INDEX.

Acetylene, Discovery of.....	220	Automobiles in Europe.....	16, 17, 187, 206	California, Southern, Development of Electric Power in.....	173
Adams, Alton D. (Relative Dynamo and Motor Capacities).....	243	Automobiles in Paris. By John K. Gowdy. Illustrated. (U. S. Consular Report).....	206	Canada, History of the Telephone in. By W. L. Sewell. (U. S. Consular Report).....	241
Advance Gas Lighter. Illustrated.....	176, 232	Automobile Truck, Patton. Illustrated.....	209, 210	Canadian Electrical Association.....	280, 325
Air, The Region of the Upper. By Prof. John Trowbridge.....	4	Automobile Vehicles at the Cycle Show. Illustrated.....	21	Canadian Intelligence. (Correspondence).....	73, 74, 88, 130, 234, 261, 292, 275, 361
Albanese, G. Sacco. Portrait.....	340	Baker, W. E., Dinner to.....	140	Canadian Power Transmission Project.....	227
Allen, Henry E. (Taxation, Trusts and Natural Monopolies).....	129, 130	Balancing of Armatures, The. By Claude W. Hill. Illustrated.....	225	Canadian Side, Development of Niagara Power on the.....	164, 223
Alley "L," Success of the Electric System on the.....	64, 65, 274	Baltimore, Independent Telephone Interests in.....	126	Canadian Telephone Service.....	217, 244
Alleys, Private, Poles and Wires in.....	324	Bates Ceiling Fan. Illustrated.....	163	Cary Springs, The. Illustrated.....	191
Alternating-current Motors, Single-phase, in St. Louis (Wagner). Illustrated.....	30, 31, 32	Battery, Bunnell's Home Medical. Illustrated.....	201, 205	"Cape to Cairo" Telegraph, The.....	106, 107, 191
Alternator, La Roche Ideal. Illustrated.....	86	Battery, Hercules. Illustrated.....	163	Carbide Factory, A Great. By Orrin E. Dunlap. Illustrated.....	241
Aluminum as an Economic Factor. By Franklin H. Wentworth.....	52	Battery, Progress Dry (Phoenix Carbon Manufacturing Company). Illustrated.....	17	Carbon Duty Assessed at Twenty Per Cent.....	95
Aluminum at Niagara. Illustrated.....	183	Becken's Non-magnetic Watch. Illustrated.....	205	Carbonization of Wood, Electrical. By G. E. (Communication).....	227
Aluminum, Electrical Production of.....	261	Beers, G. W. Portrait. (Supplement).....	132b	Carbon, Elliptical Patent Litigation.....	261
Alumina, Electrical Uses of.....	343	Bell Company Absorbs Interstate.....	15	Carbon Makers, Combination of.....	27
Aluminum Feeders for the Northwestern Elevated Railroad.....	271	Bell Companies' Mortgages.....	113	Carlson, A. Portrait. (Supplement).....	132b
Aluminum Telephone Lines.....	175	Bell Instrument Output.....	330	Carnes, Gen. S. T., President of the National Electric Light Association. Portrait.....	263
American and German Iron Workers Compared.....	319	Bell Interests, Consolidation of.....	71	Carriage and Bicycle Lamps, Vesta Electric. Illustrated.....	272
American Automobiles for Bombay.....	86	Bell Interests in Michigan.....	28, 216, 357	Carty Bridging-bell Patent Upheld by Court of Appeals.....	344, 345, 358, 359
American Bell Telephone Company, Annual Meeting of the.....	188	Bell Management, Meadacity of.....	244	Carty Patent and Independent Exchanges. By H. C. Dodge. Illustrated.....	358, 359
American Bell Telephone Company, Principal Stockholders of the.....	268	Bell Monopoly, Result of the.....	300	Ceiling Fan, Bates. Illustrated.....	163
American Currency in Porto Rico.....	3	Bell, Professor, Believes in "Wireless Telephony".....	212	Central-energy Telephone System at Henderson, Ky. Illustrated.....	138
American Electric Specialty Company's Direct-reading Ohmmeter. Illustrated.....	72	Bell Securities Increased.....	189	Central-office System of the Newark Telephone Company. Illustrated.....	136, 137
American Electric Telephone Company's New Building.....	352	Bell Service, Opposition to.....	43	Central-station Business, Arc-lamp Department of. By H. W. Hillman. Illustrated.....	252, 253, 254
American Electric Telephone Company's Specialties. Illustrated.....	143, 144	Bell Telephone Business for 1898.....	28, 188	Central-station Design, Trend of. By B. J. Arnold. With discussion. (Northwestern Electrical Association).....	168, 169, 170, 176, 177
American Electric Vehicle Company's Exhibit at the Cycle Show. Illustrated.....	21	Bell Telephone Company, American, Principal Stockholders of the.....	268	Central Stations, The Progress of in 1898. By Louis A. Ferguson.....	30, 11
American Electrical Novelty and Manufacturing Company's "Ever Ready" Electric Light. Illustrated.....	176	Berlin, Motor-carriage Exposition at.....	236	Central Telephone and Electric Company's New Home. Illustrated.....	142
American Electrical Progress in South America, English Review of.....	111	Berliner Litigation.....	160	Central Union Telephone Company (Annual report).....	59
American Electro-therapeutic Association.....	329	Bicycle and Carriage Lamps, Vesta Electric. Illustrated.....	272	Central Union Telephone Company, Finances of.....	180, 316
American Engineering Exhibits at Paris.....	49	Board of Trade, Chicago, Telephone System. Illustrated.....	352, 353	Cheap and Poor.....	230
American Impulse Water-wheel. Illustrated.....	289	Boats, Electric, To Build.....	100, 101	Chicago, Automobiles in.....	351
American Institute of Electrical Engineers. (Regular meetings and papers).....	4, 72, 81, 87, 92, 93, 94, 107, 108, 111, 113, 114, 115, 116, 122, 123, 184, 257, 297, 329	Bogart Company's New Device for Igniting Welsbach Lights in Series. Illustrated.....	218	Chicago Board of Trade Telephone System. Illustrated.....	352, 353
American Management, Labor and Resources.....	272	Bombay, American Automobiles for.....	86	Chicago City Railway Company (Annual report).....	41
American Manufactures in Russia.....	159, 196	Book Table.....	159	Chicago, Department of Electricity of, Annual Report of the.....	197, 198, 315
American Society of Mechanical Engineers (Paper).....	281	Boston Elevated Road, Route of. Map.....	24	Chicago, Early Electric Lighting in.....	66
American Steel and Wire Company.....	27	Bowen, M. K., Death of. Portrait.....	215	Chicago Edison Company (Annual statement and annual meeting).....	257, 343
American Street Railway Association.....	41, 67, 83, 184	Bowes, A. L. (Electric Lighter for Fire-engine Boiler Wanted).....	320	Chicago Edison Company, Temporary Removal of.....	273, 274
American Telephone Equipment for British Columbia Exchange. Illustrated.....	135	Brain X-ray Work in the, Some Suggestions on. By N. B. Delamater, M. D. (Illinois Homoeopathic Association).....	282, 283	Chicago Electrical Association (Meetings and papers).....	86, 149, 155, 156, 157, 162, 163, 182, 183, 190, 297, 297
Andrae & Sons Company's Switchboard for Fish Brothers. Illustrated.....	58	Bramhall, John T. (Power at the Paris Exposition).....	324	Chicago Electrical Banquet.....	259, 280
Animals, Influence of Electricity on. By Henri Coupin. Illustrated.....	25	Brazil, North, Electrical Supply Houses in, Opportunities for the Establishment of. By C. Paulo Rei.....	240, 205	Chicago Electrical Exposition. Illustrated.....	255
Appleton, Joseph. (Latest Progress in the Application of Storage Batteries. Illustrated).....	66, 67, 80, 81, 101	Breslau, Electric Railways in.....	205	Chicago, Electric Street-lighting Extension in. Illustrated.....	243, 281
Apprentices and Journeymen, Electrical, Education of. By Arthur A. Hamerschlag. (American Institute of Electrical Engineers).....	81, 87	Bridge, Steel Arch, at Niagara, Threatened by Ice Bridge. By Orrin E. Dunlap. Illustrated.....	66, 67	Chicago, Expansion of Electric-vehicle Interests in.....	16, 17, 210, 273
Arc, Electric, Steel Girders Burned by an.....	153, 154	Bridging-bell Patent, Carty, Upheld by Court of Appeals.....	344, 345, 358, 359	Chicago, First Result of Telephone Competition in.....	85
Arc Generator Regulator, Brush. Illustrated.....	17, 18	Bridging System, Modern. By Herbert Laws Webb. Illustrated.....	98	Chicago, Institute Meeting in.....	92
Arc Lamp and Ceiling Fan, Combined (Interstate Electric Company). Illustrated.....	301	British Admiral in Electric Cab.....	123	Chicago, Marconi System in. Illustrated.....	237, 238
Arc-lamp Department of Central-station Business. By H. W. Hillman. Illustrated.....	252, 253, 254	British Columbia, American Telephone Equipment for. Illustrated.....	135	Chicago Municipal Arc-lighting Plant, New. Illustrated.....	281
Arc Lamp, Large.....	187	British Guiana, Electric Cars in.....	187	Chicago, Overhead Trolley to be Substituted for Cable in.....	49
Arc Lamp, Morris. Illustrated.....	191	Brooklyn Railways.....	27	Chicago Street-railway Affairs. Illustrated.....	1, 2, 3, 4, 5, 32, 33, 41, 44, 45, 49, 64, 65, 69, 72, 83, 95, 107, 223, 229, 265, 267, 271, 274, 280, 323, 324, 337, 338
Arc Lamps, Knutson Gravity Clutch for. Illustrated.....	246	Brooklyn, Frederick C. Portrait. (Supplement).....	132b	Chicago Street-railway Companies, Combination of.....	95, 223, 267, 280, 323, 324, 337
Arc-lighting Plant, New Chicago Municipal. Illustrated.....	281	Brundage Telephone Bill. By Charles G. Armstrong. (Communication).....	203	Chicago Street Railways, Underground-contact System Said to be Practicable for.....	72
Argentina, Electrical Trade in. By C. Paulo Rei.....	24	Brush Arc Generator Regulator. Illustrated.....	17, 18	Chicago's Street Lamps, Cost of.....	315
Argentine Electrical News.....	129	Brushes, Vite Carbon. Illustrated.....	16	Chicago Telephone Building, New. Illustrated.....	300
Argentine News Items.....	185	Brushsels, Electric Development in.....	233	Chicago Telephone Company, Opposition to.....	29, 59, 70, 85, 112, 133, 360
Armatures, The Balancing of. By Claude W. Hill. Illustrated.....	225	Building a 2,100 Horse Power Generator. Illustrated.....	265	Chicago Telephone Company's Franchise, Proposed Extension of.....	70, 85
Armstrong, Charles G. (Brundage Telephone Bill).....	203	Bullock, M. C., Death of. Portrait.....	41	Chicago Telephone Company's Extensions. Illustrated.....	91, 92, 93, 94, 286, 309, 344
Army, Automobiles for the.....	319	Bunnell, J. H., Death of.....	97	Chicago Telephone Company (Annual report).....	59
Arnold, B. J. (Electric-railway Development of 1898).....	8	Bunnell's Home Medical Battery. Illustrated.....	201, 205	Chicago, Telephone Rates in. Illustrated.....	360
Arnold, B. J. (Trend of Central-station Design).....	168, 169, 170, 176, 177	Burglars in a Power House.....	129	Chicago, Telephone Service in. Illustrated.....	28, 29, 59, 70, 85, 91, 92, 93, 94, 286, 309, 344, 352, 353, 360
Asher, James (Electric Traction on Highways).....	211	Buried Pipes, Thawing Ice in, by Electric Heat. Illustrated.....	123	Chicago, Pasla's Visit to.....	285
Assumption of Risk in Passing Rope Under Wires.....	225	Burma, Electrical Development in.....	187	Chicago, Two New Telephone Exchanges in. Illustrated.....	91, 92, 93, 94
Astor's, Colonel, Telephone System.....	355	Burned by an Electric Arc, Steel Girders.....	153, 154	Chicago, Underground Electric Road Proposed for.....	44
Attachment Plug and Receptacle, Pringle "New Style." Illustrated.....	289	Burns Hole in Partition, Incandescent Lamp. Illustrated.....	297	Chicago Union Traction Company, Chicago North and West Side Surface Roads Leased to.....	323, 324, 337
Atwell, W. P. (Cloth Pressing by Electricity).....	129	Burns, P. C. Portrait. (Supplement).....	132a	Chicago, Yerkes Street-railway Properties in. (Annual reports).....	32, 33
Audiophone, Hutchison's Electrical. Illustrated.....	254	Burns Sneak-current Arrestor. Illustrated.....	359	Chief Operator's Telephone Equipment. (Sterling Electric Company.) Illustrated.....	44
Austin, Power and Light Exposition at.....	164	Business, The Electrical, An Open Discussion on. Business, Private, Public Supervision of. By Franklin H. Wentworth.....	111	Children, Must Furnish Protection for.....	343
Austin, The Water-power Failure in.....	329	Business, Volume of, for 1898.....	12, 13, 11, 15	China, Telephone Privileges in.....	113
Australia's, West, Electrical Activity.....	241	Busy; Please Call Again.....	360	Circuit Breaker, A New (McCarthy Bros. & Ford). Illustrated.....	128, 129
Automatic Telephone System, Lundquist. Illustrated.....	145	Butler-Taylor New Automatic Lightning Arrestor. Illustrated.....	145		
Automobiles. Illustrated.....	12, 16, 17, 21, 86, 106, 123, 129, 164, 167, 185, 187, 209, 210, 226, 266, 273, 293, 296, 319, 351				
Automobiles, American, for Bombay.....	86				
Automobiles for the Army.....	319				
Automobiles in Chicago.....	351				

