electricity, and on the other the coal oil lamp.

The hydro-electric lamp, consisting of a hollow base or pedestal *A*, for forming the Döbereiner apparatus, the coal oil lamp *B*, the battery *E*, and the supporting frame *W I F*, all combined and arranged substantially as and for the purpose described.

Born.

REED.—To the wife of Mr. DAVID B. REED, of Driftwood, Pa., April 10, 1875, a daughter.

WILLIAM BROWNLEE,
Dealer in
CEDAR TELEGRAPH POLES.
OFFICE, FOOT OF SHELBY STREET,
DETROIT, MICHIGAN.

BASTET'S NEW ELECTRICAL MOTOR AND BATTERY.

For Sewing Machines, Church and Parlor Organs, Small Printing Presses, Pumps, Lathes, Dentists' Instruments, or any Light Machinery.

My new ELECTRICAL BATTERY is the most powerful for quantity and durability manufactured, and does not crystallize the carbons. For Electroplating, Telegraph ng, and for Motive Power, it cannot be surpassed.

Our No. 1 Engine, for Sewing Machines, with four cells of Battery, is furnished for \$40.

Other Motors at prices proportional to power required.

BATTERY, No. 1 Cells \$5.
" No. 2 " " 10.

L. BASTET,
116 Fulton Street, New York.

SAWYER'S BATTERY TOP.

(Patent applied for.)

JAR RENDERED ABSOLUTELY AIR TIGHT.

NO EVAPORATION. NO MORE OIL.

ONLY SURE METHOD EVER DEvised.

We are prepared to fill orders for any size at short notice,

WATTS & COMPANY,

Sole Agents and Manufacturers,
No. 47 Holliday street,
Baltimore.

PROTECTION OF TELEGRAPH WIRES.

Cables and Instruments Protected from Lightning.

THE GLOBE LIGHTNING ARRESTER.

The season of the year when Telegraph Wires, Cables and Instruments are peculiarly exposed to danger from Excess of Atmospheric Electricity has come. Every prudent Manager of telegraph lines will insure

Protection Against Damage

By the use of Suitable and Reliable

Lightning Arresters.

THE GLOBE LIGHTNING ARRESTER,
Manufactured and Sold by us, is as

NEARLY PERFECT

as can be made. They should be generally introduced and used. Price \$4.

The usual discount made to dealers.

P. O. box 5,503.

F. L. POPE & CO.,
38 Vesey street, New York.

Send for circular and price list.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that is returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,
No. 40 WEST EIGHTEENTH STREET,
or to
L. G. TILLOTSON & CO.,
8 Dey street, Sole Agents.

THE KENOSHA INSULATOR CO.

**TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS**

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellant of moisture, which does not change nor deteriorate after years of exposure to the weather.
THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

**THE NORTH WESTERN TELEGRAPH CO.,
THE WESTERN UNION TELEGRAPH CO.,**

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES,

prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

L. G. TILLOTSON & CO.,

General Eastern Agents.

GEORGE H. BLISS & CO.,

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS—COMBINATION SETS; Box and POCKET RELAYS.

PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, wire connections above the table.

REGISTERS, with SPRINGS or WEIGHT.

CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANNUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.

BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANIFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWE CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular Pioneer Cheap Telegraph Instrument has recently been improved and a Straight Lever Key placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and is still the leading telegraphic apparatus of its class.

They are furnished at the following popular prices:

Single Instruments with three cells of Battery, Chemicals,
Connecting Wire and Instruction Book, - - - \$6.50
Two sets of Instruments, etc., - - - - - 12.00

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

FOR THE SPRING CONSTRUCTION,
1875.

WE HAVE IN STOCK UPWARDS OF

1,000 MILES LINE WIRE,

INCLUDING

GALVANIZED AND PLAIN IRON,

Nos. 8, 9, 10, 11 and 12,

AMERICAN COMPOUND,

ALL SIZES.

50,000 INSULATORS

INCLUDING

SCREW GLASS,

CAUVET PATENT,

KENOSHA PATENT,

BROOKS' PATENT,

TOGETHER WITH A LOT OF

PLAIN GLASS,

WHICH

Answers every purpose for Short Lines,

WHERE PARTIES DESIRE TO ECONOMIZE.

50,000 INSULATOR BRACKETS.

ALSO, A VERY LARGE VARIETY OF

MISCELLANEOUS EQUIPMENT.

For particulars of which we refer to our Catalogues.

The great volume of our business enables us to sell at

LOWER PRICES

THAN ANY OTHERS IN THE TRADE.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the **UNITED STATES** and **CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES** and the **DOMINION OF CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury, Professor **SILLIMAN**, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, the **ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER

A JOURNAL OF

ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, MAY 1, 1875.

VOL. XI. WHOLE No. 459.

The Quadruplex Telegraph.*

BY F. W. JONES.

Just one hundred years ago George Louis Lesage, of Geneva, constructed a telegraph composed of twenty-four line wires, corresponding to the twenty-four letters of the alphabet, and by the use of frictional electricity and pith balls, succeeded in transmitting intelligible signals over the wires to a distance.

Numberless experiments by different philosophers followed in quick succession with a view of establishing means of rapid communication between widely separated places, but none of the systems that were devised proved anything more than scientific toys.

It remained for Morse, in 1844, to establish a system which was to stand the test of actual experience.

During the same year considerable activity in experimenting was also manifested in England. The first line of any length was constructed between London and Gosport, on the London and Southwestern Railway, but it was two years later before lines were extended for commercial purposes.

In our own country, starting with one wire between Baltimore and Washington in 1844, we can now boast miles enough of telegraph wire owned by the various companies to encircle the globe about ten times. Chicago had its first wire in 1847, and now the Western Union Chicago office alone works 72 long circuits stretching in every direction to all parts of the country, besides 30 metropolitan and 60 private lines.

So far from adhering to first principles in the use of twenty-four wires for the transmission of a single message, the hour is at hand when twenty-four messages can be transmitted simultaneously over one wire.

At the present time four messages are sent at the same time a distance of nearly one thousand miles, with the utmost ease and certainty, at the rate of 120 words per minute.

The wonderful instrument performing this miracle in telegraphy is *The Quadruplex*, an invention of Messrs. Prescott and Edison, electricians. It is based on the same principle as the Bridge Duplex, comprising all its main features, and in order to render a description of the Quadruplex easier and more comprehensible, I will briefly review the duplex system. Authors do not agree in their account of the origin of the duplex; some refer it to Dr. Gintl in 1853. It is well established, however, that experiments were made by the Electric Telegraph Company, of England, in 1853, but their system did not prove of any advantage, and it fell into disuse about the same time Gintl, Siemens, and Frischen directed their efforts towards perfecting a duplex, and many Russian stations were fitted up with their instruments; but, from the fact that no gain was realized over single transmission, the stations were refitted with the ordinary Morse. Mr. De Sauty, in 1855, successfully worked the Frischen-Siemens system between Manchester and Altringham. He only accomplished ten words per minute against sixteen by the single Morse.

In 1856 attempts were made to work the duplex between London and Birmingham, on the Magnetic Company's wires, and the signals were improved by using a condenser; but the experiments ceased, for the reason that Mr. Gordon, of the firm of R. S. Newall & Co., to whom the English patents belonged, did not deem the addition of condensers of sufficient value to warrant the expense of their construction.

In 1868, the duplex was revived by J. B. Stearns, of Boston, and was actually worked on one of the wires of the Franklin Company. His system, which I will now describe, does not differ materially from those that have preceded it, save in the application of an improved form of double pointed key or transmitter, and, more recently, condensers, whereby long line difficulties were entirely overcome, and the carrying capacity nearly doubled.

A relay is wound throughout with two separate wires, the outer end of one and the inner end of the other are brought directly to the double pointed key.

One of the opposite ends of these wires is connected to the line, and the other to a rheostat and ground of resistance equal to the resistance of the line.

The transmitter, or double pointed key, is arranged to be in contact with battery when the lever is depressed, and with ground when elevated—one contact always taking place, through spring contrivances, before the other ceases; thus the line is always on battery or ground.

Supposing B, the distant station, to have his key open, the transmitter, which his key opens, keeps the line grounded through one wire of his relay. When Station A closes his transmitter, the current passes therefrom to the relay, and there divides in two direc-

tions; one part goes by one coil of the relay to line, and the other part by the second coil of relay to rheostat and ground. The resistances being equal in these two directions, an equal quantity of current flows through them; but, as they pass oppositely around the core no magnetic effect is produced, and the armature is not attracted from the back stop.

The current arriving at station B passes through one coil of his relay to transmitter and ground, causing his armature to move forward and close the recording sounder. At this moment, should B close his transmitter, he will divide his battery between rheostat and line, as was done at A, and feel no effect from it upon his own armature—one part exactly neutralizing the other; but currents being on the line, there is now double the quantity there was when B was open, consequently through the line coil of either relay, there is more current than there is flowing through the rheostat coils; therefore, the cores of each relay become magnetized by this difference, and signals are recorded simultaneously at each station.

As soon as this system was tried on long lines a kick was experienced on the armatures, rendering the signals totally unreliable. This was caused by the discharge of return current through relay, and depended for volume on the static capacity of the line. A familiar illustration of this may be had by supposing a straight

pipe to connect two points in the same plane, and at one end of the pipe water is forced through at a high pressure; if the pressure is suddenly removed and the pipe left open at each end, part of the water in the tube will return and empty itself, in preference to overcoming the friction of the distant portion of the tube.

Electricity, in a long and well insulated conductor of large metal cross section, will flow through to the distant end and to ground so long as battery contact is maintained; but let the battery be suddenly removed and a ground substituted, part of the charge at that instant left in the conductor will return to ground in preference to passing through the whole resistance of the line to the farther end. This return is the kick that causes so much vexation to telegraphers. By the use of condensers the kick has ceased to annoy, and five hundred mile circuits are now worked as well as those of one hundred.

It will be readily comprehended that the few coils of fine wire of which a rheostat is composed have not the static or charge capacity of a long line, the metal

of one weighing only a few ounces, that of the other perhaps a hundred tons of a superior conducting metal, therefore no return charge or kick is felt from the rheostat; but by attaching to the rheostat a condenser whose static capacity is nearly equal that of the line a charge will be returned from it, at the same moment that the battery charge returns from the line, thus destroying all kick in the relay by neutralizing each other's tendency to magnetize the cores.

This system can be worked as well with the same poles of battery to line as with opposite or "agreeing" poles. When both stations send positive currents they neutralize each other on the line side, allowing the currents in the rheostat coils of relays at the home ends to move the relay tongues and record the signals, the same as if both currents combined on the line.

Next in order to the differential duplex comes the bridge duplex, founded on the principle of the Wheatstone Bridge. This method was adapted on the Gibraltar and Lisbon cable in April, 1872, by Mr. De Sauty, the electrician of the Eastern Telegraph Company at Gibraltar, at the suggestion of Mr. W. H. Preece, of England.

The length of the cable is 360 nautical miles, and worked by mirror galvanometer and syphon recorder. Mr. De Sauty was from March 16th, 1872, until April 11th of same year before he made it a success, so much trouble being felt from the static discharge; this he overcame by making his rheostat circuit similar to the cable in static capacity, dividing his resistance and interspersing his condensers, so that they would return a proper charge at the exact time it was returning from the cable. Thus he made himself master of the situation, and has since duplexed other cables, including the Mediterranean cable from Gibraltar to Malta.

In the *Journal of the Telegraph*, Sept. 1st, 1873, is described the bridge duplex as a recent invention of J. B. Stearns of Boston, and as this system is intimately connected with the quadruplex, a brief notice of the former is necessary to make plain the latter.

The bridge duplex embodies the principle of the Wheatstone balance, wherein a current dividing between two circuits, which are connected by a cross wire or bridge, no current will flow over the bridge if the resistances of the circuits on each side of the bridge are equal, or be the same proportion to each other.

By reference to the diagram it will be seen that when transmitter K is closed the current it sends out will divide at point H; one part going over line and the other part via B and rheostat to ground. Now, if the resistance of these two circuits is equal no current will pass over the bridge wire F C, consequently the relay R will be unmoved. When the current arrives at distant end it divides at F, between the transmitter and rheostat X, in inverse proportion to the resistance of respective routes; the portion passing through F C operates the relay R, and records the signals, and so when distant station closes his transmitter a double amount of current flows through the line, producing unequal tensions in the line and rheostat sides of the bridge, causing a current to flow across each bridge and close the relays, recording signals at each end simultaneously.

Towards the close of 1874 it was noised abroad that a quadruplex had been put into successful operation between New York and Boston by Messrs. Prescott and Edison, electricians. More recently it has been put into actual use between New York and Chicago, through a repeater at Buffalo, and between Chicago and Cincinnati—the former distance being nearly one thousand miles, the latter three hundred miles. As previously stated, it has for its foundation the bridge duplex. In the bridge wire of the duplex there are two relays—one is a common relay of very short cores and moderately low resistance, capable of being affected only by strong currents. The other is a Siemens polarized relay, which is sensitive to feeble currents, and is so constructed as to allow the tongue to be thrown on the back or open stop when a current of a certain polarity passes through its coils, and on the front or closing stop when a reverse current passes. There are two separate transmitters brought into use in double transmission from either end. The double transmitter is a pole changer having one spring connected to line and the other to ground. The contacts with each spring are connected crosswise with the smaller portion of main battery through the spring and lever of the single transmitter, which has an additional section of battery inserted between the lever and its closing contact point. When both transmitters are open the smaller part of the battery will be presented to the line. The current flowing therefrom will divide between the sides of the bridge—one part passing to rheostat and earth, the other passing over line and dividing between the bridge wire and the transmitter ground at receiving end. The portion crossing the bridge will push the tongue of polarized relay on the back stop, but will not affect the common or neutral relay for reasons before stated. If the double transmitter at sending end be closed the same portion of battery is reversed in circuit, deflecting the tongue of polarized relay at distant end to the front or closing

* Read before the meeting of the American Electrical Society, at Chicago, Ill., Feb'y 17, 1875.

stop, thus recording a signal. The second transmitter merely cuts in or out of circuit an increased portion of battery, sufficient to close the distant common relay, and the movements of the first or double transmitter wholly determine the polarity sent to line; when the double transmitter is up and the single one closed the latter cannot record a signal on the polarized relay at the remote station, for the reason that the current is of the wrong polarity; the same effects take place at the home station under similar manipulations at the distant end. Here then is the curious possibility of one operator having his key open, a second his key closed, the third making a dot, and the fourth a dash at the same time, and the respective positions being recognized fully at opposite ends.

Under the supposition that the batteries are divided into proportions of 50 cells and 150 cells the following changes of polarity and quantity will take place on the line during transmission from both stations: 50 plus and 50 minus, 50 plus and 50 plus, 50 plus and 200 minus, 50 plus and 200 plus, 50 minus and 200 plus, 200 minus and 200 plus, 200 minus and 200 minus, 200 plus and 200 plus.

These constant variations and reversals taking place through the relay coils tend to produce in them an unsettled magnetic condition causing the movements of their armatures to be unsteady and unreliable for signals. To remedy this the bridge wire is supplied with a condenser which is charged by the same currents that work the relays, and so soon as they are withdrawn from relays the condenser discharges before a reversed current reaches them, thus prolonging the signals and preserving a magnetic equilibrium of the cores.

The condensers connected to the equating rheostat require the nicest adjustment to exactly neutralize the static discharge from line. Compared with the differential system the percentage of effective signalling current on the quadruplex is very low, and is divided between two relays in the same circuit, therefore the utmost care is necessary in balancing and arranging the different adjustments to bring out its full value. During actual service it requires great vigilance and an intelligent supervision, else it will fail to even duplex the capacity of a wire. When depended on to do the work of four wires it will be readily seen how grave would be the smallest delay, hence it behooves managers to familiarize themselves thoroughly with every part, in order to render the proper service of the quadruplex to the companies by whom they are employed.

Other methods of quadruplex have been devised, but have proved of no practical value. That of M. Meyer, of the French Telegraph administration, exhibited at the Vienna Exposition is the most notable transmitting four messages over one wire in the same direction, but its best performance was only 110 ordinary messages per hour. Dr. H. C. Nicholson, of Mt. Washington, near Cincinnati, has also constructed a quadruplex for transmitting two messages in opposite directions over one wire at the same time. His system is on the differential principle. The outgoing currents passing in opposite directions around the home relay produce no effect on its cores. Two keys are used and are so arranged as to send current to line in the following order: When one key is depressed a positive current of given tension, when the other is closed a negative current of equal tension when both keys are closed simultaneously a positive current of double the tension of that sent by a single key.

The relay has horizontally and side by side two straight cores wound differentially, and at either end are permanently magnetised armatures. One is placed horizontally on a tongue in front of the poles at one end, and the other armature swings vertically on an axis between two semi-circular extensions of the poles opposite those facing the first described armature. Both armatures are so polarized that when one is attracted by a current of certain polarity passing through the coils the other is repelled. In order to balance for work, the distant station is asked to open both keys. This removes his batteries and grounds the line through his instruments. At the home station dots are struck on either key, and the equating rheostat is so adjusted that an even division of current is made through the relay between line and ground, neutralizing all magnetic effect in the cores. Condensers must be used for static discharge the same as in duplex system. The distant station is now asked to dot on positive key, which sends a current attracting the corresponding armature at the home end, closing the local points and recording a signal. Then the distant station dashes on the negative key, closing the armature of home relay at the end opposite the one operated by the positive key, and recording a signal on sounder by contact. When both keys are closed at once the tensions of their batteries are doubled and of positive polarity. This causes a double force to act on the agreeing armature which presses forward a spring, thus closing not only its own sounder but also the one in the connection with the opposite armature recording signals simultaneously. The weak points of this system seem to lie in the constant and uneven

reversals of the current during transmission producing an unsettled condition in the cores; uncertainty of action between the armatures and the imperfect mechanical contrivance for transferring the operation of the sounder from one tongue of relay to the other.

What may yet come of this system is a problem for future solution. It has worked moderately well on a rheostat circuit of 6,000 ohms, but has disappointed the expectation of its friends on an actual line circuit, probably on account of its infancy and want of a thorough test.

How a Lightning Rod Man was Sold.

KEYSER had lightning rods placed upon his barn three or four years ago; but during last summer the building was struck by lightning and burned. When he got the new barn done a man came around with a red wagon and wanted to sell him a set of Bolt & Burnam's patent lightning rods.

"I believe not," said Keyser, "I had rods on the barn at the time of the—"

"I know," exclaimed the agent. "I know you had, and very likely that's the reason you were struck. Nothin's more likely to attract lightning than worthless rods."

"How do you know they were worthless?"

"Why, I was drivin' yer in the spring, and I seen them rods, and I says to myself that barn 'll be struck some time, but there's no use in tryin' to convince Mr. Keyser, so I didn't call. I knowed it, because they had iron tips. A rod with iron tips is no better 'n a clothes prop to ward off lightning."

"The man who sold them to me said they had platinum tips," remarked Mr. Keyser.

"Ah! this is a wicked world, Mr. Keyser. You can't be too cautious. Some of these yer agents lie like a gasometer. It's awful, sir. They are wholly untrustworthy. Them rods was the most ridicklus sham I ever see. A regular gouge. They wa'n't worth the labor it took to put 'em up, they wa'n't; now that's the honest truth."

"What kind do you offer?"

"Well, sir, I've got the only genuine lightning rod that's made. It's constructed on scientific principles. Professor Huxley says it's sure to run off the electric fluid every time. Twisted charcoal ion, glass insulators, eight points on each rod, warranted solid platinum. We give a written guarantee with each rod. Never had a house struck since we began to offer this rod to the public. Positive fact. The lightning 'll play all around a house with one of 'em and never touch it. A thunder storm that'd tear the bowels out of the American continent would leave your house as safe as a polar bear in the middle of an iceberg. Shall I run you one up?"

"I don't know," said Keyser, musingly.

"I'll put you up one cheap, and then you'll have somethin' reliable. Somethin' there's no discount on."

"You say the old rod was a fraud?"

"The deadliest fraud you ever heard of. It hadn't an ounce of platinum within a mile of it. The man that sold it ought to be prosecuted, and the fellow that put it up without insulators should be shot. It's too bad the farmers should be gouged in this sort of way."

"And Bolt & Burnam's rod is not a fraud?"

"A fraud? Why, really, my dear sir, just cast your eye over Professor Huxley's letter and these certificates, and remember that we give a written guarantee—a positive protection, of course."

"Just cast your eye over that," said Keyser, handing him a piece of paper.

"Well, upon my word! This is indeed somewhat—that is to say it is, as it were—it looks—it looks a little like one of our own certificates."

"Just so," said Keyser. "That old rod was one of Bolt & Burnam's. You sold it to my son-in-law; you gave this certificate; you swore the points were platinum, and your man put it up."

"Then I suppose we can't trade?"

"Well, I should think not," said Keyser. Whereupon the man mounted the red wagon and moved on.—*Danbury News.*

An Ex-Telegrapher on the Scaffold.

VASQUEZ, the bandit who was executed at San Jose, California, recently, was formerly a telegraph operator. Lately he became identified with a murderer band, and finally became its leader. His demeanor while in prison was marked by composure and gentleness, characteristics which never deserted him. He took his place on the scaffold like a martyr dying in a good cause, and gave up his life without a struggle or murmur. He declared to the last that he was guiltless of bloodshed, but acknowledged the fitness of his death, as he had headed a bad and desperate band.

Winter lingers in the lap of Spring this year with a vengeance.

Changes in the Chicago, Ill., Western Union Office.—Report of Proposed Resignation of Dist. Sup't Col. J. J. S. Wilson not correct.

CHICAGO, ILL., April 26.

TO THE EDITOR OF THE TELEGRAPHER.

I AM creditably informed that the following changes will take place in the management of the Western Union office here May 1st.

Mr. Summers will retire from the temporary management of the operating department, and Mr. H. C. Maynard, present night manager, will assume the duties of manager of the whole operating department. Mr. F. W. Jones, the present electrician of the office, will be advanced to the position and emoluments of assistant manager day fore. Mr. York is reduced in rank to a position at the key. Messrs. Sholes and Plum are affected, in so far as Mr. Jones being advanced over them, and with probably a reduction of salary in the case of Mr. Sholes, and an assignment of new duties. Mr. Springer, present assistant night manager, will be advanced to fill the vacancy caused by Mr. Maynard's promotion. Mr. W. A. Leary, who for some time past has been looking after the interests of the way business nights, without any special title, will be promoted to second assistant night chief operator, Mr. Kelly taking the position of first night chief, or assistant night manager. Probably no one in the company's employ here is any better, if as well, fitted to assume the management of such an important office as Mr. Maynard, and certainly no better selection could have been made than that of Mr. Jones as assistant; his well known qualification as an electrician, and a perfect gentleman in every respect, are known and appreciated by all who come in contact with him. With Messrs. Maynard and Jones at the head of this department the company can depend upon their interests being well taken care of, while the operators under them can expect full justice in every case, and an appreciation of every effort they make for the interest of the company and their own advancement. While, of course, the operators deeply feel the reduction in position of the other chief operators, and regret that in the rearrangement of the office such a course was thought to be necessary by those in authority, it is not policy for them to show any feeling in the matter. Messrs. Sholes and York are among the oldest employes here, 'tis true, and as far as the rank and file are aware, have always been faithful to their trust. Mr. Sholes especially, being a very strict disciplinarian, but it is not becoming in an employe to sit in judgment on the action of his superiors, and we would advise all those who feel sore over the matter to refrain from any inconsistent remarks and attend to their duties faithfully.

It is to be hoped that those who have been reduced in rank will endeavor to remedy any possible errors in their course heretofore, and that they will be placed in good positions elsewhere in the future, and that the present change shall prove for the good of all concerned, and all departments of the company work harmoniously together. I have been told Mr. Sholes was one of the few who stood by the company during the strike. Mr. York, who has not taken a vacation for nearly five years, will probably not confine himself to the office so closely now. Mr. Springer's long experience as assistant night manager fit him for the position vacated by Mr. Maynard's promotion better than any other man in the business here. Mr. Kelly's numerous friends are much pleased to see one so young (comparatively speaking) advancing step by step, maintaining the good will of his associates while giving perfect satisfaction to his superiors. Mr. Leary not having had charge as a chief operator yet, his qualifications are only measurably known, but if he shapes his course as a chief with the same honesty of purpose as he has as an operator, he will prove a success in his new role.

In retiring from the temporary management, Mr. Summers has the best wishes of all those who have worked under him. Too much cannot be said of the kindness and consideration with which he has treated them.

Mr. F. M. Lester, of the New York duplex, Western Union office, this city, has been quite ill for some weeks with inflammatory rheumatism, and is still confined to his bed.

The rumor spoken of by your correspondent "Western Union" in regard to Col. J. J. S. Wilson resigning the superintendency of this district, is entirely without foundation, merely an idle rumor which should not have been repeated.

Some of the boys who were "checking" here six years ago will probably remember one of their number, Clark Albro. He lately entered into partnership with his father in the flour and feed commission business in this city. Check boys, you need only to be little men to advance, and finally become honored members of society.

OCCASIONAL.

Where Next?—Personals.—A Railroad Telegraph Supt. Surprised.—A Scene.—Bulls, etc.

ALBANY, N. Y., April 27.

TO THE EDITOR OF THE TELEGRAPHER.

"WELL! where are we going to work next?" was the general inquiry, as the "boys" filed into the office the other morning after reading in the morning papers a letter from the Assistant Secretary of the Treasury, addressed to Postmaster Smyth, of this city, to the effect that all tenants of the Exchange Building, whose leases expire on May 1st, should be notified to vacate the premises on that day. As the Western Union Co. have only a verbal lease, which expires June 1st, there was naturally some anxiety to know whether we were to be turned out again or allowed to rest in peace a little longer; the probabilities are that we shall not be called upon to vacate before the first of June. The contracts for the repairs to the Museum Building, which will cost about \$20,000, have been let, and work was commenced on Friday, the 23d inst. It is understood that the repairs are to be completed in thirty days from the above date, and will include a Mansard roof of corrugated iron.

Mr. Thomas Steward, Jr., has been placed in charge of the Capitol and Congress Hall offices of the W. U. Co., Mr. MacAuliffe having returned to the main office. "Tom" has been rather unfortunate since the change was made, as his money drawer was robbed a few days ago of a considerable amount. A boy has been arrested on suspicion, and committed to jail to await trial, but none of the money has been recovered as yet.

It is astonishing to observe what an increased interest there is manifested in "stox" lately by the gentlemen in and around the Capitol. "Tom" knows how to touch the tender spot and get the "biz."

Mr. F. Scott Smith, better known to some of the fraternity as "Snorky," has returned to his first love, and is now doing the heavy tragedy business on the Troy wire.

Mr. C. D. Hammond, whose appointment as superintendent of the Albany and Susquehanna Division of the D. & H. C. Co. was noticed in a former letter, was quite agreeably surprised a few evenings since. As he was about to take the train for Troy, one of the employees handed him a small package, which upon opening was found to contain a handsome gold watch and chain with a Maltese cross attached to the chain. The testimonial was from his old associates of the Rensselaer and Saratoga road, and was gotten up by the Messrs. Williams & Son of this city. On one of the covers of the watch is handsomely engraved the monogram of the recipient, and the inside cases bear appropriate inscriptions. Mr. H. was much delighted with his present.

The following scene occurred here a few days ago: Way wire, 1 P. M. (message for way station been hanging on hook since 8 A. M.), station finally raised and message sent.

Sender—(Sarcastically). We have had this message only five hours!

Way Station—(Coolly). What a wonderful invention is the telegraph.

One "bull" and I'm done. A message was recently received here addressed C. A. Shier, First Nat. Bank; it reached the Cashier finally, but was somewhat "scratched."

Since writing the item in regard to the Museum Building I have learned that the contract for repairs calls for their completion in three months instead of thirty days. "Where next?" is again the general inquiry.

Monday, the 27th inst., was probably the heaviest day ever seen in this office. The day's business footed up 3,751 commercial messages, besides a considerable amount of press matter received and sent. The quad. handled about 1,100 messages after 10 A. M., and was not worked up to its full capacity more than four hours. The prostration of wires by the sleet storm in New York was the cause of the rush. DOUBLE SIX.

Appreciation of The Telegrapher.—The Southern and Atlantic Co. in Boston. Telegraphic Personals.

BOSTON, MASS., April 25.

TO THE EDITOR OF THE TELEGRAPHER.

It is a paradox, for which I claim the full credit of originality, that more men have risen in the world through the attempts at injuring them by their enemies than have risen through the kindness of friends. A

striking illustration of the truth of this remark is seen in the recent scurrilous and unwarranted attacks of the Operator upon THE TELEGRAPHER and its editor.

A year ago the subscribers to THE TELEGRAPHER in this city were few, and none in the Western Union office. Now there are fourteen regular subscribers in the Western Union offices, and the number is increasing, and a club is being formed in the Franklin office also, through the persistent efforts of Mr. J. J. C. Wilson, to whom the credit is due of being the first to set the ball in motion.

There are many old timers like myself, whose interest in "matters telegraphique" has long since disappeared, who remember with a thrill of pride and satisfaction the excellent advice given and the manly and independent course pursued by THE TELEGRAPHER during the premature and unfortunate strike of 1870. During all the excitement before and obloquy after this occurrence, it never wavered for an instant, though well knowing that its espousal of the operators' cause would lead to its proscription by the managers of the Western Union Company.

The best way to prove one's friendship is to practically try it, and in the case of THE TELEGRAPHER it is a satisfaction to know that it has stood the test bravely, and that it is at last meeting with due appreciation. THE TELEGRAPHER is the only true organ of the fraternity in America.

The Western Union Company have leased one of their through wires to the Southern and Atlantic Company, who are rapidly fitting up their new office at No. 27 Devonshire street, where they expect to control a portion of the Southern business. Mr. Joseph A. Elms, for many years an operator in the Western Union office here, has been appointed manager, with Mr. Thomas Bishop, a young, but really excellent operator, as assistant. Mr. Elms is a thorough electrician and a courteous gentleman. The Southern and Atlantic Company are fortunate in securing the services, as manager, of one who combines so many excellent qualifications for the position.

He is succeeded in the Western Union office by Mr. J. F. Shorey, of St. Johnsbury, Vermont.

Mr. Fred. Hutchinson, of the New York cable department, who has been visiting his relatives in this section during the past week, called upon us the other day, and was shown round the office by Mr. Jules Guthridge. Fred. is a good boy and has many friends here, by whom he is kindly remembered, and who would be pleased to see him with us once more, whenever he may be disposed to exchange the gaiety and excitement of the metropolis for the quiet and monotony of the Hub.

QUIEN SABE.

Anecdotes of Old Time Telegraphers.

ST. LOUIS, April 20.

TO THE EDITOR OF THE TELEGRAPHER.

"Oh! where are the friends of my youth?
(Gone to the Poor-house.)
Then let the electric fluid flow."—HANK COWAN.

"LET us sing of the days that are gone, Maggie," the palmy days of the telegraph business, when there was always a demand for first class talent; when Hank Cowan, Jack McDonald, old Bogardus and others flourished (?); when George Washington was dead, and before St. Louis could boast an operator who requested another office to "cut out and leave his repeaters in," but when a first class TELEGRAPHER (that's you), could be had for money. As a "pau out," I shall tell you of another amusing anecdote, which is told of the great American traveller, Hank Bogardus ("Bogy"), which, as an illustration of the "eccentricities of genius," is, I think, worthy of publication.

While at Buffalo, as usual, in his normal condition—"hroke"—the thought struck him that he would like to visit Canada, "to see the boys," several of them, including Jack McDonald, Billy Logue, "Rox" Mullen, and others, at that time, being at Toronto. So Bogy wrote the following characteristic despatch, and some philanthropic operator forwarded it:

"BUFFALO, N. Y.

To— Gen. Supt., Toronto. Anything? Bogy."

The laconic style of the message so pleased the Supt. that he gave him a job, which he, of course, retained—for a time.

While I am about it, I may as well rake up another "old personality." Everybody knows Jack McDonald, and that his ability as an operator is of the "no bngs" order. Well, in the course of his perambulations through the country he struck Toronto, and got a job. On his first day in the office he was assigned to duty on the Ottawa special wire, it being the heaviest wire in the office, and, as was customary, they put all new men on that wire, to "see what they were good for."

Jack worked along for an hour or so all right, when he suddenly got up, walked over, and sat down at a "Pony" wire. The chief operator, noticing the business accumulating on the Ottawa circuit, reminded Jack of it, and told him to go there and clear up. Jack looked

up at him, an incredulous expression on his phiz, and said, "Do you think I'm going to work that wire for forty dollars a month, eh?" Chief replied that that was the first class salary there, and that he was expected to do any work that was to be done. Jack couldn't see it, so got up put on his hat and coat, and left.

That's what I'll do now: for I fear there's already
Too MUCH CED.

The Sholes and Gliddon Type-writer.

CHICAGO, ILL., March 28.

TO THE EDITOR OF THE TELEGRAPHER.

AS QUITE a number of the Western Union operators in this city are now practicing on the Sholes and Gliddon Type-writer, no doubt it will be interesting to the fraternity elsewhere to know how they can become familiar with this admirable machine without ever seeing one of them. The following is a correct diagram of the position of the keys:

2	3	4	5	6	7	8	9	—			—	
	Q	W	E	R	T	Y	U	I	O	P	:	
:	A	S	D	F	G	H	J	K	L	M	.	
	&	Z	C	X	V	B	N	?	;		.	

The following are the rules for manipulating the machine:

Use both hands and all the fingers. As a rule touch the keys to the left of G with the left hand, and to the right of G with the right hand. (It will be convenient to deviate from this rule occasionally.)

Touch A, and Q with the fourth finger of the left hand.

Touch P and M with the fourth finger of the right hand.

To make \$ hold the space bar down and touch S and I. To make ! hold the bar down and touch space . and , Touch the space bar with either thumb after each word, and also after punctuations.

Every time a key is depressed on the machine, or the space bar touched, it works the copy to the left, but when the space bar is held down it does not remove the copy till released, and the letters and punctuation marks being arranged in the form of a circle when the key corresponding to the letter or mark wanted is struck, it flies up and strikes the copy wherever wanted; the arm of each letter being about seven inches long, considerable force can be gained by striking it quickly. When the copy has passed across the top of the machine, within as far as it will print by the length of a letter or two, the operator is notified by a bell inside, and he can then insert a hyphen and finish the word in the next line; or, if only a letter or two remains to be printed, finish the word before throwing the copy back to the right again for a new line. This latter operation is performed by a treadle, like a sewing machine, on which the right foot rests at ease until the bell notifies that the copy is at the extreme left side of the machine; when, by pressing the foot forward, the copy runs back to right side, and when the copy carriage strikes the stop on the right side the foot is raised to its easy position again, resting on the heel until the bell strikes again.

There is a place arranged for a sounder, and the operator can sit near enough the table to break — By cutting this diagram out and placing it before him on the table when not busy, any operator can learn in a week's time to follow slow writing on his instrument, or write his thoughts by following the rules laid down, and can become expert in a short time. The moving of the copy carriage on the machine would not trouble him when he was ready, and had a chance to use one of the machines, and the throwing of the copy back to right would be the only thing to be learned after getting the machine, which would be a very small task, as the bell notifies when to press down the foot. After once becoming familiar with the position of the letters, figures and punctuation marks, the use of the machine is virtually accomplished. To make the figure 10 the letters I and O are used, and of course they are used for the figures one and nought whenever necessary. I am extending my remarks somewhat on this subject, as I understand it is the intention of the W. U. officials here to have report and specials taken with this machine as soon as enough of the operators in their employ here familiarize themselves to the use of them. A great many of the W. U. men, I hear, are learning in the way I propose to your readers. I am told Mr. Strong, who takes night report for the W. U. Co. here, has one of the machines now in his room practicing. As "Sg" makes one of the prettiest copies of any one in the business, this action is not on account of the copy if my information is correct. OCCASIONAL.

Warm weather, lightning and mosquitoes, though delayed, are sure to come.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, MAY 1, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an *extra copy free*.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

SINGLE COPIES OF THE TELEGRAPHER MAY BE OBTAINED ON THE DAY OF PUBLICATION AT THE NEWS STAND IN FRONT OF THE NEW WESTERN UNION TELEGRAPH BUILDING, CORNER OF BROADWAY AND DEY STREET.

The Policy of The Telegrapher and its Relation to the Telegraphic Fraternity.

A BOSTON correspondent, whose communication will be found in this number of our paper, refers in a complimentary manner to the fidelity with which THE TELEGRAPHER has adhered to the interests of the telegraphic fraternity, though by so doing it has at times incurred persecution and proscription from those who considered it antagonistic to their interests. We think we may without egotism consider that this commendation is deserved.

It has always been the object of the present manager of this paper to conduct it in such a manner as, in his opinion, would advance the real and permanent interest and welfare, not only of the telegraph business and art, but also of those who were engaged in its service as employes. In this we have not infrequently, as is the case of a Government ownership and management of the telegraphs, been in antagonism to some of the practical telegraphers of the country; but in the end have had the satisfaction of seeing the soundness of our position vindicated and acknowledged. While we do not claim infallibility in telegraphic matters yet we believe that we are in a position to consider calmly and dispassionately such questions as they arise, and while we do not intend hastily to decide, yet when our position is once taken we are not easily moved to alter or reconsider it.

THE TELEGRAPHER was originally established as the organ of the first national telegraphic association, and although that association has ceased to exist, THE TELEGRAPHER remains, and its benefits to the fraternity has fully justified, if any justification were needed, the wisdom which dictated its establishment, and compensated most fully the labor and expense incurred in starting it. Those who inaugurated THE TELEGRAPHER builded wiser than they knew, for to it is due much of the superiority of the present condition of the fraternity in this country over that of their brethren in other lands.

But this paper is something more than a mere organ of the telegraphic fraternity.

It is also a scientific journal, and a very complete telegraphic newspaper. In its columns from week to

week may be found a daguerreotype, as it were, of telegraphic advance and progress throughout the world. It has ever welcomed and encouraged telegraphic improvement and invention, believing that in such improvement and invention the best interests of all connected with telegraphy are advanced. Whatever tends to simplify and increase the capacity of the telegraph for the transmission of its vast and increasing business, will in the end improve the condition of those who make a livelihood by it. The real interests of telegraph proprietors, managers and employes, and the public, are, to a great extent, identical.

If telegraph lines are operated unprofitably the employes must share the loss. The telegraph, like any other business, is mainly established and conducted for the purpose of making money. Were it carried on with any other view it would be unbusinesslike, and in the end disastrous to all parties. For this reason we have never favored extremely low rates for telegraphic service. That gradual reductions in the cost of telegraphic service were not only desirable but inevitable we have fully recognized, but that such rates as have been advocated by some parties were practicable without loss to all, employes as well as telegraph companies, has been too evident to us to admit of any reasonable contradiction. The peculiar situation, telegraphically, in this country, will not admit, without a great increase in the capacity of lines and instruments, much more radical changes in tariffs than have already been made.

The interests of the public and of the telegraphic fraternity have seemed to us to require reasonable competition in the business, and we have therefore opposed the establishment of a telegraphic monopoly, either by a private corporation or by the Government, and shall continue to oppose it. At the same time it should be understood that while THE TELEGRAPHER is not the organ of, it is not antagonistic to, any telegraph company. It is, in fact, in the fullest sense of the word, an *independent* telegraphic journal. While its independence subjects it to the disfavor of some narrow minded persons engaged in telegraphy, it is the only policy which will give a leading journal any marked or recognized influence.

We might consider this matter at much greater length but it is hardly necessary to do so. Our object at this time in calling attention to the policy upon which THE TELEGRAPHER is and has been conducted is to show that it has been beneficial to the telegraphic fraternity and to telegraphic interests generally, and is the only one that can consistently be pursued by a journal which aims at something more than mere amusement of its readers or the advancement of special interests. It should certainly entitle it to a more general and liberal support than it receives even now, when the resentments, animosities and persecutions of the past have to a great extent ceased. We hope that telegraphers and others interested will take these suggestions into consideration, and will exert themselves to bring the paper to the notice and support of all who are engaged in or interested in telegraphic pursuits.

M. Gaugain's Experiments on the Brooks' Insulators.

THE last number of the Paris *Annales Telegraphiques* contains a report of experiments upon the BROOKS insulators, by M. GAUGAIN.

Twenty of these insulators were exposed to the weather, side by side with twenty of the double bell china were insulators of the administration pattern.

The galvanometer employed was by RUMKORF, of 24,000 convolutions the battery, a Bichromate of the DELAURIER system, containing ninety elements.

He states that it is difficult to give an exact comparison between the two kinds of insulators in rain, they vary so widely, but the variations are analogous—at a certain time during the commencement they are equal, while the rain is heavy the BROOKS exceed those of the administration. About the time the rain has ceased they are again equal; and after the rain of

in clear weather the French insulators are higher than the Brooks.

Thus, on the 28th of June, at fifty three minutes past one, and at the commencement of the rain, the two systems gave very nearly the same resistance. At two o'clock and thirty-five minutes, when the rain fell in torrents, the resistance of the BROOKS were six or seven times greater than the others. At four o'clock when the rain had ceased they were again equal. Thirty-five minutes later the resistance of the French were five or six times greater than the BROOKS.

During the rain the least resistance of

the BROOKS were.....	113,497,776 kilos.
Average per insulator.....	2,269,595,520 do.
French average per insulator.....	327,830 404 do.

The BROOKS exceeded the French in the proportion of 90 to 13, being about seven times higher.

After exposure, and when both systems had become dirty, the BROOKS exceeded the French in the proportion of three to one.

Carefully cleaning both kinds, the original difference was restored; that is, about seven to one in favor of the BROOKS.

M. GAUGAIN seems to attach importance to the circumstance of the French insulators being much the highest in clear weather, but to a practical telegrapher this is of little consequence. In fact, on long circuits inductive disturbances are often experienced. This never occurs except when the insulation is too high. The circumstances favoring this condition are, the weather being very dry, cold and clear.

M. GAUGAIN gives the resistance of the 20 BROOKS insulators in hard rain as 113,497,776 kilometres. This in our measurement would be equivalent to 1,133,000,000 ohms.

