General Information

The Blessed Virgin Mary and the Christ Child.

Probably there is a rebate of half an inch or so in the casing that holds the sash in place. This should take care of holding the glass on one side, and the carpenters can easily provide a wooden stop bead, or a bevel of putty for the other side.

As the window will be in the middle of the nine inch space, I think we should provide a heavy outside lead came, probably about one and a half inches, otherwise as one looks up at the window, the width of the casing is liable to cut off the view of the lettering, at the angle at which it will be seen. Also a dark frame around the brilliant color will set it off to good purpose.

Wall thickness where the window is located is 9 inches.