Circuit Breaker, Relay (Ward Leonard). Illustrated	246	Dunlap, Orrin E. (Niagara in Winter. Illustrated)	109	Electrical Industry, The Record and Promise of the, for the Years 1898-1899.	15
Citizens' Telephone Company, Appeal Against the, Dismissed	188	Dunlap, Orrin E. (Steel Arch Bridge at Niagara Threatened by Ice Bridge. Illustrated)	66	Volume of Business	7, 8, 9, 10, 11, 12, 13, 14
Clark, Frank H. (The Use of the Storage Battery in 1898)	9	Dunlap, Orrin E. (Transformer Station at Tonawanda, N. Y. Illustrated)	153	Mortuary Record	7
Clausen, H. P. (Minor Telephone Troubles and How to Correct Them)	353, 354	Dnty, Carbon, Assessed at Twenty Per Cent.	95	Conventions and Expositions	7
Clausen, H. P. (Signal-current Generators for Telephone Exchanges. Illustrated)	127, 128	Dynamo and Motor Capacities, Relative. By Alton D. Adams	243	Electric-railway Development of 1898. By B. J. Arnold	8
Cleveland, Independent Telephone Interests in	133	Dynamo, New Interrupted-current (Triumph Electric Company). Illustrated	58, 72	Progress in Power Transmission. By L. L. Summers	9
Cling-surface Tests. Illustrated	260	Dynamos and Motors, Effect of Commutation on the Fields of. Illustrated	39	The Telephone in 1898. By Angus S. Hibbard	9
Cloth Pressing by Electricity. By W. P. Atwell. (U. S. Consular Report)	129	Dynamos and Motors, Mayer. Illustrated	232	The Use of the Storage Battery. By Frank H. Clark	9
Clutch, Knutson Gravity, for Arc Lamps. Illustrated	246	Early Electric Lighting in Chicago	66	Isolated Light and Power Plants. By R. H. Pierce	9, 10
Coal, Electricity Direct from. By A. J. Rogers. (Northwestern Electrical Association)	94	Eco Electric Door Switch. Illustrated	289	Ten Months' Electrical Exports. By A. F. Tennille	10
Coleman, Clyde J. (Electrical Protection of Safes and Vaults)	347	Edison Manufacturing Company's Fan-motor Outfits. Illustrated	190, 191	The Telegraph in 1898	10
Columbus, Independent Telephone System for	133	Editorial	6, 26, 40, 54, 68, 82, 96, 110, 124, 140, 158, 172, 186, 200, 214, 228, 242, 256, 270, 284, 298, 314, 328, 342	The Progress of Central Stations. By Louis A. Ferguson	10
Comic Opera by Telephone	126	Education of Electrical Apprentices and Journeymen. By Arthur A. Hamerschlag. (American Institute of Electrical Engineers)	81, 87	The Independent Telephone Movement. By H. D. Critchfield	11, 12
Commonwealth Electric Company (Annual report)	257	Effingham, Ill., Lightning Flash at. Illustrated	310	The Moto-vehicle Industry. By C. E. Woods	12
Commutation, Effect of, on the Fields of Dynamos and Motors. Illustrated	39	Electric Appliance Company in Its New Home. Illustrated	184, 185	Electrical Construction and Inspection. By Edward B. Ellicott	12
Como, Electrical Exposition at, in Honor of Volta. Illustrated	173, 299	Electric Arc, Steel Girders Burned by an	153, 154	Business Situation	12, 13, 14, 15
Competition, Crippling Telephone	161	Electric Boats, To Build	100, 101	Electrical Machinery in England	213
Competition, Result of. Illustrated	84	Electric Cabs in New York. Illustrated	296, 297	Electrical Machinery Exports	111
Conventions and Expositions of 1898	7	Electric Car Lines in Germany	187	Electrical Machinery in Japan	215
Construction, Electrical, Poor. Illustrated	65	Electric Cars in British Guiana	187	Electrical Machinery, Lowering Heavy, over the Niagara Bank. Illustrated	324
Conduct, G. Herbert. (The Motor Vehicle in Commercial Operation)	164	Electric Company of America	233	Electrical Machinery, Repairing. By B. F. Fells. Illustrated	38, 39, 78, 224, 225
Conduits, Electric Mail Transmission in. Illustrated	157	Electric Development in Brussels	233	Electrical Mechanic, Practical Hints for the. Illustrated	155
Controller Patent, Series-parallel, Infringement of	27	Electric Fans, Care and Repair of. By B. F. Fells. Illustrated	282	Electrical and Mechanical Equipment of the Union Hotel. Illustrated	35, 36, 37
Connecticut, Telephone Competition in	189	Electric Furnace, Enclosed. Illustrated	52, 53	Electrical Men, Mechanical Topics for. By B. F. Fells. Illustrated	22
Copper and Zinc	259	Electric Heat, Thawing Ice in Buried Pipes by. Illustrated	123	Electrical Phenomenon, Curious	64
Copper Market, Boom in	22, 23, 53	Electric Launches on the Thames	109	Electrical Plant, Great Northern. Illustrated	251, 252
Copper Trust, Formation of	22, 23, 53, 238, 259	Electric-light Companies, Illinois, Municipal Supervision Proposed for	79	Electrical Plants, Mr. Kang Investigating	287
Copper Wire, Daring Theft of, at Omaha	54	Electric Light, The "Ever Ready" (American Electrical Novelty and Manufacturing Company). Illustrated	176, 128	Electrical Power Applications in a Stove Foundry	329
Cook Invention Sustained	42, 230, 343	Electric Lighter for Fire-engine Boiler Wanted. By A. L. Bowes (Communication)	320	Electrical Production of Aluminum	261
Cook, F. B. Portrait. (Supplement)	132b	Electric Light, Matchless (Stanley & Patter Electric Lighting in Chicago, Early	66	Electrical Protection of Safes and Vaults. By Clyde J. Coleman (Chicago Electrical Association)	347
Corliss Engines, Westinghouse Company to Make	246	Electric Lighting in London. Illustrated	170, 171	Electrical Progress, American, in South America, English Review of	111
Cost of Chicago's Street Lamps	315	Electric Lighting in Massachusetts	191	Electrical Reminiscences, Mr. C. J. Warner's	309, 310
Cost of Public Lighting at Detroit	215	Electric Lights in a Small Southern Village	27	Electrical Repair Shop, Methods and Tools in the. By B. F. Fells. Illustrated	211
Couch, S. H. Portrait. (Supplement)	132a	Electric Mail Transmission in Conduits. Illustrated	157	Electrical Sawmill, An. Illustrated	181, 182, 183
Coupin, Henri. (Influence of Electricity on Animals. Illustrated)	25	Electric Motor and Equipment Company's Portable Photometer. Illustrated	346	Electrical Shop Practice. By B. F. Fells. Illustrated	108
Crandall, Chester D. Portrait	167	Electric Motor, Practical Application of the, to Printing-press Machinery. By W. H. Tapley. (Franklin Institute)	65	Electrical Spectacular Effects, Patterson's. Illustrated	196, 197
Crescent Fans. Illustrated	288	Electric Power in Southern California, Development of	173	Electrical Supply Houses in North Brazil, Opportunities for the Establishment of. By C. Paulo Rei	240
Critchfield, H. D. (The Independent Telephone Movement in 1898)	11, 12	Electric Power Transmission in Mexico. Illustrated	195	Electrical Trade in Argentina. By C. Paulo Rei	24
Crossing Railway Tracks, Necessity of Using Reasonable Care in	45	Electric Pumps, Operation of. Illustrated	239, 240	Electrical Trade Conditions in New South Wales	167, 168
Cruisers, Electricity on New	332	Electric Railroad, An, with Steep Grades	227	Electrical Trade, South African	212, 226
Cuba, Cable Rights to, Postal and Western Union Dispute over	164	Electric Railroads in Russia	27	Electrical Transmission Through Space. Illustrated	176, 198, 199, 201, 205, 212, 227, 230, 237, 238, 239, 268, 269, 271, 287, 310, 315
Cuba, Electrical Trade with	21	Electric Railways in Breslau	205	Electrical Uses of Aluminum	343
Cuba, Telegraph Construction in	53	Electric-railway Building in Mexico. Illustrated	246, 267	Electrical Ventilating Plant. Illustrated	44
Cuming, J. S. Portrait. (Supplement)	132b	Electric-railway Competition in Massachusetts	5	Electrical Waves in Space, Proposed Receiving Apparatus for. Illustrated	310
Curious Electrical Phenomenon	64	Electric-railway Consolidation in New England	267, 315	Electrical Work in Mexico	159, 195, 246, 267
Currency, American, in Porto Rico	3	Electric-railway Development of 1898. By B. J. Arnold	8	"Electrical World" Sale of the	92, 149
Cutter's New Mast-arm. Illustrated	260	Electric Railway in Ireland	23, 24	"Electrical World" and "Electrical Engineer" Combined	149
Cycle Show, Automobile Vehicles at the. Illustrated	21	Electric-railway Litigation	5	Electrically Driven Printing-presses in Kansas City	101
Damages, \$10,000, for an X-ray Burn	251	Electric Railway, Long	100	Electrically Driven Temperley Transporter. Illustrated	226, 227
Davey, Charles B. (Practical Applications of the Rotary Equalizer. Illustrated)	154, 155	Electric Railways in the Netherland	315	Electrically Operated Paint Factory. By Orrin E. Dunlap. Illustrated	212, 213
Davis, A. G. Portrait. (Supplement)	132b	Electric-railway Operation, The Profit of	274	Electrician, Spare That Tree!	212
Dawson, Telegraph Line to	215, 320	Electric-railway Patent Litigation	27, 72, 95	Electricity at the Omaha Exposition	149
Delamater, N. B., M. D. (Some Suggestions on X-ray Work in the Brain)	282, 283	Electric Road, Underground, Proposed for Chicago	44	Electricity, Cloth Pressing by. By W. P. Atwell (U. S. Consular Report)	129
Delaware, Telephone Legislation in	145	Electric Signal Apparatus at Atlantic City, N. J. Illustrated	25	Electricity, Department of, of Chicago, Annual Report of the	197, 198, 315
Dentistry, The X-ray in	315	Electric Stage Elevators. Illustrated	156, 157	Electricity Direct from Coal. By A. J. Rogers. (Northwestern Electrical Association)	94
Department Notes	18, 19, 20, 33, 46, 47, 48, 60, 61, 62, 74, 75, 76, 78, 80, 90, 102, 103, 104, 117, 130, 131, 149, 150, 151, 165, 166, 177, 178, 179, 192, 193, 194, 206, 207, 208, 220, 221, 234, 235, 248, 249, 250, 262, 263, 275, 276, 277, 291, 292, 293, 304, 305, 306, 321, 322, 333, 334, 335, 348, 349, 350, 364	Electric Storage Battery Company. Reported Transfer of the	149, 164	Electricity for Private Mansions and Hotels. Illustrated	318, 319
Department of Electricity of Chicago, Annual Report of the	197, 198	Electric Street Lighting. By Albert Scheible. (Chicago Electrical Association)	182, 183, 190	Electricity, Influence of, on Animals. By Henri Coupin. Illustrated	25
Detroit, Cost of Public Lighting at	215	Electric Street-lighting Extension in Chicago. Illustrated	243, 281	Electricity on Board Ship. By S. Dana Greene. (American Institute of Electrical Engineers)	93, 94, 107, 108, 113, 114
Detroit, Mich. (Correspondence)	73	Electric System on the Alley "L," Success of. Illustrated	64, 65, 274	Electricity on New Cruisers	232
Detroit Street-railway Ownership	196, 210, 227, 240, 241, 259, 271	Electric Traction on Highways. By James Asher	211	Electricity, Stealing	243
Detroit, Telephone War in	42, 71, 84	Electric Traction, Some General Observations on. By Horace F. Parshall (Northern Society of Electrical Engineers)	114, 338	Electricity, Thawing Frozen Ground by	45
"Diamond H" Push-button Switches. Illustrated	318	Electric Transfer Table. Illustrated	337	Electricity, Why Does, Influence Plant Growth?	229
Dicke Ball-bearing Pay-out Reel (Western Electric Company). Illustrated	16	Electric-vehicle Business	16, 17, 129, 164, 167, 185, 210, 273	Electrolytic Interrupter, Wehnelt's. Illustrated	213
Direct-connected Generating Sets, Standards for. By J. B. Stanwood. With discussion. (American Society of Mechanical Engineers)	281	Electric-vehicle Company, Siemens & Halske Company Sold to	273	Electromagnet, The Gambler's	187
Discharges, Electrical Effect of, on Photographic Plates. Illustrated	105, 106	Electric-vehicle Interests in Chicago, Expansion of	16, 17, 210, 273	Electroplating Hulls of Vessels. Illustrated	340, 341
Distribution, Electrical, Means of Attaining Safety in. By W. L. R. Emmet. Illustrated (National Electric Light Association)	312, 313	Electric Wires in a Storm. Illustrated	23	Elevated Road, Boston, Route of. Map	24
Distribution, Single-phase. By Herbert A. Wagner. Illustrated (National Electric Light Association)	326, 327, 331, 332	Electrical Activity, West Australia's	241	Elevators, Electric Stage. Illustrated	156, 157