This is at least a thousand times higher than the standard of insulation in England, as given by Mr. VARLEY (1,000,000 units per mile minimum), but we have much reason to believe this is much higher than is attained in that country, for Mr. CULLEY gives the insulation of the Belfast-Dublin circuits "better situated as regards insulation" as "maximum" weather fine" per mile, 78,750,000 ohms; minimum, damp and dull, 91,900 ohms.

It will thus be seen that the BROOKS insulators, by M. GAUGAIN'S report, were fourteen times higher when the rain was hardest than the insulation in Ireland when the weather was "fine;" and twelve thousand times higher when the weather was damp and dull in the latter country, upon the basis of twenty insulators to the mile being employed.

Quadruplex Telegraph Inventions.

WE print in this number of THE TELEGRAPHER the paper read before the American Electrical Society at its regular meeting at Chicago, in February last, by Mr. F. W. Jones, electrician of the Western Union, Chicago office, on duplex and quadruplex telegraphic systems, for the copy of which we are indebted to our efficient and attentive Chicago correspondent OCCASIONAL.

This paper will be read with much interest, for its brief but concise history of duplex or double transmission systems, as well as for its account of the quadruplex inventions which are now exciting so general attention among telegraphers and the public.

The necessity of obtaining permission from the executive committee of the society before being able to obtain a copy for THE TELEGRAPHER, has somewhat delayed the publication of this important paper, but it will be none the less acceptable to our readers.

Geo. H. Bliss & Co. and the Western Electric Manufacturing Company, of Chicago.

AS WILL be seen by the announcement printed in our advertising columns, GEORGE H. BLISS & Co., formerly of 41 Third avenue, Chicago, Ill., have removed their stock to 220 Kinzie street, and offer it for sale upon

terms exceedingly favorable. The interests of BLISS & Co. have been transferred to or consolidated with the Western Electric Manufacturing Co., and when their present stock is disposed of they will discontinue their business as a separate and independent concern.

This will leave the business entirely in the hands of the Western Electric Manufacturing Co., which has ample means and facilities for carrying it on effectively and satisfactorily, and we commend them with pleasure to the attention and patronage of those who may need telegraphic and electrical apparatus, material, equipment, or supplies.

A New Commission Stock Broker's Firm.

Messrs. H. L. HOTCHKISS and J. W. BURNHAM have formed a copartnership for the transaction of business as commission stock brokers. Both of these gentlemen are well and favorably known to the telegraphic fraternity—the former having for several years been connected with the Gold and Stock Telegraph Company and the American District Telegraph Company, as secretary and treasurer, and the latter as an operator and manager of the Fifth Avenue Hotel, and other offices. Their main office is at 36 Broad street, with a branch office at the Fifth Avenue Hotel, where orders can be transmitted by their private telegraph line to the main office, and where quotations will be furnished without charge. This will be a very great convenience to up town customers.

The popularity of Messrs. HOTCHKISS and BURNHAM, and their intimate connection with telegraphic interests, cannot fail to secure them a profitable business, and we cordially commend them to the favor and patronage of our readers, and all who may have occasion to avail themselves of their services.

Personals.

Mr. J. A. MORRISON has been appointed manager of the Western Union office at Nebraska City, Neb.

Mrs. A. VIRGINIA CARR has been appointed manager of the Western Union Co.'s office at Jacksonport, Arkansas.

Messrs. M. S. BACON, WINFIELD S. FRENCH and D. A. WILLIAMS have been appointed to positions in the St. Louis, Mo., Western Union office.

Mr. JOS. A. MURRAY, of St. Louis, Mo., who has been off on a six weeks leave of absence, visiting in Michigan, has returned, looking hale and hearty, and has resumed his duties on the Western Union night force.

Annual Meeting of the Atlantic and Pacific Telegraph Company.

THE Annual Meeting of the Atlantic and Pacific Telegraph Company was held at the office of the company, No. 198 Broadway, in this city, on Wednesday last, April 23th.

The report of the President of the company, Mr. Thos. T. Eckert, to the stockholders, states that during the year 1874 new lines were constructed:

From Chicago to Omaha.....	530 miles.
“ New York to Long Branch.....	68 “
City Loops.....	64 “
And the Scioto Valley Line from Columbus to Ironton, Ohio, was purchased.....	124 “

Total additional lines.....728½ “

The entire system of lines and connections covers 14,612 miles of poles, and 28,477 miles of wire, and brings into direct communication 1,385 offices.

The number of miles of pole line in the direct control of the Atlantic and Pacific Company at the close of the year was 5,097, and of wire 12,039.

The authorized capital stock of the company is \$10,000,000. Amount issued at the end of 1874 was \$9,578,100, leaving a balance of 4,219 shares in the treasury.

The gross receipts of the company for 1874, including those of the Franklin, from November 20 to Dec. 31, inclusive, were.....\$450,534 01
The gross expenses were..... 399,111 97

Leaving a net profit of..... \$51,422 04

This surplus and a portion of the company's funds, derived from sale of its Treasury stock, was expended in the construction and purchase of the lines above mentioned, to the amount of..... \$68,162 64

The company had on hand at the close of 1874, net assets amounting to \$197,113 44, in addition to its Treasury stock.

The company is free from debt of every kind.

The company since the beginning of this year has acquired working possession of the American Automatic system of transmission, which is protected by thirty-six indisputable patents. It has also purchased the exclusive right to the Wheatstone Automatic System of Transmission in the United States and Cuba. This system has lately been patented in this country by Sir Charles Wheatstone, the inventor.

The company has also purchased from Thomas A. Edison, and his business partner and assignee, Mr. George Harrington, the inventions known as the duplex and quadruplex.

Arrangements are well progressed for extending the facilities of the company by an additional route from New York City to St. Louis, Mo., from Chicago to Milwaukee, and from Rye Beach, N. H., to Portland, Me. Other and important extensions and connections, both north and south, are under consideration with the prospects of favorable results.

The following were elected Trustees of the Company for the ensuing year: Messrs. Oliver Ames, Elisha Atkins, S. L. M. Barlow, Benjamin E. Bates, F. Gordon Dexter, Sidney Dillon, G. M. Dodge, Thos. T. Eckert, Wm. H. Guion, Jay Gould, C. P. Huntington, S. M. Mills, J. H. Mortimer, C. J. Osborne, G. G. Sampson, James D. Smith, E. D. L. Sweet, W. J. Syms, Henry M. Taber.

The Southern and Atlantic Telegraph Company Extensions.

THE Southern and Atlantic Telegraph Company have opened an office at Providence, R. I. This office is temporarily located until more suitable quarters can be secured next door to the Franklin office (up stairs), on Weybosset street.

This company are now engaged in constructing a line between Montgomery and Mobile, Alabama, on the route of the Mobile and Montgomery Railroad. This line will be 178 miles long, and is a second main route from Montgomery. At Pollard, Alabama, it will connect with the Pensacola and Milton, Florida line, which has a number of offices upon it.

The line from Jessup, Georgia, to Jacksonville, Florida, on the route of the Great Southern Railway, is nearly completed. This line shortens the distance to Jacksonville 132 miles, over that by the present route. At Callahan, Florida, it connects with the Florida lines and the Cuba cables.

A branch line has also been built from Spartansburg, S. C., to Union, 30 miles. This supplies telegraphic communication to territory hitherto without such facilities.

The Gold and Stock Telegraph Co.—Issue of Bonds.—Removal.

By a resolution adopted by the Board of Directors of the Gold and Stock Telegraph Company, March 9th, it was provided that for the purpose of raising the sum of \$250,000 an issue of \$500,000 twenty year 7 per cent. coupon bonds should be made. It was further provided that each stockholder of record on the 15th day of April should have the privilege of purchasing one hundred dollars in bonds at 50 per cent. of the par value for every twenty shares of the stock so owned, and that each stockholder shall give written notice to the Treasurer of the Company, on or before the 15th of April of his intention to avail himself of this privilege, and pay for the same on or before the first of May; and the transfer books were accordingly ordered to be closed from the 15th of April to May 3d.

These bonds have been nearly all taken up under this provision by the stockholders of the company, the difference between the par value and the rate at which they are issued being considered as a dividend of past earnings which have been invested in the purchase of valuable property and rights, and the extension of the system.

In conducting the operations of the company, it is stated with a view to its future prosperity, in the purchase of the property and rights before mentioned, and in the extension of its private line and commercial news department to other principal cities, a considerable portion of the current income had been expended, and a floating debt of over \$200,000 incurred. The proceeds of these bonds will be applied first to the payment of this debt, and the balance will be applicable to future purchases and extensions.

The bonds are issued for sums of \$100 and \$500 each, and are very handsomely engraved, and will doubtless prove a very good investment to those who are so fortunate as to obtain them. The business of the company is large and increasing, and is now remunerative, and with the means thus afforded for relieving it from the necessity of immediately providing

for its accumulated indebtedness the company will be enabled to carry on its operations advantageously.

The work of removal of the offices heretofore at 61 Broadway to the quarters in the new Western Union building is nearly completed, and the several departments are being regulated and got into good working order. The task of making such a change, with the very large number of wires, etc., involved, and at the same time keep the business working along satisfactorily, can hardly be appreciated except by those who are employed in planning, supervising, directing and accomplishing the work.

The Law Telegraph Company.

THIS company, of which a brief account was given in THE TELEGRAPHER of April 10th, has now commenced operations, and is working very successfully, and is proving a great convenience and accommodation to the legal fraternity. It has already about seventy subscribers, and the number is increased as rapidly as the necessary wire and instruments can be provided. Five circuits are connected with the Court House and principal courts of the city, and by means of these subscribers are notified of cases on the calendar in which they are interested, and can be kept informed of matters in connection with the courts essential for them to know, without the necessity of personal attendance, which occupies so much time of lawyers of considerable practice in this city unprofitably. Besides this, each subscriber has a wire running to the central office, at 145 Fulton street, and, by notifying the central office, can be put in communication with any other party similarly provided. The system and apparatus appear to be very well adapted to the purpose for which they are designed.

The company intend to extend the system to Brooklyn immediately.

Mr. Wm. A. Childs, the manager of the company, can be found at the central office, and will give to those who may desire to avail themselves of the facilities, provided any further information or explanation is required.

A Destructive Sleet Storm in April, Telegraph Lines Prostrated..

THE exceptional character of the weather this spring was forcibly demonstrated on Saturday night and Sunday morning last. A destructive sleet storm in the latter part of the month of April is an anomaly in this climate, and a new experience for telegraph managers.

On Saturday evening of last week, a pretty heavy rain storm commenced, and the weather became quite cold, so much so that the rain soon turned into a sleet storm, and the telegraph wires in this city and vicinity became heavily loaded with ice. The sleet storm eventually became a regular snow storm, accompanied by a high wind. The effect upon the telegraph wires was quite disastrous—the wires of the fire alarm telegraph came down in all directions. The numerous private lines throughout the city were also badly damaged and interrupted, as well as the wires of the different telegraph companies.

The Western Union wires stood up pretty well, but were badly mixed up and crossed by the fire alarm and other wires which were broken. The Atlantic & Pacific wires were also considerably damaged, but communication was kept up.

It was also reported that the cables of the Western Union and Atlantic & Pacific Companies in the North River were torn up and broken by vessels dragging their anchors, but this was incorrect. Some two weeks ago the A. & P. cables were badly damaged by ice and vessels which were forced down the river by it, but this damage has been repaired. In addition to their present cables across the North River the A. & P. Co. are about to lay a new three wire cable, higher up the river it is understood, from the foot of Sixty-ninth street.

The Western Union cables have recently been pulled up by vessels, but not seriously damaged. This company has a steam tug which is always ready for use in repairing and relaying cables, which are interfered with by anchors or otherwise—a very frequent occurrence.

The most serious damage to the Western Union wires was at Woodlawn, near the junction of the New Haven and Harlem Railroads. During the storm a pole on which there were a large number of wires fell, and a train coming along about the time the engine got tangled up with the wires, and sixteen or eighteen poles were prostrated and broken off, badly wrecking the line, and for sometime interfering with communication east.

In Jersey City and along the route to Elizabeth the lines of the Western Union and other companies were badly damaged by the storm, the wires being broken and crossed in numerous places, and a number of poles broken off and prostrated.

The storm extended for some distance south along

the coast, and did much damage to telegraph lines elsewhere.

Toward morning the weather moderated, and by sunrise the sleet had entirely disappeared from the wires, and during the day the snow, which had fallen during the night, also disappeared.

It is to be hoped that this is the last experience of this description which will occur, during the present season at least.

The Reduced Tariff on Atlantic Cable Business.

ON and after May 1st, 1875, the ten word minimum on telegraph business to or from Great Britain, Ireland and France will be abolished.

The tariff for Atlantic Cable messages to Great Britain, Ireland and France will be as follows:

Table with columns for destination (e.g., From New York City, From all points in New York) and rates (e.g., 50 cts., 53 ").

Note.—The rates to points beyond France, which have hitherto been computed by adding to the rate for ten words to London (or the rate to France) will now be found by computing the rate by word to London, and then adding the rate beyond given in tariff book.

The Electric Base Ball Club, of Boston, Mass.

THE Electric Base Ball Club, of Boston, Mass., were out for practice on Saturday last, in a new uniform of white flannel, and presented a very neat appearance.

The Telegraphers' Mutual Benefit Association.

ASSESSMENT 75, ISSUED APRIL 29, 1875.

DEATH OF WILLIAM LEE ALLEN.

WILLIAM LEE ALLEN, of Key West, Fla. (Certificate No. 2,302, issued August 25, 1874, died at Key West, Fla., March 23, 1875, of yellow fever.

One dollar for assessment 75 is due from members holding certificates numbered up to and including No. 2,424.

Members who have not yet remitted for assessment 74 (notice of which was issued March 29, 1875), will please consider this a duplicate notice that that assessment is due, and should be paid before May 29th.

W. HOLMES, Secretary. J. D. REID, Treasurer.

RECEIPT OF ASSESSMENTS—NEW YORK, April 29, 1875, ASSESSMENT No. 75.

21, 29, 131, 143, 208, 211, 217, 277, 289, 312, 464, 555, 626, 742, 858, 859, 873, 880, 932, 1024, 1154, 1178, 1182, 1199, 1333, 1357, 1489, 1503, 1566, 1572, 1862, 1986, 2066, 2164, 2240, 2287, 2288, 2322, 2389, 2415, 2422, 2423, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433.

ASSESSMENT No. 74.

ASSESSMENT No. 72.

Table of numbers for Assessment No. 72.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

The Telegraph in the African Deserts.

A CORRESPONDENT of the London Times, writing from Berba, in tropical Africa, says:

"It was singular to meet with the telegraph in the heart of the desert between Aryab and Berba; not the telegraph put up and in working order, as we see it in Europe, but all the appurtenances of that instrument of civilization carried on the backs of hundreds of camels, which, laden with coils of wire and hollow iron posts, trod their toilsome path through the burning sand.

Quotations of Telegraph Stocks at N. Y. Stock Exchange.

Showing Lowest and Highest Prices each day during week.

Table with columns for date (April), stock names (Western Union, Atl. and Pac., Amer. Dist., Gold and Stock), and bid/ask prices.

Born.

HENDRICKSON.—February 19, 1875, to the wife of M. P. HENDRICKSON, agent and operator New Jersey Midland Railroad, Stockholm, N. J., a son, second edition, eleven pounds.

MCNEVIN.—To the wife of JOHN MCNEVIN, of the Western Union Telegraph Company, St. Louis, Mo., at half past ten o'clock P. M., March 26th, 1875, a son, eleven pounds, first copy.

THOMPSON.—At St. Louis, April 20th, 1875, at half past eight o'clock P. M., a son (eight pounder), to the wife of A. G. THOMPSON.

THORNTON.—To J. G. THORNTON, Superintendent of the Southern and Atlantic Telegraph Company, Macon, Ga., April 2d, 1875, a daughter.

REMOVAL.

GEO. H. BLISS & CO.

We respectfully announce our removal to 220 KINZIE STREET, CHICAGO, ILL. Having determined to transfer our interests to the Western Electric Manufacturing Company, we offer our entire stock of TELEGRAPH INSTRUMENTS, GOODS and MACHINERY for sale upon terms which cannot fail to prove desirable to purchasers.

GEO. H. BLISS, President.

220 KINZIE STREET, CHICAGO, ILL., April 12th, 1875.

ANNOUNCEMENT.

Western Electric Manufacturing Company.

GEO. H. BLISS having acquired an interest with this Company, has been appointed its General Agent.

His attention will be given to the sale of the Instruments and Goods of our manufacture and in which we deal.

In addition to our former line we have added the various specialties heretofore controlled by GEO. H. BLISS & CO.

With our ample facilities we hope to give to customers and the trade increased satisfaction in prices, quality and variety of our goods.

We invite correspondence and solicit patronage.

WESTERN ELECTRIC MANUFACTURING CO.,

220 Kinzie street,

CHICAGO, ILL.

BASTET'S NEW ELECTRICAL MOTOR AND BATTERY.

For Sewing Machines, Church and Parlor Organs, Small Printing Presses, Pumps, Lathes, Dentists' Instruments, or any Light Machinery.

My new ELECTRICAL BATTERY is the most powerful for quantity and durability manufactured, and does not crystallize the carbons. For Electroplating, Telegraphing, and for Motive Power, it cannot be surpassed.

Our No. 1 Engine, for Sewing Machines, with four cells of Battery, is furnished for \$40.

Other Motors at prices proportional to power required.

BATTERY, No. 1 Cells \$5.

" No. 2 " 10.

L. BASTET,

116 Fulton Street, New York.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that is returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET,

or to L. G. TILLOTSON & CO.,

8 Dey street, Sole Agents.

THE KENOSHA INSULATOR CO.

TELEGRAPH COMPANIES and TELEGRAPH CONSTRUCTORS

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellant of moisture...

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO., THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire...

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES,

prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading Dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

L. G. TILLOTSON & CO.,

General Eastern Agents.

GEORGE H. BLISS & CO., 41 Third Avenue, Chicago, Ill.

CINCINNATI, O., Elm St., cor. 5th.

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS—COMBINATION SETS; BOX and POCKET RELAYS. PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, wire connections above the table.

REGISTERS, with SPRINGS or WEIGHT.

CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SOREY GLASS and KENOSHA CARBON.

BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AXL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular Pioneer Cheap Telegraph Instrument has recently been improved and a Straight Lever Key placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and is still the leading telegraphic apparatus of its class.

They are furnished at the following popular prices:

Single Instruments with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50 Two sets of Instruments, etc., \$12.00

Sent for our new Circular and Price List.

F. L. POPE & CO.,

P. O. Box 5503.)

38 Vesey street, N. Y.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

20 PER CENT. REDUCTION IN THE PRICE OF TELEGRAPH INSTRUMENTS!

SEE WHAT IT MEANS.

On First-class Morse Sets for Railway and Commercial Lines:

No. 1 Relays, of standard size and resistance (120 to 150 ohms), on rosewood bases, fine finish, polished rubber covered coils, wound either with our patent glazed or with best silk covered pure copper wire, having soldered connections and firm nut fastenings throughout, and latest improved extension adjustments. Regular price, \$16, reduced to \$12.80.

No. 1 Relay, same make throughout, but of higher resistance, 160 to 600 ohms. Price, \$18, reduced to \$14.40.

No. 1 Relay, ditto, low resistance, 60 to 100 ohms. Price, \$15, reduced to \$12.

No. 1 Sounders—"Railroad" or Bunnell's "New Giant" Sounders, with all the latest patented improvements in both. The best forms of Morse sounders ever invented. Beautifully finished. Mounted upon rosewood bases. Price, \$7.50, reduced to \$6.

No. 1 Keys, Caton pattern, curved levers. Price, \$6.50 reduced to \$5.20.

No. 2 Keys, W. U. pattern, curved or straight levers. Price, \$5.50, reduced to \$4.40.

No. 1 Premium Register, \$45, reduced to \$36.

" " Spring Register, \$47.50, reduced to \$38.

" 2 Register. Price, \$38, reduced to \$31.40.

Box Relays, Combination Sets, Pocket Relays, Switches, Cut Outs, Lightning Arresters, etc., furnished at the same rate, viz., 20 PER CENT. REDUCTION from regular prices. See catalogue.

SINGLE SETS, OR PARTS OF SETS, WILL BE SENT BY EXPRESS AT THESE PRICES TO ANY PART OF THE U. S., ON RECEIPT OF MONEY ORDER OR DRAFT FOR THE AMOUNT OF THE BILL.

Superintendents and others about to purchase first class equipment for offices will readily see by a comparison with other price lists the advantages here offered to those who send their orders to us.

No. 2 SETS.

LEARNERS' APPARATUS, SHORT LINE INSTRUMENTS, Etc.

No. 2 Relays, 150 to 175 ohms resistance. Price, \$15, reduced to \$12.

No. 2 Relays, 50 to 100 ohms resistance. Price, \$11, reduced to \$8.80.

Pony Relays, complete and pretty little instrument for short lines, city wires, etc., \$7.50, reduced to \$6.

No. 2 Pony Sounders, \$6.50, reduced to \$5.20.

No. 3 Pony Sounders, \$5.50, reduced to \$4.40.

No. 1 Main Line Sounders for lines from 1 to 6 miles in length. Price, \$8, reduced to \$6.40.

No. 2 Ditto, \$7, reduced to \$5.60.

No. 3 Keys, curved levers, Caton style, same as No. 1, but smaller. Price, \$5, reduced to \$4.

No. 4 Keys. Price, \$4, reduced to \$3.20.

Amateurs' Key, \$3.50, reduced to \$2.80.

Excelsior Amateur Instruments, \$6.50, reduced to \$5.20.

Bunnell's Champion Learners' Instruments, \$6.50, reduced to \$5.20.

At the above figures all grades of Telegraph Instruments may be obtained from L. G. TILLOTSON & CO. for less money than will buy as good materials at any other manufactory in America.

Orders, correspondence and inquiries will receive prompt attention. Make your memorandums of amounts for what you want from the above price list, and enclose the sum to us by postal order or draft along with your order for goods.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by
MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAYS

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER
A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, MAY 8, 1875.

VOL. XI. WHOLE No. 460.

Annual Report of the President of the Atlantic and Pacific Telegraph Company.

THE following is the report of Mr. Thomas T. Eckert, President of the Atlantic and Pacific Telegraph Company, made to the stockholders at the annual meeting of the company, held April 28th, a brief synopsis of which was printed in the last number of THE TELEGRAPHER:

TO THE STOCKHOLDERS OF THE ATLANTIC AND PACIFIC TELEGRAPH COMPANY.

NEW YORK, April 28, 1875.

Having assumed the Presidency of your Company on the 14th day of January, 1875, in accordance with an unanimous vote, at the meeting of your trustees held on that day, it becomes my duty to present to you at this, your annual meeting, a report of the progress of your Company during the year 1874, as shown by the records which have been committed to my care.

The lines of the Atlantic and Pacific Telegraph Company extend from New York City, via Albany, Saratoga, Oswego, Syracuse and Buffalo, N. Y., thence by two routes—one through the Province of Ontario and Detroit, Mich., and the other via Cincinnati to Chicago, and thence, via the Chicago, Rock Island and Pacific Railway, to Omaha, Neb., and via the Union Pacific Railway to Ogden, Utah, with various branch lines, and having connections with the lines of several important railroad companies and local telegraph companies. At Ogden we connect with the Central Pacific Railroad Company's system of lines, in accordance with a contract with that company, the terms of which are mutually advantageous—affording the Central Pacific Company through communication to the Atlantic coast, and us the same to the Pacific.

As stated in your President's report for the year 1873, the Atlantic and Pacific Company purchased, in its corporate name, during that year, a majority of the stock of the Franklin Telegraph Company, whose lines extend from Rye Beach, N. H., via Boston, to Washington City, connecting, via New York Philadelphia and Baltimore, with all the most important intermediate cities and towns, and, by lease of the Northern Telegraph Company, with the principal towns in New Hampshire; and by contract with the lines of the Southern and Atlantic Telegraph Company, extending from Washington City through the most important cities and towns on and near the Atlantic and Gulf coasts to New Orleans.

At Oswego and Buffalo, N. Y., and Detroit, Mich., we connect, under an acceptable contract, with the lines of the Dominion Telegraph Company, of Canada, a vigorous corporation which is now in effective operation throughout both Upper and Lower Canada.

At Rye Beach, N. H., we connect, by contract, with the "Direct United States Cable Company," whose cable is in perfect working order from Rye Beach, N. H., to Tor Bay, N. S. The shore end of the ocean cable is laid and buoyed, ready for connection with the deep-sea cable, which lacks less than a hundred miles, east from the Newfoundland coast, to complete communication across the Atlantic.

New lines were constructed during the year.

From Chicago to Omaha.....	530	miles.
From New York to Long Branch.....	68	"
City Loops.....	64	"
And the Scioto Valley Line from Columbus to Ironton, Ohio, has been purchased.....	124	"

Total additional lines..... 728½ miles.

Our system of lines and connections, as thus briefly described, covers 14,612 miles of poles and 28,477 miles of wire, and brings us into direct communication with 1,385 offices.

The number of miles of pole line in the direct control of the Atlantic and Pacific Company at the close of the year was 5,097, and of wire, 12,039.

The authorized capital stock of the Company is

\$10,000,000. The amount issued at the end of the year 1874 was \$9,578,100, leaving a balance of four thousand two hundred and nineteen shares in the treasury.

The gross receipts of the Atlantic and Pacific Company for the year 1874, including the Franklin, from November 20 to December 31, inclusive, were \$450,534 01
The gross expenses were..... 399,111 97

Leaving a net profit of..... \$51,422 04

This surplus and a portion of the Company's funds, derived from sale of its Treasury stock, were expended in the construction and purchase of lines before mentioned, viz.:

Chicago to Omaha.....	\$55,907 28
New York to Long Branch.....	4,922 36

\$68,162 64

The Company had on hand at the close of 1874 net assets amounting to \$197,113.44, in addition to its Treasury stock. This sum is available for the extension and development of our lines and business. There were also on hand at the close of the year materials and supplies sufficient for about two months' use.

The Company is free from debt of every kind.

In November, 1874, a lease of the lines and property of the Franklin Company to the Atlantic and Pacific Company was negotiated, chiefly for the purpose of securing economy of administration, and avoiding the necessity of maintaining separate organizations and accounts.

The reports of my predecessors have been made to cover only the calendar years. It is, therefore, only necessary for me to refer at this time to the affairs of the Company during 1874. But, as my connection with the Company did not begin until after the close of that year, and more than three months have since passed, I will briefly mention a few subjects of most immediate and important interest to the stockholders, which are proper subjects for report in 1875, and concerning which I shall endeavor to present the facts fully at a future meeting.

Since the beginning of this year your Company has acquired working possession of the American Automatic System of Transmission, which is protected by thirty-six indisputable patents. The use of this system readily admits of instant change from ordinary Morse to Automatic, at the will of the operator.

Your Company has also purchased the exclusive right to the use of the Wheatstone Automatic System of Transmission in the United States and the Island of Cuba. This system has lately been patented in this country by Sir Charles Wheatstone, the inventor. It has for some years been extensively and advantageously used in Great Britain, as evidenced by the reports of Mr. Scudamore and Mr. Culley, the chief officers of the British Post-office telegraphs, whose mention of this system in 1871 was favorable, and whose later reference to it has been still more favorable, showing that its continued and extended use has served to improve its utility. Since the beginning of the present year the right to use this system has been purchased by the French Government.

The American Automatic possesses some very important advantages over the Wheatstone, especially that of much greater speed, but the latter is also a most valuable acquisition.

Your Company has also purchased from the inventor, Mr. Thomas A. Edison, and from his business partner and assignee, Mr. George Harrington, the inventions known as the duplex and quadruplex. In solving what has been properly called "the most difficult problem which has ever been presented to the managers of telegraph companies, to wit: how to provide for the rapidly increasing volume of business without an annual expenditure for the erection of additional lines and wires that would prevent the payment of reasonable dividends," the duplex and quadruplex inventions are valuable, but they are much less so than the automatic, for the reason that the transmitting capacity of a single wire, by the use of the latter, is not less than five times greater than that of the quadruplex, and for the further important reason that the automatic is capable of clear transmission, at a high rate of speed, under conditions of the line and of the atmosphere so unfavorable that an ordinary Morse circuit can hardly be operated at all, while the duplex requires exceptionally favorable conditions of line and weather, and the most skillful operators, in order to render it available; and the same is true, in a much greater degree, of the quadruplex.

We have recently taken charge of the Marine Line, New York to Sandy Hook, under an acceptable agreement, enabling us to compete for marine news and the service connected therewith, in which the great cities of the coast especially are deeply interested.

The steamer *Faraday* left England on the 5th instant, for the purpose of completing the United States Direct Cable. Under favorable circumstances this can

readily be accomplished within a few days from the time of the steamer's arrival at the point to be connected.

It is hoped that the connection will be successfully made at a very early day. Many of the details of our prospective business relations with the Direct Cable Company were satisfactorily arranged with Mr. Oliphant, its American representative, and Mr. Von Chanvin, its general manager, during their recent visit to New York.

Arrangements are now well progressed for extending our facilities by an additional route from New York City to St. Louis, Mo., from Chicago to Milwaukee, and from Rye Beach, New Hampshire, to Portland, Maine. Other and important extensions and connections, by which we shall reach all the leading cities, both North and South, are under consideration, with the prospect of favorable results.

The reduction of rates by our Company, which took effect on the 15th of February, resulted in an immediate increase of business, throughout the territory affected by it, quite equal to our expectations. The gross receipts for the first three months of this year were \$180,736 42. The increase in March over February was over seven thousand dollars, and over January nearly eight thousand dollars.

Further reductions would have been made before this but for the unusual severity of the weather, which has prevented to a great extent the work upon our lines that would otherwise have been done, and the unavoidable delay in the manufacture of automatic machinery sufficient to fully equip all principal offices.

Some of the most serious difficulties and obstacles with which your officers have heretofore had to contend are now removed, and others are fast being removed, and we may reasonably expect to bring about a general and material improvement in the important essentials to the business of telegraphing before the close of the present season by securing such lines, offices, employes, and service as cannot fail to invite and retain the business and confidence of the public, and to ultimately secure the extension and development of your property to the highest attainable efficiency and value.

Respectfully submitted.

THOS. T. ECKERT, *President.*

Original Articles.

The Morse vs. The Automatic.

BY JOHN STERLING.

AS THE columns of THE TELEGRAPHER evince a decided editorial leaning toward the "Automatic" as the telegraph system of the future, and the panacea for all the telegraphic ills under which the poor public groan; and as a great deal has been said in its columns in favor of that system, while the arguments on the other side have been very meagre, and those inadequately presented, I wish to give a few facts in connection with the subject which must be plain to any one who gives them any consideration. In doing so I shall be as brief as possible.

First. What motive has Mr. George B. Prescott, the electrician of the Western Union Company, for condemning the Automatic system as possessing no advantages over the present system in universal use in this country? It is admitted that the Western Union could have easily secured the Automatic system, if they had deemed it for their interests to do so. Mr. Orton, Mr. Prescott and other officials of that company receive large salaries, and may be supposed to labor for its interests; yet, after a fair investigation of the merits of the Automatic method, they use their influence against its introduction on the lines of their company. Its wires are crowded to their utmost capacity between the large cities, and while making every exertion to increase the working capacity of their wires, is it likely they would ignore the Automatic if that system possessed half the advantages claimed for it? The idea is preposterous.

Second. The Automatic system, if introduced, would be practicable only on through lines doing a heavy business. For lines with many way stations, the Morse is the only system yet devised which answers every requirement. The time will come when the old foginess of even the English will succumb to an improvement on their present needle and bell telegraphs for way wires, and that improvement will be the American Morse method, pure and unadulterated. They have taken a step in that direction recently by improvements on the bell instruments. The defunct Automatic Company were weak on this point, and most of their business was done by Morse. I have been informed by those in a position to know, that only in a pressure of business were the Automatic instruments used.

Third. Mr. Craig, in a communication to this paper some months ago, quoted Mr. Orton's statement plac-

ing the average speed on Morse lines at 15 words per minute, knowing very well that the average given was based upon calculations in which the whole vast business of the company was included. It is well known that an operator who cannot receive at least 35 words per minute has but small claims to be ranked high in ability. The heavy wires between the principal cities are worked at an average of over 30 words per minute night and day, while 40 words is no unusual achievement. There are dozens of operators in every large office who can both send and receive at least 40 words per minute for hours with no unusual exertion. Go to, Mr. Craig! you are not fair. With your vaunted Automatic, with its capacity for 500 words per minute, you should surely allow us Morse operators a fair show in your calculations. But let us examine your claim of 500 words per minute on a wire of 250 miles. Words average above 6 letters each in our modern language, which isn't so simple and pure as that in which Shakespeare and Milton wrote. This would give 3,000 letters per minute. By a little figuring you will find that each letter of the 26 contains 7-9 of a dash, and about 2.9 dots in Morse characters. Each dash should equal at least 3 dots in length for proper proportion. This would give 52-9 dots for each letter, or, in round numbers, 15,000 dots per minute—I give you the benefit of the fraction—and 250 per second. Two hundred and fifty breakings of the circuit, or "pulsations," as Mr. Little would say, per second, to be recorded legibly on the strip of paper at the receiving station! Naturalists tell us of the number of billions of times a mosquito's wings "vibrate" per second in order to produce those beautiful musical sounds, so much admired, and which, by the way, we shall soon be listening to with rapture o' nights. But we never took much stock in those statistics, and neither does the average operator in yours, when he must face such a conclusion as they lead to in regard to those "pulsations."

Fourth.—Meeting Mr. Craig on his own ground, economy, and allowing a fair average for the system he advocates, 250 words per minute—a higher average than is warranted by its achievement thus far, I will indulge in a few more statistics, even at the risk of being pronounced dry and uninteresting, though I think no operator who takes an interest in the subject will consider them so, prefacing them with a few necessary explanations in regard to certain points which may not be generally understood.

The latest improvement in punching machines is now in use on the A. & P. lines. They are a triumph of the mechanical ingenuity of Mr. Edison, but no woman or child could work one of them. The keys have a "drop" of three or four inches, and require a strong pressure to carry them down. An hour's work on one of these punches is a severe strain on the muscles of a strong man. The hand soon becomes tired, and the process is laborious in the extreme. On a Phelps' "Printer" the keys require but a touch, and an expert can touch fifty of them per minute by unusual exertion. On the punches, however, the highest achievement I have heard of was forty words. The average work on them will not exceed thirty words.

The "copyists" at the receiving station will do well if they average twenty words per minute. It is well known that the labor of copying from manuscript or visible characters is much greater than by the ear, and progress is necessarily slow. Manifolders of many years' experience tell me that it is impossible to attain a higher average, and certainly better progress could be made with plainly written manuscript than with telegraphic characters to copy from.

Now the figures. Compare the following tables

Automatic (one wire) one hour's work, 14,400 words, would require	
"Punchers," at 30 words per minute.....	8
Operators, 1 at each end.....	2
"Copyists," at 20 words per minute.....	12
	22
Morse (Duplex, 3 wires)—	
Operators to send, at 40 words per minute	6
Operators to receive.....	6
	12

Thus it appears the Automatic method does the work on one wire while the Morse requires three. But, *per contra*, the former requires nearly double the force. Let the quadruplex be brought to perfection, which it doubtless will be soon, and the Morse system with two wires, one "quad" and one duplex, will be capable of the same work per hour with twelve men as the Automatic with twenty-two.

Now, suppose Mr. Craig finds that he must dismiss his theory of "cheap labor" in this connection and accept the present policy of the A. & P. in employing none but experienced men as punchers and copyists, and paying them salaries as first class operators, let us see what effect it would have on his economical theories.

Automatic (1 wire)—	
8 punchers, at \$90 per month... \$720.00	
2 operators, at \$100 " ... 200.00	
12 copyists, at \$90 " ... 1,080.00	
	\$2,000.00
Morse (3 wires)—	
12 operators, at \$100 per month.....	1,200.00
Balance in favor of latter.....	\$800.00

An amount sufficient, suppose the wires to be 250 miles long, to pay the salaries of five linemen to keep them in order, and purchase 166 miles of new wire every year! If some genius will invent a "multiplex" the Automatic would be "nowhere."

Another objection to the Automatic system is, that the business passes through too many hands—is placed at the mercy of too many grades of intelligence and judgment—before reaching its destination. The simplicity of the Morse system would alone render it infinitely superior. The receiver's judgment acts as a check on the possible ignorance or incapacity of the sending operator. If the latter makes an error, and the receiver knows it to be such, he can correct the sender, and perhaps save his employers from loss.

The benefit of this is lost to the company using the mechanical method.

The "copyist" will transcribe just what is given on the strip of paper, and in doing so is relieved from all responsibility for errors, if any occur. But suppose the "puncher" strikes the wrong key occasionally—rendering a word unintelligible—how is a correction to be made without delay? The machinery must be stopped, an inquiry made, and that particular message must be hunted up, repunched, and retransmitted. Does any one suppose that eight punchers could prepare 15,000 words in an hour without numerous mistakes of this kind? The physical exertion required to work the punching machines, as I have said, soon tires the muscles of the hand, rendering the operator peculiarly liable to such mistakes. To sum up, I have endeavored to demonstrate the following facts:

First. That the officials of the Western Union Company who have every incentive to increase the capacity of their wires, after careful experiment with the Automatic system, pronounce it inferior in its practical working to the Morse method, and that their decision cannot be attributed to personal or interested motives, but must be accepted as a deliberate judgment based upon the facts as they appeared to them.

Second. That the Automatic system is practicable only on through lines.

Third. That the average speed on heavy Morse wires is above thirty words per minute and that forty words is no unusual speed, while at 500 words per minute claimed for the Automatic, it must be able to record 250 signals per second legibly upon the paper strip, which I do not believe possible.

Fourth. That allowing the very high speed of 250 words per minute to that system, twenty-two persons are required to perform the necessary auxiliary work at the same rate, while twelve men can perform the same work with the Duplex on three Morse wires, and that if skilled labor is employed on the former the balance in favor of economy is on the Morse side, the saving in salaries being more than sufficient to maintain the two additional wires used.

And fifth. That there are numerous other objections which weigh heavily against the Automatic system, a few of which I have imperfectly described. In simplicity and accuracy the Morse system in the hands of capable, intelligent operators, cannot be approached by any mechanical performance.

Now a word in regard to Mr. Little, that irrepressible gentleman of whom a friend of mine once remarked that it was his deliberate conviction, based upon the patent office reports and Mr. Little's "Claims" in these columns, that the Almighty himself could not strike a haystack with His lightning without an infringement of one of Mr. Little's patents!

Mr. L.'s artistic attempt in THE TELEGRAPHER of Oct. 31st, '74, has not been equalled since Mark Twain issued his celebrated diagram of the Siege of Paris, but not even his startling assertion that in the year 1846 he "stood before a committee of the British Parliament cheek by jowl with Alexander Bain," can convince those who know the facts, that "It is well known that specially large wires had to be constructed for Stearns' duplex" (TELEGRAPHER, Oct. 24th). Such is not the fact. Not until two years after the introduction of the duplex were any wires larger than the standard size (No. 9) constructed by the W. U. Then but two (No 6 size) were strong (between Boston and New York) not for the duplex, but for the Atlantic Cable circuits.

Mr. Little betrays his ignorance still more glaringly in his assertion that Edison's quadruplex is an "old idea." The principle of that system is this—suppose A and B the termini. The reversal of the poles of a fixed quantity of battery at A produces one set of signals on a polarized relay at B, while a second set is

produced by "cutting in" an additional battery at A, causing an increase in the line current, which increase works an ordinary relay properly adjusted at B. This arrangement being duplexed by the "Wheatstone bridge," gives two sets of signals each way, or the "quad," and if it was not a new device in TELEGRAPHY, then I have read authorities on the subject in vain. This arrangement, however, does require a specially large wire, owing to the fact that when the Wheatstone bridge is used only one fourth of the strength of the battery can be utilized, the rest being necessarily wasted. In the Stearns duplex one half the effective strength of the battery is similarly wasted. If Mr. Little would study up these simple facts he would not make such blind and ridiculous statements on the subject.

The idea that the opposition of Morse operators is based upon narrow and selfish grounds is a most fallacious one. When a real advance is made in methods of telegraphing, none will indorse it sooner than they, for as a class they are above the average in sense and intelligence. But the Automatic is not an advance; it is but an attempt to transfer the telegraph business from the hands of skilled and well paid labor to those of "cheap labor," and supply by machinery the loss of brains and skill. There is no analogy between this case and others quoted editorially by this paper, a means of communication upon the accuracy of which depend profit and loss by thousands of dollars, often health and sickness, happiness and sorrow—sometimes even life and death—cannot be compared to the process of making shoes, or any other mechanical occupation. A man may encounter the results of "cheap labor" in the form of paper soles on his boots without flinching, but when he is betrayed into unseemly hilarity by a telegram announcing the death of his mother-in-law, only to learn next day that it should have read a *visit* from her, we may naturally expect an ebullition of his wrath. He may have shoddy palmed upon him for broadcloth, and patiently submit; but let him telegraph an order to sell ten hundred shares of stock on a falling market and have it delivered two hundred, thereby losing a few thousands, and the company employing such talent may expect a suit for heavy damages. Let a company establish a reputation for doing business in this style, and I opine the public would soon indicate its decided preference for skilled labor in telegraphy.

Morse operators have regarded THE TELEGRAPHER as peculiarly their organ, and there are many who cannot understand why it should so warmly support the Automatic system, even if it were capable of 100,000 per minute, and threatened to sweep the Morse operators into oblivion. Why should their paper advocate it? While it gives both sides an opportunity of advocating and opposing *ad libitum*, why run counter to the opinions and prejudices of a large class of its readers by editorial support of the obnoxious innovations? By ignoring the disputed point and allowing the advocates and opponents to "fight it out" in its columns, the editor would please all, offend none, and remove what has been to many the only objection to THE TELEGRAPHER as the operators' journal. If he will do this we can submit cheerfully to even the indiction of a column or two from Mr. Little every week. "Let us have peace!"

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Presentation to Mr. I. D. Purkis, late General Manager of the Dominion Telegraph Company.

TORONTO, CANADA, April 28.

TO THE EDITOR OF THE TELEGRAPHER.