Western Electrician

EVERY SATURDAY.

Vol. XXIV.

CHICAGO, JANUARY 7, 1899.

No. 1

Union Loop Power House.

Inasmuch as the Union Loop is used jointly by the three elevated-railway companies of Chicago now in operation, it is of much importance that there be no interruption in the service of electric power used to move the trains upon it. Therefore the power plant of the Union Elevated Railroad company has been designed to carry the heavy and suddenly fluctuating loads on the loop structure with a maximum factor of safety. The boilers, engines and generators provide a reserve of 50 per cent. above the greatest demand that has yet been made on the station, and possess capacity nearly three times as great as the average load; many of the auxiliaries, such as boiler-feed pumps, fuel-oil pumps, circulating pumps, etc., are installed in triplicate to provide against all contingencies; and in every respect the plant has been very solidly and generously equipped to insure easy continuity of operation under any emergency that can be

fuel, and this fact makes for convenience in operating a station of this description. Of course, the idea in erecting a two-story power house was to effect a saving in the value of the ground area. The loop is in the central business district of the city, and, to follow the plan of simplicity and lack of complications, it was necessary to erect a direct-current station near it. Thus the value of the land had to be carefully considered. The Union Loop power house is

loop is an oblong, double-tracked elevated structure about two miles long in Lake street, Wabash avenue, Van Buren street and Fifth avenue. It belongs to the Union Elevated Railroad company, controlled by Mr. Yerkes, and serves as the downtown terminal of the Lake Street, Metropolitan and South Side elevated railroads. It will also be used for the same purpose by the Northwestern Elevated Railroad company when its road is built. The Union Elevated

FIG. 1 UNION LOOP POWER HOUSE.—VIEWS IN THE ENGINE ROOM.

forseen. Complications have been avoided, even at the possible sacrifice of some economy in operation.

An especially interesting feature of the station is its "double-deck" design. It has two lofty stories, with a hanging floor between, and the boilers are placed in the upper story, over the engines and generators and more than 50 feet above the street grade. In the basement is installed the auxiliary steam apparatus, condensers, separators, feed-water heaters and pumps. The hanging floor under the boiler room carries the smoke flues to the stack and gives room for coal and ash-handling machinery, if the latter shall be installed. At present oil is used as

one of very few stations in the West built on this plan.

The Union Loop has been in regular service for its whole extent since early in October, 1897, and work on the power house was begun over two years ago. But the completion of the generating plant was delayed by workmen's strikes and delay in getting machinery, and the station has only recently been completed, although one unit has been in use for several months. In the interval power was obtained from the surface-railway plants of the companies controlled by Mr. C. T. Yerkes, principally from the Hawthorne avenue station of the North Side company. The

Railroad company does not operate any cars, but leases the structure to the other four companies and furnishes electric power to three of them. The loop structure itself and its electrical fixtures have been described in previous articles in the *Western Electrician*. All the current for the trains on the loop is furnished by the plant described in this article.

The location of the power house is on Market street, opposite Congress street. The site is within one block of the elevated structure of the Metropolitan road and three blocks from the nearest point on the Union Loop itself. As will be seen by the plan (Fig. 4, page 21, it is of irregular shape. The building faces on Market street and extends back to the South Branch of the Chicago River. A general exterior view of the power house is given in Fig. 2, and Fig. 3 is a longitudinal section (from east to west) through the building.

In putting in the foundations much care was exercised, owing to the weight of the machinery and building and the character of the soil. The edifice and its contents rest on 1,572 piles, each 50 tons on each pile. The building has a street frontage of 142 feet and a depth of 164 feet. The rear elevation extends 62 feet along the river. The height of the street front is 98 feet. The walls are strongly built of brick, the facing on the street front being of pressed brick, and the heavy weights are supported on massive iron girders and columns and piers of masonry in the usual manner. Strength and solidity are characteristics of the whole plant—precautions which are, of course, particularly demanded in a power house of this description. The stack is 240 feet high, square at the base and octagonal

above. It is built of brick and the base is 23 feet square. The flue is round and 13 feet in diameter. The boiler flues enter the stack at an elevation of about 50 feet above the ground. Combustible building materials have been avoided; the floors are of steel plate, the stairways of iron, and the building is as near fireproof as it can be made.

Fuel oil from Indiana is received at the power house in tank wagons. It is stored in tanks having a capacity of about 2,000 barrels, and pumped to the boiler room as needed. The plant for pumping, storing, circulating and burning the fuel oil is an exceptionally large one and has been carefully worked out. It was installed by the National Supply company. In the picture of the boiler room (Fig. 5, page 3) the fuel-oil circulating apparatus is shown at the right. This picture is taken looking toward the eastern or street front of the station. There are 16 Babcock & Wilcox 400 horse power water-tube boilers, arranged in eight batteries on either side of a central open space. The boilers have each about 4,000 square feet of heating surface. As before stated, the flues are connected with the stack through the hanging floor beneath. The plant has not yet been equipped for burning coal any farther than the setting of the boilers with Acme furnaces. However, there is ample room for coal and ash conveyors, hoppers over the boilers, etc. The site has the advantage that coal could be received either in front, from wagons, or from barges on the river in the rear.