LAST Monday evening a number of the employes of the Dominion Telegraph Co. assembled at the house of ex-General Manager, I. D. Purkis, Esq., and presented him with a very handsome repeating stem winding gold watch, with a fine chain and locket, and an exquisite gold locket set with pearls and gold chain for Mrs. Purkis; together with an address. Amongst those present were Messrs. H. Neilson, Superintendent, Toronto; M. C. Lavin, Manager, Hamilton; C. G. Craig, Manager, St. Catharines; F. Reynolds, Manager, North Hope; L. B. McFarlane, Manager, London; S. J. Ritchie, Manager, Toronto office; T. C. Elwood, Inspector; S. E. Gibbs, Chief Operator, Toronto office; P. W. Snider, Assistant Chief Operator; N. Burke, Night Manager; A. J. Pattison, J. Wilson, H. Pingle, J. Raymond, J. Anderson, Operators; N. Marshall, Store Department; C. McCluskey, Operator, Rossin House.

Mr. and Mrs. Purkis gave the company a very

cordial welcome, and after a short pause Mr. Lavin stepped forward and read the following address:

"Dear Sir—Your retirement from the general management of the Dominion Telegraph Co. suggests to the employes of the company the present opportunity to tender you some tangible expression of the good will and esteem in which they hold you.

"Your experience and ability as a telegraph manager is too well and widely known to need any comment on this occasion. It therefore only remains for us to assure you of the great respect and esteem entertained for you by all those whose duties have brought them in contact with you. During the five years you have managed the affairs of the company we have found you at all times ready to aid and assist by your counsel and advice, not only in your official but also in your private capacity. Your cordiality, tender regard, gentlemanly and courteous demeanor have been unsurpassed, so that in the severance of an association so long enjoyed we experience regret not easily expressed.

"We beg your acceptance of the accompanying souvenirs for yourself and Mrs. Purkis, which are offered as tokens of our great regard and esteem. Most cordially wishing you success in your future career, and trusting that yourself, Mrs. Purkis, and family will be blessed by the Giver of all good with prosperity, health, and happiness.

"Signed on behalf of the subscribers.
H. NELSON, C. R. HOSMER, M. C. LAVIN,
Committee."

Mr. Neilson then read letters and telegrams of apology from a number of gentlemen who were unable to be present. He then made a pleasant and interesting little speech, and concluded his remarks by expressing the best of good wishes for Mr. and Mrs. Purkis—wishes which he felt assured would be echoed by every employe of the company who had had personal contact with the ex-manager, whose departure was so deeply regretted.

Mr. Purkis then made the following reply:
Messrs. H. NELSON, C. R. HOSMER, M. C. LAVIN,
Committee.

Gentlemen—I can scarcely find words to express the great pleasure your address affords me, expressing, as it does, such kindly sentiments on behalf of the telegraphic staff of the Dominion Telegraph Company, over which I have so long presided as General Manager; and I assure you that I shall ever remember, with heartfelt gratitude, this occasion, and those with whom I have so long associated as co-workers in bringing the company to its present efficient state; and you may all be justly proud, for to you its success is largely due. The handsome watch and chain accompanying the address will be highly prized by me as a memento of your kind appreciation, and it will daily bring to my mind many pleasant associations of the past. On behalf of Mrs. Purkis, I thank you most sincerely for your kind remembrance of her at such a time, and assure you she will prize the beautiful locket and chain, and, coming from such a source, these mementoes, with their inscriptions, will be proudly handed down to our children, together with former presentations, in due course, and, I trust, will prove an incentive to them to so regulate their walks in life as to merit the esteem of all with whom they come in contact. Having worked so long harmoniously with my directors and yourselves for our common aim, I shall continue to feel a warm interest in the company, and, judging from the past, I believe you will all give that hearty assistance to your General Manager, Mr. Swinyard, in carrying out the interests of the company that you have rendered me. In conclusion, I cannot better express my feelings, and those of Mrs. Purkis and family, than by repeating your best of wishes—that you and yours may all be blessed by the Giver of all good with prosperity, health and happiness.

I remain, as ever,

Yours, faithfully,

I. D. PURKIS."

Mr. Purkis invited his visitors to stay and spend the remainder of the evening with them. A very comfortable supper was improvised, and after that had been partaken of the company enjoyed themselves singing and dancing, the Misses Purkis presiding at the piano. Quite a number of ladies were present, and an extremely pleasant evening was passed.
Jo.

Corrections.—Personals.—A Sandwich.—Meeting of the American Electrical Society.

CHICAGO, ILL., April 28.

TO THE EDITOR OF THE TELEGRAPHER.

HAPPY ED. ANGELL is probably the most truthful man in the biz, not excepting even Huddleston, Stoner or Lithgow. He informs me THE TELEGRAPHER has done him great injustice by stating, in the Personal column, that he resigned when he got the "grand bounce." No doubt you will take pleasure (in this as in all other cases) in "correcting your testimony."

One more correction. In my article, regarding the accident on the Burlington and Missouri branch of the C. B. & Q. R. R., recently your printer made me say "That the operator handing the conductor and engineer only the order for the freight train should place the blame entirely on his shoulders;" I said, "should not place the blame," etc.

If any of the boys East intend visiting Chicago soon they must not forget that the "University" cap is all the rage here now, and if they want to be in style they must wear one.

We notice a strong tendency of late to settle amicably a little feud that had its origin with the formation of the "Merry Meeting Club" here, and we all hail with joy the cessation of hostilities.

The populat on of Cairo, Ill., was increased some four or five days ago by the birth of a son to Mr. H. E. Stanbury, of the W. U., Chicago, office, night force. "Stan." has a nice little family now—two boys and a girl.

Mrs. O'Connor, of the Western Union office, this city, who left here January 10th for her home in Dublin, was ordered to the seaside, at Malahide, immediately upon her arrival, her health being very poor. She is rapidly improving, however, and hopes for a speedy recovery are entertained by her friends.

One of the boys on the W. U. day force recently attended a surprise party. While preparing to go one of the ladies was lamenting that they hadn't more coffee, cakes, etc. "Pshaw!" says George, "I wouldn't give a fig for such things; give me a good sandwich any time in preference." Oh, you like sandwiches, do you, Mr. H—?" "Yes, indeed," was the reply. "Well, I'll make you one," was the reply, and sure enough she did. George helped himself to his solitary sandwich, while the others had pies and cakes, etc. Just as he was about biting into it he thought it might be well to examine the mate, when he found—oh, horror! a small child's head—rubber. The laugh was on "Halley," but he quickly sandwiched himself between two young ladies and escorted them home, bringing the fruit to the office to show the boys.

Our friend Mr. Leroy Robinson, Manager of the Northwestern Companies, Minneapolis, Minn., office, has had a male sounder switched into his family circuit. It was ready for operating its lungs April 22d, 1875. Being the first edition, it's a complete volume of "get up in the cold—nights to make catnip tea." "hurry up that soothing syrup," etc.

An engineer's life was almost miraculously saved on the Illinois Central Railroad near Carbondale, Ill., on the 22d inst., while the fireman met an instant death. The engine they were running blew up, throwing them some twenty feet in the air; the engineer, in coming down alighting on the telegraph wires, some four or five in number, thus breaking his fall (and the wires) and escaping with a few scratches and bruises.

The regular monthly meeting of the American Electrical Society, which was held Wednesday evening, April 21st, was one of the most largely attended, instructive and interesting held since its formation. Mr. Gray's Telephone was the chief feature of the evening, and it was minutely explained by the inventor. He delivered an oral discourse, reserving the right to hand in a written explanation at some future time. He began with the foundation (sound), explaining the difference between a loud sound and a low sound, the former being the result of the particles of air disturbed moving farther and returning to their normal position than in the latter case. Several familiar tunes were played on the telephone.

Among the new members elected were Mr. E. Payson Porter, Elisha Gray, Supt. Western Electric Mfg. Co.; James Pettit, Asst. Manager Board of Trade, W. U. office; L. C. Springer, Asst. night Manager W. U. office, all of this city, and several whose names I cannot recall. These meetings are gradually growing in interest. Wish they were weekly instead of monthly. The usual pleasantries were indulged in by the members, Mr. Gray remarking that he was not perfectly satisfied with the action of his analyzer, or something to that effect, one of the members replied, this was not the only Ann Elizer that had not acted satisfactorily to those interested; for instance, Brigham Young's.

OCCASIONAL.

Personals and Changes.—Rough Experience in Travelling.

SAN FRANCISCO, CAL., April 10.

TO THE EDITOR OF THE TELEGRAPHER.

SEVERAL changes have recently been made in this Division of the Western Union Telegraph Company.

Mr. George Campbell forsakes the Western Union for the Atlantic and Pacific at San Francisco.

Mr. George Fitch, Manager of the San Luis, Obispo, office, has resigned, to engage in other business, and was relieved by Mr. W. Bennett, of Sacramento, the position held by Mr. Bennett at Sacramento being taken by Mr. Chas. Boynton, of San Francisco. Mr. S. S. Pomeroy, of Salt Lake, Utah, arrived in this city

just in time to fill the vacancy caused by the transfer of Mr. Bennett. Mr. Pomeroy is one of the old reliables, but only favored us with a few day's help and a few remarks about old times, getting our old friend Foley warmed up in the reminiscences of other days, which never fail to interest us more recent graduates in the telegraphic art. Mr. Pomeroy returns to Salt Lake City to engage in other business, but proposes to do the vicinity of San Francisco a la tourist for a week or so.

Mr. Charles J. Lawson, late night chief operator at St. Louis, Mo., who came west on account of his health, fills the vacancy caused by Mr. Pomeroy's resignation.

Mr. Lawson came overland, and had a rather rough experience by the way. Miscalculating the expenses of the trip, he ran "short," and had to do a part of it in sections, an experience not calculated to impress one favorably of the trip. He sometimes got a lift on the "fast freight" trains (eight miles an hour when running), not allowing for side tracking, etc. He says that if he makes the trip back alive, he will adopt Ncd Peirson's suggestion of getting flanges on his shoes and taking the track himself.

Ned, who dropped in on us last week, recalling this, says you can always get passed in this way—about twenty miles an hour, and don't have to side track yourself very often west of "O. M." CLIX.

An Unseasonable May Day.—Reorganization of the Chicago Western Union Office.—Personals, etc.

CHICAGO, ILL., May 1.

TO THE EDITOR OF THE TELEGRAPHER.

WE are having very changeable and unpleasant weather. No genial showers visited us last month to bring forth May flowers, and to-day it has rained and snowed alternately from "early morn till late a' night."

The following order was posted on the Bulletin Board yesterday:

"WESTERN UNION TELEGRAPH COMPANY,
Central Division, First District.

Notice to Employes.

The following appointments have been made in the operating department of Chicago office, to take effect May 1st, 1875:

- H. C. Maynard, Manager.
- F. W. Jones, 1st Asst. "
- C. G. Sholes, 2d " "
- H. W. Plum, 3d " "
- L. C. Springer, Night Manager,
- C. H. Kelly, 1st Asst. " "
- W. A. Leary, 2d " " "
- J. Dewitt Congdon, Late " "

J. J. S. WILSON, Supt."

Mr. York still assists to test wires, etc., but does not rank as an asst. manager as heretofore.

Mr. G. W. Hurd, of the day force, who has been laid up some time with a swollen face, caused by an ulcerated tooth, is again at his post.

Mr. "Tom" Weller, an old veteran, began work on the night force in this office last night.

It is rumored that Mr. Swift, of the Amboy wire, is soon to be transferred to our Indianapolis office; also, that Mr. Avery, of the Illinois Central line, intends resigning soon to go to school—wise young man.

Mr. Stoner, the monied man of the office, has returned from his two weeks' vacation, and is again on the St. Louis wire nights.

It is understood that Mr. Benson and Mr. Knox, who have changed tricks—former working nights, latter days—will exchange back again soon.

Mr. Stevley, who graced the night force and the Pittsburg wire at the same time, by changing off with Mr. Fish, has gone back on the day force, and "Jim" is with us again on the night force.

Mr. Bale is to take charge of the way business, and look after it nights the same as Mr. Leary formerly did, the latter's appointment as 2d asst. night manager necessitating the appointment of a good man to see to this business.

Considerable discussion arose in the office here last night as to the proper way to spell employes, some of the most knowing ones claiming that although usage made employes proper, as well as employes, still, according to Webster (who is the recognized authority in all such cases), employes is the only proper way to spell it. Please decide this vexed question for us, and oblige
WESTERN UNION.

[NOTE.—Employes is the proper spelling of the word. EDITOR OF THE TELEGRAPHER.]

The man who won't take a paper because he can borrow one, has invented a machine, with which he can cook his dinner by the smoke of his neighbor's chimney.

Battery carbons can be readily cut with a handsaw moistened with water.

Back Numbers of The Telegrapher Wanted.

OUR supply of copies of the current volume of THE TELEGRAPHER, Nos. 446 for January 30th, and 449 for February 20th, are already exhausted, and we would be under obligations to any of our subscribers who do not keep files of the paper for binding, that may have these numbers, or either of them, on hand, if they will forward them to this office. The postage necessary to be prepaid on those papers, to insure their transmission, is two cents for each.

We regret to be obliged to ask this, but the demand for these numbers has exhausted the supply.

A Late Season.—Prospects for New Telegraph Construction.

THE season this year is just about a month behind its usual progress. In March we had February weather, in April, March, and so far in May we have had weather which is customary for April. Whether this is to be continued through the summer remains to be seen, but the probability is that the hot season will suddenly come upon us, and that we shall all be complaining of the heat, as we have thus far of the cold.

The lateness of the season, and the interruptions to the telegraph wires from storms, etc., have delayed somewhat the construction of new lines projected, but this difficulty is probably now about over, and we may expect soon the commencement of active operations in this direction for the season. In fact, as is recorded elsewhere, the Atlantic and Pacific Company have begun the work at the West, and the Southern and Atlantic Company is also engaged in the construction of additional lines South, the details of which were given in THE TELEGRAPHER of last week. There was comparatively but a small extent of new lines built last year, and business in connection with such construction was exceedingly dull in consequence. The prospects for the present season are better, and it is probable that there will be a much larger extent of lines constructed than last year. We understand that the Atlantic and Pacific Company contemplate building several thousand miles of new line, and it is probable that this company will do more in this direction the present season than any other.

We do not hear of any extensive additions proposed to the Western Union system, but there will, undoubtedly,

be more or less new lines built by this company during the season.

There seems to be considerable activity in extending lines on the Pacific Coast, both by the Western Union and the Atlantic and Pacific Companies.

The prospect, on the whole, may be considered fair for the coming season, although there will not be the activity which has been witnessed in former "flush times" for telegraphs. However, we must be content with what can be had, and wait with as much patience as possible for the return of the "good times."

Business generally is still very much depressed, and we cannot expect that the telegraph will escape the influence which has unfavorably affected other departments of business and labor.

There is no probability of any very urgent demand for telegraph operators, or a demand beyond what the present supply can easily meet, and we trust that there will not be a pressure on the part of those not now in the business to engage in it. If there were no additions to the number of operators in this country and Canada for two or three years to come it would be all the better.

The Atlantic and Pacific Report.

We print in full in this number of THE TELEGRAPHER the report of President ECKERT to the stockholders of the Atlantic and Pacific Telegraph Company, of which we gave a brief synopsis last week. It will be found of interest as giving the present status of the principal organization competing with the Western Union combination. It will be noticed that in addition to the American and WHEATSTONE automatic systems, Mr. ECKERT speaks of the purchase of the EDISON duplex and quadruplex inventions by the Atlantic and Pacific Company. The Western Union also claim to have completed a prior contract for the purchase of the quadruplex from EDISON and PRESCOTT, and are manufacturing and putting the instruments on their lines. The unique facility which the great professor of duplicity and quadruplicity has of dealing simultaneously with antagonistic parties and interests, is well calculated to befog any who may desire to avail themselves of the results of his study of standard and obscure telegraphic works, and his application of ideas thus developed or intrusted to him by others.

In this connection a little incident which occurred at the hearing recently by Secretary DELANO, on the application for patents on the quadruplex inventions of the great professor of duplicity and quadruplicity is illustrative. General B. F. BUTLER, who appeared nominally for EDISON, in the course of his argument read over the various contracts and assignments made by the professor to and with Mr. PRESCOTT, Mr. HARRINGTON, Mr. JAY GOULD, etc. The Secretary could not comprehend the erratic manner in which the professor had quadruplexed his business arrangements in connection with the invention, and remarked "Why there must be more than one EDISON."

Senator CONKLING, who appeared for Mr. PRESCOTT, quietly responded, "Oh, no, Mr. Secretary, *there is only one Edison!*"

Another person present suggested "None but himself *could be his parallel.*"

The incident excited considerable amusement and laughter.

As a matter of fact we do not suppose the managers of the Atlantic and Pacific Company build very largely on the ownership of the quadruplex. An attempt to unravel the professor's business entanglements will suffice to furnish employment for a legion of lawyers indefinitely.

The Atlantic and Pacific Company proposes to build considerable line during the coming season, to extend their system.

President ECKERT represents matters as favorable for the development of a satisfactory competing system, and to this the energies of the new management of the Atlantic and Pacific Company will doubtless be specially directed.

Literature.

A Manual of Telegraph Construction; the Mechanical Elements of Electric Telegraph Engineering. By JOHN CHRISTIE DOUGLAS, M. S. T. E., &c. London: Charles Griffin & Co. New York: D. VAN NOSTRAND 1875.

IT was once remarked by a witty author that a reviewer ought never to read a book before writing a notice of it, as it would have the effect of producing a prejudice in his mind one way or the other. If we had strictly followed this original piece of advice we should have noticed Mr. Douglas' book some months ago; while, on the other hand, if we had waited to read it entirely through before writing this article it would probably have laid on our table for a considerable time to come. Mr. Douglas appears to be a practical telegraphic engineer, and we are free to say that if he constructs his lines with anything like the same solidity as he has the treatise now under consideration, they will be likely to outlast any of the present generation of telegraphers. We do not wish, however, to do our author an injustice, and we will therefore say at the beginning that he has got together a large amount of valuable material, a good share of which is original, and this makes it all the more a pity that he had not been possessed of the faculty of book making to a sufficient extent to be able to put it in a less forbidding form. He has given us over 400 pages of matter, packed in like "pemmican," in solid type, and seldom broken by paragraphs, and written in a style well calculated to repel any but the most earnest and determined student. The first part of the book is devoted to the consideration of the general principles of mechanical strength and stability, and the second to the properties and application of materials, operation and manipulation. The third and last part treats of telegraphic construction, maintenance and organization, and is, of course, the part most specially interesting to members of our craft. The most minute directions, evidently derived from practical experience, are given for laying out the route of telegraph lines, and for constructing them—both in the city and country—according to the most approved English practice; including submarine and overhead river crossings, underground lines, etc. The laying of long and short cables is fully treated of, as well as the arrangement and fitting up of offices, etc.; and the concluding chapter treats of maintenance and organization. We have merely indicated in the most cursory manner the contents of the volume. Uninviting as its pages may appear, there is a vast amount of information buried therein, which it will well repay the student, and even the experienced telegraph engineer to search out and practically apply.

In the section relating to office fixtures, Mr. Douglas speaks of the switch in the office at 145 Broadway, as probably the largest in existence, though it is less than half the size of the one now in use in the new office. He adds: "In India commutators are used, but the largest provides for only about twelve lines. In England commutators are not used; in the central office at London one large testing board is used, it will provide for 800 lines, and consists of a flat surface of wood work, carrying screws arranged in pairs, one of each pair being connected with the lines, the other with the instrument; a row of knobs projecting from the board serves to support wires used for making transverse connections, for which ordinary covered wire is used. In the battery room smaller connection boards are used. In the central office at Paris the line wires are brought into one room to a set of binding screws, arranged in a large circle, on the wall; another set of screws arranged in a concentric and smaller circle, is connected with the instruments, and these two sets of screws are connected by wires arranged radially. The battery wires are brought to a line of screws, and connected by uncovered wires in porcelain rings to a second set. From the rooms containing the arrangements described, the wires are distributed to the instrument rooms, those for each room are made up into a separate cable; the instruments are distributed over many rooms; in each room is a small connection board having two vertical rows of binding screws, one connected with the lines, the other with the instruments, the connections are made between these two rows of screws by flexible conductors covered with vulcanized India rubber and of suitable length. In the Berlin office a commutator is used, providing for 96 lines.

The commutator is very useful for a small number of lines, not exceeding perhaps 10; when larger it becomes inconvenient and unnecessarily expensive, and the connection board appears more convenient. The commutator provides more than is required; it appears useful for a large number of wires, only when divided, *i. e.*, the instruments being arranged in groups; a separate commutator is used for each group.

The book is well printed and contains a considerable number of diagrams. If it could only have been cut down about one half and the balance rewritten in a presentable form, it would have made one of the most useful books we have been favored with for many years. There are several excellent German and French treatises on telegraphic construction, but this is the first one in the English language, and despite its faults, we should like to see it on the shelves of every telegraphic engineer's library. For sale by D. VAN NOSTRAND, 23 Murray street, New York.

Guide Pratique de Telegraphie par LOUIS HOZEAN, employé des lignes telegraphiques. Paris: E. Dentu, 1874. New York: D. VAN NOSTRAND.

This work is designed for the use of students, and as a practical guide for telegraphic employes, and is intended to occupy much the same ground in relation to the French telegraphic system, that POPE'S *Modern Practice* does to the American. It commences with a description of the essential portions of the apparatus and their functions, and then treats of the laws of the current, so far as is necessary to a clear understanding of the operation of the instruments, which is followed by a concise description of the construction and operation of the switch or commutator, the galvanometer, the lightning arrester, and other less important adjuncts to the telegraphic apparatus proper. Other chapters give directions in regard to the adjustment of the instruments, the establishment of stations, the manipulation of the key and formation of the Morse alphabet, etc., etc. The appendix contains an essay on the different kinds of batteries, and their management. One ingenious feature of the book is a (presumably) complete list of all the ills that telegraphic instruments are heir to, systematically arranged in tabular form for convenience of reference. The book is written, of course, with reference to the French method of working the Morse apparatus, and, therefore, would perhaps be of little use to the average American operator, especially as it is printed in the French language. To those, however, who are interested to know how the French telegraphs are actually worked, it will prove of value. The work is beautifully printed, and the execution of the numerous illustrations, which are original drawings on wood, by the author, is simply superb. D. VAN NOSTRAND, 23 Murray street, New York, has the work for sale.

Presentation and Marriage.

MR. WILLIAM HOLMES, the efficient Superintendent of the Tariff Bureau of the Western Union Telegraph Company, has taken unto himself a partner for life, and received an anticipatory token of esteem from his friends—both of the gratifying events happening on the same day. The token of esteem, which consisted of a handsome and valuable gold watch was presented to him on Thursday morning, April 29th, and his marriage took place Thursday evening.

We congratulate Mr. HOLMES sincerely on both the presentation and the marriage, of both which he is worthy, and trust that he may live long and happily to enjoy the pleasures of the society and companionship of his bride, and that the watch may for him mark only happy hours.

Geo. H. Bliss & Co.

Our readers will notice that the address of GEO. H. BLISS & Co., at Chicago, Ill., has been changed from 41 Third avenue to 220 Kinzie street, where the balance of the stock is being disposed of at very low prices.

Mr. GEO. H. BLISS has taken the position of General

Agent of the Western Electric Telegraph Co., an arrangement which will no doubt prove very advantageous and satisfactory to all parties. Those who may desire to purchase telegraphic and electrical apparatus and supplies on unexceptionably advantageous terms will do well to communicate with Mr. BLISS, as above.

Personals.

Mr. L. F. SHERDEN is Superintendent of Telegraph for the M. K. and T. R. R. Co., with headquarters at Parsons, Kansas.

Mr. C. W. GEARHARDT, an old Eastern operator, is in the insurance business at Tucson, Arizona.

Mrs. CARR has been transferred from Nebraska City, Neb., to Jacksonport, Ark., W. Union office, and Mr. J. P. MORRISON, of the latter place, to Nebraska City.

Mr. BYRON F. BURDICK has been transferred from St. Mary's, Pa., night duty on Phila. & Erie R. R. Telegraph, to Kane, Pa., nights, same line, *vice* Mr. J. M. FAY.

Mr. EUGENE K. STEVENS, from B., N. Y. & P. R. R. junction office, has been transferred to St. Mary's, Pa., P. & E. R. R. line, in place of Mr. BURDICK.

Mr. JNO. M. GIVEN has been transferred from Round Island, night office, to B., N. Y. & P. junction, P. & E. R. R., in place of Mr. STEVENS.

Mr. R. B. DONALDSON, "extra artist," takes the position on the P. & E. R. R. line at Round Island, Pa., vacated by the transfer of Mr. GIVEN.

The Telegraph.

The Atlantic and Pacific Telegraph Company. —Election of Officers.—Construction of New Lines.

AT a meeting of the Trustees of the Atlantic and Pacific Telegraph Company, elected April 28th, at the Executive Offices of the Company, in this city, held Monday, May 3d, the following officers were elected for the ensuing year: President, Thomas T. Eckert; First Vice-President, W. J. Syms; Second Vice-President, E. D. L. Sweet; Secretary and Treasurer, Alfred Nelson.

Executive and Finance Committee: Thomas T. Eckert, Jay Gould, Sidney Dillon, John H. Mortimer, W. J. Syms.

The company have commenced the construction of new lines from Chicago, Ill., to Milwaukee, Wis., and from Chicago to St. Louis, Mo. It is understood that other new lines are shortly to be commenced by the company, and that during the present season considerable additions will be made to the lines and facilities now owned and operated by the company.

Litigation between the Atlantic and Pacific and the Southern and Atlantic Telegraph Companies.

THE Atlantic and Pacific Telegraph Company have commenced an action against the Southern and Atlantic Telegraph Company in the Supreme Court of this State. The plaintiffs ask for an injunction to restrain the defendants from breaches and violations of the contract between the Franklin Telegraph Company and the defendants, executed January 13, 1871, for the term of nine years, for connection, exchange of business, etc.; and for an accounting between the plaintiffs and defendants to ascertain the amount of the plaintiffs' damages.

The Atlantic and Pacific Company sue as the assigns of the Franklin Company.

This action arises from the transfer of the connection between the Southern and Atlantic Company and the Atlantic and Pacific Company to the Western Union Company.

The Southern and Atlantic Company claim that the contract with the Franklin Company is void through failure on the part of the latter company, and the Atlantic and Pacific Company, as its assigns, to fulfil the terms of the contract on its part, and to furnish the facilities agreed to be supplied, to the great damage and injury of the former company.

The hearing on this complaint will be had before the Supreme Court, in Chambers in this city, probably some time during the present month. The litigation growing out of this matter is likely to be long and determined. As is known, the Southern and Atlantic Company severed its connection with the Atlantic and Pacific Company about the first of April last, and is now operated under contract for connection, etc., with the Western Union Company, thus depriving the Atlantic and Pacific Company of its connection south of Washington, D. C., and establishing a new competing line between Washington and Boston, Mass.

Adverse Report on the Underground Telegraph Bill.

THE Committee on Cities, of the New York Assembly, on Wednesday last reported the bill introduced by Mr. Daly, of New York, to compel telegraph companies to put their wires in New York City and Brooklyn under ground, adversely. Mr. T. C. Campbell moved to disagree with the report of the committee, and that the bill be ordered to a third reading. This gave rise to a considerable debate, and, finally, on motion of Mr. Alvord, the whole subject was laid on the table by a vote of 11 to 63.

Foreign Telegraphic Notes.

THE traffic receipts of the Great Northern Telegraph Company, for the month of March last, were 362,145 francs, against 364,579 francs for the corresponding month last year. Total traffic receipts from 1st January to 31st March, this year, 884,312 francs; last year, 982,251 francs.

The members of the staff of the Central Telegraph Station, at London, have started a periodical called *The St. Martin's Magazine*, which has reached its fourth number.

The Dartmouth and Guernsey Cable has been again interrupted; the fracture is close to the Guernsey shore, and within the points where it was previously broken.

The traffic receipts of the Brazilian Submarine Telegraph Company for the three months ending March 31, 1875, amounted to £34,217.

The number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended April 10, 1875, was 400,383, an increase on the corresponding week last year of 58,154.

The receipts of the Submarine Telegraph Company for the month of March, 1875, amounted to £9,289, against £9,561 for the corresponding month of 1874.

The steamer Ambassador had commenced laying the cable which is to complete direct submarine telegraphic communication with Montevideo.

The Great Northern Telegraph Company's Hong Kong, Amoy, cable, which was interrupted April 7th, is restored, thus re-opening telegraphic communication with Amoy and Shanghai, *via* Falmouth, England.

A circular has been issued announcing the suspension of payment of Messrs. John Morrison & Co., of 21 Billiter street, London, E. C. The liabilities are believed to be considerable, and the cause of the failure to have arisen from intimate business relations with Mr. W. T. Henley, whose failure was lately noticed.

The Secretary of Hooper's Telegraph Works (Limited) contradicts the statement in the *Times*, dated Cape-town, March 26th, that the contract with Hooper's Company for the construction of the submarine cable between the Cape and Aden was reported cancelled and the penalty enforced.

The report of the Eastern Extension (Australia and China) Telegraph Company shows that the gross earnings for the past half year amounted to £110,759, and after deducting expenses, &c., the profits were £102,752. Three interim dividends of 1½ per cent., each amounting to £89,887, have been paid, and a further distribution of 4s. per share is now recommended, making 6½ per cent. for the year, and leaving £32,839 to be carried to the reserve fund, increasing that account to £75,453. The debenture debt has, it is stated, been reduced by £2,000, leaving a balance of £7,900, of which a further sum of £3,200 has been redeemed during the present year.

The report of the Cuba Submarine Telegraph Company just issued states that the revenue account shows a net balance of £6,464 17s. 4d., from which, after deducting the debit balance brought from the preceding half year's account, there remains sufficient to pay the accrued dividend on the ten per cent. Preference Shares, and leave £1,845 0s. 11d. to be carried to the credit of the reserve fund.

Sir Henry Wolff has given notice in Parliament that he will ask the Chancellor of the Exchequer if any applications have been made by any railway company for payment for the use of lines of railway by the Government for telegraphs; and whether he is aware that similar demands to a large amount are contemplated, and what course the Government proposes to take with regard to such demands.

The duplex is in use in England on 12,000 miles of wire. The longest circuit is 450 miles.

Rio de Janeiro, Brazil, is to have a fire alarm telegraph.

At the main office (Central Telegraph Station) in London, 20,000 cells of battery are used.

Telegraphic and Electrical Brevities.

THE San Diego, Cal., Daily Union says a despatch was sent from Tucson, Arizona, to Washington City, at ten minutes past 7 o'clock last evening, and the answer was returned to Tucson at five minutes before 8 o'clock. Distance over four thousand miles each way. There may be a bigger telegraphic feat than this on record, but this will do to make a note of.

AN old lady in a town of Worcester county lately refused the gift of a load of wood from a tree struck by lightning, through fear that some of the "fluid" might remain in the wood, and cause disaster to her kitchen stove.

Cowardly Shooting of a North River Telegraph Cable Watchman.

ON Saturday evening last Mr. James Clarke, watchman for the North River Telegraph Cable of the Marine News Rooms, Sandy Hook line, with his wife and daughter, crossed over in a boat to Guttenburg, N.J., which is nearly opposite the cable house, to visit some friends. On account of the state of the tide the party did not start on their return until about two o'clock in the morning. While on the way back Mr. Clark noticed that a schooner, which was subsequently ascertained to be the Willow Harp, from Rondout for Providence, was anchored directly over the cable and likely to foul it with its anchor. He bailed the schooner and the person on watch responded to the hail, upon which he told him of the proximity of the anchor to the cable, and said he would come on board and help to clear it. The boat was accordingly rowed alongside, and Mr. Clark boarded the schooner, leaving his wife and daughter alongside in the boat. No sooner had he reached the deck than Adrian Nelson, who was on watch, took a gun, and without saying a word, shot him, the charge of shot, which was very heavy, striking Clark in the face and breast, badly wounding and disfiguring him. The cowardly fellow, as soon as he had fired the shot, retreated to the cabin, and although Clark lay wounded and helpless on the deck for half an hour, calling for help, and his wife and daughter screaming in the boat alongside, neither he nor any other person on board made their appearance or offered to render any assistance. Finally Clark's daughter took the oars and rowed the boat to Guttenburg, and obtained the assistance of some men who went out and took Clark back to the village.

In the morning the wounded man was removed to his residence in this city, where he is now lying very severely wounded. It was merely accidental that he was not immediately killed.

Nelson subsequently surrendered himself to the police, and in the morning was brought up at the Yorkville Police Court, where, upon his statement that he had shot a river thief, and no one appearing against him, he was discharged, and the schooner immediately sailed.

Upon being informed of the facts of the case, efforts were unsuccessfully made by the police authorities to stop the vessel and rearrest Nelson before she got out of the harbor. Nelson will probably be brought back and held to answer for his cowardly outrage.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: April, May 1, WESTERN UNION, ATL. AND PAC., AMER. DIST., GOLD AND STOCK. Rows show bid and asked prices for various telegraph stocks.

Obituary.

CARL LUDWIG CHRISTIAN BECKER.

THE death of Carl Ludwig Christian Becker, one of the most able mechanical electricians of Europe, is announced. He died April 3d, 1875, of bronchitis, after an illness of ten days. The deceased was born at Ratzburg, in the Grand Duchy of Mecklenburg-Schleitz, in 1822. He received his general education at the Gymnasium of Ratzburg, of which his father was the Rector. Having studied his profession with Repold at Hamburg, Kraft at Vienna, and Steinheil at Munich, he went to London in 1849, and joined the firm of Elliott Brothers, in 1858. Within the last few years he became a Fellow of the Royal Astronomical and Physical Societies, and a member of the Society of Telegraph Engineers. His place cannot easily be filled, for he combined the refined skill of the brilliant mechanic with the deep insight of the cultivated man of science.

Sensible Advice.

WHATEVER you have to say, my friend— Whether witty, grave, or gay— Condense it as much as ever you can, And say it in the readiest way. And whether you write of household affairs, Or particular things in town, Just take a word of friendly advice— Boil it down.

When writing an article for the press— Whether prose or vers— just try To utter your thoughts in the fewest words, And let them be crisp and dry; And when it is finished, and you suppose It is done exactly brown, Just look it over again, and then Boil it down.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended March 9, 1875, and bearing that date.

160,580—SOLUTIONS FOR CHEMICAL TELEGRAPH PAPER.—Thos. A. Edison, Newark, N. J., assignor to him self and George Harrington, Washington, D. C. Filed June 1, 1874.

The solution for chemical telegraph paper prepared with aurichloride of sodium, substantially as set forth.

160,581—DUPLEX TELEGRAPH APPARATUS.—Moses G. Farmer, Salem, Mass. Filed Sept. 30, 1872.

Claims that when the circuit of a duplex apparatus is closed the static charge in the line causes the coil in main circuit to momentarily affect the armature before the equating coils act thereon. Prevents this by introducing momentarily an inducted current into the main line, to hinder the action of such charge, or else into the equating circuit, to aid the action of the equating current.

- 1. The combination of a main telegraphic circuit and its batteries with an induction coil so arranged as to hinder the effects of static charge, substantially as set forth.
2. The combination of an induction coil with an equating circuit to help the equating circuit to neutralize the effect of static charge on the relay in the main circuit, substantially as set forth.
3. The combination of a continuity preserving key and an induction coil with an equating coil and an independent equating battery, substantially as set forth.
4. The combination, in the main or equating circuit of an induction coil or coils, in such parts of the main or equating circuits as are open when the main and equating batteries are disconnected, substantially as set forth.
5. The combination of the circuit preserving key above alluded to with a relay or its equivalent, and with one or more induction coils, substantially as set forth.
6. The combination of the continuity preserving key, with a relay, an induction coil or coils, and with a means of regulating both the strength of the induction stroke or strokes and the strength of the equating current, substantially as set forth.
7. The combination of primary and secondary helices with the means above described of preventing the appearance of a spark upon rupturing the primary circuit, substantially as above described.

For the week ended March 23, 1875, and bearing that date.

161,058.—INSULATING BLOCKS FOR TELEGRAPH LINES.—Geo. B. Pidgeon, Putaski County, Ill. Filed April 24, 1874.

- 1. An insulating block provided with two or more apertures, b c d, Fig. 1, to receive and retain wires to prevent crossing or contact.
2. The combination of the angular openings f with the apertures b c d in an insulating block, having two or more apertures to receive and retain wires, all substantially as and for the purposes set forth.

161,151.—PRINTING TELEGRAPHS.—George M. Phelps, Brooklyn, N. Y. Filed August 22, 1874.

- 1. The shifting lever b carried by the lever c that is operated by the crank e and shaft d, in combination with the shifting impression roller s and the independent frame s, carrying that roller, and the cam l6 for moving the same, substantially as set forth.
2. The deflecting plate 20 placed between the type wheels, in combination with the movable impression roller or pad s, as and for the purposes set forth.
3. The spring lever n', in combination with the magnet r, armature x, levers p v', and revolving arm u, for operating the printing mechanism, substantially as set forth.
4. The pause wheel t, gearing into the wheel u, in combination with the paper feed, substantially as set forth, so as to allow the paper to remain stationary while the impression takes place.
5. The arrangement of two sets of figures, fractional signs, and letters on one type wheel, combined with a second type wheel containing letters, substantially as set forth.
6. In a printing telegraph with two type wheels and a mechanism for shifting the printing from one to the other, the combination of the arm w, the detents therefor controlled by an electro-magnet, the wrist pin or cam operating the roller shifting mechanism, and the cam operating the printing mechanism, arranged relatively to each other, substantially as shown, the shifting mechanism being thereby operated and then removed from the parts moving with the type wheel before an impression is given, as set forth.

161,246.—GALVANIC BATTERIES.—J. Leiter, Vienna, Austria. Filed February 24, 1875.

Cup divided into two compartments by horizontal partition. Upper compartment divided into a number of cells containing the plates, and each communicating through a tube provided with a cock, operated from the top of the cup with the lower compartment, which contains the battery solution, and which has an opening in its side, through which air pressure is applied to force the solution up into the cells.

- 1. In a galvanic battery the combination of the cup A, its horizontal partition D, one or more connecting pipes, F, stopper G, and cock E, substantially as described.
2. In combination with the partition I of the compartment B, the tie piece b supporting the elements of the battery, substantially as described.
3. The combination with the cup A, of the lid L, having the holes N, and telescopic keys M, having springs f, substantially as described.

REMOVAL.

GEO. H. BLISS & CO.

We respectfully announce our removal to 220 KINZIE STREET, CHICAGO, ILL. Having determined to transfer our interests to the Western Electric Manufacturing Company, we offer our entire stock of TELEGRAPH INSTRUMENTS, GOODS and MACHINERY for sale upon terms which cannot fail to prove desirable to purchasers. Until our stock is disposed of we shall continue in the trade, and solicit a continuance of the patronage which has been so liberally bestowed by our many friends heretofore.

GEO. H. BLISS, President.

220 KINZIE STREET, CHICAGO, ILL., April 12th, 1875.

ANNOUNCEMENT.

Western Electric Manufacturing Company.

GEO. H. BLISS having acquired an interest with this Company, has been appointed its General Agent.

His attention will be given to the sale of the Instruments and Goods of our manufacture and in which we deal.

In addition to our former line we have added the various specialties heretofore controlled by GEO. H. BLISS & CO.

With our ample facilities we hope to give to customers and the trade increased satisfaction in prices, quality and variety of our goods.

We invite correspondence and solicit patronage.

WESTERN ELECTRIC MANUFACTURING CO.,

220 Kinzie street, CHICAGO, ILL.

BASTET'S NEW ELECTRICAL MOTOR AND BATTERY.

For Sewing Machines, Church and Parlor Organs, Small Printing Presses, Pumps, Lathes, Dentists' Instruments, or any Light Machinery.

My new ELECTRICAL BATTERY is the most powerful for quantity and durability manufactured, and does not crystallize the carbons. For Electroplating, Telegraphing, and for Motive Power, it cannot be surpassed.

Our No. 1 Engine, for Sewing Machines, with four cells of Battery, is furnished for \$40.

Other Motors at prices proportional to power required. BATTERY, No. 1 Cells \$5. " " No. 2 " " 10.

L. BASTET, 116 Fulton Street, New York.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY cents for each used-up Porous Cell of this Battery that is returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY, No. 40 WEST EIGHTEENTH STREET, or to L. G. TILLOTSON & CO., 8 Dey street, Sole Agents.

THE KENOSHA INSULATOR CO.
TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellant of moisture, which does not change nor deteriorate after years of exposure to the weather.
 THE KENOSHA INSULATOR has now stood the test of SIX YEARS' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO.,
THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for ANY REQUIRED NUMBER OF WIRES,

prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,
 KENOSHA, Wisconsin.

L. G. TILLOTSON & CO.,
 General Eastern Agents.

GEORGE H. BLISS & CO.,
 220 Kinzie Street, Chicago, Ill.
 CINCINNATI, O.,
 Elm St., cor. 5th.

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS—COMBINATION SETS; BOX and POCKET RELAYS.
 PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, wire connections above the table.

REGISTERS, with Springs or WEIGHT.

CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.

BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular *Pioneer Cheap Telegraph Instrument* has recently been improved and a *Straight Lever Key* placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and is still the *leading telegraphic apparatus of its class.*

They are furnished at the following popular prices:

Single Instruments with three cells of Battery, Chemicals,
 Connecting Wire and Instruction Book, - - - \$6.50
 Two sets of Instruments, etc., - - - - - 12.00

Send for our new Circular and Price List.

F. L. POPE & CO.,
 P. O. Box 5503.) 38 Vesey street, N. Y.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of
THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

20 PER CENT. REDUCTION IN THE
 PRICE OF
TELEGRAPH INSTRUMENTS!

SEE WHAT IT MEANS.