All the steam accessories for this plant are placed in the basement. Situated on the river bank, the plant is naturally a condensing one. Three Wheeler surface condensers, with Blake marine-type air pumps, are installed. One of these is illustrated in Fig. 9 (page 5), which is a view taken in the basement. The water for condensation is obtained from the river, the circulating pumps being of the centrifugal type. The water for boiler feeding, however, aside from that obtained from the condensers, comes from the city mains. But it is confidently expected that the early completion of the drainage canal will so improve the river water that it may be used for the boilers. The feed-water pumps were made by the George F. Blake Manufacturing company and are vertical, duplex and piston-packed. The feed-water passes through horizontal heaters located between the low-pressure cylinder and condenser of each engine; thence it passes into vertical heaters supplied with exhaust steam from the auxiliary machinery, and from these heaters it goes to the boilers at a temperature of about 210°. All the heaters were made by the Wheeler Engineering company.

The steam piping is arranged so that the risk from damage on account of breakage is reduced to a minimum. Three main vertical supply pipes from the boiler room to the basement pass through the engine room, back of the engine cylinders and close to the brick wall, and these are the only steam pipes to be seen on the engine-room floor. The separators are located in the basement, as well as the reheating receivers, operating valves, grease extractors, etc. The return of all water of condensation is effected by a Holly return system. All piping from which any heat could be lost is covered with the H. W. Johns asbestos-sponge material.

Two illustrations of the engine room are given on the first page (Fig. 1). This is the main floor of the building, nine or 10 feet above the street level. It contains three large engine-dynamo units and room for a fourth (see Fig. 4), two overhead trav-

FIG. 3. UNION LOOP POWER HOUSE.—LONGITUDINAL SECTION.

eling cranes and three smaller post cranes over basement hatchways, the switchboard and the office of the engineer in charge. There is also a long iron stairway leading to the boiler room above. Of the two photographs reproduced in Fig. 1, the upper one is the view looking west toward the river; in the lower one the spectator's eyes are turned toward the eastern or street front of the building.

Cross-compound, condensing, slow-speed engines are used. They were built by the Corliss Steam Engine company and drive Siemens & Halske generators, mounted on the main shaft, with the fly-wheel, between the cylinders. The three engine-dynamo units are duplicates in every respect. The engines have the type of valve gear perfected by George H. Corliss before his death. The cylinders are 30 and 60 inches in diameter by 60 inches stroke. The fly-wheel are 25 feet in diameter, and the rim

weighs 25 tons. Hollow-forged, fluid-compressed steel is used for the shaft, which is 26 inches in diameter at the flywheel hub and 22 inches in the bearings. The engines are run at 75 revolutions per minute and are rated at 1,750 horse power each at the most economical point of cut-off, but are capable of exerting 2,500 horse power each at a later point of cut-off. They are equipped with Monarch speed-limit governors and automatic safety stops.

Oil for lubrication is distributed by a gravity system. Distributing tanks for both engine and cylinder oil are located on the wall of the engine room, about 30 feet above the floor. The engine oil, after it has been used, flows to an oil filter in the basement, thence to a storage tank, from which it is pumped to the distributing tank. There is a separate storage tank for the cylinder oil. All new oil is delivered

FIG. 2. UNION LOOP POWER HOUSE.

into the storage tanks, and there are separate pumps to supply the distributing tanks.

The generators are of the internal-field type, made by the Siemens & Halske company, but they have separate commutators at the side instead of the arrangement for commutation directly on the exterior of the armature which is familiar in this company's machines. The generators have 16 poles and, of course, turn at 75 revolutions per minute. They are wound for an electromotive force of 550 volts, and the nominal capacity of each is 1,500 kilowatts. The armatures are keyed directly to the engine shafts and can be readily slipped toward the flywheel should it be necessary to remove a field spool. Any armature coil can be easily replaced without disturbing the adjoining coils, and as there is but one layer of coils on the armature core the facilities for inspection are exceptionally good. The armature bands are sectional and arranged for tightening with lugs and draw bolts in the same manner as the hoops on large-sized water tanks on railroad lines.

A close-by view of one generating unit is given in Fig. 6. The high-pressure cylinder is on the right.

Two overhead traveling cranes, hand-operated, built by Pawling & Harnischfeger, span the space over the engines and dynamos, as shown in Fig. 1. These cranes have a lifting capacity of 35 tons each, and, of course, both can be used together if desired. There are also three eight-ton post cranes placed at the hatchways opening to the basement, as indicated on the plan (Fig. 4) and shown prominently in Fig. 8.

A front view of the switchboard is given in Fig. 7, and the back of the board is shown in Fig. 8. The board is built between two of the steel posts supporting the girder for the overhead cranes. It is a two-storied affair with panels of polished black slate. The generator panels are on the level of the engine-room floor and the feeder panels are on the gallery above, which is provided with a railed balcony on all sides. The leads from the generators are laid under the floor to the switchboard, and the feeders from the latter are conducted from the power house to the elevated structure in ducts underneath the surface of Market street.

Five panels make up the lower board—a wattmeter panel in the center and two generator-controlling panels on each side. Each generator panel is supplied with a positive and a negative switch, having a carrying capacity of 3,500 amperes. Besides these large switches there is a Weston ammeter, a General Electric circuit-breaker and a Siemens field switch on each generator panel. The wattmeter panel carries two instruments, each of 7,000 amperes' capacity, and also the switches controlling the lighting circuits in the building. Two voltmeters are mounted on an insulated swinging frame on one side of the board in the manner shown in Fig. 7.

Feeder panels in the gallery may be enumerated

as follows: Four, of 3,500 amperes' capacity each, for the loop proper; one, of 500 amperes, for the lighting circuit on the structure, including lamps for ticket stations, platforms, street intersections, signal towers, etc.; five, of 800 amperes each, with wattmeter, that may be used for supplying current to surface electric-railway lines controlled by Mr. Yerkes and operating in the business district. In addition to the 10 panels named a special "emergency panel" has been recently installed. It is equipped to carry 5,000 amperes to supply the South Side elevated railway beyond the loop in case of interruption of that company's power from its station at Fortieth street. For this purpose a special emergency feeder is in position on the Van Buren street leg of the Union Loop. Each of the feeder panels has a Weston ammeter and a General Electric circuit-breaker.

The distance from the power house to the elevated structure is 800 feet. The positive and negative feeder cables are carried underground for that distance in three-inch cement-lined ducts. There are 12 cables of 1,000,000 circular mils area each, for the negative side, while the amount for the positive feeders is in excess of 17,000,000 circular mils. The outgoing feeders beneath the switchboard are shown in Fig. 9. At the structure the cables are carried up the supporting columns in three-inch iron pipes bent to conform to the conditions encountered at each location. Four columns, with a manhole at the base of each, are used for this purpose.

All of the lessee companies give an all-night service, so that the Union Loop power house is operated continuously. The maximum engine capacity of the plant is 7,500 horse power, but so far the heaviest load has not exceeded 4,000 horse power. Ordinarily one unit is sufficient for the midday load, while there is a light load for two engines during the rush hours. The variation in load is from a maximum of 6,000 amperes at 6 p. m. to as low as 250 amperes in the hours after midnight. The fluctuations in load are excessive, a swing from 250 to 3,000 amperes having been observed at 4:30 p. m., within a period of 20 seconds. These conditions were carefully considered in designing the station, and all parts are made of ample strength and capacity in consequence.

The mechanical and electrical supervision of this large and interesting plant is in charge of Mr. James R. Chapman, who designed the electrical features of the station and the loop structure, and is manager of the electrical department of the North and West Side surface street-railway systems as well.

Foreign Exhibitions for 1899.

The British government has extended an invitation to the United States to take part in the Western Australian International Mining and Industrial Exhibition, which is to be held at Coolgardie in March, under the patronage of the government of Western Australia. The opportunity afforded to American exhibitors is one of especial value and importance, in view of the fact that Western Australia, by its rapid development, its great resources and its unlimited prospects, affords exceptional openings for American goods. The exhibition will be intercolonial in its character, and will be attended by many visitors from the whole of Australasia. The following, among other classes of manufacture, will find special scope for exhibition, and, if so desired, of

FIG. 4. UNION LOOP POWER HOUSE.—PLAN OF ENGINE ROOM.

sale, viz., electric motors and lighting apparatus, wire and electric appliances of various kinds. The exhibition will be opened on March 21st and will continue for a period of at least three months.

The attention of the electrical industry is also called to the fact that a provincial exposition of East Flanders will be held at Ghent during the summer, being opened on June 14th. While the principal exhibits will naturally be made by residents of the province, there will be a department for foreign exhibitors. The exposition will furnish the best opportunity ever offered to introduce electrical goods to the markets of Ghent and the two Flanders, and is worthy the attention of American manufacturers

and exporters. American manufacturers have been quite successful in introducing electrical apparatus, not only for lighting purposes, but especially for the transmission of power, and the forthcoming exposition offers them an opportunity to still further increase their lead in the Belgian market.

An international electrical exposition and congress of electricians will be held next summer at Como, Italy, the birthplace of Alexander Volta, the discoverer of the electric pile. The exposition will illustrate the progress of electricity during an entire century, and the congress of electricians will treat of the most recent scientific progress and of the numerous applications of electricity. The exposition will be opened on May 15th and will continue in progress until October 15th.

Underwriters' National Electric Association.

The special committee of the Underwriters' National Electric association to prepare specifications for wire coverings and to compile a list of fittings acceptable for use under the electrical code will meet at the offices and laboratory of the Electrical Bureau of the National Board at 157 La Salle street, Chicago, January 9th, and continue in session until the work is completed.

The committee is composed of W. H. Merrill, Jr., chairman; J. C. Forsyth of the New York Board of Fire Underwriters, E. V. French of the Associated Factory Mutual Insurance Companies, William McDevitt of the Philadelphia Fire Underwriters' as-

"The above table is based upon the following formula, which may be applied for conductors larger than No. 0000.

"Rubber diameter = $\frac{2}{3}$ copper diameter + 62.
 "Thickness of rubber wall = $\frac{1}{4}$ copper diameter + 31.

"As the dielectric strength of a rubber wall is determined by its thinnest portion, all measurements shall be taken across the smallest diameter of the specimen tested. When depressions are caused by the braid or in process of manufacture, the lower surfaces of the channels caused by these depressions must be taken as the exterior surfaces of the wall. For a correct reading the measuring instrument must just shut out a line of light between the material being measured and the terminals of the instrument.

"All of these insulations must be protected by a substantial braided outer covering sufficiently strong to withstand all abrasion it will meet with in practice and sufficiently elastic for all wires smaller than No. 5 B. & S. gauge to admit of the conductor being wound back over itself without injury to the braid.

"The completed covering must show an insulation resistance of at least 100 megohms per mile, throughout eight weeks' immersion in hydrant water at ordinary temperatures. Each foot of the completed covering must show a dielectric strength sufficient to resist throughout five minutes the application of an alternating electromotive force of 16,000 volts, under the following conditions:

"The source of alternating electromotive force shall be a transformer of at least one kilowatt capacity.

submitted to the United States attorney-general, with a view to having the question submitted to the United States court on an agreed statement of facts.

The final reply of Commissioner Scott was:

Internal-revenue taxes are not collected through the courts and the decision of the commissioner of internal revenue on the subject is authoritative. Courts can be appealed to after the commissioner's decisions have been complied with and not before.

The commissioner adds that if the internal-revenue officers find that the express company has been failing to comply with the law, steps must be taken to collect arrearages by process of law, if necessary.

Y. M. C. A. Electrical Club Banquet.

The third annual banquet of the Chicago Central Young Men's Christian Association Electrical Club was held on Wednesday evening, December 29th. This club has a membership of fifty, and is composed of young men who are employed in electrical or allied pursuits, many being members of the electrical classes of the association's evening college. One of the features of the event was the unique menu card, which was a novel blue print. The program consisted of the following toasts:

- "The Past of the Club".....Secretary H. H. Harwood, McIntosh Battery and Optical company.
- "Selling Things".....George W. Paterson, American Circular Loom company.
- "The Wright Demand Meter".....Albert G. Turnball, Chicago Edison company.
- "The Press".....Cloyd Marshall, Street Railway Review.
- "Experiences of a Wireman".....J. T. Rumble, Chicago Edison company.
- "Our Menu Card".....Albert G. Courtright, Arnold Electric Power Station company.
- "War Experiences".....B. R. T. Collins, Chicago Edison company.
- "The Future of the Club".....President H. A. Seward, Chicago Edison company.

Mr. George A. Damon was toastmaster.

Secretary Harwood in his response reviewed the many practical talks and discussions on electrical subjects, and mentioned the numerous excursions to points of electrical interest which had been conducted by the club. He traced briefly the movement which has resulted in the establishing of an electrical laboratory by the club, with an equipment largely donated by the commercial firms of Chicago. The club holds the record for entertainments, having conducted one of the most successful special events ever held in Association Hall. Y. M. C. A. managers consider the movement a model of its kind, and the club's 32-page announcement, which was issued in the fall to describe its work, has been sent all over the country to serve as a model for similar clubs in other cities.

American Currency in Porto Rico.

A good story is told by a correspondent from San Juan, Porto Rico, regarding the difficulties experienced in maintaining a standard for American currency when the United States took possession of the country. The unsettled rate of exchange, official and commercial, of the American gold dollar and the Porto Rican silver peso is perhaps the most perplexing feature of the present reconstruction period, not only to former residents but also to the daily increasing colony of business men from the United States. When the American troops first landed on the island, General Miles established by military law an official exchange rate of two pesos for an American dollar. This ratio became the commercial rate at first, but the native merchants soon refused to accept \$1 for goods marked two pesos.

The office of the English cable company, in the meantime, did business at a special English rate, which, based on American gold and Porto Rican silver, was nothing more or less than the two-for-one ratio. The few persons who knew of this little silver mine immediately became patrons of the cable service. For \$1.17 a word they could send a message to the nearest foreign office, St. Thomas Island, and then, by reason of the small amount of American bills and silver in circulation, get pesos in change for their gold at the desired rate. What message and to whom to send it were difficulties easily overcome. If the Americans happened to have friends at St. Thomas, so much the better. On the other hand, if not acquainted there, the Yankees could cable to men whose names appeared in the St. Thomas newspaper. Most of these messages, the clerk remembered later, consisted of one word and were always accompanied by a double gold eagle. Thus their senders, after paying \$1.17, or 2.34 pesos, for the one word, received 37.66 pesos in return, 7.66 pesos more than they could get for the same gold piece on the street. At the other end of the wire, naturally, the receivers of these short cablegrams were greatly puzzled. In one instance a newspaper correspondent recognized the name of an old friend after the word: "Buy."

"What?" cabled back the correspondent.

"Nothing," replied the American.

"Are you crazy, old boy?" inquired the St. Thomas correspondent, not by cable this time, but by the first mail steamer.

"No, my old chum," wrote the new San Juan resident, who, unexpectedly, had a chance to cash another double eagle by the cabled reply of his friend; "I merely sent the message in order to get pesos in change from the cable company." But within a week the cable manager himself discovered his unprofitable trade and refused to pay out any more pesos.

FIG. 5. UNION LOOP POWER HOUSE.—BOILER ROOM.

sociation, A. M. Schoen of the Southeastern Tariff association, J. E. Cole of the Boston Wire Department and Edward B. Ellicott, city electrician of Chicago.

Acting with the committee will be E. A. Fitzgerald of the Underwriters' Association of New York, A. E. Braddell of the Underwriters' Association of the Middle Department, J. M. DeCamp of the Suburban Underwriters' association, Franklin H. Wentworth, Theodore Varney, W. S. Boyd and Benjamin H. Glover of the Electrical Bureau, and a number of other officials.

The manufacturers of insulated wire have been invited to be present at certain hours during the meeting when the experimental records on their products will be under discussion. The following specifications for rubber wires, prepared by the Electrical Bureau will come up for action:

40. Wire Insulation.

"(a) Rubber. Insulating compounds containing rubber must conform to or be in excess of the measurements given in the following table, which shows standard thickness of insulating walls for standard wires and cables:

B. & S.	Mils. Thickness of wall.	Mils. Diameter over rubber.
18	.0411	.122
16	.0437	.138
14	.0469	.158
12	.0512	.183
10	.0565	.215
8	.0631	.255
6	.0715	.305
5	.0764	.335
4	.0821	.368
3	.0883	.406
2	.0954	.448
1	.1033	.496
0	.1122	.549
00	.1222	.609
000	.1334	.676
0000	.1460	.752

The application of the electromotive force shall first be made at 4,000 volts for five minutes, and then the voltage increased by steps of not over 3,000 volts, each held for five minutes, until the rupture of the insulation occurs. The tests for dielectric strength shall be made on a sample of wire, one foot of which is submerged in a conducting liquid held in a metal trough, one of the transformer terminals being connected to the copper of the wire and the other to the metal of the trough."

War Tax on Telegraph and Express Business.

The commissioner of internal revenue has directed Collector Treat of New York to inform Frank H. Platt, representing the United States Express company, in an appeal from the decision of the commissioner, that the rulings of the commissioner are authoritative and cannot be overruled by any other executive officer, and that an appeal to the courts can only be made after taxes have been paid and application for refunding rejected by the commissioner. The letter was called forth by a communication from Mr. Platt, saying that the United States Express company does its business in the transfer of money by telegraph, and asking the liability to the stamp tax of such transactions. Mr. Platt said that Deputy Collector Wood had informed the company that these telegraphic orders were taxable at the rate of two cents per \$100 or fraction thereof. The internal-revenue office holds that the transactions call for a two-cent revenue stamp on the money order and a one-cent on the telegraphic order of payment. Mr. Platt then said:

As this is a legal question, on which there is room for reasonable difference of opinion, and as we think that the decision of the commissioner of internal revenue is not in accordance with the law, may we suggest to you that the matter be immediately

The Region of the Upper Air.¹

BY PROF. JOHN TROWBRIDGE.

At the paltry distance of 10 miles above the earth the air is too thin to support respiration, and the thermometer would register far below zero. A person in a balloon could not hear a friend in a neighboring balloon, even if they were near enough to shake hands. There would be no medium for the propagation of sound waves. There would,

occupants. The boat was 15 feet long, but it is intended to build one to hold six men. The man in the conning tower can manipulate the vessel or it can be manipulated from below. The submarine war machine is built of brass and is thicker on the under side than on top, to give it trim. The engines are placed amidships. They drive a shaft which turns the stern-wheel. In addition to this propeller there is another which works at the end of a vertical shaft directly under the center of the craft and causes

Saitaro Oi, Tokyo, Japan; Francis E. Tyng, Cranford, N. J.; Arthur J. Wood, Brooklyn, N. Y.

Pacific Cable Project.

On December 31st Secretary Hay disapproved the contract entered into between the Hawaiian government, subject to the approval of the United States, and the Pacific Cable company of New York. The action of the secretary is in accordance with the terms of the contract, which provides that it shall not take effect if disapproved by the State Department within six months from July 2, 1898. The contract gave the Pacific Cable company exclusive cable rights between Hawaii and the United States and Japan, and the determination of this government not to grant such exclusive privileges is responsible for its revocation. It is believed that the administration favors a government cable, and that a bill will be introduced in Congress immediately, providing for the establishment of means of telegraphic communication between San Francisco, Hawaii, the smaller islands in the Pacific, where provision has been made for cable stations, the Philippines and Japan.

The Hydrographic Office of the navy is to begin a survey of the route over which the contemplated cable from San Francisco to Manila is to pass. That portion of the path to be traversed which lies between the coast of California and the Hawaiian Islands was carefully mapped some years ago, but the remainder of the track from Honolulu to Luzon is as yet unexplored. The character of the bottom, which has to be considered in the laying of submarine wires, is unknown, and there are not even any figures as to the depths, save for a few scattered soundings at intervals of hundreds of miles.

The cable will go by way of Hawaii, of course, and thence to one of the islands of the Caroline group. The distance from Honolulu to Wake Island is 2,000 nautical miles; from Wake Island to Guam 1,300 miles. The next stretch will be 1,372 miles from Guam to the Gulf of Dingala, which is on the coast of Luzon. To reach Manila, it would have to go around the Island of Luzon, and it will be a great saving of cable and of trouble also to make the landing on the east side, connecting with a telegraph crossing Luzon to Manila—only 38 miles.

If the distance from Honolulu to San Francisco, 2,089 miles, be added, it will be seen that the total length of the cable will be about 6,800 nautical miles. It is estimated that the making and laying of the cable will come to about \$1,000 a mile. This includes everything except the preliminary survey, which, being performed by a naval vessel, will not appear as an item in the account.