On First-class Morse Sets for Railway and Commercial Lines:

- No. 1 Relays, of standard size and resistance (120 to 150 ohms), on rosewood bases, fine finish, polished rubber covered coils, wound either with our patent glazed or with best silk covered pure copper wire, having soldered connection and firm nut fastenings throughout, and latest improved extension adjustments. Regular price, \$16, reduced to - \$12 80
- No. 1 Relay, same make throughout, but of higher resistance, 160 to 600 ohms. Price, \$18, reduced to - \$14 40
- No. 1 Relay, ditto, low resistance, 60 to 100 ohms. Price, \$15, reduced to - \$12 00
- No. 1 Sounders—"Railroad" or Bunnell's "New Giant" Sounders, with all the latest patented improvements in both. The best forms of Morse sounders ever invented. Beautifully finished. Mounted upon rosewood bases. Price, \$7 50, reduced to - \$6 00
- No. 1 Keys, Caton pattern, curved levers. Price, \$6 50 reduced to - \$5 20
- No. 2 Keys, W. U. pattern, curved or straight levers. Price, \$5 50, reduced to - \$4 40
- No. 1 Premium Register, \$45, reduced to - \$36 00
- " " Spring Register, \$47 50, reduced to - \$38 00
- " 2 Register. Price, \$38, reduced to - \$31 40

Box Relays, Combination Sets, Pocket Relays, Switches, Cut Outs, Lightning Arresters, etc., furnished at the same rate, viz., 20 PER CENT. REDUCTION from regular prices. See catalogue.

SINGLE SETS, OR PARTS OF SETS, WILL BE SENT BY EXPRESS AT THESE PRICES TO ANY PART OF THE U. S., ON RECEIPT OF MONEY ORDER OR DRAFT FOR THE AMOUNT OF THE BILL.

Superintendents and others about to purchase first class equipment for offices will readily see by a comparison with other price lists the advantages here offered to those who send their orders to us.

No. 2 SETS.

LEARNERS' APPARATUS, SHORT LINE INSTRUMENTS, Etc.

- No. 2 Relays, 150 to 175 ohms resistance Price, \$15, reduced to - \$12 00
- No. 2. Relays, 50 to 100 ohms resistance. Price, \$11, reduced to - \$8 80
- Pony Relays, complete and pretty little instrument for short lines, city wires, etc., \$7 50, reduced to - \$6 00
- No. 2 Pony Sounders, \$6 50, reduced to - \$5 20
- No. 3 Pony Sounders, \$5 50, reduced to - \$4 40
- No. 1 Main Line Sounders for lines from 1 to 6 miles in length. Price, \$8, reduced to - \$6 40
- No. 2 Ditto, \$7, reduced to - \$5 60
- No. 3 Keys, curved levers, Caton style, same as No. 1, but smaller. Price, \$5, reduced to - \$4 00
- No. 4 Keys. Price, \$4, reduced to - \$3 20
- AMATEUR KEY, \$3 50, reduced to - \$2 80
- EXCELSIOR AMATEUR INSTRUMENTS, \$6 50, reduced to - \$5 20
- BUNNELL'S CHAMPION LEARNERS' INSTRUMENTS, \$6 50, reduced to - \$5 20

At the above figures all grades of Telegraph Instruments may be obtained from L. G. TILLOTSON & CO. for less money than will buy as good materials at any other manufactory in America.

Orders, correspondence and inquiries will receive prompt attention. Make your memoranda of amounts for what you want from the above price list, and enclose the sum to us by postal order or draft along with your order for goods.

Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

[Written for THE TELEGRAPHER.]

"Nihil's" Grave.

By ICHABOD CRANE.

I.

WHEN the cold March wind blew its fiercest blast,
And the snows were drifting down,
While the old year quietly slept in his grave
And the new year wore a frown;
When the winter hung on the edge of the spring
And the spring yet hung aloof,
Poor NIHIL clipped his warp in twain
And reeled off the last of his woof.

II.

He'd swallowed a "Plug," in his wrath, poor man!
Which worked up his extra bile,
And then ran in on the women's time,
But *this* was too much for NIHIL;
A Canada thistle pierced his side
And NIHIL "tuckered out,"
He turned on his back and "kicked the pail,"
And so "went up the spout."

III.

He was made of delicate stuff, he was,
He couldn't abide the sight
Of women jerking the key for bread,
He didn't think it right,
So he grabbed his quill, and slung his ink,
And preached like the crack of doom;
But the women proved too many for him
And he "went up the flume."

IV.

He sa d, as he drew his last weak breath,
"I respect the women too much
To see them expose their precious minds
To the tendencies of such
A profession as this, I have done what I could
To prevent them from going astray,
Nothing more can I do—let them choose as they will,
A woman *maun* ha'er way."

V.

He died; his troubles will vex him no more;
His sleep will be quiet and still;
Since the fitful fever of life is o'er,
No more will he sling his quill,
And, as we bore his remains to the tomb,
One faithful friend was found,
Who followed the dust to its dismal home,
And wept o'er the lonely mound.

VI.

He came from the far off Quaker State;
He was quiet, and gentle and meek;
But he swallowed his martyred friend's belief
As a Dutchman swallows a leek,
His name he withheld, for reasons good,
But we heard him quietly say,
"I've come from a distant State to weep—
I am from Cent., Pa."

VII.

And now that he's dead, and gone, poor soul,
Let's lay his faults aside;
And give him a quiet, dreamless sleep,
Since from having *no rest* he died.
He had his faults, like many a man,
Who better knows how to conceal,
When the women can look upon his grave
Their wounds will surely heal.

VIII.

And if the ladies who "work the key,"
Should increase in number and price;
But "little he'll reck if they'll let him sleep,"
And forget his one little vice,
They may "peel their oranges," "write their notes,"
And earn sufficient bread
To feed the post deluvian world
So they "leave him be"—I've said.

Cincinnati, O., May 1st, 1875.

Original Articles.

The Anglo-American Automatic Telegraph.

By GEORGE LITTLE.

General THOMAS T. ECKERT, in his recent report to the stockholders of the Atlantic and Pacific Telegraph Company, asserted that my "American Automatic System of Transmission is not less than five times greater over a single wire than the quadruplex," and "that the Automatic is capable of clear transmission at a high rate of speed, under conditions of the line and of the atmosphere so unfavorable that an ordinary Morse circuit can hardly be operated at all."

Such an unbiassed concession as the above, emanat-

ing as it does from so candid a gentleman as Mr. Eckert, has induced me to present to the readers of THE TELEGRAPHER a brief account of the state of the science of electro-chemical telegraphy during the years 1853-4, when Mr. Edward Orange Wildman Whitehouse invented a long line local circuit and a short line direct circuit *Chemical Mechanical Telegraph*. The operation of this apparatus at the transmitting station was effected by the use of *sixty-five keys, contact springs and commutators*, instead of perforated papers; bringing into action high potential currents developed by a magneto-electric machine, operated by means of the foot and treadle—a third constant and a fourth local current, together with the most erroneous, injudicious and impracticable problem of grounding—to draw the line itself to earth, at the transmitting end of the line momentarily, or by the intervention the transmitting short circuit of, so called, draw tubes of water; with metal decomposing points along the line. The fact of the water contact points becoming more or less self-insulated by the accumulation of a gaseous film developed by the action of the current seems to have been entirely overlooked.

Interposition of these short circuits was to be effected by means of a "mechanical commutator disc," or by a "local circuit magnet vibrator" in connection with the transmitter, the magnet coil itself not being at any time in the short, or "draw circuit" to earth.

The receiving or recording apparatus was impelled by necessarily slow acting worm and pinion gearing, in connection with troublesome polarized relays and electro-magnetic circuits for long lines; which left the same subject to all the difficulties attendant upon the Morse system. Whilst for short line currents the "whole force of the received constant current circuit" was carried direct into and through the chemically prepared paper, the direct current itself being intended to be interrupted by high potential currents generated by magneto-electric apparatus—to the use of which the same fatal objection applies, which was shown by its employment in connection with the first Atlantic cable, the cover of which it assisted to destroy.

Mr. Whitehouse designed a long series of mechanical transmitting commutators, operated by the foot and both hands, with the addition of several hundred of short local interrupters, in a somewhat similar manner to that of the House Company cylinder or drum, being in fact a complicated substitute for the non-effective "assembling rods" invented by Alexander Bain in 1846, and lately reintroduced by another party.

The prepared receiving paper was carried, necessarily very slowly, over a wetted metal drum, the lower end of which was kept revolving in a trough of water. From one to six lines were intended to be used with this system, but there appears to be no record of its ever having been practically worked on even a short line.

Passaic City, N. J., May 10, 1875.

Jimmy S—; A Reminiscence.

By O. H. KAY.

IN the entire list of my telegraphic acquaintances there were none with more clearly defined conscientious scruples respecting matters of right and wrong than my bosom friend, Jimmy S—; none nobler, purer or more faultless; none more generous, none with a warmer sympathetic nature, none to whom I would sooner go for hope, encouragement, or a pipe of tobacco. Neither rigidly orthodox, nor yet heterodox, with nothing of formal primness about his manner, his was a pliable, easy and graceful nature that befitted every occasion, and was in appropriate keeping with every circumstance. He neither breakfasted, dined or supped with regard for any precision as to the hour, the quantity of time or food consumed, or the exact articles of diet. He slept when he felt that he required sleep, and awoke according to the requirements of the chambermaid. He walked or rode whenever he had the time and the inclination, or the spare ducats. His most prominent and peculiar feature was his desire always to see appreciated and properly accredited every good, virtuous and meritorious thing. If an article had merit he was loud in his appreciation of it. If a friend had virtues he spoke of them. If one's manner was uniformly urbane and disposition kind, he would compliment it if ever occasion offered. On the wire nothing ever gave him so much happiness as to say, "your writing is excellent," or "you take well." He would wear a smile of sweet contentment and joy which was beautiful to see the remainder of the day on these occasions.

But Jimmy was unacquainted with sophistry. He had not learned the wiles and wicked ways of a cunning and crafty world, and thus he was made the victim of a cruel and heartless joke, which it is the object of this to record.

Jimmy boarded with the rest of the boys, at the American. The American was not a comfortable or homelike hotel, but was much after the order of hotels. We were all quartered in the upper story, and had

things pretty much to ourselves up there. Our chambermaid was kept exclusively to do the work on that floor, and they were changed quite frequently. Among them a "beautiful stranger" made her advent, and quite excited the admiration of the boys, for she was, indeed, of better appearance than all the previous ones, and none of us had ever seen her before. In fact, none of us ever saw any of the chambermaids on that floor until they were regularly installed and instituted chambermaids. There was an order of discipline at that house governing the domestics that was never disregarded. There was a graduated line of promotion down which each descended in regular order until, unfit for service, they were cast out. I say this line of promotion was *descended*, for a subject started at the top floor, where we were, dropped with the whole household of servants one story when there was a vacancy created in the kitchen by dropping out the cook, dropped still another flight of stairs with the next occasion, and thus continued to settle until the door of the dining room was reached, where she was made waiter, and flitted about among us the object of much observation and speculation. The speculations were always cast in regard to her hair. We speculated as to how it would hold out, and whether it was wiry and stubborn hair, or soft and easily managed. We speculated as to the kind of pomade she used, or suggested that she used none at all. We wondered what the flavor would be and in what essential respects it would differ from the present infliction. We closely scanned to discover how much of the genuine article there was, and how long it would probably last. We also wagered as to which would be her favorite dishes and which would be served the finest quality—in fact as to the general distribution of it.

She would remain with us during five or six changes, gradually working back towards the kitchen door, from which had emanated all the varieties of hair and hash (the latter term is used in a general way) that had ever been devoured by a hungry public within those walls, and finally disappear altogether. The fourth variety after she had left us we knew was hers. Whether it was good, bad or indifferent, we received it regularly, three times a day, hair the same peculiar texture, quality and flavor, until the last was exhausted, and we knew that she, bald like a jug, was sent forth to shift for herself, and we should know her no more forever.

The "beautiful stranger" was tidy in appearance, and kept the rooms so. She supplied the water, towels and soap with more regularity than her predecessors, and we wished she might only stay. But time was fleeting—we knew she would soon be gone, and we tried to appreciate her while she lasted. Jimmy was particularly gratified with her, and told us often how nicely everything was kept in his room, and how cheerful and pleasant it was. He always found his trunk on its bottom and in the same corner of the room he had left it. His shoes and hat box were never thrown under the bed close to the wall, backside; his toothbrush was never appropriated to any one else; his blacking had less of a consumptive and wasted appearance, he said, than it usually did—in short, everything seemed to go on like a charm.

Finally he could stand it no longer. He felt that she ought to know that she was appreciated, and, for one, he resolved that her merits should not go unrewarded; so he prepared a little speech in his mind, and determined that he would deliver it at the first opportunity. It offered before long for as he was one day occupying his room she passed his door and went to work in the one adjoining. Jumping up, he glanced hastily in the glass, adjusted his cravat and hitched at his collar, jerked his vest down in front, turned away, turned back and gave his hair a brush; was not satisfied with the result, and brushed vigorously at it a full minute, and, finally, with a lingering glance he strode out into the hall, and stepped modestly just inside the next door, where he beheld Jennie in the act of turning over a heavy straw mattress on the slat bedstead before her, and looking charmingly pretty with her sleeves rolled up to her elbows, and her cheeks flushed with a rosy tint that just became them. Now, of course, at the precise moment when he required them, the fellow's wits forsook him. So would any one's after so much elaboration. When I compliment any one I just slap them on the shoulder; or if it be a lady, pinch her cheek and say: "Now, do you know—" thus, and so, and I go on with my statement. Compliments ought to be delivered in this way. Otherwise, if one goes at it seriously and laboriously it is always embarrassing and irksome.

Jimmy hesitated a moment, and his cheeks tinted in sympathy with hers. He heaved and said:

"I—ah—good morning! I—ah—that is—I have wanted to say something to you for some time."

"Indeed?" and she smiled bewitchingly. Jimmy's color heightened a shade, and he wondered what she could see to be so particularly surprised at.

"Yes; I have felt that I ought to say something—just a word."

"I should be pleased to hear it," very interestedly.

"In the short two weeks that you have been here I—ah—have learned that—that when you go—ah—I shall—you will be—I shall miss you—very much—"

"Oh! I guess not. I suppose you tell all the chambermaids that, though."

"Indeed! I never—but you do not understand me. I never told any one that before. You are the first and only woman I ever could have told it to. You are my very ideal of a girl. You are just such as I have hoped and prayed, ever since I came to think about such things, might some day be found."

There was a confused and startled look, then a reddening of the tint, and an exclamation of surprise and astonishment.

"Why, goodness! What do you mean?"

This was not at all what Jimmy intended to have said. Dislocated fragments of his intended speech had rushed through his brain an instant before, but they had all deserted him when the critical moment came to put them in shape and deliver them. The original was nothing like as serious as this, and it was to have been spoken much more mildly, and with a great deal more suavely and gracefully carelessness.

"I mean as I say. I would not speak to you in figures. I would not flatter you, nor would I deceive you. You are indeed a jewel—a treasure of your kind—a very gem of great and exceeding rarity."

"Indeed, sir, you are trifling. Let me implore you to deal less extravagantly with your expressions, and apply them where time, place and circumstances will better warrant them. You either trifle or else you are laboring under some strange mistake."

The oozing moisture of Jimmy's face became starting beads, which darted down his cheek, and dripped from his nose, and trickled down his neck. He seemed about to commit a fearful thing. He did not want to talk in *this* manner, but his language seemed to take shape without his being able to control it. He felt desperate, but in his desperation, instead of submitting to her that all was a joke he persisted in declaring that he never was more serious in his life. Now, like an instantaneous flash, a sudden inspiration seemed to dawn upon Jennie, and at once she guessed that she had been mistaken as to the seriousness of the business, and in some unaccountable way formed a pretty correct idea of what had been intended; but the spirit of mischief was too greatly imbued within her to let a good thing pass, so, in a pretty, drooping way, she urged him not to act too rashly, and said she was sure he had made a mistake. With remarkable pertinacity he obstinately refused to admit any mistake on his part. He said that when she first came to the house she had produced an impression upon him, which had grown more favorable every day. For the last week he had felt that he must seek her out, as he had now, and tell her all—that he wished she might always arrange his pillow, and make his room cheerful and his heart glad. At this she gave an affecting little scream, and fluttered over in blissful helplessness against him, threw her arms about his neck and stammered:

"Oh, my darling, my own, my darling Jimmy. It is too good. Indeed, it is a dream; and yet it is real—yes, it is true. No, darling, I cannot refuse you. I will be your own little wife to—"

"Thunder and fiddlesticks! Who said anything about darling or wife?" And Jimmy, now frantic, disengaged himself in a not very gentle manner, and rushed from the house.

The interview was as brief as I have recorded it. It required but a few moments to work a fearful mischief. Jimmy was certain that he had committed a terribly serious blunder, that might result in untold misery and anguish to one soul, and so it did—to his. The girl, though, it is said, fairly screamed with laughter, until she brought the servants up stairs from all points of the house; and that is the way the story got out. Jimmy found a private boarding house that afternoon, and shortly after left town. I have never seen him since, though I learn that a year or two after he found another that could smooth his pillow to his eminent satisfaction, and to her he contracted the job for "always."

Protection Against Lightning.

M. NOUËL, a French scientist, has recently devised an original plan for protecting buildings from lightning.

The idea is not to prevent a bolt from striking a house, but to direct its current so that it shall harmlessly reach the ground. Usually the highest point, say the chimney of a house, attracts the fluid. Thence it makes its way from one metallic projection or surface to another, until it attains the spout, when it follows the stream of water to the ground. As water is an excellent conductor of electricity, M. Nouël suggests that the chimneys of city houses be provided with an iron ear, or even with funnels, which shall be united with the spout by plates of zinc. Thus the lightning, first striking the chimney, will leap along the track laid down for it, and enter the ground without deflection from its course and causing damage to the house or its inmates.

New Telegraph Projects.—Unreliability of Oregon Winter Weather.—A Telegraph Superintendent's Experience.

ALBANY, OREGON, April 10.

TO THE EDITOR OF THE TELEGRAPHER.

I EXPECT that it has often occurred to your mind, as it does to mine at this moment, that in the way of telegraphic news from Oregon, it's either a feast or a famine; but that's the way it is, and however much I may feel like improving this, I can do nothing but give you the items as they occur from time to time.

Oregon is sort of stirred up at this time over proposed new telegraphic enterprises; and the one that looks the most feasible to my mind is the construction of a line, to be controlled in the interests of the A. & P. Co., from Winnemucca, Nevada, to Portland, Oregon, via Montana, Idaho and Washington Territories.

The A. & P. Co. now have a line from Winnemucca to Silver City, Idaho. From Silver City to Walla-Walla, W. T., there is a gap of 150 miles. From the latter place to Portland, the Oregon Steam Navigation Co. operate a first class telegraph line; and it's now proposed to fill up this gap between Walla-Walla and Silver City, thus giving us communication with California and the East by an "opposition" to the W. U. Co., who have heretofore and now hold an absolute monopoly of all the telegraph business to and from Oregon. Mr. Platt Burr, Superintendent of this line from Winnemucca to Silver City, has just paid this part of the country a visit, for the purpose of seeing what could be done in aid of this project; and I understand that a contract has been arranged, if sufficient aid can be obtained up the Columbia, to put the line across the gap referred to above.

That this line would be a paying investment there seems to be no doubt, and that shortly after it goes into operation *The Daily Bulletin*, of Portland, which is now debarred from receiving press dispatches, would be a steady patron of the new line. We sincerely hope that this season may (and we think it will) see this line in successful operation, for it will be a great benefit to that part of the country through which it will run, and also give the "boys" some new chances for "sits."

Since this "Winnemucca line" has been talked of the W. U. Co., according to the *Oregonian*, which claims to have seen a letter from Col. James Gamble to that effect, propose building a line alongside this other wire from *Winnemucca to Portland*. Most of the persons immediately concerned consider this a terrific game of "bluff," as this would have paid as much, if not more, years ago, when Oregon controlled the Idaho and Montana trade. Nothing was said about it then, and I am of opinion that there will only be one line built, at least for some years yet.

Work on the Canadian Pacific Railway is reported to commence on the 15th of this month. This is the Vancouver Island Division. The Telegraph Expedition will number about 300 men, and wages for linemen, etc., will probably not exceed \$45 per month, as there are a great number of idle men on Puget Sound that can be obtained. This line will be in the domain of and controlled by "Johnny Bull;" but we suppose enough men can be employed who are not particular whether they work for the "bloody Britishers," so long as they get good solid "British gold" therefor.

Work on the Coos Bay Telegraph Line, from Roseburg, Oregon, has not been commenced yet. I learned some time since that a party of California capitalists were ready to put this project through, provided satisfactory arrangements with the W. U. Co., regarding tariff rates from Roseburg to San Francisco, could be made. Nothing being said for some months leads us to suppose this arrangement was not perfected. This is also a line that would eventually be a paying investment.

Our winter has been a great deal more severe than usual, but the different lines have "kept up" remarkably well. At no time, with the exception of a few hours, has communication with California been interrupted. Crosses are about our only trouble, and the way we "hustle 'em out" is a caution. Oregon winter weather is one of the things decidedly uncertain and unreliable, as is shown by the experience of Superintendent Faling. Having by too close attention to duty in the management of his lines in the past year or two worked himself into a rather precarious condition of health, he concluded to take a vacation, and lay off for a few weeks. Our chief operator was accordingly ordered to Portland to look after the telegraphic interests during the Superintendent's absence.

After Mr. Faling got well enough to travel he started like a good Oregonian, taking his umbrella under his

arm, and water proof clothing along, it being reasonable to anticipate extra moisture at the season of the year. Taking this case for Roseburg, a change in the weather suggested forcibly the reflection that *furs* would be in better keeping than umbrellas and water-proofs. Upon his return to Portland the weather turning out pleasant he thought to take a trip up the Willamette by steamer; he accordingly took passage, this time determined to enjoy himself and have a good time. No sooner, however, had he got fairly on his way, when the heavens opened and the rain descended in regular Webfoot style.

By the time the party reached Albany the general opinion was that they "had enough!" and to add to the pleasures of the situation on landing at the wharf, no carriages were to be had. They therefore were obliged to undertake to find the depot amid the most terrific rain storm ever known, and by the time they arrived at the station, it could make no difference to them how hard it might rain, for they couldn't be any wetter. The party boarded the train in a most desolate and uncomfortable condition, and Mr. Faling thinks he has had enough of winter pleasuring and recreation in this climate, and will postpone further experience in that line till the weather shall become more settled and reliable. When again he takes a vacation it is to be hoped that he may have a more pleasant time than on this trip. However, the cold and the wet were not damaging, except to his clothes and temper, and he is again attending to his duties, feeling very much improved, notwithstanding his uncomfortable experience. WEBFOOT.

The Female Operator Question.—"Nihil Nameless" Annihilated.—Profanity of Managers, etc.

"And still they gazed, and still the wonder grew,
That one small head could carry all he knew."

Goldsmith.

TO THE EDITOR OF THE TELEGRAPHER.

HAD I the "gift of gab" which has reached such a wonderful stage of development in "Nihil Nameless," and a little of his conceit, I might indulge in a few rhetorical gymnastics, introducing the "Reverberating Thunders," the "Lurid Lightnings," etc., until Milton, nay Homer himself, should "pale his ineffectual fires" and shine but as penny dips 'i' the sun. But unfortunately I am but a plain, practical sort of a man, with no particular mania for airing the results of my researches among the "Latin phrases" in the dictionary, nor for poetical quotations, unless they are more *appropos* than those "Nihil" gives us. I feel flattered by his tribute to my earnestness on the subject in dispute.

It is comforting to know that the time when the class to which he belongs could block the wheels of progress has long since gone by; and when the heads of such conservatives as "Nihil" show themselves, they are quickly belabored by literary cudgels until they are withdrawn into the obscurity from which they emerged. There are some however, whose mental faculties are so obtuse that they cannot realize that in their opposition to the overwhelming odds of justice, public sentiment and established usage, they are but imitating the example of Mrs. Partington, and making themselves very ridiculous. Let me say to "Nihil," that what he is pleased to call a "powerful and prolonged mental effort," was not intended as an argument, but merely as a pleasant satire upon his assertion, that the occupation of Telegraphing is derogatory to the purity and delicacy of women. Any woman who walks alone on the streets of our large cities in the evening runs a far greater risk of insult than would a female operator in a county village in a year.

A lady remarked to me, after reading "Nihil's" communication, that it was noticeable that those men who are so extremely solicitous for the purity of women, were usually men who had good reason to be so, knowing that if the rest of mankind were like themselves their own sisters would not be safe from contamination. "Nihil" must not, however, understand this remark as quoted with any personal application, I merely give it as the opinion of a lady on the subject.

"Nihil" indulges in italics and exclamation points, with an appeal to the "shade of Murray," the point of which I am at a loss to understand, unless it is that he thinks he has discovered a grammatical error in the expression, "contribute little if anything to the cost of her maintenance." It such is the case, I hope he will procure a dictionary at once and guard himself from such an exposure of his ignorance in future. This suggestion is inspired by a feeling of benevolence for a rising young man.

Again, "Nihil" exhibits his *pouchar* for italics over my classification of agriculture as one of the coarser trades, and again I am puzzled as to the real depth of his mental faculties. He exhibits alarming symptoms of *hiatus maxime defendendus*. (If he wishes to know the meaning of that phrase, he can find it where I did—in the back part of a dictionary among the "Latin phrases.") However, lest the reader should suppose he made a point on me there, I beg to assure him that Worcester defines the word *trade*

"occupation or employment." Now, if agriculture isn't an occupation or employment I should be pleased to have "Nihil" inform me what it is.

"Nihil" gave me the impression that his pedigree could be traced directly back to that small but select company of distinguished exiles who arrived in the Mayflower. Therefore, I spoke of my ancestors in that connection, but only to prove that my comments were not inspired by the hostile feelings which some people of different descent entertain toward the Puritan. I shouldn't otherwise have alluded to any one's ancestors. I have noticed that people who are the most blatant in boasting of their Puritan descent can seldom trace their origin farther back than their great grandfather, and couldn't for the life of them ascertain whether he was English, Irish, French or Spanish. However, as "Nihil" is sensitive on the subject I will allow that he can trace his family back to the Mayflower, and as I can't go back so far by 150 years, I'll take a back seat.

But the most amusing of all "Nihil's" effusions is his last, in which occurs that brilliant preroration in which he quotes Phillips' speech on Bonaparte, and makes him characterize that matchless warrior as a woman! I suppose that any possible doubts on that point were effectually disposed of by the events which followed his marriage to Marie Louise.

I cannot find in his last communication any attempt at a refutation of the arguments I did advance, namely, that there is nothing in the occupation of telegraphing incompatible with the highest degree of refinement and culture in either sex, and that ladies have just as good a right to earn a livelihood in our calling as in any other; therefore I must believe that "Nihil" finds them unanswerable. I cannot see why the "accident of sex" should deprive women of any of the rights enjoyed by men, if they choose to avail themselves of them; and I believe that only the fact that the great majority of American women do not, as yet, desire those rights, has prevented the other sex from granting them.

In reply to "Occasional." I have to say that I see no material difference between my condensed quotation of his paragraph about Rule 34 and the original. Surely no gentleman would fear any offence from the profanity, &c., of any woman in the profession. It must be conceded that such an offence would come, if at all, from the males, whom, by custom, we call "gentlemen," whether their character entitles them to the appellation or not. This being granted, as well as the fact that such language in the presence of a lady would be an insult, and it necessarily follows that my condensation of "Occasional's" paragraph did not misrepresent its meaning. If he is willing to stand by that paragraph I must repeat that such a construction of that rule is far from complimentary to the male portion of the fraternity; for though we have some tough characters in our ranks, I must admit, yet I do not believe there is an operator in America who would be guilty of an offence of the kind in an office where ladies were employed side by side with gentlemen, and if there should be a man contemptible enough to offend in that way, I believe he would be summarily thrown out of the window by the gentlemen present without the aid, and perhaps in violation, of the book of rules.

In regard to the "manager" question, I can only plead ignorance. I never had the misfortune to work under a manager of the character described by "Occasional." With one exception, my superior officers have been gentlemen in every sense of the word. The exception it would be idle to mention, as time has long since dissipated all unpleasant memories connected with that period.

I do not profess any greater desire for the elevation of the craft than, I hope, is entertained by "Occasional," and hundreds of others. It would ill become me to take up the cause of the ill treated in a district which has such an able and vigilant champion of the rights of operators as "Occasional." I am not spoiling for a fight of any kind, but I will assure him of this, that if such a case as those to which he refers ever occurs within my personal observation and knowledge, I shall not hesitate to give the facts and names the publicity they deserve. My reply to his former letter was based on the assumption that he was one of those chronic grumblers who seize upon every incident, real or imaginary, which can be used as a peg on which to hang morbid complaints and insinuations in regard to the treatment of operators. I am convinced that this impression was erroneous, and hope he will pardon any injustice I may have done him.

Can you inform me, Mr. Editor, where I can find an account of the incident mentioned in the last *Journal of the Telegraph* of a dying man in a western city, &c.? The similar incident I gave you, occurred precisely as related, and can be vouched for by three persons who were present. If the incident mentioned in the *Journal* is true, it would afford further proof of the desirability of a knowledge of "Morse" by persons who may think some of "shuffling off this mortal coil" shortly. Think what a hit Dumas might have made in his "Count of Monte Cristo" if he had made the apoplectic old M.

Nortier communicate with his granddaughter by Morse signals instead of by winking his eyes!

By the way, what does "Con Spirito" think now of the quadruplex? contrary to his predictions, and learned demonstration of its absolute mechanical impossibility—the "quad" has been improved, and is now worked day and night with perfectly satisfactory results. Both the printing instruments also will soon be worked on one wire by a "quad."

JOHN STERLING.

Origin of the Underground Telegraph Bill.—Successful Working of the Quadruplex.—Telegraphic Extensions, &c.—The New A. & P. Office.—Personals.

ALBANY, May 11th.

TO THE EDITOR OF THE TELEGRAPHER.

QUITE a lively breeze was raised in the Assembly last week by the charges published in the *New York Tribune* against the members of the Assembly Committee on Cities. The *Tribune*, in a short, but bitterly sarcastic article, insinuated that money had been used to prevent the passage of the Underground Telegraph Bill. This at once created the storm which, it is said, that paper was glad to quiet by offering an ample apology to Mr. Hess, who is a member of that Committee, and who had already dug up the tomahawk, and was on the warpath when the apology was received. It is expected that the other members of the committee will insist upon a similar vindication. It is pretty generally understood up here that this bill is a joint outgrowth of the *Tribune's* grievance—that big telegraph pole in front of their building—and Mr. Jay Gould's desire to rake in another pile of filthy lucre. Should this bill pass, Western Union stock would inevitably suffer a heavy fall, and this opportunity would not be overlooked by so sharp a financier as the above named gentleman. However, speculations as to what might have been are without weight now, as the bill is undoubtedly killed as effectually as was the similar attempt to influence W. U. stock which was made in Congress last Spring. The *Albany Express*, in publishing the letter from Vice-President Cornell to the *Tribune*, denying the charges made against the committee, heads the item "Underground Typography." Some one suggests that the editor of the *Express* was thinking of the printing telegraphs when he wrote the above caption.

Mr. S. C. Rice, Assistant Chief Operator of the Albany office, was recently made the recipient of a handsome and valuable present, in the shape of a diagram book containing twenty sketches and diagrams, from the simple office connections of a terminal station to the complicated arrangement known as the quadruplex. It contains eight styles of repeaters, differential and bridge duplexes, duplex repeater, duplex arranged to change to two sets of single instruments, and a number of other ingenious and useful devices. Among the miscellaneous sketches is a view of the cable station at Duxbury, Mass. The diagrams are in colors, and very artistically drawn. The work was executed and presented by Mr. Chas. H. Davis, of Worcester, Mass., formerly an operator in this office, and is finished up in a manner highly creditable to "Da." The New York and Albany quadruplex circuit is now conceded to be one of the best of its kind connected with New York. The fact that it has been worked nearly a week, during the unsettled spring weather, without any change in "balance," disposes of the argument which has been put forward against it, viz., that great delay is caused by the necessity for frequent "balancing." It now works four sides as clearly and steadily as a duplex. It is said that the new double coil, short core relay recently introduced by Mr. Gerritt Smith, will remove the last "bug," and render the system much more effectual than ever before. We have always coincided with the editor of THE TELEGRAPHER in his oft expressed conviction that genuine improvements would eventually be recognized and appreciated as such; but our ideas as to the genuineness of certain so called improvements has differed somewhat from those which he evidently entertains.

The work of extension and improvement of lines is going on quite actively in this section at present. The different companies seem to appreciate the necessity for greater facilities, and are actively at work preparing to meet the wants of the business public. Last fall the Delaware and Hudson Canal Co. erected a line from Whitehall to Port Henry, a distance of fifty miles, along the line of the new New York and Montreal Railroad; they are now constructing a line of ninety miles from Albany to Rutland, Vt., for their own exclusive use. Poles are now being strung along the line of railroad for the same.

The work of reinsulating the Hudson River lines of the W. U. has been completed, and the wires are now in prime condition. The rebuilding of the Harlem wires of the same company is to begin as soon as possible, and when completed will give them fourteen first class wires between New York and Albany.

Extensive preparations are in progress to meet the requirements of the Saratoga business during the coming season, which opens in a few weeks. The main office is to be materially enlarged and thoroughly equipped with the best appliances for doing its immense business in the best and quickest manner possible. Among the improvements will be a quadruplex for the N. Y. circuit, and a duplex for the Albany wire.

A line is to be immediately constructed to Moon's, on Lake Saratoga, taking in the grounds of the Saratoga Racing Association. We suppose the A. and P. folks will trot out their automatic to enable them to compete any way successfully with the W. U. By the way, there's John Morrissey, who is universally conceded to be a first class "puncher," perhaps he might be engaged, in case of emergency, to help clear up business.

Work on the fire alarm extension in this city is progressing with all possible despatch, and it is expected it will be fully completed by the first day of June.

During their recent visit to this city the Papal Envoys inspected this branch of our fire department.

The work of repairing the Museum building (perhaps you have heard us mention the building before) is going forward rapidly; the floor timbers for the French roof have been placed in position, and there seems to be a prospect of our being able to occupy it sooner than was at first expected. We are informed that the upper stories and the ground floors are to be put ahead as fast as possible, while the rest will be finished more leisurely. The operating room is to be in the French roof, the battery room on the floor below, the delivery department probably in the second story, and the receiving room on the ground floor, as before.

The A. and P. Telegraph Co. moved into their new office, No. 444 Broadway, two doors above State street on Sunday last. The outward appearance of the office is very much disfigured by an unsightly wooden beam placed over the door and windows; upon it are perched a row of glass insulators, from which the wires are led into the office. We understand that it was the original intention to use hard rubber hook insulators for this purpose, but orders to the contrary were received from President Eckert, and glass was accordingly substituted. The interior of the office is arranged very neatly and conveniently, and seems to have been fitted up with especial reference to the prompt transaction of business. The location is second only to that of the museum corner, and it is probable that a material increase in business will be experienced by reason of the change.

Mr. William B. Derby, late receiver and cashier for the A. and P., has accepted the position of head book-keeper for the W. U., made vacant by the transfer of Mr. W. A. Austin to the operating department.

Mr. F. S. Smith has been appointed to a position in Saratoga main office for the coming season.

An office will be opened in a few days in the lumber district, located in the Dock Master's office, and will be in charge of Mr. John Brayton, a graduate of A. office, lately employed as manager and operator at Coxsackie, N. Y. His successor at "Ck." is not yet known.

Mr. Eugene A. Gay, formerly an operator in this office, but more recently in charge of the A. and P. office in the Delevan House, has been confined to his room for several weeks. A cataract had formed over one of his eyes, which it was found necessary to remove by a surgical operation. The operation was, it is hoped, successfully performed, and Mr. G. is expected to be able to be out in a few weeks.

Mr. C. E. Lincoln, of Providence, R. I., is "subbing" for him. DOUBLE SIX.

Where Gutta Percha Comes From.

DURING the year ended June 30, 1874, there was imported into the United States, free of duty, 14,191,320 pounds crude India rubber and gutta percha, valued at \$6,196,729, as follows:

From Brazil.....	6,880,185 lbs.
“ Central American States.....	166,672 “
“ France.....	30,722 “
“ England.....	930,097 “
“ Quebec, Ontario, etc.....	1,726 “
“ British West Indies & Honduras..	367,693 “
“ British East Indies.....	925,728 “
“ British Possessions in Africa.....	11,512 “
“ Other British Possessions.....	88,233 “
“ Mexico.....	72,963 “
“ Dutch East Indies.....	37,958 “
“ United States of Colombia.....	4,526,848 “
“ Venezuela.....	4,846 “
“ Other countries.....	146,137 “

AN hypothesis is the explanation of effects by possible cause; a theory is the explanation of effects by real causes.—*Flourens*.

Telegraph Lines in Cities.

THE bill, introduced by Mr. DALY in the Lower House of the New York Legislature, to compel telegraph companies to put their wires under ground in cities of this State of more than 200,000 inhabitants, having been reported adversely by the Committee on Cities and Villages, to which it was referred, and tabled by a decisive vote, is disposed of for the present session. It was opposed mainly by the Western Union and Gold and Stock Telegraph Companies, other companies not having appeared in opposition to it.

The *New York Tribune* charged that corrupt means had been used to secure an adverse report from the committee. This was denied by Mr. A. B. CORNELL, the acting President of the Western Union Company (in the absence of Mr. ORTON), in a communication to the *Tribune*, and we are satisfied that the charge was without foundation.

We have not favored the bill, although not inimical to the object proposed to be accomplished. For this there were several reasons: First, because we believed that the time in which the change was required to be made was too short, and besides this, we think that before so radical a change is required careful experiments should be made to decide what the best mode of effecting it may be. It was urged, in opposition to the bill, that some of the instruments used, especially by the Gold and Stock Company, break and close the circuit so rapidly that the static charge which is experienced in working conductors insulated and submerged in the water or buried in the ground would materially interfere with, if not entirely prevent their use. Experience in working submarine and subterranean wires gives a reasonable coloring to this argument, and it was probably the most effective one, and had the most influence in securing an adverse report from the committee.

But, although the proposed action is postponed for the present year at least, telegraph managers must not flatter themselves that the danger is entirely passed. There is no doubt but that the effort to procure the passage of a law for this purpose will be renewed, probably in the next Legislature, and if nothing is done in the meantime to solve the questions connected with the subject, it is not impossible that a different result will be reached.

The enormous increase of telegraph poles and wires in the large cities necessarily and inevitably brings into prominence the desirability that some different system than that at present in vogue should be

adopted. It is evident that we cannot go on indefinitely increasing the number of such poles and wires without seriously interfering with the proper uses of our streets. The new uses to which telegraphy, in its various applications, is constantly being adapted, must necessitate the constant increase of the number of lines in the larger and more populous places. How these may be provided with the least inconvenience and infringement upon the ordinary use of the streets is a problem of a very serious character, to the solution of which telegraph managers should devote immediate, earnest, and intelligent consideration.

That some method *must* be devised which shall relieve the streets from the incumbrance we regard as indisputable. It will, then, be for the interest of telegraph companies and telegraph managers to take the necessary steps towards determining the most effective and economical method of doing it. It will not answer for them to ignore the subject, for unless they manifest a disposition to take hold of it, and show that they are honestly seeking to meet the public demand in this matter their interests will not receive consideration, and a pressure will be brought to bear upon the law makers which they will find it impossible to resist, and they will be compelled at last to conform to legal requirements which may prove unnecessarily expensive and damaging.

Undoubtedly, any change from the present system will be inconvenient and costly to the telegraph companies, but may be made much less so, if proper investigation and a disposition to gradually and intelligently remove existing difficulties show to the public that they are disposed to yield to the requirements of the people, and voluntarily relieve the streets from the incumbrances and obstructions arising from their use for telegraphic purposes.

We write this more in the interest of the telegraph companies themselves than in that of the public. The latter have the remedy in their own hands, and will, undoubtedly, eventually enforce it, though we are satisfied that there is no disposition, so far as the people themselves are concerned, to act in an unfriendly spirit towards the telegraphists. In the end the best interests of the telegraph will be served by the manifestation of a friendly and accommodating spirit in this matter.

The Direct United States Cable Company.

WE have received from the Chief Representative of the Company in this City a copy of the report and account of the Directors of the Direct United States Cable Company, submitted to the shareholders at the general meeting held at the City Terminus Hotel, Cannon street, London, March 31st, up to the close of the year 1874.

The Directors state that the shares are now fully paid up. The cable has been paid for, with the exception of £97,300, which will become due when it is laid, and has been in working order for thirty days. To meet this payment the Directors have in hand £126,858 0s. 10d.

The Directors state that the Canada Cables Act has passed through both Houses of the Dominion Parliament, and that the effect of this will be to throw open the shores of Newfoundland to the Company.

All arrangements for commencing work at the Company's several stations in London, Ireland, Nova Scotia and America have been completed, and a staff engaged, ready to begin at any moment.

The offices of the Company in this city are at No. 16 Broad street, where a full staff of employes are awaiting the completion of the cable, which is momentarily expected.

The Quadruplex Patents Controversy.

IN his brief in behalf of EDISON, in "the matter of the application of THOMAS A. EDISON for certain letters patent to issue to himself and GEORGE HARRINGTON," filed by General B. F. BUTLER, with the Secretary of the Interior, the counsel characterized THE TELE-

GRAPHER as "the newspaper organ of the Western Union Telegraph Company."

This will, no doubt, be news to the managers of that Company; as well as to ourselves and our readers. We suppose that Gen. BUTLER not being very well informed in regard to telegraphic matters, has confounded THE TELEGRAPHER with the *Journal of the Telegraph*, which latter, as is well known, is "the newspaper organ of the Western Union Telegraph Company."

We rather pride ourselves upon the fact that this paper is not the "organ" of any telegraph company, but in a position to deal fairly and disinterestedly with all telegraphic organizations, interests, and inventions.

The Automatic vs. the Morse.

WE have received from Mr. D. H. CRAIG a caustic reply to the article of JOHN STERLING on the Morse vs. the Automatic, printed in the last number of THE TELEGRAPHER, which is unavoidably crowded out of this week's issue, but will appear next week.

Our correspondents and contributors have taken up this discussion at such length as to preclude the necessity or space for editorial treatment of it at present. We have no doubt but that it will be quite as ably handled.