The survey of the route of the contemplated cable from Honolulu to Manila will not require many months. The track to be followed will be as straight

FIG. 6. UNION LOOP POWER HOUSE.—ENGINE-DYNAMO UNIT.

however, still be a medium for the conduction of electricity—a medium, in fact, of great conductivity—almost as good as a metal; and it is this medium at even a less height which Tesla proposes to use in his methods of transmitting power hundreds of miles through the air without wires.

My recent experiences with very high electromotive forces lead me to believe that great difficulty would be met in preventing flow from the generating apparatus to the earth, for, under an electrical pressure of two or three million volts, atmospheric air, even at the surface of the earth, is a fair conductor. Before one reached the height of 10 miles—where there is greatly increased conductivity—the electricity would have deserted the terminal raised to that height and would have flowed to the ground instead of taking the path through the air to the distant station.

If, however, the upper regions of the air are practically employed for the transmission of power, the astronomical observers will be compelled to change the sites of their observatories to deserted mountain regions far from the neighborhood of cities; for there would be a fine display of celestial fireworks in the shape of luminous electrical discharges. Practical electricity now claims the earth as its own; it is no longer possible to make magnetic observations in our physical laboratories, on account of the trolley roads. Is it possible that the upper regions of the air will be pre-empted, leaving the astro-physicists no alternative but refuge in some desolate and far-distant region?

Submarine Torpedo Experiments.

Successful experiments have been conducted by the French squadron in the Mediterranean with the submarine boat *Gustave-Zédé* which has been on trial there under very exacting conditions. The *Gustave-Zédé* was launched in 1893 and hitherto has not come up to the expectations of the French Navy Department. The boat is built of bronze, is cigar-shaped, 132 feet long, and measures 266 tons. She is run by electricity supplied by accumulators, and with 720 horse power was intended to make fifteen knots, when submerged, for two hours. In the experiments made in 1894, however, when sunk in from seven to ten fathoms, the best she could do was seven knots. At that time it was reported that her torpedo tubes worked well under water. She carries a crew of eight men. Her accumulators have always given trouble, and though she has remained submerged for several hours, the people on board have suffered. The French authorities believed that the *Gustave-Zédé* was too long and too large generally for the purposes for which she was intended.

Reports have been received in this country regarding the performance of a submarine boat at Sydney, Australia. A former British naval officer, said to be Lieutenant Innes, is said to have been secretly at work on a new submarine torpedo boat which is described as follows: "The boat is cigar-shaped and pointed at both ends. The driving-power was electricity, and compressed air was supplied for the

disappearance and reappearance of the boat. The model was not fitted with torpedo tubes, as this was a matter of detail. The trial was to test the efficacy of the central screw in submerging and raising the vessel. The experiment was eminently successful."

American Institute of Electrical Engineers.

A meeting of the Institute was held in New York on Wednesday evening, December 28th. A paper was read by Mr. Arthur A. Hamerschlag of the New York Trade School on the "Education of Electrical

FIG. 7. UNION LOOP POWER HOUSE.—THE SWITCHBOARD.

Apprentices and Journeymen." It was illustrated by lantern slides, showing the work of the electrical classes at the school. Messrs. Wetzel, Lieb, Thompson and Pope participated in the discussion.

At the meeting of the executive committee in the afternoon the following-named associate members were elected: John Allan, Sydney, N. S. W.; John Jacob Bellman, New York; Robinson Crowell, Seleneclady, N. Y.; Henry B. Dates, Potsdam, N. Y.; John C. Finney, Milwaukee, Wis.; William N. Gladson, Fayetteville, Ark.; Leo Walter Hildburgh, New York; William B. Hodge, Philadelphia, Pa.;

as possible from Hawaii to Wake Island, again from Wake Island to Guam, and, finally, from Guam to the Gulf of Dingala. This will be modified only where the bottom is found unsuitable. Drowned mountains may be discovered in the path, and it would be necessary to go around them; or there might be submarine volcanic regions, which are to be avoided, not only because of fear of future convulsions, but also for the reason that the water in such subaqueous territory is apt to contain chemical ingredients that have a destructive effect upon the cable.

¹ From the Forum for January

Printing by X-rays.

[From the New York Sun.]

George Izambard, who has been experimenting in Paris with the Roentgen rays in the hope of adapting them to commercial use in the printing industry, announces that he has succeeded in producing a machine for the purpose. He reasoned that if the X-rays would penetrate oaken logs they ought to penetrate piles of paper, and that as photographs could be taken with X-rays, it ought to be possible to reproduce a picture or printing through every sheet of a pile of paper. The invention is so far matured that M. Izambard is able to expose a pile of paper between two Crookes tubes and print both sides of all the sheets in the pile at the same time. He can also place a series of piles of paper around a Crookes tube, making use of the X-rays by radiating them from a center.

It was suggested many years ago that the printing of the future would be done by electricity, operating, not on single sheets, but on all the sheets of a pile at the same instant. Various inventions have made some approach to a solution of the problem, but none of them has been successful in producing satisfactory printing. M. Izambard's first success was obtained by sensitizing the paper, on the side that was to be printed, with a gelatino-bromide emulsion, such as is commonly used in photography. A pile

on a white surface. Typewritten matter can be reduced in size and reproduced, thus saving the expense of composition.

For printing very large sheets, such as newspapers, M. Izambard uses several Crookes tubes, which are shut off from one another by partitions of a metal not easily penetrated by the rays. Thus the tubes send their rays through the paper in nearly straight lines. The limit of thickness of the pile that can be printed at one exposure is reached when the rays are so distributed as to distort the image. Probably no pile of more than a couple of inches in thickness could be impressed at a single exposure with satisfactory results.

The X-ray-proof ink used is made in part of finely divided metallic or calcareous powder. Bronze, copper, white lead or white zinc may be used. As a writing ink white lead in a solution of gum has been found most satisfactory. When the matter to be printed is first typewritten, the metallic powder is mixed with boiled linseed oil.

A peculiarity of this X-ray printing is that it affords opportunity for printing copies of private or secret matter without the printer's being able to see or read what he is printing. A customer desiring copies of private matter may deliver his copy written in the X-ray proof ink and securely sealed in an envelope. He may also see that the paper on

the consolidation of the Boston and Montana, Montana Ore Purchasing and Butte and Boston mines of Montana, Old Dominion of Arizona, Osceola, Tamarack, Isle Royale, Arcadian and several other Lake Superior mines. A corporation with a capital of \$100,000,000, it is said, will be formed to operate the mines under New Jersey laws.

Electric Railway Competition in Massachusetts.

Considerable interest is taken in the project, which will come before the Legislature at the next session, to enable street railways to carry freight as well as passengers, an express company having been organized to contract with various electric railway lines for that purpose. In Brockton, Mass., at the last meeting of the trade organizations of the city, it was voted to favor and encourage the idea, and urge the electric roads to carry merchandise, the high charges of the steam roads being severely scored. The steam roads are also under fire from residents of the suburbs, who want transportation on the steam cars as low as it is on street-car lines. A hearing was given last week before the railroad commissioners and representatives of the steam roads admitted that their busi-

Fig. 8. Rear View of Switchboard, Showing Post Crane.

Fig. 9. One of the Surface Condensers.

UNION LOOP POWER HOUSE.

or block of paper thus prepared was placed in a position of exposure to the X-rays. On top of the paper was placed a copy of the thing to be printed. This copy being proof to the X-rays, in a trice the thing was done, and on developing the pile of paper the inventor found a copy clearly printed on each sheet.

To print in this manner, it is necessary that the copy or original shall be nearly impervious to the Roentgen rays and that it shall be placed between the Crookes tube and the pile, where the rays may be directed to it. The copy is preferably first printed or written in what is called radiographic or X-ray-proof ink, composed of a material calculated to intercept the rays. A few seconds' exposure is sufficient to effect the printing through the entire pile of paper, but it is at first invisible and requires to be developed or fixed after the method of a photographer. The piles of exposed sheets are trundled into a red-light room and suspended in vats, where the developing and fixing liquids are applied. Rinsing and drying follow, and the latter may be hurried by mechanical and chemical means. It is apparent that the process is really a sort of wholesale method of photography with the X-rays, and is printing only in the photographic sense of the term.

The inventor admits that there is a difficulty in printing on one side only of the paper, owing to the tendency of the print to show through on the reverse side. He proposes to overcome this by sensitizing the paper in stripes, printing the lines on the stripes, and causing the lines on one side of the paper to fall opposite the spaces between the stripes on the other side. Until he can improve upon this method the process must be limited by these restrictions. To offset this drawback, there are peculiar advantages in the process. It is just as easy to print in white on a black ground as it is black

which the copies are to be printed is securely sealed. Then the printing may be done by the X-rays and the developing executed without once breaking the seals, so that no one through whose hands it passes can know the contents. If desired, the envelopes may even be made of stout canvas or leather and securely locked.

Weather Bureau Warnings for War Department.

During September provision was made, by direction of the secretary of agriculture, to telegraph from the central office of the Weather Bureau at Washington forecasts to commanding officers of the several army corps whenever weather conditions injurious to the health or comfort of troops under canvass were expected in the states where the army corps were located. An appreciation of these forecasts is indicated by the records of the department, which show that, as a result of the warnings sent much suffering and loss were avoided. In a typical case the following report was made: "A severe storm set in here last night and continued this morning. The camp authorities had been warned of its approach by the Weather Bureau, and were prepared for it. Every tent had been strengthened, and the storm did no damage in camp, except to make it cold and cheerless."

Proposed Formation of Copper Trust.

A dispatch from Houghton, Mich., December 29th, announced that Standard Oil men were trying to control the American copper mines. The Calumet and Hecla and Quincy owners have been approached, it was said, but the mines cannot be obtained at satisfactory figures. The plan comprises

ness in the vicinity of Boston had fallen off tremendously in the last two years, largely on account of the cheaper fares and competition of the electric lines.

Electric Railway Litigation.

When a jury in the Supreme Court in Brooklyn brought in a verdict last week for the defendant in the suit of Herman Schienauer against the Brooklyn Heights road for \$10,000 damages for personal injuries in a trolley accident, the court set a new precedent in such cases by awarding to the defendant, in addition to the usual costs, an extra allowance of \$500 on account of the difficulty and expense of defending the action. This, it is believed, will have a tendency to lessen the number of such actions.