"Nihil's" Grave.

THE verses which we publish on our first page this week from the pen of ICHABOD CRANE, indicate that NIHIL NAMELESS has succumbed to the assaults which his ill judged communications on the subject of the propriety of females engaging in, and their adaptability to the business of telegraphy have brought upon him. Under the circumstances we may, perhaps, regard the communication of JOHN STERLING in the present number as another "nail in his coffin." Had not the communication been crowded out heretofore it might perhaps have appeared in time to aid in dispatching NIHIL. While we mourn the sad fate of our correspondent, we cannot but confess that it was not entirely undeserved. It was a rash act on his part at this late day to argue on his side of this question, the discussion of which has in years past occupied so much space in THE TELEGRAPHER, and which by the inexorable logic of events has been decided adversely to him.

The discussion now, as heretofore, has developed one fact, and that is that women telegraphers can *write* as well as telegraph, and that those who have the temerity to venture to attack them must be prepared for the consequences. We admire the ability, zeal and energy with which Jo. and her sisters have responded to NIHIL's literary attacks, and, now that he is no more, have no doubt but that they will, in a spirit of womanly forgiveness and pity, drop a tear upon his (metaphorical) grave. Henceforth we have no doubt but that they will be permitted to exercise their chosen calling without let or hindrance, and our columns will cease to be occupied with the fierce charges and repulses which have for some months past enlivened them. Cannot Jo. prepare a suitable and sympathetic obituary for her discomfited and fallen (literary) foe?

Orton's Patent Awt Clip, and Secure Message Hook.

THESE useful articles, which are advertised in this number of THE TELEGRAPHER by the Western Electric Manufacturing Company of Chicago, should be used in every telegraph office and by every operator. Large numbers of them have already been sold, and the small price at which they are offered place them within the reach of every one who may have occasion to use such articles.

Something New.

ATTENTION is called to the advertisement of Messrs. LENNART & DECKER, manufacturing electricians, of Cleveland, Ohio, under this caption, which will be found worthy of consideration.

We have received one of the pocket galvanometers

referred to, and shown in the cut, and it is a very neat little affair, and, we should judge, would be very useful to electricians, telegraph operators, etc., who have occasion to test the direction and force of electrical currents. It is substantially made, and we have no doubt will meet with a general demand.

Back Volumes of the Telegrapher Wanted.

A GENTLEMAN in Europe is desirous of obtaining a complete file of THE TELEGRAPHER of the first eight volumes, if they can be had at reasonable cost. Any person who may have these volumes, either bound or unbound, in good condition, and is willing to dispose of them, is requested to communicate with the publisher, stating particulars, price, etc.

Illness of President Eckert.

WE regret to learn that President T. T. ECKERT, of the Atlantic and Pacific Telegraph Company, has been quite ill for nearly two weeks past, from an attack of pneumonia. He is better now, however, although unable at this writing to leave his room, but it is expected that he will be able to attend to business again in a few days.

Personals.

MR. GEO. W. BAUSMAN has retired from the Western Union, Oil City, Pa., office for the purpose of visiting his home for a short vacation.

MR. SMITH, formerly of St. Petersburg, Pa., takes the position vacated by MR. BAUSMAN, in the Oil City, Pa., Western Union office.

MR. S. M. MCKEE, for some time past "press" operator at Parker, Pa., has been appointed manager of St. Petersburg, Pa., Western Union office. Mac is to be congratulated on his promotion.

MR. E. W. WELLER, book-keeper, Oil City, Pa. Western Union office, has obtained three months' leave of absence, for the purpose of visiting his friends in England. MR. HAMILTON will attend to the book-keeping department during MR. WELLER'S absence.

MR. D. K. BLANKNEY has been appointed manager of Houston, Texas, Western Union office, vice MR. GEO. E. NETHERLAND, who has accepted the position of chief operator of the Louisville Ky., office of the same company.

MR. CHAS. E. TODD, supt.'s chief clerk and train dispatcher of the St. L., K. C. and N. R. R. at Kansas City, Mo., has resigned, and accepted a position in the Western Union office in that city.

MR. ARTHUR H. ELLIOTT, of the Kansas City, Mo., Western Union office, has resigned, and returns East.

MR. ED. SCHERMERHORN is acting as line repairer for the Western Union Co. at Wallace, Kansas.

MR. W. M. SPINK has resigned his position with the Western Union Co. Kansas City, Mo., to accept a position on the reportorial staff of the *Globe*, at St. Louis, Mo.

MR. DAVID CAMPBELL has been transferred from the Jefferson, Texas, to the Marshall, Texas, Western Union office.

MR. JOHN L. CASSIDY, of St. Louis, Mo., Western Union office, who has been rusticated at Barry, Ill., has returned looking handsomer than ever.

MR. HENRY C. MAHONEY, of St. Louis, Mo., Western Union office, is visiting at Quincy, Ill.

MR. D. S. RYAN, of Galveston, Texas, has accepted a situation in the St. Louis, Mo., Western Union office.

MR. M. S. BACON has been transferred from the St. Louis to the Kansas City, Mo., Western Union office.

MR. ROBERT BROWN, the well known veteran telegraph constructor and contractor, has removed his office from No. 5 Dey street to No. 206 Broadway, New York, where he may be found in rooms 52 and 53.

The Telegraph.

By Cable.

THE REDUCTION OF TARIFF CABLE MESSAGES.

LONDON, May 6.—The reduction of fifty per cent. in the cable telegraph rates to North America, which was made on the first inst., has given the commercial community much satisfaction.

The Southern and Atlantic Telegraph Company.

A NEW line on the Brunswick and Macon Railroad, about twenty miles in length, has been connected with the Southern and Atlantic system, and new offices opened at Buffalo, No. 2, and Darien, Georgia. The business of this company is reported to have very largely increased during the last six weeks.

New and Superior Location of the Atlantic and Pacific Broad Street Office.

THE office of the Atlantic and Pacific Telegraph Company which has been so long located at No. 11 Broad street, in the basement, has been removed to No. 8 Broad street, nearly opposite. The new office is next door to the Stock Exchange, and is in every respect a vast improvement upon the old office. This is one of the most important offices of the company in this city, and could not be better situated for business purposes than it now is. The entrance is directly from the street, the office being located on the first floor, front, handsomely fitted up and well lighted. It is gratifying to notice this indication of business tact and energy on the part of the management of the Atlantic and Pacific Company, and equally gratifying to know that it is appreciated by the public, as is proved by a large increase of business already. The old office was underground, dark, dismal and unhealthy, while the new one is the reverse of this in every respect.

There are at present ten loops, putting this office in direct-connection with the principal telegraphic points, and additional loops are to be run shortly. It is understood, also, that this office is to be fitted up with a set of automatic telegraph apparatus to facilitate disposing of the increasing business. The following is the force at present employed:

Manager, Mr. Jeremiah Case; chief operator, Mr. C. E. Merritt; operators, Messrs. C. M. Fulton, E. D. Forbes and Miss Fanny M. Brown; book-keeper, Mr. C. E. Merritt.

Removal.

THE office of the Automatic Signal Telegraph Company has been removed from No. 42 Pine street to the new *Evening Post* building, on the corner of Broadway and Fulton streets, room 39. The flattering success which this company has met with is fully deserved. Its system of notifying the first commencement of fires in buildings has already prevented several conflagrations in this city, some of which would have otherwise proved very extensive and destructive.

New Loan for the Western Union Telegraph Company.

THE Western Union Telegraph Company offer for subscription through Morton, Bliss & Co., bankers, of this city, a loan of \$4,000,000 six per cent. gold bonds, interest payable semi-annually, and the principal in the year 1900. Subscriptions for these bonds will be received until Thursday, the 25th day of May, at noon. A minimum price of 97½ per cent. and accrued interest is reserved, below which no offers will be accepted. Subscriptions will become binding as soon as they reach \$2,000,000; if the subscriptions exceed \$4,000,000 the \$2,000,000 first subscribed will be allotted in full, and the balance *pro rata*.

The proceeds of this loan are to be used to redeem bonds of the company which mature Nov. 1, 1875, amounting to \$4,448,900, and will be included in any mortgage the company may make in the future, the amount of which shall in no event exceed \$6,000,000.

When the above bonds of Nov. 1 are redeemed, the only bonded debt of the company, besides the present issue, will be \$1,500,000 seven per cent. Gold Building Bonds, issued in 1872, and £206,000 Sterling Bonds, and the total interest on the company's debt, including this issue, will be \$405,000 gold, or with gold at 115 per cent. premium, \$465,750 currency; the net earnings of the company last year showing a margin over this amount of \$2,610,910, in excess of expenses and interest account.

The payment for the new bonds, when allotted, will be due June 1, and the Currency Bonds of the company, due Nov. 1 next, will be received at 100½ and interest, in payment for them.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended April 17, 1875, was 402,903, an increase on the corresponding week of last year of 32,038.

The Engineer-in-Chief of Hooper's Telegraph Works telegraphs on the 18th ult. from Santiago, "Cuba cable laid yesterday. Insulation superb. Commence discharging cable from the Hooper into the Great Northern to-morrow."

The dividend of the German Union Telegraph Company has been fixed at 27 marks, or £1 6s. 5d. per share for the past year.

The directors of the Hamburg-Heligoland Telegraph Company have declared a dividend for the year 1874 of 21 marks, being equal to 7 per cent. per annum.

The Eastern Telegraph Company gives the following as the average time in transit between London and India *via* Falmouth, of all outward messages to India, viz: During the week ended the 9th April, one hour nineteen minutes; week ended 16th April, one hour twenty-eight minutes.

Telegraphic and Electrical Brevities.

THE municipal authorities of Providence, R. I., are considering the economy and expediency of adopting an underground insulated system of lines for the police and fire alarm telegraph purposes of the city.

The Western Union Telegraph Co. are building a loop line from Cherryvale to Independence, Kansas, a distance of ten miles.

The Western Union Co. are repairing and rebuilding the Great Western Telegraph lines (leased by them) through Kansas, Missouri and Nebraska, thus enlarging the facilities of the company in the West.

A repeater has been put in at Nebraska City, Neb., thus giving Lincoln, Neb., a direct line to Omaha.

The Massachusetts Supreme Court has decided, in the case of John C. Gray against the Boston Gas Light Company, that the latter is liable for damage done by a telegraph line it had fastened to a chimney belonging to the plaintiff, without his permission.

West India and Panama Telegraph Company.

THE report states that the amount received during the half year ending the 31st of December last on revenue account was £16,263, and the expenses had been £13,337, leaving a balance of £2,926, which was carried to general reserve account. The traffic receipts during that period were larger than in any previous half year, and showed an increase of 45 per cent. over those of the corresponding period of last year. The company's cables had worked without intermission since the last report. An interruption to one of the connecting cables, between Havana and Key West, occurred on the 16th of September and continued until 1st December, 1874, thus stopping for eleven weeks all through telegraphic communication between the West India system and America and Europe. This had a serious effect on the receipts. The Cuba Company had decided to lay the cable from Cienfuegos to Santiago, thus duplicating its part of the system. The section of 140 miles from Santiago to Jamaica belonging to the West India and Panama Company was left unduplicated for the present. The Trinidad St. Croix-Ponce section of new cables was completed on the 25th March, thus duplicating an important part of the company's system. The St. Croix-St. Thomas cable had also been laid. The directors had purchased the steamship Investigator for £10,500. She would shortly proceed to her station and would take 100 miles of spare cable for repairing purposes. The company had acquired by the settlement of the suit the whole mileage covered by the India rubber Company's claim, including the Jamaica-Colon cable, without any further payment. Thus the former capital expenditure of £525,836 on account of the contract with that company now represented a much greater length of cable than heretofore. The balance sheet showed that the capital expenditure was £809,510.

Beefsteak Electricity.

THE six Christmas lectures for juvenile listeners at the Royal Institution were delivered by Dr. J. H. Gladstone, F. R. S. He chose for his subject "The Voltaic Battery." Most of the experiments and teachings were, of course, too elementary to interest the readers of these pages, but one of the experiments revealed a fact not generally known. He said that in daily life weak electrical currents are at work where their presence is often little suspected; for instance, supposing a person at dinner to have a silver fork in one hand and a finger upon the steel part of a knife held in the other, it follows that, when he plunges the knife and fork into a beefsteak, two dissimilar metals are thereby placed in a moist conducting substance, consequently a voltaic circuit is formed and an electric current flows through the body of the individual between the knife and fork. To prove that this was really the case, he connected a reflecting galvanometer with the knife and fork by means of wires; he then proceeded to cut a beefsteak, and the current thus generated deflected the needle of the galvanometer, so that the spot of light which it reflected was seen travelling along the screen by all the observers.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: May, WESTERN UNION, ATL. AND PAC., AMER. DIST., GOLD AND STOCK. Rows 6-12 showing stock prices.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each.

For the week ended March 30, 1875, and bearing that date.

161,561—ELECTRICAL RAILWAY SIGNALING APPARATUS.—Erdst W. Siemens and Carl L. Frischen, Berlin, Germany. Filed Aug. 1874.

1. The toothed semaphore arm or segment R1 R2, biased by a weight or spring to move either upward or downward, in combination with an anchor engaging with its teeth, and connected to the armature of an electro-magnet, which is rendered active by a number of successive and alternating electric currents, whereby the arm or segment, being moved tooth by tooth in obedience to its bias, is not materially affected in its position by accidental or defective currents, or by atmospheric electricity, substantially as herein described.

2. The combination of the said semaphore arm or segment R1 R2 with a knob or handle, T1 or T2, and its rod for moving a sliding weight C or C2, to give the bias to the arm or segment, and at the same time moving a commutating lever, L, to alter the electric circuits of the apparatus, substantially as herein described.

3. The combination, in one instrument or apparatus, of two sets of biased arms or segments, R1 R2, and their appropriate knobs or handles, T1 T2, with their rods and commutating levers L, with one magneto-inductor, b, and with line wires L1 L2, connecting them to distant instruments or apparatus of like kind, substantially in the manner and for the purposes herein set forth.

4. The combination of the biasing and commutating knobs or handles T1 or T2, and their rods with extended rods G, acting by means of spring pawls, on point rods or signal pulleys, and held down or released by detent levers L M, being engaged with or escaping the axes Z of the arms, substantially as herein described.

5. The combination, in one apparatus, of two or more sets of biased arms or segments, R, and their knobs, T, rods and commutators L, with extended rods G, acting in the manner above referred to, on two or more sets of point or signal motors, substantially in the manner and for the purposes herein set forth.

For the week ended April 6, 1875, and bearing that date.

161,721.—COMPOUND SWITCHES FOR FIRE ALARM TELEGRAPHS.—Samuel Weeks, New Orleans, La. Filed January 11, 1875.

A compound switch for fire-alarm telegraphs, for throwing by one movement a series of switches into circuit, composed of a series of upper switch fingers, establishing and breaking circuit of main alarm battery, and of a set of lower spring fingers for closing and opening the local batteries, in combination with an intermediate insulated crank shaft, with opposite non-conducting cam excursions, so arranged that a turn of the crank shaft causes simultaneously the contact of the upper fingers and the disconnecting of the lower, or the breaking of contact of the upper and the closing of the lower, substantially in the manner and for the purpose set forth.

161,739.—TRANSMITTERS AND RECEIVER FOR ELECTRIC TELEGRAPHS.—Alex. G. Bell, Salem, assignor to himself and Thos. Sanders, Haverhill, and G. G. Hubbard, Cambridge, Mass. Filed March 6, 1875.

Receiver set into vibration by isochronous pulsations transmitted from the sending end. The vibrating piece b takes against a lever, f, whose times of vibration are less than those of b; hence, during such vibration, its end j is kept depressed, changing the intermittent contacts of b and f into a continuous close of circuit.

1. In a system of telegraphy in which the receiver is put in vibration by electrical impulses sent along the line wire from the transmitting station, as described, the combination at the receiving end of a local circuit independent of a receiver and a vibratory circuit breaker in said local circuit, acted upon by said receiver to effect a permanent make or break, as the case may be, of the local circuit, which is continued so long as the receiver continues to vibrate, and ceases with the cessation of the receiver's vibration, substantially as herein set forth.

2. The combination, substantially as herein described, with the vibratory portion of a receiver, of a vibratory circuit breaking lever which will vibrate or oscillate at a slower rate than that at which the former moves when in vibration, as and for the purposes set forth.

3. The autograph telegraph comprising the combination of a series of transmitters and transmitting bristles or wires, a single main wire, receivers corresponding in number to the transmitters, tuned to a pitch to vibrate in unison with the succession of electric impulses transmitted from their respective transmitters, vibratory circuit breakers, one for each receiver, and a local circuit, electro-magnet and recording lever for each circuit breaker, the whole for operation substantially as shown and described.

For the week ended April 13, 1875, and bearing that date.

161,874.—MAGNETO-ELECTRIC MACHINES.—Moses G. Farmer, Salem, Mass. Filed June 21, 1873.

Cores of magnets of cast iron; initial magnetism therein induced by earth currents; by rotation of helical armature currents are produced therein, which are led around cast iron magnets, strengthening the magnetic field.

1. A dynamo-electric machine, constructed substantially as set forth, in which the electro-magnetic field is sustained solely by

the magnetism produced by currents which, circulating in it, are evolved from the armature which rotates in this field.

2. The combination of the non-magnetic plate F, provided with lugs H H', having bushings n n' thereon, the pivots P P', the armature O, the plates A A' the coils B B', and the cross piece D, substantially as and for the purpose set forth.

3. The combination of the cross piece D, having lugs or ears E E' attached thereto, the shaft I, wheel K, the pinion L, pivot P, armature O, and commutator R, substantially as set forth.

4. The arrangement of the coils B B', armature O, segments a a' of the commutator springs b b', screw cups W V, connecting wires c c' c'' d, and the external wire connecting the screw cups in one and the same electric circuit, substantially as set forth.

5. A dynamo-electric machine having the cores A A', and connecting cross piece D of the electro-magnet, and the armature O, constructed of cast iron, substantially as and for the purpose set forth.

162,057.—ELECTRIC ANNUNCIATORS.—Elisha Gray, Chicago, Ill. Filed September 24, 1874.

The spindles carrying the pointers have attached to them, on the inside of the case, irregularly shaped arms having two projections. In restoring the pointers to their normal position, one of these projections catches upon a hook-shaped arm extended from the armature, and the other serves to push the armature away from its pole, across the face of which it vibrates.

1. The armature D, provided with the hooked levers D', in combination with the tilting piece G, rigidly connected to the index, and constructed and arranged substantially as shown and described, to be struck by the restoring mechanism, to strike the said armature, and to be engaged by the said lever, as and for the purposes set forth.

2. The combination of the pivoted armature D, provided with the hooked lever D', the tilting piece G, rigidly attached to the spindle or sleeve of the index, and the sliding bar H, provided with the extensions h h', the piece G being constructed and arranged to be struck by the said extensions, to strike the said armature, and to be engaged by the said lever, all substantially as and for the purposes specified.

6,377.—LIGHTING GAS BY ELECTRICITY.—S. Gardiner, Jr., Washington, D. C. Patent No. 45,241, dated Nov. 29, 1864. Filed February 23, 1875.

For insulating the platinum coil and the conducting wires.

1. A tip of lava or other non-conducting material, in combination with an apparatus for lighting gas by electricity.

2. In apparatus for lighting gas by electricity a non-conducting pillar burner, whereby the conducting wires are isolated from the gas fixtures.

3. The combination, in the burner for lighting gas by electricity, of a non-conducting burner pillar, B, with a lava tip, F, substantially as and for the purpose set forth.

4. The combination, in apparatus for lighting gas by electricity, of the lava tip with the conducting wires c c and their supporting insulators c c, substantially as described.

5. The combination, in the burner for lighting gas by electricity, of a lava tip with a platinum coil and a metal pillar, substantially as and for the purpose herein set forth.

6. The combination, in a burner for lighting gas by electricity, of a non conducting pillar, B, with a lava tip, D, and an intervening metallic pillar or nipple, A, substantially as and for the purpose herein set forth.

Married.

PEPPER—ROSS.—At the Capital Hotel, Marshall, Texas, on the evening of April 29, 1875, Mr. CHAS. H. PEPPER, Sup't T. and P. S. R., to Miss LILLIE ROSS, of Marshall.

Born.

MCDONALD.—To the wife of Mr. J. W. MCDONALD, of the St. Louis, Mo., W. U. office, April 3rd, at 8 o'clock P. M., a daughter, 14 pounds. "Well done thou good and faithful servants."

ORTON'S PATENT SECURITY MESSAGE HOOK.

The damage resulting from the loss of a single message is frequently sufficient to equip a line many times with the hook.

Papers cannot be blown or carelessly crowded from it.

These hooks were first introduced by Geo. H. Bliss & Co. Thousands of them are in use in telegraph offices, banks and counting rooms.

Price, 30 cents each; or, \$3.00 per dozen. Liberal terms to the trade.

WESTERN ELECTRIC MANUFACT'G CO., 220 KINZIE STREET, Chicago, Ill.

WESTERN ELECTRIC MANUFACTURING CO. SOLE AGENTS

ORTON'S PATENT AWL CLIPS.

These Clips have been in practical use for three years, and are rapidly displacing all others. They are designed for holding messages, and every form of blanks.

For convenience, durability and economy they are unequalled.

WESTERN ELECTRIC MANUFACT'G CO., 220 KINZIE STREET, Chicago, Ill.

IMPORTANT TO INVENTORS.

Inventors of Electrical and Telegraphic arrangements are invited to communicate with the

ELECTRO-MAGNETIC MAN'G CO., 36 Broad Street, (P. O. Box 1,804), NEW YORK.

REMOVAL. GEO. H. BLISS & CO.

We respectfully announce our removal to 220 KINZIE STREET, CHICAGO, ILL. Having determined to transfer our interests to the Western Electric Manufacturing Company, we offer our entire stock of TELEGRAPH INSTRUMENTS, GOODS and MACHINERY for sale upon terms which cannot fail to prove desirable to purchasers. Until our stock is disposed of we shall continue in the trade, and solicit a continuance of the patronage which has been so liberally bestowed by our many friends heretofore.

GEO. H. BLISS, President.

220 KINZIE STREET, CHICAGO, ILL., April 12th, 1875.

ANNOUNCEMENT.

Western Electric Manufacturing Company.

GEO. H. BLISS having acquired an interest with this Company, has been appointed its General Agent.

His attention will be given to the sale of the Instruments and Goods of our manufacture and in which we deal.

In addition to our former line we have added the various specialties heretofore controlled by GEO. H. BLISS & CO.

With our ample facilities we hope to give to customers and the trade increased satisfaction in prices, quality and variety of our goods.

We invite correspondence and solicit patronage.

WESTERN ELECTRIC MANUFACTURING CO., 220 Kinzie street, CHICAGO, ILL.

BASTET'S NEW ELECTRICAL MOTOR AND BATTERY.

For Sewing Machines, Church and Parlor Organs, Small Printing Presses, Pumps, Lathes, Dentists' Instruments, or any Light Machinery.

My new ELECTRICAL BATTERY is the most powerful for quantity and durability manufactured, and does not crystallize the carbons. For Electroplating, Telegraphing, and for Motive Power, it cannot be surpassed.

Our No. 1 Engine, for Sewing Machines, with four cells of Battery, is furnished for \$40.

Other Motors at prices proportional to power required. BATTERY, No. 1 Cells \$5. No. 2 " " 10.

L. BASTET, 607 Broadway, New York.

SOMETHING NEW!

25 Pocket Galvanometers to be given away!!

To any Chief Operator who will favor us with his address, accompanied by the bona fide addresses in full of ten operators, with name of company, we will forward by mail, FREE OF CHARGE, a finely finished, nickel plated POCKET GALVANOMETER. Only one will be sent to the same office. Apply early, to secure an instrument. Time limited to one week from date of this publication.

Instruments will be sent two weeks from date of this publication.

LENNART & DECKER, Manufacturing Electricians, Cleveland, O.

THE KENOSHA INSULATOR CO.

**TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS**

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an **INDESTRUCTIBLE COATING**, highly repellant of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of **SIX YEARS'** actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its *insulating qualities* are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO.,

THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our **IMPROVED WIRE HOLDER**, arranged for a tie wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is **TESTED IN WATER** with a battery of 500 cells, and *not a single imperfect one is allowed to leave the factory.*

We are also prepared to furnish, at short notice,

CROSS-ARMS for any REQUIRED NUMBER OF WIRES,

prepared with our patent **INDESTRUCTIBLE INSULATING COATING**, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading Dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

L. G. TILLOTSON & CO.

General Eastern Agents.

GEORGE H. BLISS & CO.,
220 Kinzie Street, Chicago, Ill.

CINCINNATI, O.,

Elm St., cor. 5th.

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS—COMBINATION SETS; BOX and POCKET RELAYS.

PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, wire connections above the table.

REGISTERS, with SPRINGS or WEIGHT.

CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest ingenious; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.

BRACKETS, PINS and SPIKES, TELEGRAPH POLES,

LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANIFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOR and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that is returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,
No. 40 WEST EIGHTEENTH STREET,
or to
L. G. TILLOTSON & CO.,
8 Dey street, Sole Agents.

ELECTRIC BELLS.

We have on hand and will furnish all descriptions of

ELECTRIC BELLS,

either Table or Wall Bells or Gongs, at manufacturers' prices.

F. L. POPE, & CO.,

38 Vesey street.

Send for new illustrated circular and price list.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by MR. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

**20 PER CENT. REDUCTION IN THE
PRICE OF
TELEGRAPH INSTRUMENTS!**

SEE WHAT IT MEANS.

On First-class Morse Sets for Railway and Commercial Lines:

- No. 1 Relays, of standard size and resistance (120 to 150 ohms), on rosewood bases, fine finish, polished rubber covered coils, wound either with our patent glazed or with best silk covered pure copper wire, having soldered connections and firm nut fastenings throughout, and latest improved extension adjustments. Regular price, \$16, reduced to - \$12 50
- No. 1 Relay, same make throughout, but of higher resistance, 160 to 600 ohms. Price, \$18, reduced to - \$14 40
- No. 1 Relay, ditto, low resistance, 60 to 100 ohms. Price, \$15, reduced to - \$12 00
- No. 1 Sounders—"Railroad" or Bunnell's "New Giant" Sounders, with all the latest patented improvements in both. The best forms of Morse sounders ever invented. Beautifully finished. Mounted upon rosewood bases. Price, \$7 50, reduced to - \$6 00
- No. 1 Keys, Caton pattern, curved levers. Price, \$6 50 reduced to - \$5 20
- No. 2 Keys, W. U. pattern, curved or straight levers. Price, \$5 50, reduced to - \$4 40
- No. 1 Premium Register, \$45, reduced to - \$36 00
- " " Spring Register, \$47 50, reduced to - \$38 00
- " 2 Register. Price, \$38, reduced to - \$31 40

Box Relays, Combination Sets, Pocket Relays, Switches, Cut Outs, Lightning Arresters, etc., furnished at the same rate, viz., 20 PER CENT. REDUCTION from regular prices. See catalogue.

SINGLE SETS, OR PARTS OF SETS, WILL BE SENT BY EXPRESS AT THESE PRICES TO ANY PART OF THE U. S., ON RECEIPT OF MONEY ORDER OR DRAFT FOR THE AMOUNT OF THE BILL.

Superintendents and others about to purchase first class equipment for offices will readily see by a comparison with other price lists the advantages here offered to those who send their orders to us.

No. 2 SETS.

LEARNERS' APPARATUS, SHORT LINE INSTRUMENTS, Etc.

- No. 2 Relays, 150 to 175 ohms resistance. Price, \$15, reduced to - \$12 00
- No. 2. Relays, 50 to 100 ohms resistance. Price, \$11, reduced to - \$8 80
- Pony Relays, complete and pretty little instrument for short lines, city wires, etc., \$7 50, reduced to - \$6 00
- No. 2 Pony Sounders, \$6 50, reduced to - \$5 20
- No. 3 Pony Sounders, \$5 50, reduced to - \$4 40
- No. 1 Main Line Sounders for lines from 1 to 6 miles in length. Price, \$8, reduced to - \$6 40
- No. 2 Ditto, \$7, reduced to - \$5 60
- No. 3 Keys, curved levers, Caton style, same as No. 1, but smaller. Price, \$5, reduced to - \$4 00
- No. 4 Keys. Price, \$4, reduced to - \$3 20
- AMATEURS' KEY, \$3 50, REDUCED TO - \$2
- EXCELSIOR AMATEUR INSTRUMENTS, \$6 50, REDUCED TO - \$5 20
- BUNNELL'S CHAMPION LEARNERS' INSTRUMENTS, \$6 50, REDUCED TO - \$5 20

At the above figures all grades of Telegraph Instruments may be obtained from L. G. TILLOTSON & CO. for less money than will buy as good materials at any other manufactory in America.

Orders, correspondence and inquiries will receive prompt attention. Make your memoranda of amounts for what you want from the above price list, and enclose the sum to us by postal order or draft along with your order for goods.

Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAYS

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SULLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

VOL. XI. WHOLE No. 462.

A Soliloquy.

BY A FIFTY DOLLAR MAN.

Shakespeare—Revised by J. S.

To BE, or not to be an operator?
Whether 'tis nobler in a man to suffer
The slings and arrows of outrageous fortune,
Or to take arms against this sea of troubles,
And, by resigning, end them? Resign—swim out
No more; and by that "swim" to say we end
The heartaches and the thousand dismal doubts
That rack our brains; 'tis a consummation
Devoutly to be wished. Resign—Swim out;
Swim out! Perchance to beg; aye there's the rub—
For by resigning beggary may come!
So ere we shuffle off this uly toil
We must e'en pause. There's the five years
That we have s'ent in learning this profession—
Five years lost from the heyday of our youth;
Those years devoted to another trade
Had made us independent of the grasp
Of those two corporations which divide
Telegraphy between them. We need not then
Have borne without redress the slights and spurs
That patient merit of the unworthy takes;
The false economy of great corporations
Which clouds the prospects of ambitious "plugs"
By cutting off promotion! Who would be ar
To toil and toil, with prospects such as ours,
But for the knowledge that, as 'twas his choice,
He must with patience bear the ills he suffers
Not fly to those unknown which may be worse?
He who resigns begins the world anew;
Unlearn what took him weary years to learn;
Throws all those years away! Necessity
Does thus make cowards of us all.
And thus the native hue of resolution
Is sicklied o'er with the pale cast of thought,
And enterprises of great pitch and moment
With this regard, their currents turn awry
And lose the name of action.

Electric Telegraphy in Australia.

A VERY interesting lecture or *conversazione* was given last evening in the Athenaeum Hall by the members of the Victorian Electrical Society. There was a very large attendance, and the chair was occupied by Mr. Turner, Deputy Postmaster-General, who made a few introductory remarks. The society had provided plenty of instruments for experiments, and to Mr. Daniels was entrusted the task of explaining the whole of the proceedings, which he did in a very lucid manner. During the evening the systems of Morse and Wheatstone were fully explained, and in order to elucidate the manner in which telegraphic messages were transmitted from one station to another, a station was arranged on the platform and another in the gallery, with an intermediate station halfway down the hall. At the former, Messrs. M'Gauran and Smibert officiated; in the gallery, Messrs. Clay and Jenvey were stationed; while Mr. Cumming was the operator at the intermediate station. The first part of the evening's entertainment was devoted to the explanation, in as simple a manner as possible, of the various systems of working the electric telegraph; and this was very lucidly done by Mr. Daniels, as was also the system of the construction of the circuit, so that the messages might be transmitted on the various lines. He explained that under the present system it was a matter of impossibility to send a message from both ends of the line at the same time, and when two messages crossed on the way it became necessary for the operators to break the circuit and allow one message to pass along the line before the other message was transmitted. The rate of speed attainable in sending messages by the Morse system was about the same as that attainable by a fast writer; but he thought there were not many writers with the pen who could keep up with some of the more expert operators. Twenty-five words per minute was the presumed competent operator's limit; but as much beyond that as he could do was his ambition, and as much as eighty words per minute, under certain conditions, had been attained. At the last Melbourne Cup meeting one operator sent two hundred and twenty messages in two hours—a feat only surpassed by the skill of the operator who received them. This part of the proceedings was illustrated by the transmission and reception of messages from different parts of the hall. Mr. Daniels then proceeded to give a scientific explanation of the system of duplex telegraphy, or the sending of two messages in

opposite directions at the same time by the same wire. He stated that the system was not at all new, as it was discovered in 1853, but had not hitherto come into general operation. After making the explanation, Mr. Daniels had to admit that the explanation was difficult to understand without fully understanding the full working of the whole of the telegraph system. That the duplex system could be successfully worked was shown by the fact that several messages were sent from the platform and the gallery, and *vice versa*. The messages crossed one another most successfully, and were received simultaneously at each end of the hall. One of the questions asked, was whether messages could be transmitted without any wire, and Mr. Daniel answered this in the affirmative by stating that it could be done in short distances, and by means of a new American invention called a "snapper sounder," which can be carried in the waistcoat pocket, transmitted a message from the platform to the gallery. The remainder of the entertainment consisted of a number of interesting experiments with the electrical machine, including the explosion of torpedoes by electricity, all of which were attentively watched by the audience and loudly applauded. It had been intended to give an explanation of the drum mystery, as shown by Heller and Haschmayer at their entertainments, but owing to some defect in the battery the circuit could not be obtained, and as the instrument would not work, Mr. Daniels apologised to the audience for the excision from the programme. A vote of thanks to the chairman terminated the proceedings.—*The (Melbourne, Australia) Argus*, February 2d.

The Gramme Magneto Machine.

MR. H. WILDE sends to the London *Engineer* the following rather important note—highly important for the assignees of the Gramme patent: A short time since, Dr. Antonio Pacinotti, of the University of Pisa, was good enough to send me a reprint of his memoir "Sulle Elettro Calamite Trasversali," from the *Nuovo Cimento* of 1846, Vol. XIX, page 378, which contains a description of an electro-magnetic machine with an armature in the form of a closed ring, wrapped round with a series of small coil of insulated wire, in the same manner precisely as in the machine of Gramme. The learned Italian professor states in the memoir that he had one of these machines constructed as early as 1860, for the Cabinet of Technological Physics of the University of Pisa, and that, with either permanent or electro-magnets, it could be used as a magneto-electric machine for producing a continuous current: "Una macchina magneto-elettrica con corrente continua," p. 383.

The volumes of the *Nuovo Cimento* are to be found in the libraries of the Royal Institution, London, and other learned societies in Europe and America.

The memoir is illustrated with an excellent engraving from which it will be seen that Signor Pacinotti has anticipated most completely the communication of Mr. Gramme, entitled "Sur une machine magneto-electrique produisant des courants continus," published in the *Comptes Rendus de l'Academie des Sciences*, tome 73, p. 175, 1871, as well as his English patent of 1870, No. 1668.

What renders the Gramme scheme the more remarkable at the present time, is the fact that, in the month after the appearance of Gramme's note in the *Comptes Rendus*, Signor Pacinotti sent his reclamation of the invention to the French Academy, where it was admitted, as will be seen by reference to p. 544, and to the index of tome 73, where it is described as "Une machine electro-magnetique construite en 1860, d'apres le même principe que la machine de M. Gramme."

It is scarcely necessary for me to state that, as Signor Pacinotti's memoir of 1864 is to be found in the public libraries of this and other countries, the knowledge therein communicated belongs to the commonwealth of learning, and cannot be made the subject of a valid patent. The publication of these facts, to which I have felt it my duty to draw attention, will doubtless prove of public advantage.—*English Mechanic*.

The kind of Lightning Rod Peddlers they have in Indiana.

AS THE season when the lightning rods are supposed to be of a great deal of service to buildings has arrived, probably an account of the *oily tongued* kind of lightning rod peddlers they have in Indiana would not be out of place. I clip the following from the *Madison (Ind.) Courier*, it being the best of the kind I have ever seen.

The widow lady mentioned was needing a man to run the farm and help her take care of those "eight small children," and as she was prepared for an offer of marriage, no wonder she was enraged when all the eloquence below was wasted on the introduction of a lightning rod instead of being a *bona fide* offer of her hand, heart, and those "forty acres of sub-carboniferous limestone land."

"He drove his team close up to the fence, got down and rapped on the door. The widow Gilkens opened it, when he said: 'Mrs. Gilkens, I am cognizant of the circumstances by which you are at present surrounded, left as you are to trudge down the journey of life through a cold and heartless world—no longer sustained and encouraged by the noble one to whom you gave the treasures of your heart's affection, and bowed down by the manifold cares and responsibilities incidental to the rearing of eight small children on forty acres of sub-carboniferous limestone land; yet, Mrs. Gilkens, you are aware that the season is now approaching when dark, dismal, dangerous clouds at frequent intervals span the canopy of heaven, and when zigzag streaks of electricity dart promiscuously hither and thither, rendering this habitation unsafe for yourself and those dear little ones—hence, therefore, let me sell you a copper wire, silver tipped, and highly magnetic lightning rod.'

"The woman staggered back a few paces and yelled, 'Nareis, unfasten old Cronch!' In another instant a savage bull dog came darting round the corner of the house, with bristles up, thirsting for gore. The dog had already mangled a machine agent and a patent soap man, and was held in great esteem by the better class of citizens for his courage and service: but when his eye met the hard, penetrating gaze of Mr. Parsons, his chops fell, and he slinked off and hid in the currant bushes. Then the man said: 'My dear lady, you seem to be a little excited. Now, if you will allow me to explain the probable inestimable—'

"'Durn ye, I know something that will start ye,' said Mrs. Gilkens, as she reached under some bed clothing, and brought forth a horse pistol; but, owing to the shattered condition of her nerves her aim was unsteady, and the charge of buckshot missed, save where a few scattered ones struck his cheek and glanced off. A hard, metallic smile spread over his countenance, as he leaned his shoulder against the door frame, and again commenced: 'My dear madam, such spasmodic manifestations of your disinclination to make a judicious investment of a few paltry dollars—'

"'Hi—eo,' shrieked the widow, and collapsed into a kind of jerking swoon, and before she had recovered a highly magnetic lightning rod decorated her humble domicile, and Parsons had the blank note filled out all ready for her signature."

Queer Conceits.

A COLORED gentleman entered the Victoria (B. C.) office a few days ago and inquired of the operator if he was "de boss wat drives de telegraph;" on being answered in the affirmative, he expressed a desire to have "a word driven to New Westminster," which was done accordingly. In about two minutes the negro returned and asked if an answer had been received, when the following dialogue ensued:

Op.—"No sir, even lightning can't travel as fast as that."

Cæsar.—"Well, ain't it done got thar, de telegraph wat you sent for me?"

Op.—"I can't say for certain, but at all events it will soon be there."

Cæsar.—"Well, den it wou't be long a coming back for it had head wind going!"

Another man, a son of Erin this time, sent a message to Cache Creek, but failed to receive a reply, which made him feel very uneasy. About a week later on hearing that the line had been down, he inquired if it was not possible that his message was on the way just when the line broke "and had jumped off into the Frazer!" (B. C. line runs along the banks of that river.)

Shocking the Negroes.

THE Lexington, Ky., *Gazette* thus describes a "right funny scene" which occurred the other day at one of the stations on the Kentucky Central: A couple of negroes cut down a tree across the telegraph wire and broke it. The operator came out at once, determined on revenge. He quietly took his seat and ordered the negroes to bring the two ends of the wire together and mend it. Each seized end and end, but the moment they came in contact there was a sharp electric shock, and they let go. It was raining, and the battery was strong. However, the negroes didn't know where the shock came from, and tried it again. By this time they were so wet that the current would pass if the clothes of one but touched the other. Frightened and bewildered they brought the wires together again and again; each time, to their great astonishment, an electric shock convulsed them. And when the train started there sat that operator under the shelter of the depot still egging the negroes to fresh efforts.

As you cannot avoid your own company, make it as good as possible.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications

Automatic vs. Morse Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR correspondent, John Sterling, has a very novel, but, it must be confessed, very convenient and summary way of disposing of the facts and arguments of his opponents. It would be odd indeed, if he could not write down the Automatic or write up the Morse systems, when he not only and utterly ignores facts, but draws solely from his own narrow and partisan imagination, and thereby constructs a theory in accordance with his wishes, but totally at variance with facts known to everybody who knows anything of either of the systems of telegraphy now before the public.

Your correspondent thinks it was "not fair" in me to quote the sworn testimony of Mr. Orton, before the Senate Committee, in which he said "that six hundred words per hour is a large average speed of the Morse system." Mr. Sterling clinches his assertion of "unfairness" against me in these most innocent words—the average given by Mr. Orton, he says, "was based upon calculations in which the whole vast business of the company was included." When Mr. Sterling writes his next four column article upon the Telegraph controversy I hope he will find time and room to explain what he understands by "fairness" in quoting the deliberate and sworn testimony of leading gentlemen upon vital points of the Telegraph question.

Whilst I quoted Mr. Orton's judgment, in the matter of speed, I am satisfied he was in error, and I have freely conceded, in all my estimates of the Automatic and Morse systems, that first class Morse operators could transmit eight thousand to ten thousand words per day, of ten hours. I do not need Mr. Sterling's assurances that there are to be found among the eight or ten thousand operators of the Western Union Co., several—possibly a dozen or more—who are capable of transmitting in short circuits, and in good weather, forty words per minute, and for several minutes consecutively; but, of course, only an idiot or something worse, would assert that there were "dozens of Morse operators in every large office," who do or who could do, for love or money, twenty-four thousand words per day of ten hours, and day by day—no, nor half of twenty-four thousand, without killing themselves, or becoming inmates of a mad-house within ten days. What earthly use, therefore, was there in your correspondent's framing, what he is pleased to call, a "table," to illustrate the practical value of the Morse system, on such an illusory foundation as two thousand and four hundred words per hour, day by day—when the fact is beyond question that there are not ten Morse operators out of any ten thousand, who can show a record of ten days, consecutively, where they transmitted twelve hundred words, or even one thousand per hour, day by day, and for several days, consecutively.

In an editorial of the "Official Journal" of the Western Union Company, which is under the absolute control of Mr. Prescott, that company's electrician, the editor says, in the number for January 15, 1875, that a "single Morse wire in a lively circuit may average per hour 40 messages of 20 words each"—aggregating 800 words per hour and 8,000 per day—not 2,400 words per hour and 24,000 per day, as your correspondent so absurdly claims for his pet system.

Your correspondent shows a lamentable degree of ignorance of Automatic telegraphy when he assails my modest claim of five hundred words per minute, at only fair speed in transmitting messages. I do not care to go into the mathematical question of "breaks" or "pulsations," but I will say what everybody knows who knows anything of the science of Automatic telegraphy, and that is, that accurate and reliable transmission and recording of fifteen hundred words per minute, between Washington and New York, over two hundred and eighty-two miles of wire, is perfectly practicable, has been repeatedly accomplished, and can be at any time by the Automatic system, and this feat can be much more easily accomplished, hour by hour, than forty words per minute, hour by hour, by the Morse system.

We all know, of course, that Mr. Orton, Mr. Prescott, and all the other shining lights of the Western Union Co., have often declared, officially and otherwise, that even one hundred and fifty words per minute, in circuits of two hundred and fifty miles, was impossible, contrary to all science, and contrary to all that Mr. Prescott, Mr. Orton, and their scientific and practical assistants could possibly accomplish in Automatic or fast telegraphy, between Boston and New York, over a specially insulated wire, and after daily and nightly efforts, lasting through more than ten days. Indeed,

the "concentrated talent and wisdom" of the Western Union Co. could not accomplish over seventy words per minute, and cannot, now by any of the devices known to or controlled by the Western Union Co.

And yet your very verdant correspondent appears to be astounded at the fact that I should think highly of the Automatic system, when such wonderfully astute gentlemen as Mr. Orton and Mr. Prescott, ("who are paid large salaries," and therefore, of course, the correspondent thinks, must have a "heap of brains.") insist that there is no value whatever in it, "either in connection or in competition with the Morse system." So, too, those two shining lights in the science of Telegraphy, have gravely informed their shareholders "that messages cannot be sent by the Automatic system at a faster rate of speed than by the Morse system, except over comparatively short distances, and cannot be used upon a wire strung upon poles with other wires! Again, has your correspondent forgotten how indignantly those two gentlemen, "who are paid large salaries," spurned the duplex system, for more than three years, whilst it was in daily use on an opposition line, strongly insisting that it was useless, and yet, within a month after they purchased the very shaky patents, they declared that the duplex system had virtually duplicated the transmitting capacity of the Company's 100,000 miles of wire. Of course, there was at best only the shadow of truth in their statements, but yet they served to inflate the bubble, and thus they earned their "large salaries," and a score of curbstone brokers were made happy.

People who are at all observing, understand very well that in the estimation of the officers of the Western Union Co., nothing possesses merit, or real value, or legal foundation, until it becomes the property of that Company, nor is anything practical until it is understood and has been pronounced so by the electrician of the Company, who is always and notoriously behind even third rate operators in discovering or appreciating real improvements in telegraphy.

Your correspondent says, "it is admitted that the Western Union Co. could have easily secured the automatic system, if they had deemed it for their interests to do so." This is a gratuitous statement, without substantial truth, and made in the face of the well known fact that for more than a year past a distinguished diplomatist, acting in the interests of the Western Union Co., has endeavored, but without success, to get from the Automatic Co. an offer of sale of the Automatic patents. The Automatic system was at its birth dedicated to the breaking down of the Western Union monopoly, and the time is not distant when its power, under its new and more practical managers of the Atlantic and Pacific Company, will be fully appreciated by the Western Union Company in that direction.

Your correspondent also says that "the Automatic system, if introduced, would be practicable only on thorough lines doing a heavy business." All gentlemen of intelligence, and some real knowledge of the Automatic system, concede that it is really more advantageous, practically, for side or way lines than for through lines, for the obvious reason that on a way line of say twenty offices every operator can find constant employment, if the business exists, in perforating, sending, receiving or copying messages, whilst every office in circuit can be "called" through once in twenty or thirty minutes, no one having occasion to hold the wire more than a few seconds at a time, whilst with the Morse line there must be necessarily eighteen of the twenty operators waiting all the time, and utterly unable to advance the business of the line at all until they can get the control of the wire, whilst all the offices could not be "called" for business oftener than once in two to five hours.

Those who understand the practical working of the Automatic system, know that it can be used successfully on much longer circuits than the Morse, and on wires upon which the Morse system cannot be worked at all. They also know that they can send reports by the Automatic system, and drop copies to any desired number of way offices with very much less difficulty than this class of work can be done by the Morse system. They also know that Mr. Orton's and Mr. Prescott's disgraceful ignorance in asserting that the Automatic system could not be worked on long lines at a faster rate of speed than the Morse system, has no shadow of foundation, and it is within the truth to say that it is more than thirty times faster. They also know that the Automatic operator can at pleasure, and in a fraction of a second, work his wire by the Morse system and in the next moment by the Automatic system—the machinery for both systems resting upon the same table—so that if there is in ordinary or extraordinary office or other business any advantage in one system over the other the Automatic people, or Atlantic and Pacific Co., control one, whilst the Western Union Co. controls neither, and never will.

I dismiss the argument of your correspondent, based upon the duplex and quadruplex systems, with the single remark as to duplex, that it costs the Western Union Co. very considerably more to do their business

by the duplex than by the Morse system; and as to the quadruplex, that Mr. Prescott had no more to do with the brains part of that invention than the Man in the Moon; and neither Mr. Prescott or the Western Union Co. will ever see their names officially associated with the real inventor's, Mr. Edison, in any patent which may be issued from the Patent Office.

Your correspondent's opening paragraph promised us some "facts" and a clear solution of the much befogged questions connected with Morse and Automatic telegraphy, and he occupies four columns of stuff which is alike destitute of "facts" and even of probabilities; and in every allusion to the Automatic system he displays the most lamentable ignorance and the most stupid prejudices. His so-called "tables," showing large advantages in favor of duplex over Automatic telegraphy, are too utterly preposterous to justify me in asking for space to expose their fallacies—more especially as past numbers of your journal have contained careful and elaborate estimates (as yet unanswered), based upon well known facts in connection with Morse, duplex, quadruplex and Automatic telegraphy, and clearly showing advantages in favor of the latter, of more than two to one, in the matter of labor, and more than eight to one in the expense of lines, batteries and other incidentals connected with the telegraph business.

Your correspondent says that the maximum speed of the Automatic perforator is 40 words per minute, and of the copying machine 20 words per minute; and yet his mentor, Mr. Prescott, saw, in my presence, the perforator worked up to 135 words per minute, and the copying printer up to 85 words per minute.

Argument and common sense is alike thrown away in discussing the principles or the practice of Automatic telegraphy with correspondents such as John Sterling. Who next? D. H. CRAIG.

May 10, 1875.

A Pleasant Office.—Improved Management.—Changes.—Selling a Stranger.

CHICAGO, ILL., May 8

TO THE EDITOR OF THE TELEGRAPHER.

THE new management here seems to have inaugurated a general clearing up and remodeling of the office.

The ceiling has been kaesomined white, with a large border all around, of high tau color, fringed with blue, and a design in each conspicuous corner, of the latter color, which, for aught we know, is copied from some Chinese engraving; but it's mighty pretty—at least the effect is very pleasing to the sight, and, on the whole, that's what every one says. The walls are lavender tint, and we have certainly one of the most cheerful rooms you ever saw. The walls in the hall leading to the elevator have been wainscotted and grained in imitation of live oak, about seven feet high.

The old order of things seems to be reversed. Instead of being ordered under penalties (if disobeyed) to do certain things, the operators are requested to obey, as for instance, after the repairing was done the maleness of the employes was appealed to, to preserve the beauty of the office. If I am not very much mistaken the new departure will work wonders. If any are found so mean as to mar the beauty of our office they should not be screened by their fellow laborers, but reported for the offence and suffer the penalties imposed, as such consideration from our employers deserves our hearty acquiescence.

A great many changes in the operating force has occurred recently. As "Occasional" predicted, "preference would be given the older night men for day work." Such has been the case. "Eph." Martin takes the place of Mr. French on the Cincinnati duplex days. The two Martins, "Jack" and "Eph." will make this end warm no doubt. As "Eph." was recently *duplexed* he probably "knows how it is himself." Mr. French takes the Janesville and Green Bay line; Frank Richardson taking the Peoria wire; Mr. M. L. Lawson, of the night force, takes the Fort Wayne line, "Billy" Manners being promoted to the first New York. "Curt" Meserve, of the extra force, takes one side of the New York duplex days, regular, Mx. Lester not yet being able to resume his duties at the office.

"Ed." Dorval and Eitemiller, of the extra force, have been put on regular, nights, the latter on one side of the N. Y. duplex, with "Sam" Wallace. If that isn't "a team," then we don't know where you will find one. "Ed." Delano, who has been laid up a week with an alicerated tooth, is again in his place on the day force.

Mr. "Eddie" Swift bid the "girls" and "boys" good bye this afternoon, as he leaves for Indianapolis Monday. Who will work with Amboy now, and keep flowers on that table to perfume the room? Echo answers—who?

"Ed." Cuthbert, formerly of Dubuque, who recently took night report at Des Moines W. U. Office, has accepted a situation on the extra force here.

Mr. J. W. Strong, of the New York Press wire, nights, also goes on days Monday; and Mr. "Dug" Burnett, an old timer, takes the N. Y. Press wire.

Mr. Pettitt, Ass't Board of Trade Manager, who has been on the sick list for nearly a week, expects to be able to resume his duties Monday.

The day boys had lots of fun day before yesterday, with a "Granger," as they called him, who visited the office. He was seemingly the guest of Mr. Avery. They tried to make him believe the large round iron pillar that supports the roof, which stands near the centre of the office, was the ground wire, and that "Z." was the fastest sender in the world. They sent him notes, &c., "he smiled childlike and bland," and did not betray his feelings. Such conduct towards any one, whether green or not, to say the least, is *unbecoming*. Some of those foremost in this *sell* were the *greenest* set of men when they first struck Chicago, and knew as little for men as conceited as they proved to be that ever (dis)graced a telegraph office. We hope if this Granger ever gets a chance to show them the wonders of his section he will enlighten them in the same way they did him.

A lightning arrester, designed by Asst. Manager F. W. Jones, to protect duplex relays, has been placed on nearly all the duplex tables. WESTERN UNION.

Increase of Business, and New Western Union Office at Kansas City, Mo.

KANSAS CITY, Mo., April 28.

TO THE EDITOR OF THE TELEGRAPHER.

MONDAY, April 26th, the main office of the Western Union Telegraph Company, in this city, was removed to a more suitable building on Fifth, between Main and Delaware streets. The building is a three story brick, with stone front and plate glass on first floor.

This change has been brought about by the constantly increasing business of the company at this point, and the necessity for more roomy quarters.

Half a dozen years ago a single wire from this point was considered amply sufficient to perform such telegraphic service as the demands of Kansas City and its suburbs required. That such is no longer the case the net work of wires now radiating from this city in all directions fully establishes, and, for various reasons, Kansas City is now considered the most important station between St. Louis or Chicago and the Pacific Coast. In addition to the local business, which is very heavy, Kansas City distributes for all points in Western and Southern Kansas, Colorado, New Mexico, and a large portion of Missouri, Iowa and Nebraska. It is also frequently the outlet for California business by means of its Colorado connections, but this only occurs when the regular "overland" wires, *via* Union Pacific Railroad, are interrupted between Chicago and Cheyenne.

Col. R. C. Clowry, Assistant General Superintendent, left nothing undone to make the new office a model one.

The tables and instruments are arranged on a similar scale to those in the new offices of the company in New York, St. Louis and Chicago. The wires were under the supervision of Sol. Palmer, Chief of Construction, and the nicety with which it was done cannot be surpassed.

The Instruments and apparatus is of the most finished workmanship and latest design. It includes three sets of "repeaters" for the benefit of St. Louis and Galveston, Omaha and St. Louis, and the Western Associated Press, also a "Duplex," which is worked between St. Louis and Kansas City. Five wires are worked direct to St. Louis—one ends at Sedalia, one at Newton, Kansas, *via* Topeka, two at Brookville, Kansas; one at Denver, one at Baxter, one at Camerou, Mo., four at Omaha, one at Coffeyville, and another at Galveston, as well as numerous Railroad lines.

The office staff consists of M. D. Wood, Manager; M. D. Crain, Chief Operator; Geo. McMahon, Night Chief; C. H. White, Robert Livingston, John E. Magill, Arthur H. Elliott, and W. M. Spink, a corps of expert and accurate telegraphers; C. N. Davis, Receiving and Delivery Clerk; N. P. Ferris, Book-keeper; and Wm. Warrance has charge of the batteries, which consist of 400 cups of Callaud. In addition to these gentlemen, the W. U. Company employ about fifteen operators at various branch offices throughout the city. C.

A Correction.—Personals.—A Great Telegraphic Centre.

CHICAGO, ILL., May 10.

TO THE EDITOR OF THE TELEGRAPHER.

We have been having very changeable but quite moderate kind of weather, and Saturday was quite warm, making overcoats uncomfortable.

In my communication in the "Type Writer," of March 28th, which appeared in your issue of May 1st, I notice a mistake, no doubt my own. Instead of say-

ing "to make an! to touch . and ," I should have said "touch" and "

"Charley" Robinson has again mastered the rheumatism so far as to he out parts of pleasant days, and puts in a few hours each day in the W. U. office here, where he will no doubt go to work regularly as soon as entirely recovered.

"Charley" Lithgow has taken "Qu." W. U. office here, on commission, and intends to establish shortly a general ticket office for the sale of railroad, steamboat, theatre and circus tickets of all kinds. "Q" is an "old timer," one of those "go ahead" fellows who always win, and we know THE TELEGRAPHER will join us in wishing him success. His office is on Madison street, a few doors west of McVicker's theatre, on the same side of the street, in the segar store. "The boys" from abroad should not fail to call when they come to "Ch."

The W. U. operating room has been thoroughly repaired, and is a model of beauty and neatness. The employes are loud in their praises of it.

The way those three receivers, Catliu, Louderback and Crowley, take in business down stairs is enough to make a fellow's head swim, and one would naturally suppose the other companies were doing little or nothing; but a glance at "Bentley" and "Curran" at the A. and P. during business hours will soon convince a stranger that, as a telegraphic centre, Chicago is indeed a big place.

The Great Western do very little at their main office, but do a very heavy board of trade business between Chicago and Milwaukee.

The A. and P. find the automatic just the thing when short of wires. OCCASIONAL.

The Telegrapher Contributors.—Political Fore-shadowing.

CINCINNATI, O., May 8.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE been much amused of late by some of the contributions appearing in your paper. The contributors seem to have the lion's share of your space. It is customary for editors to say to contributors, "Owing to the pressure on our columns, we have not been able to find space for your communication." For some time past the *pressure* has been so great on the columns of THE TELEGRAPHER as to exclude the editor.

"Nihil" seems to have waxed fuller and more sonorous as he grew upon our acquaintance, like the notes of a bass horn well blown upon approaching us from a distance. He lifted up his voice in strange causes, and discharged his piece vigorously, and, it must be confessed, brought down his man handsomely at every shot. He is a trump, and no mistake, and he handles his key as well as his pen.

The *woman* subject seems at last, after endless wanderings from the "previous question," to have terminated very much in nothing, like the suit in court over the broken kettle. A sued B for damages for a broken kettle, which he claimed was borrowed *whole* and returned *hole*. B, the defendant, replied by his attorney, in three pleas, either of which, he claimed, if established, would clear the case. "First," said he, "I never borrowed the kettle; second, it was cracked when I got it; and third, it was whole when I returned it." "Let us have peace."

In the wake of this great unsettled question begins to loom up the lesser one, "Who is to be elected President of this great Republic in 1876?" I do not pretend to predict; I am no prophet, to myself nor anybody else, but I venture to suggest that, in the present corrupt state of political affairs, some man of *sterling* integrity ought to be selected. Can such a man be found? I know they are scarce, but think there still remains an *occasional* one. I have one in my mind now, but for the present it is best that he should be *nameless*. When a very small boy, under the tutelary care of Miss Mary Ann Weaver, spinster, I was vigorously instructed in the names of the different marks used in books (called by us punk-che-wation points). We were told that a comma was a *dot* with a curl to it, at which we should "stop long enough to count one," while the period, king of points, was a *dot* without a curl, at which we were to pause reverently and count *six*. Now, with the memory of that self-complacent and learned feminine Assham vividly before me, I would very respectfully ask how I am to deport myself in presence of this "dot?" How long must I pause? How many must I count?

How she did apply the ferule! Whack! whack! whack! "Nihil" bore it well, probably feeling it an honor to be flagellated by so fair a hand. "Oh, the pain, the bliss!" etc.

Upon the whole, we may be glad that while so much hair was pulled so little blood was spilled: "Cease fond Nature, cease thy strife."

Have you seen the new telegraphic journal published in St. Louis? It is about the size of the defunct *Plug*, and seems to be carried on with equal *spirit*. It really seems a pity that Cincinnati cannot support a telegraphic paper of its own.

Business dull, provisions scarce and high. Nothing plenty but loafers. Nothing low but morality. The lawyers seem to be the only persons who do well, and they only because others do ill. When you see one you fancy him *Beach*; the next one you meet is sure to be *Beecher*.

I don't feel well. Good bye! UNO HOO.

The Weather.—Successful Trial of the Nicholson Quadruplex.—Electric Railroad Signals.

CHICAGO, ILL., May 17.

TO THE EDITOR OF THE TELEGRAPHER:

VERY little has transpired since my last, worthy of note. That everlasting topic, the weather, of course must be commented upon. Although we have had cold winds and sudden changes, the weather can be (generally speaking) said to be quite pleasant. Spring seems to be a full month behindhand. The season, though, may be prolonged far enough into summer—summer into autumn, and autumn into winter—to make up for this delay—yes, it *may*—and then it *may not*. As this is the month for *maybe's*, let them *fly*.

I understand that quite a successful test of the "Nicholson" Quadruplex was made in the Western Union office, between here and Cincinnati, last week, all four sides of it being worked successfully for several hours.

I am told the Prescott-Edison "quad" has been worked a great deal as a duplex recently, its advantage over the "Stearns" being (as mentioned in a former letter of mine) that the receiving operators can break without stopping the sending operators on the other side. Several times lately three sides of it have been worked almost up to the capacity of three wires; but (if I am correctly informed) only once in the last three or four months has it been worked on all four sides, and then only for about an hour.

The attention of railroad managers is being very generally attracted to electric railroad signals. There seems to be a general waking up on this subject. Mr. Hendrickson, the agent of the Electric Railroad Signal Company, is working quietly but very successfully in introducing it to the notice of those interested in such matters. He has made some simple but effective improvements since I last visited the one so successfully working at South Park Station, on the I. C. R. E. Several of our leading railroads here are now negotiating for signals for their crossings, but I am not at liberty to mention them particularly.

OCCASIONAL.

A Disclaim of Authorship and Responsibility.

SAN FRANCISCO, CAL., May 4.

TO THE EDITOR OF THE TELEGRAPHER.

"GIVE a dog a bad name and then hang him," is a proverb which finds an illustration in my case. As every letter to THE TELEGRAPHER from California, whether loaded with bitter invective or bathed in the oil of fulsome flattery, was laid at my door, and lest the last cowardly effort sent to THE TELEGRAPHER for a double purpose should be by my facetious friends attributed to me, I beg to say that whatever may be my faults, cowardly double dealing, or two faced back-biting, is not, and I hope never will be one of my characteristics, and I therefore disclaim all knowledge thereof, and furthermore say that hereafter any and all of my communications will bear my own signature, and no cognomen. The letters I have written for publication in THE TELEGRAPHER were not of that kind to which I would feel ashamed to append my name. T. S. CUNNINGHAM.

A New Liquid Rheotome.

M. DUCRETET calls attention to a "liquid rheotome of constant direction," based on a new property of aluminum. Suppose two electrodes, one of aluminum A, the other of platinum P, in a voltmeter connected with a battery. If P receive the positive electricity and A the negative, the water is decomposed, and the current passes freely through the liquid space between the electrodes; but if the current be reversed, the water is not decomposed and the current passes very weakly. In the former case, an electric bell placed in the circuit will sound, or a piece of platinum wire will melt; but not in the latter case. Now, M. Ducretet proposes to utilize this property if electrified positively, where it is required to send a current only in one direction. Coupling two liquid rheotomes by the plates of contrary name, different effects may be produced in the same electric apparatus (such as a printing telegraph) and in this case, with only one line wire. It may be variously applied in telegraphy.—*English Mechanic.*

For full, accurate and reliable telegraphic news and information, THE TELEGRAPHER is the only journal.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, MAY 22, 1875.

THE TELEGRAPHER: PUBLISHED EVERY SATURDAY at 38 VESFY ST. ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00. INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESFY ST., New York.

PREMIUMS FOR SUBSCRIPTIONS.

1,000 NEW SUBSCRIBERS WANTED.

It is desired to add 1,000 new names to the present Subscription List of THE TELEGRAPHER during the next two months. To accomplish this it is only necessary for the friends of the paper to engage energetically in presenting its claims to the consideration of the Telegraphers generally throughout the country.

To encourage such efforts it has been decided to offer the following

LIBERAL PREMIUMS.

For Two New Subscriptions, or Renewals of Subscriptions which have or are about to expire, we will give the person sending them

A NEW POCKET GALVANOMETER.

For Three New Subscriptions or Renewals,

A NEW POCKET GALVANOMETER, Nickel Plated.

A very handsome and useful article to every Telegrapher.

For Six New Subscriptions or Renewals,

A No. 3 TELEGRAPH KEY.

For Ten New Subscriptions or Renewals,

A No. 1 SOUNDER or No. 1 TELEGRAPH KEY.

For Fifteen New Subscriptions or Renewals,

A GALVANO-ELECTRIC or SHOCKING MACHINE.

The price of this Machine is \$10.

For Twenty-five New Subscriptions or Renewals,

A No. 2 RELAY.

For Forty New Subscriptions or Renewals,

A No. 1 RELAY,

Handsomely finished, with glass shade.

For One Hundred New Subscriptions or Renewals,

A No. 1 SELF-STARTING REGISTER.

With glass shade, and everything complete.

Subscriptions must be paid in advance at the regular price of TWO DOLLARS per year. Subscriptions for less than a year will be counted proportionately.

Those who may desire to obtain Premiums can send in subscriptions as obtained, and they will be credited therefor, and can call for such Premium as they are entitled to for the whole number so credited at any time.

Specimen Copies of the paper will be forwarded, on application, to those who may desire to use them in canvassing.

Remittances should be made by Draft, Postal Money Order payable to, or Registered Letter addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.

NEW YORK.

The Contest for the Title to the Edison Quadruplex Patents.

OUR readers will doubtless feel interested in knowing the progress and status of the contest for the title to certain patents, known as the quadruplex patents, for which applications are pending before the Patent Office, made by THOMAS A. EDISON, and assigned jointly to himself and Mr. GEORGE B. PRESCOTT.

Probably no inventions, or supposed inventions, for which patents have been applied for, in this country at least, have been as much sold as these. It is certainly a most remarkable case, and undoubtedly will hereafter be cited as a cause celebre in the annals of patent litigation.

Since we last referred to this case another purchaser, who antedates all the others, has put in an appearance, with one of EDISON'S numerous contracts and assignments, in the person of Mr. E. B. WELCH, of Boston, Mass. That assignment was dated April 7, 1869, and recorded in the Patent Office January 30th, 1875, Liber W, page 18, and contains the following agreement:

"I do also hereby agree and bind myself to sell, assign and convey to said WELCH, for the considerations before mentioned herein, one undivided half interest in any other instrument, or any other principle, method or system which I may invent, or obtain a caveat or patent for, to be used for the transmission of messages on telegraph lines both ways simultaneously.

"THOMAS A. EDISON."

It may be of interest to recapitulate the sales of these inventions which have thus far been developed or claimed. First, of a half interest to Mr. WELCH; second, a two thirds interest to Mr. HARRINGTON; third, of a half interest to Mr. PRESCOTT; and fourth, of the entire interest to Mr. JAY GOULD. What additional claimants there may be will be developed probably as the matter progresses. As the record now stands, according to his own showing, EDISON has sold the entire interest in these patents two and two third times. Our readers will understand from this the appropriateness of the title bestowed upon him of "Professor of Duplicity and Quadruplicity."

The Professor seems to have been more fortunate than the generality of inventors, who are apt to find it difficult to secure even one purchaser for their inventions; whereas he is enabled to sell his inventions "short," and to several different purchasers at the same time.

In this connection we wish to correct an error which we find in the "statement of GEORGE HARRINGTON, of his relations with THOMAS A. EDISON and his improvements in fast telegraphy," which was filed with the Commissioner of Patents prior to the first hearing of the application of Mr. HARRINGTON for the issue of the patents to himself and EDISON, as the assignee of the latter. In this statement Mr. HARRINGTON quotes from THE TELEGRAPHER several articles in regard to fast systems of telegraphy, and refers to Mr. F. L. POPE, as their author, or as controlling the columns of this paper as editor. Mr. POPE did not write a line of the articles quoted, and neither edits or controls the paper. He was formerly, before the connection with it of the present publisher, the editor, and for two or three years subsequently was associate editor, but since the first of January, 1873, has not been responsible for anything that appears in his columns except such articles as appear over his own signature.

The more this matter is investigated the more extraordinary appear the manoeuvres of EDISON in connection with these patents. In the brief of Mr. PRESCOTT'S counsel they say "it would be no longer just to the parties, nor to the law officers having this matter in charge, to treat the new pretences of EDISON as anything but the impudent rogeries which they are. * * * * *

"This proceeding is an attempt to enable the roguish inventor to sell three times, and receive three prices for his invention, once to Mr. WELCH, in 1869, as shown below; once to the Western Union, and once to Mr. GOULD; the last sale having the added beauty, in a

rogues eyes, not only to cheat a former purchaser, but also of cheating his partner of a share of profits. If this interpretation now given to the sale to HARRINGTON were anything but a dishonest and stupid afterthought, the series would be complete as a quadruplex."

As we remarked in a former article on this subject, the business complications of this man, EDISON, would furnish employment to a legion of lawyers indefinitely to unravel.

We have not room or space, nor do we propose to discuss the equities of the case. They must ultimately, whatever the action of the Secretary of the Interior, or the Commissioner of Patents may be, be judicially decided. It will perhaps have the very desirable effect of inducing more caution in dealing with a person who has such an uncommon faculty for making and breaking contracts and agreements, and whose bond, so far as it relies upon himself, is just as good as his word --and no more so.

The matter will undoubtedly result in prolonged and costly litigation.

The Telegraphic Situation.

ALTHOUGH there is nothing of controlling interest in connection with telegraphic matters to communicate this week, there are some items of importance and interest which have transpired or been developed.

The "Faraday" succeeded in raising the ends of the Direct Cable, and has completed the work of laying the gap which existed within about twenty miles, and when this is done the cable will be completed and in operation. The ocean, in the part where the remainder of the cable is to be laid, was covered with an immense field of very heavy ice, and as there was likely to be some delay waiting for the ice to move, it was decided to run the steamer into Sidney, Cape Breton, to take on board a supply of coal, where she is at this present writing. Both ends of the cable are buoyed, and a few hours' work will complete the cable, and the long delayed competition in Atlantic telegraphy will be commenced. It is probable that we shall be able to announce in our next issue the completion of this important work.

As has been before stated, a full corps of operators are at the different stations with the necessary instruments and apparatus for working the cable the minute the final splice is made.

The Directors of the Pennsylvania Railroad Company, at their meeting in Philadelphia last week, voted to grant the Atlantic and Pacific Telegraph Company the right to extend its lines over all the routes covered by the roads owned or operated by the company. This is an important concession, and is understood to be the result of negotiations which have been for some time in progress. We are not informed as yet as to the details of the arrangement between the two companies. The contest over the EDISON quadruplex patents is still progressing vigorously, and briefs and counter briefs are being filed with the Secretary of the Interior in numbers which must rather perplex that official, if he reads them all. The literature of this complicated case is likely to make quite a large volume before it is completed, and the quadruplex will undoubtedly prove profitable—to the lawyers at least, if it does not to the parties who are striving so earnestly to secure exclusive possession and control of the same. The name of the Professor of Duplicity and Quadruplicity will go down to our telegraphic posterity—if not in a blaze of honor and renown—as the great legal telegraphic complicator of the age.

The courts and lawyers are likely to be well occupied during the next two or three years with suits, and counter suits arising out of the telegraphic complications which have arisen, and "legal expenses" will cover large items in the accounts of the principal telegraph companies.

To what is the great Professor of Duplicity and Quadruplicity now devoting his gigantic genius and intellect?

Our New Premium Offer.

WE would call attention to the list of premiums offered to those who may interest themselves in increasing the circulation of THE TELEGRAPHER. We hope that the friends of the telegraphers' paper will avail themselves of this opportunity to obtain a valuable premium, while at the same time advancing the interests of the paper and increasing its usefulness. Of the thousands of practical telegraphers who are now not in receipt of THE TELEGRAPHER, we believe that by proper exertion a considerable percentage could be induced to avail themselves of its weekly visits. One lady in Canada has within a few weeks by personal efforts obtained and forwarded to us over fifty subscribers. We are confident that others may succeed as well, if they will but undertake the work with similar energy and persistence.

The inducements offered are liberal, and we confidently expect a liberal and satisfactory response.

A Letter from Mark Twain.

MR. GEORGE CUMMING, an operator with the Western Union Company in this city, and an occasional contributor to the columns of THE TELEGRAPHER, has received the following letter:

FARMINGTON AVENUE, HARTFORD, CONN.,
May 15, 1875.

GEO. CUMMING, Esq., New York.

Dear Sir—Your paragraph about old jokes encountered me just as I was thinking in a similar vein upon the same subject. You remember "Punch's" joke: "Advice to people about to marry.—Don't!" I was astonished two years ago to run across that same joke in some old author, who was dead, petrified (and perhaps damned) before Socrates's time. It never occurred to me before, but I would give something to know what they are going to do with the petrified people at the general resurrection. It seems to me I would polish them. However, my judgment may be at fault in this; and, besides, I do not think a mere man ought to be trying to make suggestions in a matter of this kind, when he has had no experience in resurrections. But, if you believe me, there are plenty of people with no better manners than to do it. In my opinion, such persons are entitled to no respect whatever.

Yours truly,
S. L. CLEMENS.

The following paragraph from one of Mr. Cumming's letters to the Springfield (Ohio) *Republic* elicited the above:

One queer fact about many of our current stories, squibs, paragraphs, etc., is their ancient origin. Is it not Wendell Phillips who says in his lecture on "Lost Arts," in illustrating the Solomonian proverb, "There is nothing new under the sun," that even our jokes are as old as the hills, and that out of the thousands of novels published the plots can all be traced back to a foundation ages ago, to a few romances, perhaps less than a dozen in number. Phillips also claims the proverbial Irish bull to be not Hibernian at all but Greek. Who knows how much further the Grecians could trace it? Fancy Socrates spitting his sides over a story we still rehash as new. Hence the expression, no doubt, "He's a Greek refugee from Cork."

Personals.

MR. GEORGE SIMPSON has been appointed train despatcher at Aurora, Ill., of the Chicago, Burlington and Quincy R. R., in place of Mr. W. M. MIXER, chief train despatcher, who has been transferred to the general office in Chicago.

MR. THOMAS E. MARSLAND, Inspector for the Automatic Signal Telegraph Co., New York, has obtained six weeks' leave of absence, and left for a visit to his home in Merrie England.

MR. LOUIS W. CLARKE, of Providence, R. I., for nearly seven years agent of the Gold and Stock Telegraph Company, has resigned his position to engage in telegraph line construction and other telegraph work.

MR. GEORGE WARREN has accepted a position at the Western Union office corner Broadway and Dey street, New York.

MR. FRANK P. ROSS has accepted a position at the Western Union office corner Broadway and Dey street, New York.

MR. HARRY LARCOMBEE, formerly of Washington,

D. C., has taken a position with the Western Union Co., main office, in this city.

MR. THOMAS R. TALTAVAL, late of the Western Union, New York main office, has accepted a position in the Associated Press at Washington, D. C., as operator.

MISS MARY SELOVER, of Bentley's City Line, Philadelphia, Pa., has been transferred from No. 1,330 Girard avenue to the office of the same company at the corner of Third and Chestnut streets.

MR. E. R. HOWE, formerly of Louisville, Ky., has accepted a position with the Western Union Co., at Lexington Ky.

The Telegraph.

Foreign Telegraphic Notes.

THE annual account of the gross public income and expenditures of the United Kingdom of Great Britain, etc., for the year ending March 31st, 1875, puts the receipts for telegraph service at £1,120,000, and the expenditures for the same at £1,193,060.

At a special general meeting of the shareholders of the Panama & South Pacific Telegraph Co., held recently in London, the Chairman said the meeting had been called, as they were aware, to confirm the special resolutions passed at the special general meeting of the company held on the 8th of April. He would therefore now move that the resolution—namely, "That the company be wound up voluntarily—be now confirmed." This resolution was seconded and carried *nem. con.* The Chairman moved that Mr. James A. Brand be appointed the liquidator. The motion was seconded and carried unanimously.

The report of the trustees of the Submarine Cable's Trust, presented recently to the fourth ordinary annual meeting of the certificate holders, stated that the revenue for the past year has amounted to £28,310, and the expenses (limited by the trust deed to £2,000) have been £1,695, leaving a balance of £26,615. Of this sum £21,213 has been applied to the payment of the coupons due on the 15th October, 1874, and 15th April, 1875; £3,179 was expended in the purchase of twenty-nine certificates in October last, and the balance has been carried forward. No change has been made in the securities held by the trustees since the last report was issued.

A strong demand for the shares of the Telegraph Construction & Maintenance Co. in London is reported. It is understood that this company has recently made or will shortly conclude some very profitable contracts. At the dinner given to the Governor of Victoria, Sir James Ferguson announced, amid loud cheering, that Mr. Vogel had successfully negotiated the formation of the last remaining link of telegraphic communication between England and New Zealand, and had secured important modifications in the tariff. It is understood that it is the contract for this cable which has caused the recent advance in the price of the shares of this company.

The number of messages transmitted from postal telegraph stations in the United Kingdom for the week ended April 24th, 1875, was 391,403—an increase of 17,347 on the corresponding week last year.

It is rumored that the new cable to connect New Zealand with the Eastern Extension, Australasia & China Company's telegraph system, will be laid during the present year.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended May 1, 1875, was 394,518—an increase on the corresponding week last year of 16,669.

The average time occupied in the transmission of telegrams between Madrid and England, "via Santander," during April, was two hours and fiftyseven minutes, including transmission over Spanish land lines.

The receipts of the Brazilian Telegraph Company for the month of April, 1875, were £11,945.

The number of messages by the Cuba Submarine Telegraph Company's lines during the month of April was 2,235, estimated to produce £2,200, against 1,518 messages, producing £1,525, in the corresponding month of last year. The cable was cut from the 7th to the 13th to establish communication with the new station which has now been open at Cienfuegos.

The traffic receipts of the Eastern Telegraph Company for the month of April, 1875, amounted to £31,252, and for the corresponding period of 1874 to £30,766.

The receipts of the Eastern Extension, Australasia and China Telegraph Company for the month of April amounted to £18,413, and for the corresponding period of 1874 to £16,670.

The traffic receipts of the Great Northern Telegraph Company for the month of April amounted this year to 851,662 fr., and last year to 348,153 fr. Total traffic receipts from 1st of January to 30th of April, this year, 1,235,974 fr. (£49,439); and last year, 1,826,066 fr. (£53,043).

The receipts of the Submarine Telegraph Company for the month of April, 1875, amount to £9,298. The receipts for the corresponding month of the preceding year amounted to £8,510.

The receipts of the Western and Brazilian Telegraph Company for the five weeks ending the 30th of April was £12,552.

Messrs. Morton, Rose & Co., of London, announce that the definitive bonds of the Western Union Telegraph Company of the United States, of the issue of £1,030,000 six per cent. loan, are now ready for delivery in exchange for the fully paid Scrip Certificates.

Telegraphic communication in Japan is to be extended to the Loochoo Islands.

The Government of Western Australia has commenced a line of telegraph which will establish instant communication between that colony and Adelaide, South Australia.

A military telegraphic service is about to be organized in France.

Telegraphic and Electrical Brevities.

Monsignor RONCETTI, *Ablegat Apostolique*, and Prof. Ubaldo Ubaldi, of Rome, Italy, the bearers of the scarlet cap to Cardinal McCloskey, accompanied by the Very Rev. J. O'Connor and the Rev. Edward McGlynn, visited the Western Union Building on Wednesday last, and were shown through the various departments.

The Southern and Atlantic Telegraph Company have opened new offices on their lines at Darien, Ga., and High Point, N. C.

The American District Telegraph Company is being established at Washington, D. C., under the management of Mr. A. G. Davis, of Baltimore, Md.

The Western Union cable steamer *Morse* sailed last week for London, to take on board the new cable which has been contracted for by Mr. Orton, for the International Ocean Telegraph Company, to be laid between Key West and Punta Rasa, Florida. The cable is being manufactured by the Telegraph Construction and Maintenance Co., at the Silvertown works.

The hearing in the case of the Atlantic and Pacific Telegraph Company against the Southern and Atlantic Telegraph, in the application for a preliminary injunction, was set down for the 21st inst., in Supreme Court, General Term.

The case against the Atlantic and Pacific Telegraph Co., to vacate the lease of the Franklin lines to that Company, and for the appointment of a Receiver, brought by certain stockholders of the Franklin Company, is to be heard in Boston on the 25th inst., if not again postponed.

Marine Glue.

F. H. COLLINS writes to the *English Mechanic* that an excellent marine glue, far superior to the ordinary kind, and more workable, can be made by dissolving 2 oz. of bottle rubber in half a gallon of mineral naphtha. When the rubber is all dissolved add twice the quantity of shellac in the naphtha, place the whole in an iron vessel, apply heat cautiously, stir till well mixed, and then pour out on a slab to cool. This glue can be melted at the same heat as common glue, can be applied with a brush, sets very quickly, is elastic, and perfectly insoluble in water.

[CORRESPONDENCE.]

Western Union Chicago Notes and Personals.

CHICAGO, ILL., May 15.

TO THE EDITOR OF THE TELEGRAPHER.

EVERYTHING seems to be moving along harmoniously under the new management.

Some of the old timers that we never expected to see working in the office again are among us again.

The noon hour has not yet been abolished; but the boys don't growl over it any, as they are confident, when all the plans of the new management are matured, that some arrangement will be made whereby they will (after a night of toil) have the day for rest.

I understand that the extra work which has been done heretofore at fifty cents per hour will not be paid for in this manner hereafter, but that seven extra hours will be considered a day's work, and men who work extra will be paid for such work the same as for regular, in proportion to their salary. Although very few will get quite as much for their extra work as here-

tofore, this is certainly the fairest way to pay for over time.

Only a few changes have occurred since my last, and I might keep them over for another time, but guess a short letter written every week will be more readily appreciated than a long one every two or three weeks; so here goes.

Mr. Fred. Goodrich, who has been subbing here for some time, has been added to the regular night force.

Mr. Roger Pearson, General Superintendent of the American District Telegraph Company, in addition to his duties at the American District office is working extra, nights; also Mr. E. J. Stevenson and Mr. "Jack" Desmond, both old timers. Mr. Frank Farley, "one of the boys," and by no means a "slow one," and Mr. "Guss" Carroll, recently of Des Moines, Iowa, W.U. office, are subbing at this office now. Jack Congdon, our new late night manager, who has been home to visit his old parents on his farm in Michigan, ever since his appointment, returned to-night, and will take charge to-morrow night.

Mr. Kelley, first assistant night manager, has been filling in "Jack's" time during his absence.

WESTERN UNION.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: May, WESTERN UNION, ATL. AND PAC., AMER. DIST., GOLD AND STOCK. Rows show prices for dates 13, 14, 15, 17, 18, 19.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each.

For the week ended April 13, 1874, and bearing that date.

162,091—ELECTRO-THERAPEUTIC BATHS.—James W. Moliere, Detroit, Mich. Filed July 29, 1874.

The combination of the metallic lined chamber A, having a lid composed of the sections M N O, slide P, coiled pipe F, and electric pile plates G, substantially as herein shown and described.

For the week ended April 20, 1875, and bearing that date.

162,204.—INSULATED TELEGRAPH WIRES.—Wilson Striker, Lebanon, Pa. Filed August 22, 1874.

1. As a new article of manufacture, a telegraphic wire insulated by a covering of India rubber or gutta percha, coated with coal tar, and provided with mica applied both to the outside and inside of the gutta percha or India rubber covering for the wires, as and for the purpose set forth.

2. The method herein described of insulating a telegraphic wire consisting of the application of mica around the wire, and then encompassing the wire and mica with a covering of India rubber or gutta percha dipped in coal tar, to which mica is then applied, the coal tar performing the double functions of closing the pores of the covering and causing the retention of the mica in place, as set forth.

For the week ended April 27, 1875, and bearing that date.

162,633—DUPLEX TELEGRAPHS.—Thos. A. Edison, Newark, N. J., assignor to himself and Geo. Harrington, Washington, D. C. Filed April 26, 1883.

1. The armature lever L, pivoted between the magnets A and B, and operated by an increase and decrease in the tension of the line current, in combination with the key K' and rheostat R, for the purpose set forth.

2. The sounder lever S L, double spring contact a, and batteries M B and M B', arranged substantially as set forth, and for the purpose specified.

3. The combination, with the main line circuit, of a receiving instrument operated by changes in the polarity of the current independently of tension, with another receiving instrument operated by changes of tension independent of polarity, means of changing the polarity of the current, and means of changing the tension of the current, substantially as and for the purpose specified.

162,676—FRICTIONAL ELECTRICAL MACHINES.—Geo. M. Mowbray, North Adams, Mass. Filed Nov. 30, 1874.

Hard rubber cylinder surrounded by two semi-cylindrical condensers. Machine discharged by reversing the crank, as in the Smith patent, No. 93,563, August 10, 1869, with the addition that a partial reversal breaks the connections from the rubber and the collector to the condensers. Other features explained by claims.