Senator William Johnson, receiver of the Union Traction company of Hackensack, N. J., has been ordered by the Court of Chancery to sell the road bed, cars, fixtures, buildings and everything else belonging to that company in Hudson and Bergen counties. The railroad is in operation from North Arlington to Woodridge, a distance of eight miles. The company had secured a right-of-way as far north as Hackensack, but, owing to the demand of that town for \$50,000 for right-of-way, which the company could not pay, it went into a receiver's hands. It was admitted that if the right-of-way had been obtained the company would have been able to float a million dollars' worth of bonds and complete its lines. The Metropolitan Trust company is the complainant in the foreclosure suit. It is understood that at least four competitors will bid at the sale on January 27th.

Western Electrician

TELEPHONE, MAIN 1746.

Eastern Office: 148 Times Building, New York.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the entire contents of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION.—In advance, postage prepaid, \$3.00 for a full year of 52 numbers; in clubs of four or more, \$2.50, with free extra copy for eight subscriptions; foreign countries, \$5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—the only general electrical paper published in the West—thoroughly covers a territory exclusively its own. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers desiring western trade will appreciate the UNEQUALLED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

There seems to be no good reason why the New Year should not indeed be a happy one to the electrical industry. The figures given on another page show that no less than \$70,000,000 worth of machinery and apparatus for electrical plants was produced in the United States last year. The electrical exports amounted to \$5,500,000. Unless all

signs fail these values will be exceeded this year, particularly in the case of the electrical export trade, which has very flattering prospects. It looks as though the lean years had passed and the fat ones are at hand. The outlook is a pleasing one, and, as there is little danger of over-confidence in the electrical industry after the experience of recent years, we may all rejoice.

Havana can now claim to be an American city. There is a full-fledged row on in the Cuban capital over street-railway franchises. Rival interests have secured conflicting privileges, and the principals now propose to fight it out in the courts. There are many prominent American, English, French and Canadian capitalists interested, and as the several corporations seeking privileges have plenty of money there is every prospect that the controversy will be a lively one.

The Northwestern Electrical association claims the attention of central-station men, manufacturers and agents in Chicago, Milwaukee, Minneapolis and neighboring towns. Its annual meeting at Milwaukee in January promises to be a successful gathering—a repetition of former conventions in this respect, but an improvement in others. The organization is deserving of all the success it has enjoyed, and it appears to be determined to win new laurels with each succeeding meeting.

The latest information about the Keely motor is to the effect that a Boston inventor has undertaken the task of finishing the work and putting the machine on the market. What has become of Attorney Collier of Philadelphia, who declared he knew as much about the motor as Keely, and that he could explain everything connected with it? Surely no better time could be selected than the present. The Engineering society of Philadelphia should call upon Mr. Collier to make good his assertion.

It is evident that the present administration appreciates the value of telegraphic communication with Hawaii, the Philippines and Japan in extending foreign trade, and it is not surprising that the franchise for exclusive cable privileges has been refused the capitalists who have been endeavoring to secure these rights. The government will probably undertake the work itself in order to insure American control of the property. It will involve an expenditure of several millions of dollars, but this will not prove a greater burden than the subsidy which it was proposed to give a private company which desired to establish a line to Honolulu. The new cable will prove a valuable feature in extending American trade in the Orient and in protecting American interests in the Pacific. It will place the government at Washington in direct telegraphic communication with Honolulu, Manila and other important points, and the value of these facilities cannot now be fully appreciated. The commercial advantages will be more apparent at the outset, and they will place this country on more nearly an equal footing than it has heretofore enjoyed.

Electric cabs have not proved sufficiently popular in London to make them commercially successful, according to the annual report of the financial condition of the London Electrical Cab company, the accounts showing that since the incorporation of the company on November 12, 1896, to July 31st last a loss of £6,207 has been sustained. Cab maintenance, including electricity, repairs and renewals, has cost £7,121, while the receipts from cab hire amounted to only £3,242. These figures, bad as they are, do not tell the whole story, according to the Financial Times, which says that "among assets are two utterly worthless items, namely, £1,358 for preliminary expenses and £1,609 for general expenditure to August, 1897, the date when the cabs commenced to ply for hire. The sum of £29,364 is set down for expenditure on premises and rolling stock, but nothing, however, is written off for depreciation. It is, therefore, obvious that were this very necessary narrative made the accounts

would show a loss of at least double the figures given." The management is not discouraged, however, and it is announced that improvements are being made that will cut down the expenses sufficiently to admit of profitable operation of the plant.

Considerable prominence is given the statement of Mayor Harrison that during the last year the cost of operating electric street lamps from the city lighting plants of Chicago has been reduced \$21.65 per lamp per year, bringing the present cost down to \$69. It is to be hoped that other claims of the present city administration have more substantial foundation than this. Certainly it would be difficult to imagine an intelligent public man seriously presenting a more absurd proposition than that set forth in the mayor's summary. He says:

The cost of maintaining an arc lamp has been reduced as follows:
Total cost per light, 1897.....\$90.65
Total cost per light, 1898.....\$69.00

Total saving per light.....\$21.65

Central-station managers have never entertained an exalted opinion of the municipal lighting system of Chicago, and while they may agree with the mayor in so far as his statement refers to the possibility of effecting a saving of \$21.65 per lamp per year, they will appreciate the absurdity of the claim that the cost has been brought down to \$69. If Mayor Harrison seeks to give the city of Chicago a business administration, he must adopt business methods in keeping the records of the several departments, and he must avoid issuing misleading statements like the one quoted. No one desires to place the blame upon his administration for the costly and inefficient street-lighting service with which the city was burdened when he assumed office, but he cannot follow the example of his predecessors in misrepresenting the facts as they exist without placing himself in the equivocal position of supporting their policy.

Activity in stock speculation during the closing hours of the old year assisted materially in rounding out an unprecedented experience in the industrial and financial history of the country. An eminent financial writer sees in these manifestations unmistakable evidence of general prosperity throughout the country. Further proof of the revival of activity in business is furnished not only by the consolidation of numbers of industrial corporations, but by the formation of new companies of the same kind. While the managers of the old consolidations are confident of getting business enough to keep all their machinery in operation, their new rivals are equally confident that they, too, have before them a fruitful field from which to harvest profits. It is not to be supposed that they are investing their capital in manufacturing plants from which they can never recover it, unless they believed that they can make it, in that form, productive. No doubt the annual rate of profit will be, for a time, reduced by competition, but, as the country grows and its power of consumption increases, it is fair to assume that profits will increase with it. These views apply particularly to the electrical industry, in which there is unquestionably a most promising field.

The same writer, summing up the outlook for 1899, says:

The new year, therefore, promises, not so much a greater activity and higher prices for stocks as an extension to all kinds of business of the hopeful spirit which has been manifested upon the Stock Exchange. Of political hindrances to the movement there are none of importance. The recent elections assured us of a Republican Congress for the next three years, at least, and the term of the present Republican president will last for two years from next March. The silver specter is practically laid at rest, and there will be no tampering with the currency; the war with Spain is at an end; and the revenue policy of the nation will not be changed by legislation until the change is required by the slow progress of events. The new domain we have acquired will give us a new field for enterprise and investment, and extend the area of our financial as well as our political empire. Whatever, therefore, may happen on the Stock Exchange, the mass of our citizens will do well.

There can be no doubt that the best-informed electrical men of the country anticipate a profitable extension of business and that their opinion is based upon the conditions thus concisely set forth.

THE RECORD AND PROMISE OF THE ELECTRICAL INDUSTRY.

1898 - 1899.

Reviewing the year's electrical development, it is seen that 1898 was a successful but not especially noteworthy year. To all Americans the war with Spain was the great event of the year, but beyond some unnecessary apprehension before the beginning of hostilities and a temporarily increased demand for some classes of apparatus the brief conflict had no great effect on the electrical industry, either for good or ill, although the ultimate industrial effects of the war will undoubtedly be good.

No striking technical advance was made during the year, the development being gradual and along existing lines. Experiments in space telegraphy continue, but no commercial basis of accomplishment has yet been reached. The Röntgen-ray process has been developed during the year to more far-reaching fields of usefulness. It proved its value in hospital service during the Cuban and Egyptian campaigns. The naval operations of the American war also demonstrated anew the value of searchlights, electric motors for mechanical operations, and telephone service on warships, but more complicated electrical devices were not so successful.

Mr. Tesla has announced some startling applications of the theory of electrical transmission through space, but his theories have appealed principally to the speculative and the curious. Similarly, considerable popular curiosity was aroused during the early part of the year by the assertion that Szczepanik, a Pole, had invented an instrument, called the tele-troscope by the English newspapers, to enable one to see at a distance by the electrical transmission of light waves. Nothing has lately been heard of the device, and it is probable that the inventor's anticipations, exploited as facts, were not realized.

Turning to the practical side of the industry, one notes steady improvement in design and methods. Larger units are used in electrical plants and higher voltages for transmission. Several extremely large plants are under way, such as the Metropolitan (70,000 horse power) and Third Avenue (64,000 horse power) railway plants in New York city. The work on the 75,000 horse power water-power development plant at Massena, N. Y., seems to have been delayed. The year has seen a great extension of conduit electric railways in New York city and the increasing use of rotary converters for both electric-railway and electric-light plants. The multiple-unit system of car control has been tested in service and pronounced successful. The enclosed-arc lamp has made a triumphant advance and promises to supersede all open arcs. The 220-volt incandescent lamps and the 220-volt direct-current two-wire transmission seem to have made place for themselves, although not to the extent anticipated a year ago.

Copper has been dear all the year, and in three or four cases bare aluminum conductors have been used on a scale of some magnitude.

It has been a good year for the storage battery, which, after many years, seems to be now winning the favor of American electrical engineers. Many large station plants have been installed. The horseless-carriage industry has made moderate but fairly satisfactory progress.

The telephone field shows untiring activity and excellent progress on the part of the independent companies. Large anti-monopoly enterprises in St. Louis, Cleveland, Indianapolis and other large cities are reported as a part of the year's work. A notable development of the telephone situation during the closing months of the year has been the recognition of the independent companies by the Bell companies. In some cases working arrangements for co-operation were made between the opposing forces, but in most instances the Bell overtures were rejected by the opposition.

The year has witnessed something of an electrical awakening abroad, particularly in electric-railway construction. There has been a decided demand for American electrical machinery in Europe, Japan and other quarters of the globe, and American manufacturers received a number of noteworthy foreign orders during the year. With the expansion of American authority and American territory that has just taken

place, there can be no doubt that American electrical exports will in the future take a far greater proportion of the output of the factories.

Consolidation is the commercial tendency of the age, and it is as evident in the electrical industry as in others. The absorption of the Walker company by the Westinghouse company early in September was an important combination and showed the trend of events very clearly. The operating companies, also, in cities like New York, Philadelphia, Baltimore, Pittsburg, St. Louis and Chicago, as if by a general impulse, "got together" during the year in great combinations significant of the changing methods of doing business.