1. The arrangement of a frictional exciting surface between two curved dielectrics, both of these curved dielectrics having on each surface, respectively, metal armatures with sufficient marginal insulation to form a condenser, the inside surface of one of them so situated during excitation as to receive electricity from the rubber, while the inside surface of the other curved dielectric simultaneously receives electricity from the collector, and withal the inner surface or armature of each one being in connection with the outer surface or armature of the other, substantially as described.

2. The accumulator or Leyden jar, of any preferred shape, built up of sheet hard rubber and metal plates, insulated from external influence by other sheets of hard rubber, and enveloped in pure sheet rubber, substantially as described.

3. An electric rubbing cushion, formed of two distinct sur-

faces, the one resinous, to receive the amalgam and excite electricity, the other filamentous, felted, or velvety, to cleanse and polish the exciting surface with the usual oiled or varnished silk flap, substantially as described.

4. The combination of an exsiccator, composed of a material capable of absorbing moisture from the atmosphere, packed in a permeable envelope, with a frictional electric machine in a water tight case, substantially as described.

5. The oscillating cylinder, independent of the condenser, which is stationary, composed of two disks, each having a slot cut out of its periphery for about sixty degrees, carrying two semi-cylindrical sheets of hard rubber, there being affixed to one of these the rubbing cushion and its conducting knob, to the other a knob projecting through it, this oscillating cylinder admitting of a determinate limited motion from the rotation of the exciting surface, the range of oscillation being determined by the collecting rod, which is stationary, and passes through the slots of the disks, serving a triple purpose, viz: First, isolating the condenser from the rubber collector and lead wires when it receives a thirty degree reverse motion; second, discharging the battery through the leading and return wires when this reverse motion is continued to sixty degrees of a circle; and, third, conducting the charge from the rubber and from the exciting surface to the condenser by a forward motion of sixty degrees, substantially as described.

6. The graduated test gauge, with sliding or movable standard and connections for terminal wires, substantially as described, and for the purposes set forth.

7. The hard rubber shaft of a frictional electric machine, with sunken socket for crank, substantially as described, and for the purposes set forth.

8. The elastic wire connections between the knobs moving and the fixed knobs of a frictional electric machine, for the purpose of cushioning violent movement, substantially as described.

9. The combination of a rotating exciting surface, an independent oscillating frame, carrying a rubber and connecting knobs, with a stationary collector and a stationary condenser, all enclosed in a water tight case or keg, substantially as described.

WILLIAM BROWNLEE, Dealer in CEDAR TELEGRAPH POLES. OFFICE, FOOT OF SHELBY STREET, DETROIT, MICHIGAN.

SPECIALTIES. The Galvano-Electric Machine, for Medical and Family Use, will be furnished by us COMPLETE FOR \$10.

This apparatus contains a powerful induction coil, constructed to combine strength with cheapness and durability. The whole apparatus is enclosed in a neat walnut case, and is of the best workmanship throughout.

As a source of amusement it is unsurpassed. A LIBERAL DISCOUNT WILL BE MADE TO THE TRADE.

We also offer an entirely new article, A Pocket Galvanometer, Manufactured by Launert & Decker, of Cleveland, Ohio. This is a very handsome and useful article for electricians, operators, etc., etc.

It detects, indicates and shows the direction of very feeble as well as stronger currents, and in telegraphy may be advantageously used for the purpose of ascertaining the source of reversed currents in case of reversed batteries and crosses, etc. A Card of Instructions with each Instrument. The Galvanometer will be sent to any address by mail, post-paid, on receipt of price. They are furnished, finely finished in brass, for \$1 each; with extra finish and nickel plated, \$1.25.

F. L. POPE & CO., P. O. Box 5503. 38 Vesey St., New York.

WESTERN ELECTRIC MANUFACTURING CO. SOLE AGENTS ORTON'S PATENT AWL CLIPS.

These Clips have been in practical use for three years, and are rapidly displacing all others. They are designed for holding messages, and every form of blanks.

For convenience, durability and economy they are unequalled. WESTERN ELECTRIC MANUFACTURING CO., 220 KINZIE STREET, Chicago, Ill.

THE POCKET GALVANOMETER,

FINELY FINISHED IN BRASS, will be sent to any address by mail, on receipt of ONE DOLLAR, and 3 cents to pay the postage. NICKEL PLATED, Twenty-five Cents extra.

Special inducements to Operators and others acting as Agents. Further information and Circulars on application.

LANNERT & DECKER, Manufacturing Electricians, CLEVELAND, Ohio.

REMOVAL. GEO. H. BLISS & CO.

We respectfully announce our removal to 220 KINZIE STREET, CHICAGO, ILL. Having determined to transfer our interests to the Western Electric Manufacturing Company, we offer our entire stock of TELEGRAPH INSTRUMENTS, GOODS and MACHINERY for sale upon terms which cannot fail to prove desirable to purchasers.

GEO. H. BLISS, President. 220 KINZIE STREET, CHICAGO, ILL., April 12th, 1875.

ANNOUNCEMENT. Western Electric Manufacturing Company

GEO. H. BLISS having acquired an interest with this Company, has been appointed its General Agent.

His attention will be given to the sale of the Instruments and Goods of our manufacture and in which we deal.

In addition to our former line we have added the various specialties heretofore controlled by GEO. H. BLISS & CO.

With our ample facilities we hope to give to customers and the trade increased satisfaction in prices, quality and variety of our goods.

We invite correspondence and solicit patronage.

WESTERN ELECTRIC MANUFACTURING CO., 220 Kinzie street, CHICAGO, ILL.

BASTET'S NEW ELECTRICAL MOTOR AND BATTERY.

For Sewing Machines, Church and Parlor Organs, Small Printing Presses, Pumps, Lathes, Dentists' Instruments, or any Light Machinery.

My new ELECTRICAL BATTERY is the most powerful for quantity and durability manufactured, and does not crystallize the carbons. For Electroplating, Telegraphing, and for Motive Power, it cannot be surpassed.

Our No. 1 Engine, for Sewing Machines, with four cells of Battery, is furnished for \$40. Other Motors at prices proportional to power required.

BATTERY, No. 1 Cells \$5. No. 2 " 10.

L. BASTET, 607 Broadway, New York.

ORTON'S PATENT SECURITY MESSAGE HOOK.

The damage resulting from the loss of a single message is frequently sufficient to equip a line many times with the hook.

Papers cannot be blown or carelessly crowded from it. These hooks were first introduced by Geo. H. Bliss & Co. Thousands of them are in use in telegraph offices, banks and counting rooms.

Price, 30 cents each; or, \$3.00 per dozen. Liberal terms to the trade.

WESTERN ELECTRIC MANUFACTURING CO., 220 KINZIE STREET, Chicago, Ill.

THE KENOSHA INSULATOR CO.

**TELEGRAPH COMPANIES and
TELEGRAPH CONSTRUCTORS**

are invited to examine the merits of our new and improved patterns of

KENOSHA CARBON INSULATORS!

These insulators are made of wood, thoroughly baked, and covered with an INDESTRUCTIBLE COATING, highly repellant of moisture, which does not change nor deteriorate after years of exposure to the weather.

THE KENOSHA INSULATOR has now stood the test of Six Years' actual service, and we feel warranted in stating that, although costing but little if any more than the ordinary glass insulator, its insulating qualities are on an average

MORE THAN TEN TIMES AS GREAT

during the prevalence of rain or fog.

Immense numbers of these insulators are in use by

THE NORTH WESTERN TELEGRAPH CO.,

THE WESTERN UNION TELEGRAPH CO.,

as well as many RAILWAY and OTHER TELEGRAPH LINES, and they have invariably been found to give

ENTIRE SATISFACTION.

Besides the suspension insulator above shown, which is fitted with our IMPROVED WIRE HOLDER, arranged for a wire, and which does not cramp or injure the line wire, we manufacture several other patterns, among which is the

CAP INSULATOR, WITH PIN OR BRACKET,

which is fitted with a zinc protection, as shown in the above figure.

THE KENOSHA INSULATOR

is manufactured with the utmost care by skilled workmen and special machinery. Every individual insulator is TESTED IN WATER with a battery of 500 cells, and not a single imperfect one is allowed to leave the factory.

We are also prepared to furnish, at short notice,

CROSS-ARMS for any **REQUIRED NUMBER OF WIRES,**

prepared with our patent INDESTRUCTIBLE INSULATING COATING, either with or without wire insulators.

These insulators are packed for shipment in boxes containing 100 each, and may be ordered direct from us, or through any of the leading Dealers in Telegraph Supplies.

We are now prepared to fill all orders promptly, however large, and we guarantee all insulators furnished by us to prove entirely satisfactory.

THE KENOSHA INSULATOR CO.,

KENOSHA, Wisconsin.

L. G. TILLOTSON & CO.

General Eastern Agents.

GEORGE H. BLISS & CO.,
220 Kinzie Street, Chicago, Ill.

CINCINNATI, O.,

Elm St., cor. 5th.

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS—COMBINATION SETS; BOX and POCKET RELAYS.

PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, wire connections above the table.

REGISTERS, with SPRINGS or WEIGHT.

CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SREW GLASS and KENOSHA CARBON.

BRACKETS, PINS and SPIRES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANIFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRIC APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that is returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,
No. 40 WEST EIGHTEENTH STREET,
or to
L. G. TILLOTSON & CO.,
8 Dey street, Sole Agents.

ELECTRIC BELLS.

We have on hand and will furnish all descriptions of

ELECTRIC BELLS,

either Table or Wall Bells or Gongs, at manufacturers' prices.

F. L. POPE, & CO.,

38 Vesey street.

Send for new illustrated circular and price list.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

20 PER CENT. REDUCTION IN THE PRICE OF TELEGRAPH INSTRUMENTS!

SEE WHAT IT MEANS.

On First-class Morse Sets for Railway and Commercial Lines:

- No. 1 Relays, of standard size and resistance (120 to 150 ohms), on rosewood bases, fine finish, polished rubber covered coils, wound either with our patent glazed or with best silk covered pure copper wire, having soldered connections and firm nut fastenings throughout, and latest improved extension adjustments. Regular price, \$16, reduced to - - - \$12 80
- No. 1 Relay, same make throughout, but of higher resistance, 160 to 600 ohms. Price, \$18, reduced to - - - \$14 40
- No. 1 Relay, ditto, low resistance, 60 to 100 ohms. Price, \$15, reduced to - - - \$12 00
- No. 1 Sounders—"Railroad" or Bunnell's "New Giant" Sounders, with all the latest patented improvements in both. The best forms of Morse sounders ever invented. Beautifully finished. Mounted upon rosewood bases. Price, \$7 50, reduced to - - - \$6 00
- No. 1 Keys, Caton pattern, curved levers. Price, \$6 50 reduced to - - - \$5 20
- No. 2 Keys, W. U. pattern, curved or straight levers. Price, \$5 50, reduced to - - - \$4 40
- No. 1 Premium Register, \$45, reduced to - - - \$36 00
- " " Spring Register, \$47 50, reduced to - - - \$38 00
- " 2 Register. Price, \$38, reduced to - - - \$31 40

Box Relays, Combination Sets, Pocket Relays, Switches, Cut Outs, Lightning Arresters, etc., furnished at the same rate, viz., 20 PER CENT. REDUCTION from regular prices. See catalogue.

SINGLE SETS, OR PARTS OF SETS, WILL BE SENT BY EXPRESS AT THESE PRICES TO ANY PART OF THE U. S., ON RECEIPT OF MONEY ORDER OR DRAFT FOR THE AMOUNT OF THE BILL.

Superintendents and others about to purchase first class equipment for offices will readily see by a comparison with other price lists the advantages here offered to those who send their orders to us.

No. 2 SETS.

LEARNERS' APPARATUS, SHORT LINE INSTRUMENTS, Etc.

- No. 2 Relays, 150 to 175 ohms resistance. Price, \$15, reduced to - - - \$12 00
- No. 2. Relays, 50 to 100 ohms resistance. Price, \$11, reduced to - - - \$8 80
- Pony Relays, complete and pretty little instrument for short lines, city wires, etc., \$7 50, reduced to - - - \$6 00
- No. 2 Pony Sounders, \$6 50, reduced to - - - \$5 20
- No. 3 Pony Sounders, \$5 50, reduced to - - - \$4 40
- No. 1 Main Line Sounders for lines from 1 to 6 miles in length. Price, \$8, reduced to - - - \$6 40
- No. 2 Ditto, \$7, reduced to - - - \$5 60
- No. 3 Keys, curved levers, Caton style, same as No. 1, but smaller. Price, \$5, reduced to - - - \$4 00
- No. 4 Keys. Price, \$4, reduced to - - - \$3 20
- AMATEURS' KEY, \$3 50, REDUCED TO - - - \$2
- EXCELSIOR AMATEUR INSTRUMENTS, \$6 50, REDUCED TO - \$5 20
- BUNNELL'S LEARNERS' INSTRUMENTS, PERFECTED, \$6 50, REDUCED TO - - - \$5 20

At the above figures all grades of Telegraph Instruments may be obtained from L. G. TILLOTSON & CO. for less money than will buy as good materials at any other manufactory in America.

Orders, correspondence and inquiries will receive prompt attention. Make your memoranda of amounts for what you want from the above price list, and enclose the sum to us by postal order or draft along with your order for goods.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,
TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAYS

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth, or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDER made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Original Articles.

The Gold and Stock Telegraph Company.—Its Inception, Development, Business, etc.

THE removal of the offices of the Gold and Stock Telegraph Company from No. 61 Broadway, which was occupied by it for about five years, to the new Western Union building, corner of Broadway and Dey street, has been completed, and the company is now thoroughly and permanently established in its new quarters. It may not be uninteresting to the readers of THE TELEGRAPHER to be informed more in detail than they have been heretofore in regard to the business and apparatus of this enterprise, which from small and feeble beginnings has become one of the leading telegraphic enterprises of the country.

Like most of the new applications of telegraphic facilities to the purposes of business, the system of reporting the quotations of the Stock Exchange originated in this country. To Mr. E. A. Calahan belongs the credit of developing the first apparatus and system which was to become an indispensable business institution. It is not proposed at this time to trace the gradual development of this system to its present enormous proportions, but any account of it which should fail to accord to Mr. Calahan the credit due him for his foresight and ingenuity would be unjust to him, and would be incomplete and partial in its statements. Mr. S. S. Laws, who was at one time in its earlier days Vice-President of the Gold Exchange, about the time that Mr. Calahan was developing his system of stock reporting, was impressed with the necessity and advantages of immediate and continuous reports of the quotations of gold, which at that time greatly fluctuated, and he devised and introduced a system of "gold indicators," as they were termed, which were extensively patronized. Mr. Laws also invented and had commenced to introduce a stock reporting system and instrument, when he was bought out by the Gold and Stock Telegraph Company, and eventually retired from the business.

After Mr. Laws' sale to the Gold and Stock Company another system of printing telegraph instruments was invented by Mr. Frank L. Pope and T. A. Edison, for reporting the quotations of gold and exchange. The then firm of Pope, Edison & Co. entered into the business and met with considerable success. Unlike their predecessors, Mr. Laws and the Gold and Stock Telegraph Company, they did not seek their customers specially among the brokers, but undertook mainly to supply a different class, the merchants and others who were interested in the quotations. This firm never undertook to furnish stock quotations, and did not, therefore, enter into direct competition with the Gold and Stock Telegraph Company. However, the latter company eventually purchased their system and consolidated it with its own. Subsequently this firm, in connection with the Gold and Stock Co., established the American Printing Telegraph Company, for the construction of what are known as private telegraph lines, which also eventually was consolidated with the Gold and Stock Company. Before any of the purchases and consolidations above referred to had been consummated Gen. Marshal Leferts had become President and Executive Manager of the Gold and Stock Telegraph Company, resigning the situation which he had previously held with the Western Union Telegraph Company to accept the position. In the meantime the Western Union Telegraph Company had looked jealously upon the success and prosperity which had attended the enterprise inaugurated by the Gold and Stock Telegraph Company, and had made preparations to enter into competition with it. Mr. G. M. Phelps, the well known and ingenious Superintendent of the Western Union Company's shop in this city, had invented an instrument for the purpose, which was an improvement in many respects on that used by the Gold and Stock Co. The managers and principal stockholders of the latter company were considerably disquieted at the prospect of encountering so formidable a competitor as the Western Union Company, and after considerable negotiation a compromise was effected, by which the latter company obtained a controlling interest in the former, and abandoned its project of establishing a reporting system of its own. By the

terms of the arrangement the Western Union Company turned over to the Gold and Stock Company its system of commercial news reports (known to telegraphers as the C. N. D.), which had become a leading and successful feature of its business.

It will thus be seen that the Gold and Stock Telegraph Co. had purchased and absorbed all its rivals and competitors, and by its alliance with the Western Union Company had largely extended the sphere of its operations and increased its power and importance.

Subsequently, however, another rival and competitor made its appearance. The field was too good a one to be left entirely to the company. The Manhattan Quotation Company was organized. A new and very fast printer was devised and invented for this company by Mr. John E. Smith, then and still connected with Mr. Charles T. Chester, the well known telegraph and electrical instrument manufacturer of this city. Mr. Chester was largely interested in the new company, and was, in fact, its leading spirit. A bitter and protracted competition was inaugurated between the two companies. The charge for the introduction of the instruments was first done away with, and ultimately the price charged customers for the reports was reduced from \$6 per week to \$10 per month, the latter price by no means defraying the actual cost of furnishing the quotations and keeping the lines and apparatus in working order. A number of lawsuits for infringement of patents resulted from this competition, and while the Gold and Stock Telegraph Company were deprived of a large share of their profits, the opposition company was brought to the verge of bankruptcy. A few months since, as was announced in THE TELEGRAPHER at the time, an arrangement was made by which both companies maintained their existence, unprofitable competition was abandoned, and the charge for reports was advanced to \$20 per month—a not unreasonable amount, but one which affords a margin for reasonable profit.

The history of the inception, progress and present state of the Gold and Stock Telegraph Company has thus been hastily sketched, as a preliminary to the account which it is proposed to give of its present facilities, accommodations, and extent of operations.

The new offices of the Gold and Stock Telegraph Company are located in the fourth story of the new Western Union building, a large part of which is occupied by it. The executive officers of the company occupy three rooms on the left hand side of the hall, which extends from the elevator to the rear of the building. These offices are handsomely furnished and fitted up with every convenience for the accommodation of the officials, clerks, and the public who may have business with them. They are very light and pleasant, and are an improvement on those previously occupied. In these offices may be found during business hours the President, Gen. Marshall Leferts, the Secretary and Treasurer, Mr. H. H. Ward, the Superintendent of the Commercial News Department, Mr. E. F. Ludwig, and their assistants.

On the right hand side of the hall is found the offices of Mr. George B. Scott, the Superintendent of the Gold and Stock Department, and of Mr. W. K. Applebaugh, Superintendent of the Private Lines and Bank Lines. The Commercial News Department proper is located in the main operating room of the Western Union Telegraph Company, in the seventh story, one end of which is specially fitted up for its use. It will, perhaps, be well to give an account of each of the departments into which the business of the company is necessarily divided, and of the mode of doing the business, and the apparatus employed for the purpose.

As has before been stated, the principal and original business of the company is the reporting of the quotations of stocks and gold from the Stock Exchange and Gold Exchange, or Gold Room, as it is more generally termed.

The reports from the Gold Room are sent out directly from the room on the Laws Indicators, which are still used by the company for that purpose. These do not record the quotations, but indicate them by figures, which appear at perforations in the face or disk of the apparatus as they are transmitted from the Gold Room. Each subscriber is furnished with one of these instruments, which works automatically. The quotation shown is always the last one sent, which remains until some change takes place in the price. There is also used in connection with these indicators, for those who desire and are willing to pay an extra price therefor, what is termed the "bid system." This is, in fact, a simple galvanometer. The deflection of the needle to the right indicates that the "bid" price is $\frac{1}{2}$ per cent. below the selling price; a deflection to the left, that the "bid" and the selling prices are the same.

But one person is required to work the transmitter and report the quotations of gold from the Gold Room. A Morse wire also connects the Gold Room with the C. N. D., by which the quotations are transmitted to that department, and communication for other purposes kept up with the main office. The gold quotations are also sent with the stock quotations on the "stock" instruments.

The wider range of business at the Stock Exchange necessitates more extensive and elaborate arrangements. There are five reporters, who are also operators, employed in the Stock Exchange from its opening in the morning to its close in the afternoon. Each of these reporters and operators has a certain line or "pool" of stocks to look after and report, and is expected and required to keep track of them, and report any changes in quotations or bids. These reports are sent by telegraph to the central or main office, and are distributed from there by operators and instruments specially employed and designed for the purpose. The apparatus designed and used for this distribution is very elaborate and efficient. The original three wire system of Calahan, although of course much improved from what it was at first, is still used for what is known as the Down Town, or Brokers' System. Three wires are required to be connected with the receiving instruments by this system. The quotations are sent to all the offices in this division at one time by means of a Phelps Automatic Transmitter, which is run by a Phelps Electrical Motor. The cylinder and break-wheel used in this transmitter are similar in principle to the original transmitter in the House Printing Telegraph instrument. Projections on the cylinder are caught by the keys, and its revolution stopped at any desired letter or figure, which is then automatically printed on each of the numerous instruments in connection with it. A keyboard is used in connection with this transmitter resembling in its arrangement a piano keyboard. The keyboard has a very familiar appearance to an old House operator.

The Up Town System, as it is termed, is worked by what is known as the "Universal" instruments; but these are, it is understood, shortly to be abandoned and replaced with the stock printer invented by Mr. G. M. Phelps. A transmitter having no special peculiarities worthy of note is used in connection with the Universal.

Another circuit, known as the Up Town and Brooklyn Circuit, is operated with the Phelps Stock Printer. These instruments are very fast, and are excellent for the purposes for which they are designed and used. The transmitter used with these instruments is also a very ingenious affair, and is run, as are the others, by a Phelps Electric Motor.

By an excellent arrangement of relays the signal transmitted from these different instruments are automatically repeated on every instrument in connection with them respectively. Large cases on one end and side of the operating room contain hundreds of these repeating relays, and the whole apparatus is in the immediate control of the managers and operators.

The Private Lines Department is under the immediate management of Mr. W. K. Applebaugh. This is one of the most important branches of the business of the Gold and Stock Company. There are nearly 200 different contracts for supplying this facility to merchants, manufacturers, steamships, agents, etc., and over 350 instruments are now in operation in this city and Brooklyn. These lines and instruments are leased by the company, who maintain and keep them in order, supply ink and paper, etc. The instruments used are Gray's Printer, the Universal Printer, Phelps Printer, and the ordinary Morse telegraph instruments.

Under the care and management of this department there is also a system of "Bank Lines," by which a number of the leading banks of the city are connected with the Clearing House, and can, when so desired, be connected with each other for the interchange of communications. That is to say, by notifying the central office, any bank having one of these instruments can be connected temporarily with any other bank similarly provided, which is undoubtedly a most important convenience, and much facilitates the transaction of business between them.

The Produce and Cotton Exchange are connected directly with the Commercial News Department. Reporters are employed at each to prepare and transmit reports of quotations, state of the markets, etc., to the C. N. D. main office, which are there consolidated, and at certain specified times are simultaneously transmitted to subscribers, not only in this and adjoining cities but also throughout the country. The C. N. D. also receives and transmits through its agents commercial news and reports from all the important business localities. The system is a very perfect one, and supplies at a small individual cost to each subscriber an amount of reliable information which it would be almost impossible to obtain at any expense in any other manner. There are 250 printing instruments in connection with the C. N. D. in this city and Brooklyn. The reports are automatically sent to these by a direct acting transmitter, which is also the invention of Mr. G. M. Phelps, by means of which the necessity of using repeating relays is avoided. By means of this transmitter the reports are sent on all the circuits at the same time, and it is truly a very perfect and beautiful piece of machinery.

There is also another two wire apparatus used to a limited extent, but this is soon to be dispensed with. The printers mainly used by the C. N. D. are the inven-

tion of Mr. Henry Van Hovenburgh, who is Assistant Superintendent of this department.

This gentleman, although very modest and unassuming, is an able and accomplished electrician and mechanic, and the perfection of the apparatus and its adaptation to the commercial news system is largely due to his labors, talent, and inventive genius.

The marine news department of the Gold and Stock Company is located in the basement of the Cotton Exchange. This department was established a few months since, in consequence of the difficulties between the Western Union Telegraph Company and the Merchants' Exchange and News Room, and is under the management and superintendence of Mr. Thomas P. Scully. It is in direct competition with the old News Room and Association. A system of marine news reports is being perfected in connection with this room, and it is intended to be permanently established as a department of the company.

This article has already exceeded the limits assigned to it; but it would give an inadequate idea of the extent of the business of the company, present and prospective, if no reference were made to its operations in places outside of this city and its immediate vicinity.

The company has agencies and its special reporting instruments in use in Providence, Boston, Buffalo, Cincinnati, Chicago, Milwaukee, San Francisco, New Orleans, Memphis, Shreveport, and a multitude of other places of less note.

Its system of leased private lines and instruments is also established at St. Louis, Louisville, Chicago, Milwaukee, Cincinnati, Cleveland, Buffalo, Indianapolis, Memphis and Pittsburg, and its operations generally are being constantly extended.

With a few additional statistics this lengthy, but it is hoped by no means uninteresting, article will be closed.

There are used by the Gold and Stock and Private Lines Departments about 4,000 cells of carbon and 250 cells of Western Union Callaud battery. The battery room is in the upper stories of the building adjoining the Western Union building on Dey street, the lower stories of which are occupied by Messrs. L. G. Tibbottson & Co. The C. N. D. have, in addition to this, 2,600 cells of Western Union Callaud battery in constant use.

There are nearly 500 Three Wire Stock Instruments in use in this city and Brooklyn; 75 Universal Stock Printers; 13 Phelps Stock Printers; 86 Gold Indicators; 30 Gold Printers; 25 "Gold Bids" Instruments; about 250 instruments in connection with the C. N. D., and over 350 Private Line Instruments.

The company has about 100 miles of lines suspended on buildings, known as "housetop" lines; an air cable from 61 Broadway to Canal street, about one mile long, containing 11 wires; and 10 wire air cables to the Western Union building—aggregating about eight miles. Besides these it has 23 miles of pole lines in New York and 29 miles in Brooklyn, some of which carry as many as 43 wires to the pole. Seven cables, containing 7 wires each, connect New York with Brooklyn, and other cables, aggregating about a thousand feet, are laid at the Wallabout and in Newtown Creek.

The company employs in this city 140 persons in its service.

The above hastily prepared figures will give some idea of the extent and importance of the business of the company.

"The Telegrapher" deserving of a far more Liberal Support.—What it has accomplished, and what it is doing for the Fraternity.—How every Operator can Subscribe for it without missing the Money.

BY AGITATOR.

THE TELEGRAPHER commenced its career on the 26th day of September, 1864, under the auspices of the "National Telegraphic Union," an association of operators organized to build up and promote fraternal intercourse, help brothers in distress, etc.; but which, for lack of sympathy or disinterestedness, failed to accomplish anything enduring except the founding of THE TELEGRAPHER. In doing this the N. T. U. conferred upon the profession a benefit that will endure to the end of time. The chords that were then ever so lightly touched will continue to vibrate when we of this generation are sleeping beneath the sod.

Mr. L. M. Smith was first called to the editorial chair, who after a few months, was succeeded by Mr. Frank L. Pope. The last act of the Union was to call the present editor and publisher to the chair in place of Mr. Pope, who was desirous of retiring, on account of the pressure of other business. Mr. Ashley took the founding gently in his arms and commenced its nurture with a father's fondness for a child. He never fed it with skim-milk, but at the outset, seeing the positive necessity for its sturdy growth, poured into its veins the most nourishing food.

Scorning all offers to make the paper an organ, he said, "No; this nursling is the offspring of no narrow minded monopoly, but is fathered, and mothered, too, by the working class, poor but honest, and as their mouthpiece it shall continue to be so long as I have any connection with it. It shall be taught to speak boldly the truth, irrespective of combinations, cliques or individuals." That was over six years ago, and what has been the career of THE TELEGRAPHER up to this time? Has it ever been the exclusive organ of any company? Has it ever favored the strong to the exclusion of the weak? Has it ever indulged in bitterness towards a single person not deserving the same? Has not its course from its first to its last issue been one of honesty, straightforwardness and fair dealing towards all? Is it not right where Mr. Ashley then intended it should be—i. e., head and shoulders above any other publication of its character in the country? We think so; and it is only necessary to look at it and read it to be satisfied that he has performed an arduous task. From a small sized semi-monthly it has become a twelve page weekly. From a publication with very little reading matter of interest, he has made it to contain five or six pages of good sound articles, scientific, humorous and newsy. At first, with a very small list of subscribers and advertising patronage, he has added very materially to both, until the paper long since became self-supporting. Many have complained because of too much space being taken by advertisements. They forget that without this aid, relying upon subscribers alone, the paper never would have become even self-sustaining.

I don't think telegraphers fully appreciate the benefits which result to each one of them in the support and publication of such a journal in their midst. Suppose any of the telegraph companies should adopt an overbearing course with their employes—which has been done, and which will continue to be done—would not THE TELEGRAPHER be quick to sound the notes of condemnation, and speak forth manfully, fearlessly in the cause of the oppressed? Has it not done so in the past, and prevented many wrongs from which the operator would have suffered?

The fear of publication prevents many things, and we have THE TELEGRAPHER to thank for many things left undone.

Notwithstanding the paper has become self-supporting, operators should not withdraw the helping hand. It still needs and is deserving of your utmost support. Every telegrapher employed in the land should be a willing subscriber, and the more liberal the support in this quarter the more interesting will be THE TELEGRAPHER. Mr. Ashley is progressive, and when properly encouraged the paper will assume larger proportions and become more attractive.

There are hundreds of operators not taking the paper on the plea that times are hard, money scarce, and they can't afford it. Hundreds of these same operators smoke from three to six segars a day, costing ten cents each; now, cut off one segar a day (thereby doing yourself a good) for twenty days and you have two dollars saved; send it to Mr. Ashley, and within one year thereafter you will have received one hundredfold more gratification than those twenty segars would have afforded.

The other hundreds who don't smoke segars drink from three to (well, that's a stumper)—glasses of lager every day, at ten cents a glass. Cut it short only twenty glasses in a year—just think of it, only twenty glasses and send the two dollars, for which you will receive, not swill but something that will instruct your mind and make you a more noble ornament to the profession.

Boys, I have taken THE TELEGRAPHER from its first number to the present, and I would not be without it on my instrument desk and at my home fireside for five times its cost. I have it bound, and no money would buy it. As a volume for reference, telegraphically, it has no equal, and when I want to find the date of any prominent telegraphic occurrence in the past I can always get it from THE TELEGRAPHER.

Let us make it to the telegraphic world what the *Scientific American* is to the scientific world, and a few segars unsmoked, and a few glasses of lager untasted will accomplish it.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

"Express" Telegraph Messages.

TO THE EDITOR OF THE TELEGRAPHER.

THE official *Journal* of the Western Union Co., of the 15th inst., referring to Latimer Clark's advocacy, in England, of the "express" telegraph message system, takes occasion to publicly express the well known

views of the managers of that Company against this class of business—stating, in that elegant, forcible, and convincing language for which that truly *scientific* (!) and representative "journal" has long been distinguished, that the system, if established here, "would be perilous, and destructive, and disastrous," and that "no low priced message could hope for speedy delivery."

The "express" telegraph message system has long been in operation on the Continent, in Europe, and is there universally popular, both with the governments (who own the wires) and the peoples—and as we, in America, have all other kinds of "expresses," it is not quite so clear to my mind as it appears to be to the managers of the Western Union Co., that the system of "express" telegraph messages might not be introduced in this country with great advantage to the public and also to the telegraph companies.

With the exception of the messages incident to stock and kindred speculations between a few large cities, it is probable that more than one half the business of our telegraph companies is of a class for which great speed in delivery is of little, if any, importance; and the senders and receivers would be quite satisfied if the same were sent and delivered within one, two, or three hours. Why, then, should not that class of patrons be served at less expense than that other class whose business requires that their messages should be sent and delivered within a few minutes, or within the briefest possible time?

By the American system of treating all messages alike during the daytime, the really hurried messages are often delayed by others which are in no special haste. It is not infrequently the case in bad weather that a Morse telegrapher cannot send over a wire of even 100 miles in length as many as ten or even five ordinary business messages in an hour. At such times especially, and, indeed, it is an every day experience in telegraphing, that there is a class of business which can afford to pay five or ten times as much as other and unimportant business would justify; and it would be interesting if the opponents of the "express" system would state even one plausible reason why, as a matter of policy or of justice, the rule of *intrinsic value* should not be applied to telegraphing as well as to all other kinds of business. Suppose, for instance, that there are 1,000 messages to be sent from New York to Boston, between 10 o'clock A. M. and 6 o'clock P. M., and that 500 of them would be useless if not delivered before 2 o'clock P. M., whilst the other 500 would answer all practical purposes if delivered at any time before 6 o'clock P. M. Surely, in such a case, the 500 hurried messages ought to have precedence, and I can conceive of no more just principle than to charge for their transmission something more, and for the less hurried something less, and thus spread the business of telegraphing throughout the whole day, at the same time extending to all patrons more equally the facilities they really stand in need of and can afford to pay for. The effect would be unquestionably to bring on to the wires, at low rates of tariff, a vast number of long and short communications which now go through the mails.

The President of the Western Union Co. has stated to his shareholders the astounding fact that it costs that Company 32½ cents per message of 10 words for two of the many items which go to make up the total expense of telegraphing. Doubtless this statement is true, and it suggests urgent need for the managers of that company to scrutinize the workings of its whole system, and see if there is not some way by which the ordinary business of telegraphing can be reduced in cost; and when that duty shall have been faithfully and intelligently performed, I predict that one of the first conclusions will be that, in order to reduce the cost of telegraphing, the operators and wires must be occupied more uniformly through the whole day, thereby performing more labor with less operative force; and secondly, that these results can in no way be accomplished with advantage to all parties, except by the introduction of the European system of "express" messages, at a higher tariff than for ordinary or less hurried messages.

D. H. C.

A Lively Telegraph Business in Canada.—Enterprise and Extensions of the Dominion Telegraph Company.—No Obituary but Some Appreciative Words for "Nihil Nameless."

TORONTO, CANADA, May 21.

TO THE EDITOR OF THE TELEGRAPHER.

AS THE TELEGRAPHER is largely circulated among Canadian operators, perhaps a little Canadian news would not be out of place in its columns.

No need to complain of dull times any longer, at least not on the Dominion lines. In fact, they are getting almost too lively to suit those of the fraternity who are "constitutionally tired." One day last week 425 messages and about 5,000 words of "specials" passed over the Duplex, from Toronto to Montreal, between the hours of 10 A. M. and 6 P. M. It is the

D'Infreville Duplex which is in use here, and it has proved a great success.

A very busy season is anticipated, and in order to be able to handle the rapidly increasing business successfully the company is running up quite a number of new lines. Already this season a line of thirty-five miles has been built from Toronto to Whitby, giving five or six offices, which were formerly on a branch line, direct communication with Toronto; also a new line to Port Perry, fifty-five miles in length, taking in Markham, Uxbridge and Stouffville, so that there are now eight wires east from Toronto. Then there is another new seventy mile wire to Barrie; a 140 mile one to London; a 70 mile one from Hamilton to Fort Erie and Buffalo, and a 75 mile one from Harriston to Southampton. An additional line is also to be completed on the present poles to Buffalo, so that a duplex can be put on. Not a bad beginning for one season—a ray of hope for some of those ambitious students who are perhaps beginning to lose faith in the veracious insinuating circulars which give such glowing pictures of the large number of lucrative situations waiting for them to step into as soon as they shall have graduated. The present head office of the company is getting too small to accommodate the number of lines which are being run into it and the number of operators required to work them. In order to economize space as much as possible the desks which formerly stood in the centre of the room have been moved up close against the wall. This arrangement gives quite a bit more room, but I doubt if it will long prove sufficient. Nothing short of a "brand new" office, built to order, will satisfy the "rising young company."

Your editorial invitation in last week's paper to write an obituary for "Nihil Nameless" is "declined, with thanks," as your editorials sometimes say to aspiring authors. (Hope you won't feel it as keenly as I did when my first brilliant effusion, which I fondly imagined would bring me fame and cash, was returned with that encouraging remark.) I don't believe "Nihil" is dead at all, in spite of the neat burial Ichabod Crane gave him, and the touching requiem he sang over his grave; and I have no fancy for writing obituaries on live men—it makes one look silly when they "resurrect." He was fighting in a hopeless cause and against fearful odds. In talking skirmishes most men—even brave men—retreat ignominiously when the women open their mouths to speak. Poor "Nihil!" had the men as well as the women arrayed against him, and it must be admitted that he fought it out bravely. He certainly did not show any signs of "dying" in his last article—made some pretty good points. His generous offer to "share the honor" of using many words to express few ideas is neatly put and his home I assure you, for it is a fact that he is not the only one of your correspondents who is "extravagant in his use of the English language (not to mention the Latin). It was a good while before we heard the end of "Honest Irjun, share and share alike," and it was generally admitted here that he was fully entitled to score one that time. It certainly was a rash act for him to argue on his side of the question, but I think few could have argued it more skilfully than he did. He is evidently pretty clever, and can write well when he likes, and if he would only choose better subjects to write on his contributions would add considerably to the interest of the paper. I hope he will write often, and let his friends (and foes too, if he has any,) see that he is still alive, in spite of his rumored death and burial.

O. H. Kay and John Sterling deserve a vote of thanks from the ladies for so gallantly coming to their assistance. Had I known that "our side" was going to be so ably defended I would not have had so much to say on the subject.

I have a lot more news to tell, but as you seem prejudiced against long letters I'll just "hold it." Jo.

The Latest Strike.—The Boston, Mass., Western Union Telegraph Messengers Strike Against the Great Monopoly and Fail.

BOSTON, MASS., May 18.

TO THE EDITOR OF THE TELEGRAPHER.

AS WILL be seen from the following account which appeared in the *Boston Herald* of the 13th inst., there has been a little breeze here to relieve the monotony of the situation:

"Around the Doane street entrance to the rooms of the Western Union Telegraph Company, where the delivery boys have their headquarters, there was something of a breeze about noon to-day as the startling word went round that the boys had "struck." Forty young Mercuries had taken a stand against tyranny and oppression, which, in their eyes, was as outrageous as any that ever oppressed a people, and rising in their might had determined to overthrow and destroy the gigantic monopoly which stood between them and their rights. The cause of the trouble related to the uniform system which has been in operation since the first of the current year. The company furnished the uniforms on the first of January and charged each boy

\$10 for his outfit, deducting the amount from his wages by regular instalments. Many of the youngsters have been dissatisfied with this arrangement, but submitted to it, and would probably have done so longer had not new grievances been heaped upon them, as they think. With the opening of summer the company desired to have the boys appear in a fresh and lighter uniform, and made their arrangements accordingly. Last night the boys were informed that they were to receive Summer uniforms, and that \$11.25 would be charged for them. The young heroes went home and thought it over, and came this morning determined to resist. This they did as already shown, all but one or two of the entire party throwing up their commissions and leaving the corporation to its fate. There was no trouble or disturbance, but the resolution and sturdy determination in the faces of the youngsters could not be mistaken. They contented themselves with lingering around the street for a short time and then leaving the offensive locality. The company called in such boys as they could pick up to fill the vacancy, and it is not expected that they will have to suspend business on account of the "strike." The boys have received from \$5 to \$8 per week; the average being \$6.50. The officers of the company claim that this is more than they can earn anywhere else, and that the boys are foolishly injuring themselves. On the other hand, the boys say that they cannot afford to be buying clothes all the time. They say that when the clothes were furnished, the company stated that in case the boys were discharged or left before three months, an additional \$5 would be charged them, and this they thought a hardship. They were compelled to leave their uniforms at the office nights, and several had been discharged for wearing their pants home. Believing that having paid for the clothes they are now their own property, the boys took the uniforms with them when they left. They formed in a body and marched through several of the principal streets, stating their case to the merchants and business men, who generally gave them their sympathy. The boys have headquarters at 186 Washington street, whither they repaired for consultation.

"Mr. Twitchell, who has charge of the delivery boys, states that when the suits were delivered each boy was made to understand thoroughly that the uniforms were to be retained by the company. The amount charged for them, \$10, was considerably less than the cost, and the company deemed it necessary for their own protection, as well as the public interest, to retain the uniforms, since the principal object of the uniform system was to guard against the delivery of bogus telegrams and other forms of imposition."

The strike referred to above ended in complete failure. The strikers' places were speedily filled, and those who desired to return to work were not allowed to do so. One of the striking messengers, it is said, had a bank account of nearly \$1,000, which he had accumulated during the seven or eight years he was employed as a messenger. At first thought it would seem unjust that they should be compelled to pay for their uniforms, but when it is considered that the amount is really only about half their value, and that the system insures a neatness of appearance which could not be obtained if they were allowed to dress as they pleased, it will be seen that the boys were somewhat hasty and inconsiderate in their action. It will be a severe blow to many families which, in these hard times, have depended in part upon the money earned by the boys for support. S.

Cincinnati Musical.—Ruminations of a slightly Musical and very Hungry Telegrapher.

CINCINNATI, OHIO, May 15.

TO THE EDITOR OF THE TELEGRAPHER.

DURING the present week Cincinnati is in her best attire. The May Musical Festival has been in full blast, horns are tooted and fiddles squeaked till the very bricks of Cincinnati have become atomically adapted to the rhythmical motion of musical sound, and are fairly ready to "break forth into singing." I scarcely dare to speak of our city without a musical instrument in my hands, and as the flute is the only instrument which, in my wrestling, I have overcome, I keep one always handy and "breathe it softly" through that. In default of that I resort to a *subterfuge*. I once knew how to pound "The girl I left behind me" (I mean the tune, not the girl,) on a snare drum, so when I have not the flute at hand I put it through *juba* fashion on my stomach; not on account of its great size, but because, during the prevailing "tight times" and high price of *boards*, it is mostly empty enough to answer for one. Well, however scarce money may be, flags are plenty and cheap, and so 12 x 18 patriotism can afford to indulge itself in an unlimited number of small flags. Cincinnati is draped in flags (I am not certain that *draped* is the correct word, it may seem a trifle funeral but I'll let it pass). The W. U. office is ornamented with some eighty flags, I was out Wednesday evening on the Esplanade, and

there mingled with the throng which had congregated to "see the doings." Thousands were there viewing the statue fountain, so graphically named by Gris, the "Fat Contributor," "Mrs. Scattahwatah," and the display of calcium lights thrown upon it from opposite windows.

First a white light was projected upon it and the effect was, indeed, beautiful. The showers of water falling from her hands into the basin below, and springing into jets from the smaller founts, sparkled and flashed in the brilliant light like drops of molten silver. Who shall blame me if, like a boy, I wished that I might hold my hat in the argent stream until I had supplied myself with enough to keep the gaunt wolf from the door through the financial "Cramp?" While the thought was yet fresh and strong upon me a green light was thrown upon the same. A change came "over the spirit of my dream," my own late wish received then a portion of the light, and I saw it in its true color. A red light was used and my thoughts went back through the ages, and paused in the streets of ancient Rome, beside the bier of Julius Caesar. I saw Marc Antony stand over it, and heard his voice as he told the Romans his great love for him who should command their legions, win their victories, guide their state no more forever. In the statue I remembered the great Pompey's statue, and in the reflected color could see, as I had never seen before, the picture Antony painted for them, when he said—

"Then burst his mighty heart,
And in his mantle muffling up his face,
Even at the base of Pompey's statue,
Which all the while ran blood, great Caesar fell."

There was no strong probability that any otherwise unemployed Brutus would take it into his head to make a Caesar out of me. It was well that such was the case, since I had no mantle to use as a muffler. I know of no one who could or would officiate as a Marc A., and as I looked around upon the multitude of up-turned faces I thought I saw another probable dissimilarity in the twin circumstances. I could not help thinking to myself who in all this assemblage would miss me were I suddenly to pipe out? Echo did not answer who. Echo was not there, but I could answer the question myself. One figure would have expressed the sum total of their number, and that would have been the sum of one minus one. Then, in the independent spirit of a true operator, I remembered that I didn't care if they didn't care! So I whistled to myself something I tried to think had once been a tune before times got so hard and board so high, and slowly wandered homeward, wondering whether I should have for breakfast the faded ghosts of to-night's supper, or the prophetic type of to-morrow's dinner—so practical, so worldly do we become as soon as the back of an elevating thought is turned.

Having, as you see, already dwindled from the moralist over the corpse of Caesar to the careless hungerer after the loaves and fishes, I will bid you an "affectionate farewell!"
ICHABOD CRANE.

Business Improving on the Philadelphia & Erie Railroad.—Personals.

NORTHWESTERN, PA., May 1.

TO THE EDITOR OF THE TELEGRAPHER.

WINTER as yet holds on with a firm grip; the weather is cold and unseasonable, with snow frequently clothing the hills in a garb of white. The health of the operators along the line of the Philadelphia and Erie railroad is, however, good, and all are at their respective posts.

Succeeding the excitement occasioned by the "ice gorges," came the thawing weather. A few land slides occurred, but in no instance were trains seriously delayed.

The following is a list of the stations and operators on the Western Division of the Philadelphia and Erie railroad, commencing with Erie, Pa., the headquarters of the division: Mr. J. W. Scobell is chief operator at Erie, but is at present absent on his wedding tour through Canada; Messrs. J. S. Henry, J. W. Shatto, and G. Clarke are the train despatchers, with Messrs. J. A. Ebaugh and J. C. Curtis as operators in the same office, N. S. Connors, operator at the passenger depot, and J. Grace, day, and F. E. Wagner, night, operators at "O. D." outer depot.

Mr. G. W. Langdon is the operator at Langdon's, Pa.; Mr. Guenther, day operator at Waterford, Pa.; Mr. P. Deviney is the day, and Mr. W. S. Jeffery night operator at Union, Pa.; Mr. E. M. Chidester, day, and Mr. Wm. Atherly, night operator at Corry, Pa.; Mr. F. McDonald, day operator at Spring Creek Station, Pa., and Mr. D. Hubble at Garland, Pa.; Mr. J. M. Cronenberg is day, and Mr. J. D. Wells night operator at Princeton, Pa.; Mr. J. H. Harrison day, and Mr. L. W. Quirk night operator at Warren, Pa.; Mrs. E. J. Bouton, day, and Mr. J. F. Zurn, night operator at Sheffield, Pa.; Mr. J. C. Caswell day, and Mr. M. Hickey night operator at Ludlow Station, Pa.; and last, on the Summit, Mr. P. Small, day operator and P. Osborne, night operator at Kane, Pa.
THE WANDERER.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, MAY 29, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.) 38 VESEY ST., New York.

PREMIUMS FOR SUBSCRIPTIONS.

1,000 NEW SUBSCRIBERS WANTED.

It is desired to add 1,000 new names to the present Subscription List of THE TELEGRAPHER during the next two months. To accomplish this it is only necessary for the friends of the paper to engage energetically in presenting its claims to the consideration of the Telegraphers generally throughout the country.

To encourage such efforts it has been decided to offer the following

LIBERAL PREMIUMS.

For Two New Subscriptions, or Renewals of Subscriptions which have or are about to expire, we will give the person sending them

A NEW POCKET GALVANOMETER.

For Three New Subscriptions or Renewals,

A NEW POCKET GALVANOMETER, Nickel Plated.

A very handsome and useful article to every Telegrapher.

For Six New Subscriptions or Renewals,

A No. 3 TELEGRAPH KEY.

For Ten New Subscriptions or Renewals,

A No. 1 SOUNDER or No. 1 TELEGRAPH KEY,

For Fifteen New Subscriptions or Renewals,

A GALVANO-ELECTRIC or SHOCKING MACHINE.

The price of this Machine is \$10.

For Twenty-five New Subscriptions or Renewals,

A No. 2 RELAY.

For Forty New Subscriptions or Renewals,

A No. 1 RELAY,

Handsomely finished, with glass shade.

For One Hundred New Subscriptions or Renewals,

A No. 1 SELF-STARTING REGISTER

With glass shade, and everything complete.

Subscriptions must be paid in advance at the regular price of TWO DOLLARS per year. Subscriptions for less than a year will be counted proportionately.

Those who may desire to obtain Premiums can send in subscriptions as obtained, and they will be credited therefor, and can call for such Premium as they are entitled to for the whole number so credited at any time.

Specimen Copies of the paper will be forwarded, on application, to those who may desire to use them in canvassing.

Remittances should be made by Draft, Postal Money Order payable to, or Registered Letter addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.

NEW YORK.

Business Prospects and the Telegraphs.

THE spring season is over and summer is at hand. It is certainly and painfully apparent that the hopes of a revival of business, which were so generally entertained, have not been realized. The depression in business continues, and prices of most kinds of merchandise, property and labor are still tending downwards. The railroads are competing for business at unprofitable, and in some cases at ruinous rates, and the good time which was by many so confidently looked for during the season which has just passed, is now by common consent postponed till next fall. Whether it will come then is problematical, but it is perhaps better to live in hope even if eventually compelled to die in despair.

The financial centres are flooded with capital seeking temporary employment at very low rates of interest, while at the same time enterprises of good promise languish because capital for their development is unattainable on account of lack of confidence and timidity on the part of capitalists. This is not an encouraging picture of the situation, but it is a true one, and it is better to look the truth squarely in the face than to delude ourselves with a fool's paradise.

The fact is that the financial disease with us lay much deeper than was realized by people generally when the panic of 1873 suddenly arrested us in a seeming prosperity, which was in fact getting us farther and deeper and more inextricably involved in certain though future difficulty and embarrassment. As a nation we had been living beyond our means, and recklessly incurring indebtedness abroad, which must eventually be liquidated or repudiated. The country as a whole was by no means bankrupt, but we were drifting towards bankruptcy, and, notwithstanding the enormous resources of the country, it is a matter of time, and one of much suffering and rigid economy that is to restore us as a people to prosperity and a renewal of remunerative and profitable business enterprise. We are undoubtedly making progress in that direction, and while the path to solvency and prosperity is a hard and difficult one, yet it must be followed, and the more determinedly we pursue it the sooner will the goal be reached.

Our readers may, perhaps, wonder why we indulge in this line of reflection and reasoning, but if they will consider a moment they will realize the connection between the general financial and business condition of the country and the prosperity and success of telegraphs and telegraphic enterprises. While the telegraph enters so intimately into all the habits and peculiarities of our people that in any event there will always be a considerable amount of use of telegraphic facilities, yet it is undeniably true that the telegraphs cannot attain a satisfactory measure of prosperity unless the community generally is prosperous. When business is dull and unremunerative there cannot be so much demand for telegraphic facilities, and this fact has become practically apparent to telegraph managers. There is also at such times a demand for cheaper rates for telegraphic service, for people forced to economize in other directions are inclined to practice it in the use of the telegraph as well. It, therefore, becomes a matter of serious concern with telegraph managers how these demands shall be met, and the resources of their lines made commensurate with their expenditures.

A necessity has undoubtedly arisen for a more careful and economical administration of telegraphic affairs. It is believed that a wise and judicious economy might materially reduce the aggregate expenditure without diminishing the efficiency or earning capacity of the lines. There is not much chance for saving by a reduction in the compensation of the operators and clerks, for, as a general thing, this is now about as low as it could reasonably be made, but there are many ways in which economy might be profitably introduced.

At this time of general financial depression our telegraph corporations seem to be indulging quite ex-

tensively in the luxury of legal proceedings, which we fear will not prove very profitable to anybody but the legal fraternity. We do not know that these lawsuits could very well be avoided, but it is to be regretted that such a generally litigious disposition should be developed at such an unfortunate time. It would be well if telegraph companies could agree upon some other and less expensive mode of settling their differences and arranging conflicting interests. However, human nature is pretty much the same, whether shown in telegraph management or otherwise, and while individual or corporate interests are to be served by litigation, we suppose it will go on.

That we shall eventually work out of the present situation, as in former similar seasons of financial difficulty, is, of course, unquestionable; but the good time may not be so near as many are inclined to believe. We must all, whether connected with telegraphy or engaged in other business, economize as much as possible. If we make but little we must be content to spend but little until such time as we are more favorably situated. And while this very economy of expenditure contributes to the prevalent dulness of business, it will in the end prove most beneficial. There is no royal road to national prosperity and wealth. Real prosperity and wealth can come only by the exercise of intelligent industry and wise economy.

Reform Needed in the Patent Office.

WE hear much complaint in regard to the administration of affairs in the Patent Office. It is evident that a thorough reorganization and reform is needed in that branch of the Government administration. Unreasonable delay is constantly experienced, especially in that division which has charge of electrical and telegraphic inventions. This arises, in part at least, because the force is too small to act promptly on applications. The business of the Patent Office increases very rapidly, and no adequate provision is made for meeting this increase. The number of Examiners should be increased, and applications, instead of being delayed, should be promptly acted upon, and either granted or rejected speedily.

There would, perhaps, be some excuse for this condition of things if the Patent Office, like some other departments of Government business, was a losing concern; but, on the contrary, it is, and has been for many years, a source of revenue. Were it otherwise, it would be better that the amount of the fees required should be increased.

It is also charged that there is partiality and unfairness in the treatment of applicants, and that while some have no difficulty in getting their applications passed upon promptly, others are obliged to wait months and years before they can obtain final official action. It is undoubtedly true that some patents get through the office with suspicious promptness. What influences are brought to bear in such cases is more than we are prepared to state; but in one instance, at least, it is understood by those familiar with the business of the office that a patent was passed within a few days of its being filed, through the direct influence and interposition of the President. This is all wrong, for the President of the United States should have no more influence upon the action of the Patent Office officials than the humblest applicant for a patent. It was, in our estimation, most improper for the President to interfere in behalf of or adverse to any applicant, and we regret very much that he should have allowed himself to do so.

It is also privately asserted that there is a Patent Office Ring, composed of certain officials, and ex-officials, and patent solicitors, and that in order to get applications promptly and favorably acted upon in the office, it is necessary to employ certain solicitors who are connected with this ring. We do not assert the truth of this charge, but, at the same time, there are some things which indicate that it is not entirely destitute of foundation. We have not heard it asserted or intimated that the present Commissioner of Patents is

connected with this ring; but, in order to insure its success, this is not necessary. We desire simply to call the attention of the Commissioner to the unfavorable reports which are circulated—and by many who have business with his office are certainly believed to be true—in the hope that he will take the necessary steps to ascertain whether they are true, and remedy the evils complained of. If it is ascertained that any of the subordinates in the office are unfaithful to their trust, or partial in the discharge of their important duties, they should be removed; and if any such ring exists as is privately stated, it should at once be broken up, and its members, however high their position, debarred from further intercourse or business with the office.

Congress is very much to blame for its refusal to act upon the recommendations of the present and former Commissioners of reforms in the patent laws, which are urgently required. Notwithstanding this failure of Congress to act, the Commissioner under existing laws has power to remedy many of the evils complained of; and, while by prompt and energetic action he will, no doubt, incur the enmity and opposition of those who find their profit in the present condition of affairs, he will be supported in any reforms which he may attempt by every honest patentee and patent solicitor.

The Gold and Stock Telegraph Co.

THE account which we print in this number of THE TELEGRAPHER of the Gold and Stock Telegraph Co. will, we have no doubt, prove generally interesting to our readers. There has been no more wonderful development of telegraphic enterprise than is shown in the history of this company. It originated an entirely new system and application of telegraphic facilities, and in no other city in the world could its advantages have met with such an instant appreciation as in New York. Attempts to introduce this system in London and Paris have met with but indifferent success, and it will probably be years yet before it will come into general use in any of the financial centres of Europe. Its influence upon financial business in this city has been very great, and it is now indispensable.

But the Gold and Stock Telegraph Co., under the management of Gen. LEFFERTS, its President and Executive officer, has extended its sphere of operations, and its system of leased private telegraph lines cover this and adjoining cities, and it has been introduced into many of the other larger cities. Its commercial news reports are sent over the whole country, as well as generally distributed in this locality, and its last enterprise, a Marine news system and News room, shows that it still seeks for pastures new in which to display its enterprise.

The sketch of the company, although not as full and complete as could be desired, embodies the most important facts in regard to its past and present, and gives an idea of the extent of its operations. No other similar telegraphic enterprise is to be found in the world, and everything at present indicates for it a successful and prosperous future.

The Latest Telegraphic Strike.

IT seems, from the account which is printed in our correspondence column, that the messenger boys employed by the Western Union Telegraph Company, at Boston, have been indulging in the luxury of a strike. The cause of this was not insufficient compensation, but because of dissatisfaction at being required to pay for the uniforms furnished to them by the company, and which every messenger is obliged to wear while in the discharge of his duties.

As was to be expected this strike was a failure, and the only result was some temporary inconvenience to the company, and the loss of their situations by the strikers. This is not a good year for strikes, and none that have been undertaken thus far have been successful. These boys were evidently badly advised, and if they had considered the superabundance of

labor, especially of juvenile labor, in our large cities, they would have known what the result must be. Strikes are seldom beneficial to the strikers, and should be resorted to only in extreme cases, when the evils are unbearable, and no other remedy is possible.

Personals.

Mr. H. J. FORMAN has accepted a position with the Southern and Atlantic Telegraph Co., at New Orleans, La.

Mr. JOSEPH E. MCILVAINE of St. Louis, Mo., has accepted a position in the Leavenworth, Kansas, Western Union office.

Mr. S. T. ARMSTRONG, late manager Leavenworth, Kansas, Western Union office, has been appointed Superintendent Telegraph of the sub-division, and manager Denver, Colorado office, *vice* Mr. B. F. Woodward, resigned.

Mr. ALF. BREWER is taking "night press" at Sedalia, Mo., Western Union office.

Mr. ROBERT IRWIN, "the lightning transmitter of the West," is working on the night force, St. Louis, Mo., Western Union office.

Mr. FRED. B. MOXON, who was at Jefferson City, Mo., during the session of the Constitutional Convention, has returned to St. Louis, Mo., and accepted a position on the Western Union night force. 'Tis said that while at Jefferson City Fred. made the boys get down to their work a "little soon." That's a fact.

Mr. B. N. TROUT has been appointed Manager of the new Western Union office, just opened at Independence, Kansas.

Mr. CHARLES F. SNYDER, at St. Louis, Mo., who has been confined to his bed by sickness for the past seven months, has recovered sufficiently to be out again.

Mr. GEO. A. BOSWORTH has been appointed Manager of the Western Union office at Colorado Springs, Colorado.

Mr. E. L. RYDER, Chief Train Despatcher of the Mo. Pacific R. R. at State Line, Mo., has resigned.

Mr. C. H. SUMMERS, of Chicago, Ill., Electrician of the Western Union Telegraph Co., paid St. Louis, Mo., a brief visit recently.

Mr. SAMUEL ALLEN, Manager of the Atlantic and Pacific, Denver, Colorado, office, has resigned to accept a position in a bank in that city.

Mr. JAMES P. KEANE, of the New Orleans, La., Western Union office, is rusticiating at Titusville, Pa.

Mr. MORELAND, late press operator, Parker, Pa., Western Union office, has accepted a situation on the day force, same office.

Mr. JNO. ALGEO, of Oil City, Pa., Western Union office, succeeds Mr. MORELAND as press operator, Parker, Pa., same company.

Mr. BROOKS, formerly of Millerstown, Pa., Western Union office, but more recently of Parker, Pa., has been transferred to the Oil City, Pa., office, same company.

The Telegraph.

The Lease of the Franklin Telegraph Company's Property Annulled.

THE lease of the lines and property of the Franklin Telegraph Company to the Atlantic and Pacific Telegraph Company for ninety-nine years has been cancelled by agreement of the parties thereto. The validity of this lease was contested by a majority of the stockholders of the company (which was effected through the ownership by the Atlantic and Pacific Company of a controlling interest in the stock). This action restores the lines and property to the company, and the old arrangement will be resumed for the present, at least, by which the two companies connected for business purposes, but the organizations and accounts were kept separate. This action also restores to the Franklin Company the control of the connection with the Direct Cable, when it is completed.

The petition of the stockholders to the Supreme Judicial Court of Suffolk County, Mass., for the appointment of a Receiver, and the sale of the property and winding up of the company, on the ground of alleged frauds on the part of the Atlantic and Pacific Company, was to be heard before Judge Morton, Friday, the 28th inst.

The Western Union Telegraph Company have just had their poles through Richmond, Va., repainted.

A New District Telegraph.

YESTERDAY a number of gentlemen were, by special invitation, at the office of the Western Union Telegraph Company, to witness the practical operations of Messrs. Kates and Paynter's automatic telegraph. As previously stated, instruments have been placed in a large number of private residences and offices of the city. These instruments consist, as far as the uninitiated can see, of small walnut boxes, out of which run a lot of tapes attached to rings. Over the slots through which the tapes pass are indicated "Fire," "Dray," "Carriage," "Police," &c. If anything is wanted all one has to do is to pull the proper tape out to its full length and let it go. This immediately signals the central office, and the business is attended to by a corps of messengers forthwith. In case of fire the alarm passes through the central office direct to the engine house. The sender of the call is notified of the reception of his message by the vibrations of a needle on a dial attached to the face of his box. At eighteen minutes past 12 Mr. Paynter called the City Ambulance, which is stationed at the almshouse. In about a minute and a half came the answer, "Ambulance started," and in exactly fifteen minutes after the call the vehicle, in charge of Dr. F. Hannah, resident physician of the almshouse, and the driver, and provided with stretchers, lanterns, medicine case, surgical instruments, bandages, &c., was standing at the door of the office. Several other tests of the efficiency of the invention were made, after which all hands adjourned to discuss a collation.—*Richmond (Va.) Enquirer.*

Foreign Telegraphic Notes.

THE directors of the Great Northern Telegraph Company have issued an abridged report of the general meeting held at Copenhagen on the 28th April. It goes into details respecting the condition of the cables, &c., and states that the total dividend for the year was fixed at 7 per cent., after an amount had been added to the reserve fund; also that the traffic during 1874 had increased 492,072fr. compared with the previous year, or 27 per cent. It further states that the receipts had increased 567,068fr., or 38 per cent. against 1873.

There is every reasonable hope of a telegraphic line being shortly established between the Cape Colony and the Free State.

Some indignation is felt at the collapse of the Telegraph Cable Company to Aden *via* Mauritius (Hooper's), and the Ministry at the Cape will have to answer several plain questions about this contract during the ensuing session.

The "Indo-Australasian Telegraph Company (Limited)" has just been registered, with a capital of £2,000,000, in £10 shares. Its object is the establishment of telegraphic communication between India, Australia and New Zealand, and the intermediate points, in connection with the lines of the Indo-European Telegraph Company (Limited).

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended May 8, 1875, was 402,502, an increase on the corresponding week of last year of 26,632.

Telegraphic and Electrical Brevities.

The Western Union Telegraph Co. have built a loop from Cherryvale to Independence, Kansas, a distance of ten miles. Heretofore business for the latter point had to be mailed at Cherryvale.

The Government telegraph line from Deuison, Texas, to Fort Sill, has just been completed to Fort Richardson, Indian Territory, 114 miles west of Denison, and it is expected will reach Fort Sill by the first of June.

The Rocky Mountain Telegraph company are building a line from Central City to Georgetown, Colorado.

The Southern and Atlantic Telegraph Co. have opened new offices at 57 Second street and 58 Exchange place, Baltimore, Md.; and 42 Kilby street, Boston, Mass.

Branch offices have been opened at the Grand Avenue Base Ball Park, and at the corner of Garrison and Eastern avenues, St. Louis, Mo., for the accommodation principally of base ballists.

Death of Mr. Geo. Vail.—An Early Co-operator with Prof. Morse in Perfecting the Telegraph.

MR. GEORGE VAIL, a prominent citizen of Morristown, N. J., died at that place on Sunday evening of Bright's disease of the kidneys, at the age of seventy-two. Mr. Vail was in Congress from 1853 to 1857, and was United States Consul at Glasgow during Mr. Buchanan's administration. He was also a Judge of the Court of Errors of New Jersey. Among the dis-

inctions claimed for Mr. Vail is the fact that he co-operated with his father, his brother Alfred and Professor Morse in perfecting the telegraph and the first telegraphic instruments.

Failure of the Proposed New Western Union Loan.

THE bids for the loan of \$4,000,000 on bonds of the Western Union Telegraph Company, for which a call was made by Messrs. Morton, Bliss & Co., bankers of this city, which were opened on Tuesday, May 25th, aggregated less than \$300,000, and were not, therefore, held binding. The company therefore, in order to provide for the \$4,448,000 due November next, will probably have to adopt some new plan. The money can be raised by the sale of the stock of the company held in the treasury, or by using the net revenue for the purpose, and suspending dividends for a time.

The Illness of Prest. T. T. Eckert.

GENERAL T. T. ECKERT, President of the Atlantic and Pacific Telegraph Company, whose illness from a severe attack of pneumonia was recently noticed in THE TELEGRAPHER, although still confined to his room, is convalescent, and is progressing favorably. It is expected that he will be able in a few days to resume the discharge of his telegraphic duties.

Telegraphic Litigation.—Atlantic and Pacific Telegraph Co. Against the Southern and Atlantic Telegraph Co.

THE answer of the Southern and Atlantic Telegraph Co. to the complaint of the Atlantic and Pacific Telegraph Co. in the suit commenced by the latter, for breach of contract, asking for an injunction restraining the defendant from connecting with the Western Union Co., for damages, &c., has been filed.

The Southern and Atlantic Telegraph Co. claim that the contract of the 13th January, 1871, for connection, &c., made with the Franklin Co. was never legally ratified by the former company, and was the unauthorized act of the President of the company, Mr. Dorphley, that the plaintiffs have no standing in Court, as the contract was legally unassignable, and had in fact never been assigned by the Franklin Co. to the Atlantic and Pacific; that the lease of the lines of the Franklin Co., under which the Atlantic and Pacific Co. sue as plaintiffs, was fraudulent and illegal. Notwithstanding the contract to enforce which action is brought, was legally unauthorized, executed and ratified, the defendant claims that up to about the 6th of April, 1875, its stipulations on the part of the defendant were, so far as they legally could be, performed. That the stipulations on the part of the plaintiff and the Franklin Co. were grossly and continually violated; that the facilities agreed upon were not furnished, and that, in other respects, the agreements were persistently ignored and violated by the Franklin Co. and the plaintiff; and that this caused great and increasing damage to the defendant, amounting to at least \$100,000. That its business was constantly decreasing, its complaints and remonstrances fruitless and that, finally, for self-preservation, from ruin and bankruptcy, it was compelled to seek elsewhere for the facilities which the Franklin Co. and the plaintiff failed to furnish. It also asserts, on information and belief, "that plaintiff's company has fallen into the hands of certain speculators, who are ambitious to obtain the control of all the telegraph companies in the country, and then, by consolidating them, to form a gigantic monopoly of the entire telegraph business." That they have conspired to depreciate the stock of the different telegraph companies, and then, under guise of long leases, to absorb and consolidate them. That they have already thus seized the Franklin Telegraph Co. and have absorbed or obtained the control of the Automatic Telegraph Co., and that it intended to depreciate the stock of the defendant, secure a controlling interest therein, or by forcing it to a consolidation, "finish it up as they have done with the Franklin Co."

The answer further asserts that the defendant is a perfectly solvent and responsible corporation, in much better financial condition than the plaintiff; that its business is profitable, and since the discontinuance of its relations with the plaintiff, is increasing; that its telegraph business is now promptly and satisfactorily done, and that thus the increased patronage is secured and retained. Judgment is therefore demanded, dismissing the action, with costs.

Vacations of Telegraphic Employes.

A QUESTION that has often occurred to us, and caused much thought, is why the telegraph companies do not allow their employes leave of absence during the dull season, when a reduction of force is found necessary; and when with a little extra labor, they can spare one or more men.

The employes in the Government departments, in

business houses of all kinds, and even the man of all work (politely termed "clerk") of the humble "corner grocer," are allowed a brief week or so, in which to browse around, to gambol on the green, so to speak, in fact to refresh themselves and to recuperate their wasted energies.

To be sure telegraph operators are not the same as common mortals—"they make the lightning speak," and all that nonsense, but in our experience we have found that members of our fraternity can, under propitious circumstances, stand a little rest, and, without seriously discomposing the calmness of their spirits; in isolated cases they can stand a deal of "hard rest;" as for instance, the immortal Parsons, at Washington. But, do they ever have an opportunity to enjoy a brief season of uninterrupted doing-nothingness (to be sure we except ourselves, who were fortunate enough to be sent to Jefferson City, to send "specials," and assist the inhabitants in disposing of some country edibles)? The officials of our company have no objection to their employes going off on a visit if they provide a suitable substitute. But, how many among the thousands of us can afford the expensive luxury of a vacation on increased expense *without salary*? Alas, they are like angels' visits, few and far between.

In our business, at least, the saying that "none but the wealthy enjoy this life," is true. We want it otherwise, and look forward to the day when the company (the officials of the company—all the same) shall see the error of their ways and allow us all a short vacation, wherein to hie ourselves to the mountains, to the farm or any where, where we can find health and enjoyment.

"And low of cattle, and song of birds,
And health and quiet. * * *"

Every one would return to their duties with renewed life and energy, and tackle the increased work with a will.

O, ye bloated bondholders, and "high mucky mucks," who watch o'er the destinies of the toilers on the wires, if generosity, if goodness of heart is inherent in you, come down, in the language of the immortal bard—"give us a rest."—*The Electric.*

The Conflicting Quadruplex Interests of the Professor of Duplicity and Quadruplicity.

Extract from brief of counsel for Mr. Prescott to the Secretary of the Interior:

"For reasons controlling him (Edison) at that time," he did, as shown above, agree to assign an interest in these inventions conflicting with those claimed by Prescott, Harrington and the Atlantic and Pacific Telegraph Company, to Mr. Welch; and "for reasons controlling him at THAT time," he again conveyed the same inventions to Mr. Mills, through his attorney, Mr. Gould; and "for reasons controlling him at THAT time" he appeared before the Patent Office, asking that the patents might be issued to himself and Mr. Harrington; and "for reasons controlling him at THIS time" he now asks that, notwithstanding all former conveyances and requests, the patents should be "issued now to himself alone."

Telegraphic Test of Chronometric Time between Persia and England.

SOME idea of the ramifications of the electric telegraph may be gathered from an experiment successfully accomplished in London a few weeks since. Capt. Sartorius, at present in Teheran, Persia, wished to test his pocket chronometer, and to check with absolute correctness its time in Persia with Greenwich time. To do this it was necessary to have a clear line from Teheran to London, a distance by "wire" of nearly 4,000 miles. After some little trouble in getting the German relays into satisfactory order (the lines come through Berlin) the important signal was made several times to insure accuracy, with the result that the watch was found to be two seconds slow by Greenwich time. The experiment was of double interest, as it also tested the performance of a watch which has been constructed on a plan calculated to withstand a great deal of comparatively rough usage, and yet keep time with sufficient accuracy for many scientific observations. The watch was a half chronometer double rolled lever, made by Messrs. Barraud & Lund.

Miscellanea.

ELECTRICAL PROPERTIES OF THERMAL SPRINGS.—The water of thermal springs is sometimes possessed of remarkable electric properties, as appears from recent observations by M. M. Thury and Minich, at Baden, Switzerland. They inserted two platinum electrodes (connected with a galvanometer), one in a thermal spring, the other in the River Limmatt, and a continuous deflection of 74° was obtained. Later, when the electrode in the spring got covered with bubbles, the needle went back to 60°; but it returned to 70° again when the bubbles were removed. The thermal

water was shown to be negatively electric. Fresh and still warm mineral water in a vessel was also found to be negatively electric to cold river water in another vessel. The deflection was 44½°, and came down to zero as the mineral water cooled. Polarization was here not the cause of return of the needle. When the cooled water was heated to 47° Cent. no current was obtained with the cold water. Nor, again, did heated water that was charged with carbonic acid give a current with cold water. It would, therefore, appear that the electricity in question depends neither on a thermoelectric action nor an action of carbonic acid on the electrodes. Further experiment is required to explain it sufficiently.—*English Mechanic.*

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended May 4th, 1874, and bearing that date.

162,806.—GALVANIC BATTERIES.—William M. Davis, Cleveland, Ohio. Filed March 9, 1874.

Automatically gives notice of the total consumption of the sulphate of copper or of the zinc. Water level automatically regulated by a hydrometer.

1. In combination with the zinc bar E of a galvanic battery, the guiding cell F and its supporting shell f, substantially as and for the purpose specified.

2. The combination, in a galvanic battery, of a water reservoir, G, a hydrometer, H, and valve K, operating together, substantially as and for the purpose specified.

3. The combination, with the reservoir D and the common call circuit, of the call weight P and the contact spring Q, substantially as and for the purpose specified.

4. In combination with the descending bar of zinc E of a galvanic battery and a common call circuit, the call catch R and the contact spring r operating together substantially as and for the purpose specified.

5. In combination with the ascending bulb H, in the liquid of a galvanic battery and a common call circuit, the contact spring S on beam I, or their mechanical equivalents, operating together substantially as and for the purpose specified.

162,953.—FIRE ALARM TELEGRAPHS.—Andrew Rosenbusch, Quincy, Ill., assignor of one half his right to Theodore W. Kretz, same place. Filed Mar. 3, 1875.

Pointer in each box continues to be carried around by a step by step movement, produced by automatic interruptions of the circuit at the central box, until circuit is permanently broken at the box from which signal is sent in by means of an arm upon the shaft of the pointer operating a circuit breaking lever; said arm being so arranged with relation to the pointer that the circuit shall be broken at the moment that the pointers stand at the number indicating that particular box.

1. A system of fire alarm signal boxes in a common closed circuit, with an alarm box common to them all, upon the breaking and making of which circuit at any signal box the number of said box is automatically transmitted from the common alarm box and indicated at all the other boxes.

2. The lever I, provided with the detent R, in combination with the curved tooth U, operated by the shaft r, substantially as set forth.

3. The lever O, of non-conducting material, provided with the tongue b, and operated by the lock Q, substantially as set forth.

4. The curved tooth U, for the purpose specified.

NOTICE.

In consequence of the number of applications for the POCKET GALVANOMETER, which we offered as a premium for addresses being so much greater than we anticipated, we are compelled in justice to the applicants and to ourselves, to resort to what we believe will be a more satisfactory method of distribution than that of "first come first served," which would entirely exclude those from a distance and give to those near at hand.

Desirous of giving all an equal chance we have resorted to the following plan of distribution:

As many cards as applicants (with the name of an applicant on each card), were placed in a box, and in another box were placed as many cards as applicants, 25 of which were premiums, and the remainder blanks, then a disinterested person, blindfolded, drew a card from each box at the same time, until all were drawn. The applicants whose names were drawn with prizes will receive a GALVANOMETER, which will be sent at time stated.

In order to satisfy all applicants that we have distributed the number advertised, we will be compelled to send to each applicant, a list containing the address of those who will receive an instrument. Thankful for the favors extended us, we remain,

Very respectfully,
LANNERT & DECKER,
Manufacturing Electricians,
CLEVELAND, O.

BASTET'S NEW ELECTRICAL MOTOR AND BATTERY,

For Sewing Machines, Church and Parlor Organs, Small Printing Presses, Pumps, Lathes, Dentists' Instruments, or any Light Machinery.

My new ELECTRICAL BATTERY is the most powerful for quantity and durability manufactured, and does not crystalize the carbons. For Electroplating, Telegraphing, and for Motive Power, it cannot be surpassed.

Our No. 1 Engine, for Sewing Machines, with four cells of Battery, is furnished for \$40.

Other Motors at prices proportional to power required.

BATTERY, No. 1 Cells - - - \$5.
" No. 2 " - - - 10.

L. BASTET,
607 Broadway, New York.

WESTERN ELECTRIC MANUFACTURING CO.

SOLE AGENTS

ORTON'S PATENT AWL CLIPS.

These Clips have been in practical use for three years, and are rapidly displacing all others.

They are designed for holding messages, and every form of blanks.

For convenience, durability and economy they are unequalled.

WESTERN ELECTRIC MANUFACTURING CO.,

220 KINZIE STREET,
Chicago, Ill.

THE POCKET GALVANOMETER,

FINELY FINISHED IN BRASS,

will be sent to any address by mail, on receipt of ONE DOLLAR, and 3 cents to pay the postage.

NICKEL PLATED, Twenty-five Cents extra.

Special inducements to Operators and others acting as Agents.

Further information and Circulars on application.

LANNERT & DECKER,

Manufacturing Electricians,

CLEVELAND, Ohio.

ELECTRIC RAILROAD SIGNALS

ECONOMY, RELIABILITY AND SAFETY

Are secured by the use of our improved

AUTOMATIC BLOCK SIGNALS,

SEMAPHORE SIGNALS,

SWITCH AND DRAWBRIDGE SIGNALS.

We have Patented and Manufacture an

ELECTRIC BELL,

FOR

RAILROAD CROSSINGS,

Superior to anything of the kind heretofore used.

IT IS LOUDER,

MORE RELIABLE

AND ECONOMICAL

Than any similar apparatus ever offered for sale.

Our inventions are covered by numerous patents, and the entire system is the most reliable and complete of any in this or any other country.

For Pamphlet, containing full description, Illustrated, Railroad Officers and Managers will please send to

THE ELECTRIC RAILROAD SIGNAL CO.,

38 VESEY STREET,

NEW YORK

P. O. Box 5408.

GEORGE H. BLISS & CO.,

220 Kinzie Street, Chicago, Ill.

CINCINNATI, O.,

Elm St., cor. 5th.

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS—COMBINATION SETS; BOX and POCKET RELAYS.

PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, wire connections above the table.

REGISTERS, with SPRINGS or WEIGHT.

OUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUITA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SOREW GLASS and KENOSHA CARBON.

BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANIFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that is returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET,

or to

L. G. TILLOTSON & CO.,

8 Dey street, Sole Agents.

ELECTRIC BELLS.

We have on hand and will furnish all descriptions of

ELECTRIC BELLS,

either Table or Wall Bells or Gongs, at manufacturers' prices.

F. L. POPE, & CO.,

38 Vesey street.

Send for new illustrated circular and price list.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

20 PER CENT. REDUCTION IN THE PRICE OF TELEGRAPH INSTRUMENTS!

SEE WHAT IT MEANS.

On First-class Morse Sets for Railway and Commercial Lines:

- No. 1 Relays, of standard size and resistance (120 to 150 ohms), on rosewood bases, fine finish, polished rubber covered coils, wound either with our patent glazed or with best silk covered pure copper wire, having soldered connections and firm nut fastenings throughout, and latest improved extension adjustments. Regular price, \$16, reduced to - - - \$12 80
- No. 1 Relay, same make throughout, but of higher resistance, 160 to 600 ohms. Price, \$18, reduced to - - - \$14 40
- No. 1 Relay, ditto, low resistance, 60 to 100 ohms. Price, \$15, reduced to - - - \$12 00
- No. 1 Sounders—"Railroad" or Bunnell's "New Giant" Sounders, with all the latest patented improvements in both. The best forms of Morse sounders ever invented. Beautifully finished. Mounted upon rosewood bases. Price, \$7 50, reduced to - - - \$6 00
- No. 1 Keys, Caton pattern, curved levers. Price, \$6 50 reduced to - - - \$5 20
- No. 2 Keys, W. U. pattern, curved or straight levers. Price, \$5 50, reduced to - - - \$4 40
- No. 1 Premium Register, \$45, reduced to - - - \$36 00
- " " Spring Register, \$47 50, reduced to - - - \$38 00
- " 2 Register. Price, \$38, reduced to - - - \$31 40

Box Relays, Combination Sets, Pocket Relays, Switches, Cut Outs, Lightning Arresters, etc., furnished at the same rate, viz., 20 PER CENT. REDUCTION from regular prices. See catalogue.

SINGLE SETS, OR PARTS OF SETS, WILL BE SENT BY EXPRESS AT THESE PRICES TO ANY PART OF THE U. S., ON RECEIPT OF MONEY ORDER OR DRAFT FOR THE AMOUNT OF THE BILL.

Superintendents and others about to purchase first class equipment for offices will readily see by a comparison with other price lists the advantages here offered to those who send their orders to us.

No. 2 SETS.

LEARNERS' APPARATUS, SHORT LINE INSTRUMENTS, Etc.

- No. 2 Relays, 150 to 175 ohms resistance. Price, \$15, reduced to - - - \$12 00
- No. 2. Relays, 50 to 100 ohms resistance. Price, \$11, reduced to - - - \$8 80
- Pony Relays, complete and pretty little instrument for short lines, city wires, etc., \$7 50, reduced to - - - \$6 00
- No. 2 Pony Sounders, \$6 50, reduced to - - - \$5 20
- No. 3 Pony Sounders, \$5 50, reduced to - - - \$4 40
- No. 1 Main Line Sounders for lines from 1 to 6 miles in length. Price, \$8, reduced to - - - \$6 40
- No. 2 Ditto, \$7, reduced to - - - \$5 60
- No. 3 Keys, curved levers, Caton style, same as No. 1, but smaller. Price, \$5, reduced to - - - \$4 00
- No. 4 Keys. Price, \$4, reduced to - - - \$3 20
- AMATEURS' KEY, \$3 50, REDUCED TO - - - \$2 50
- EXCELLENT AMATEUR INSTRUMENTS, \$6 50, REDUCED TO - - - \$5 20
- BUNNELL'S LEARNERS' INSTRUMENTS, PERFECTED, \$6 50, REDUCED TO - - - \$5 20

At the above figures all grades of Telegraph Instruments may be obtained from L. G. TILLOTSON & CO. for less money than will buy as good materials at any other manufactory in America.

Orders, correspondence and inquiries will receive prompt attention. Make your memoranda of amounts for what you want from the above price list, and enclose the sum to us by postal order or draft along with your order for goods.

L. G. TILLOTSON & CO.,

8 Dey street, New York,

54 SOUTH FOURTH STREET, PHILADELPHIA.

AMERICAN FIRE ALARM AND POLICE TELEGRAPH.

GAMEWELL & CO., Proprietors, 62 BROADWAY, NEW YORK.

- J. W. STOVER, General Agent and Superintendent. L. B. FIRMAN, Chicago, Ill., General Agent for the West and North-West. TELEGRAPH SUPPLY AND MANUF'G CO., Cleveland, Ohio, Special Agents for the Middle States. J. R. DOWELL, Richmond, Va., Special Agent for Virginia and North Carolina. J. A. BRENNER, Augusta, Ga., Special Agent for Georgia and South Carolina. L. M. MONROE, New Canaan, Conn., Special Agent for New England. ELECTRICAL CONSTRUCTION AND MAINTENANCE CO., San Francisco, Cal., Special Agents for California, Oregon and Nevada.

THIS SYSTEM OF FIRE ALARM & POLICE TELEGRAPH WITH A CENTRAL OFFICE, OR UPON THE AUTOMATIC PLAN, is now in operation in the following Cities, to which reference is made for evidence of its great SUPERIORITY, VALUE AND UNIFORM RELIABILITY.

- Albany, N. Y., Alleghany, Pa., Boston, Mass., Bridgeport, Conn., Buffalo, N. Y., Baltimore, Md., Chicago, Ill., Cincinnati, Ohio, Columbus, Ohio, Cambridge, Mass., Charlestown, Mass., Covington, Ky., Detroit, Mich., Dayton, Ohio, Elizabeth, N. J., Fall River, Mass., Fitchburg, Mass., Hartford, Conn., Indianapolis, Ind., Jersey City, N. J., Louisville, Ky., Lowell, Mass., Lawrence, Mass., Lynn, Mass., Mobile, Ala., Montreal, Canada, Milwaukee, Wis., New York City, New Orleans, La., New Bedford, Mass., New Haven, Conn., Newark, N. J., Omaha, Neb., Philadelphia, Pa., Pittsburg, Pa., Portland, Maine, Peoria, Ill., Providence, R. I., Quebec, L. C., Rochester, N. Y., Richmond, Va., St. Louis, Mo., St. John, N. B., Springfield, Mass., San Francisco, Cal., Savannah, Ga., Syracuse, N. Y., Troy, N. Y., Taunton, Mass., Toledo, Ohio, Toronto, Canada, Washington, D. C., Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.