VOLUME OF BUSINESS.

From the best information that the Western Electrician has been enabled to gather, after diligent effort, the value of the machinery and apparatus manufactured in the United States during the year 1898 for use in electrical plants (including engines, boilers, cars, trucks, water-wheels, etc., used exclusively for such purpose) was about \$70,000,000. Of this product a portion valued at \$5,500,000 was exported to foreign countries. The electrical imports into the country during the year were worth about \$500,000. These figures are based on estimates furnished by a large number of manufacturers and electrical men, supplemented by government figures to the limited extent to which they are available, and are believed to be approximately correct, although it is impossible to obtain the data with exact accuracy.

In the following table detailed estimates are given:

Class of apparatus.	Made in the U. S.	Imported.
Arc lamps, enclosed.....	\$ 500,000	\$.....
Auxiliary steam plant, for electric installations, such as pumps, condensers, separators, feed-water heaters, injectors, piping, etc.....	750,000
Bells, buzzers, push-buttons, call-boxes, annunciators.....	400,000
Belling used in electrical plants.....	625,000
Boilers (water-tube only) for electrical plants.....	2,000,000
Carbons for lamps, batteries or motors.....	1,200,000	100,000
Cars and trucks for electric railways.....	1,700,000
Cranes and hoists, electrically operated.....	750,000
Dynamoes and motors, including parts of machines, boosters, rotary converters, etc., and all motor applications not specifically enumerated in this list.....	20,000,000
Elevators, electric (mechanism only).....	2,000,000
Engines, steam, gas or oil, used to drive electrical machinery.....	12,000,000
Fans, electrically operated and directed.....	550,000
Fixtures for electric lighting.....	3,750,000	75,000
Heating and cooking apparatus, electrical.....	150,000
Incandescent lamps.....	2,100,000	12,000
Lightning arresters.....	150,000
Lights, arc, electrically operated.....	1,100,000
Lights, molting, junction-boxes, brackets, etc.....	250,000	40,000
Primary batteries.....	450,000
Rheostats, car controllers, motor starters, etc.....	500,000
Shafting, pulleys, clutches, etc., used in electrical plants.....	800,000
Sockets, switches, cut-outs.....	1,600,000
Storage batteries, electrically operated.....	2,100,000	125,000
Transformers, stationary.....	1,250,000
Water wheels, used to drive electrical machinery.....	440,000
Wire and cables (rubber-covered wire, \$1, 250,000; weather-proof wire, \$1,000,000; cables, underground, aerial and submarine, \$7,500,000).....	12,750,000
Total.....	\$69,835,000	\$352,000

It will be noticed that the table contains no estimates for electrical measuring instruments, open-arc lamps, telegraph instruments, fire and burglar-alarm apparatus, overhead railway material, bare wire and other less important classes of apparatus. The Western Electrician could, unfortunately, obtain no reliable estimates on these lines. But it is evident that if the figures had been obtained the total would have gone considerably above \$70,000,000. Even if some of the classes are estimated too high, the total of \$70,000,000 for the electrical manufacturing business of the country is still a fair one.

In the telephone field it must be borne in mind that the American Bell Telephone company does not sell telephones or switchboards. Its output for the year was about 194,000 instruments.

To the gentlemen who assisted in preparing the table given above the Western Electrician returns thanks.

MORTUARY RECORD.

Several well-known names are included in the death-list of the year. Perhaps the most famous is that of Dr. John Hopkinson of London, the electrical engineer, who was killed in the Alps on August 27th at the age of 49. Latimer Clark, a prominent tele-

graph engineer, whose name is perpetuated by the Clark standard cell, died in London on October 30th at the ripe age of 76. Camille A. Faure, the French storage-battery inventor, died in October, aged 56. Another name—note or notorious, as one chooses to view it—on the death-roll of the year is that of Dr. Cornelius Herz, whose checkered career was closed by death at Bournemouth, England, on July 6th, after a life of 53 years.

The list of American electrical men of prominence who died during the year is not long, but it still contains but too many familiar names. In chronological order it is as follows:

January 24.—Oliver B. Shallenberger of Rochester, Pa., the talented alternating-current investigator and designer of the instruments bearing his name, at Colorado Springs, aged 38 years.

February 17.—James H. Rhotemmel, president of the Columbia Incandescent Lamp company, at his home in St. Louis, aged 42 years.

February 25.—Dennis Doren of New York, general superintendent of construction of the Western Union Telegraph company, at Norwalk, O., aged 68 years.

March 27th.—Nelson W. Perry, writer on engineering subjects, at his home in Brooklyn, aged 45 years.

June 28.—Alexander Kempt, at one time prominently identified with the arc-lighting business of the West, at his home in Chicago, aged 61 years.

July 6.—John Mason Jackson of Chicago, secretary and treasurer of the Western Electric company, at Honolulu, aged 39 years.

November 2.—Charles H. Summers of Chicago, electrician of the western division of the Western Union Telegraph company, at San Francisco, aged 61 years.

December 20.—Dr. Wellington Adams, who claimed to have originated the idea of mounting electric motors on the trucks of railway cars, at his home in St. Louis, aged 42 years.

December 24.—Ranald T. McDonald of Fort Wayne, president of the Fort Wayne Electric corporation, at Dallas, Texas, aged 49 years.

CONVENTIONS AND EXPOSITIONS.

One feature of the year not to be overlooked is the exceptional number of electrical conventions and exhibitions in the United States.

The Trans-Mississippi and International Exposition at Omaha was very successful, and the electrical exhibits and illumination formed one of its most attractive features. This exposition was open from June 1st to November 1st. The New York Electrical Exhibition in May attracted much attention, particularly a popular exposition of space telegraphy. It was followed by a similar show in Philadelphia in June. There was a fine display of electrical and street-railway apparatus at the annual meeting of the American Street Railway association of Boston early in September, and also at the triennial exhibition of the Massachusetts Charitable Mechanic association in the same city during October and November.

The annual meeting of the National Electric Light association was held in Chicago early in June, and was a well-attended, business-like gathering, distinguished by an exhaustive discussion of the old but important subject of distribution from central stations—whether it should be by direct or alternating currents. Immediately following was the unique excursion-convention of the Northwestern Electrical association on the steamer Northwest while making a voyage from Chicago to Duluth. The winter meeting of the Northwestern association was held in Milwaukee in January. The general meeting of the American Institute of Electrical Engineers was held in Omaha June 27th-20th, and was an important gathering at the most western point yet visited by the Institute. The international meeting of street-railway and electrical men from Texas and Mexico in Laredo, Texas, in March, was an assemblage of considerable interest and significance. The Independent Telephone association met in Chicago June 30th and July 1st and 2d, and effected important changes in the organization. The Municipal Electricians gathered at Elmira, N. Y., on August 9th, and the members of the Association of Edison Illuminating Companies at Sault Ste. Marie on September 12th. The important convention of the American Street Railway association at Boston has been already mentioned. The annual meeting of the Canadian Electrical association was held at Montreal June 28th-30th.

In addition there were meetings of the state associations of electric-light, street-railway and telephone men in larger number than ever before. Many of these were creditably attended and of lasting result, notably those of the Ohio Electric Light association at Sandusky on August 18th and 19th, and of the New York State Street Railway association at Brooklyn on September 13th and 14th.

Electric Railway Development of 1898

By B. J. ARNOLD.

During the year 1898 few electric railways were built in the United States, owing to the larger cities having been previously supplied with roads sufficient to meet the demands, although there were a few additions and extensions made.

Trolley Roads.—While railway construction was somewhat interfered with by the Spanish-American war, there were, however, a number of cross-country or interurban roads built, aggregating probably 250 miles of track, upon many of which were instituted freight and express services. These roads are distributed throughout the United States, several being in Ohio, several in New England, a few in Michigan, two in Illinois, and one in Colorado. They are operated mainly by the standard system of direct-current overhead construction, although three of them derive their power from alternating-current generators, while three others are using direct-current generators with boosters upon the long feeders.

Freighting by electricity has received an impetus by the placing in operation of the Buffalo and Lockport railway, consisting of 29 miles of standard steam-railroad track, upon which is operated a freight and passenger service. The freighting is done by 36-ton electric locomotives of the type used in the Baltimore tunnel, and the passenger service by ordinary eight-wheeled cars. The power is obtained from the Niagara Falls Power company through rotary converters.

Accumulator Traction.—While there have been no additional accumulator or storage-battery roads built during the year, the Englewood and Chicago road (Chicago Electric Traction company) has been operated a sufficient length of time to demonstrate the practicability of the use of storage batteries for traction purposes, both from the standpoint of the public and of the railway company, the cost per car-mile of operation and maintenance now having been fairly well established to be not prohibitively greater than similar costs for overhead trolley lines. The latest reports from the Hanover and Dresden roads in Germany, which operate combined trolley and battery systems, indicate that the systems continue successful and satisfactory and that the costs per car-mile of operation are not excessive.

Conduit Railways.—The underground conduit system has been used by the Metropolitan Street Railway company in New York city on Lenox avenue during the entire year and on other streets occupied by the company for a part of the year, and reports indicate its satisfactory operation.

Underground conduit systems are now being laid in Paris and in Brussels.

The latest railway equipped with the underground conduit system is that of the Capital Traction company of Washington, which has recently completed and placed in operation about 22 miles of track, adopting practically the same system that is used on Lenox avenue, New York. This company also changed over a portion of its old underground system to conform to the new standard. This gives Washington the most complete and extensive underground conduit system in this country.

Contact Systems.—While there have been numerous patents taken out for contact and button railway systems, there have been no lines yet operated a sufficient length of time to demonstrate their practicability, although progress is being made along these lines, which may ultimately bring success, the chief difficulty being in providing a suitable switch for making and breaking the contact with the live section of the conductor which can be operated without rapid destruction. Besides a few experimental lines of this character put down in the United States, there has recently been installed at Monaco, France, a line three miles long, which is said to operate successfully. Each car carries a storage-battery auxiliary and takes its current from two rows of staggered contact points between and parallel to the rails. The company operates six cars supplied with direct current at 500 volts.

Elevated-railway Work.—In elevated-railway work electricity may be said to have demonstrated its superiority, for with all of the Chicago roads operating electrically, and the Brooklyn elevated road under contract to equip electrically, the probability is that the single remaining steam-elevated road must soon follow.

The Chicago South Side "Alley L" road, being the latest to abandon the steam locomotive, has had in use the multiple-unit system, in conjunction with storage-battery sub-stations, for several months, and while the results of its operation have not been published the increase of speed made by the trains, on account of their ability to rapidly accelerate, makes this road superior in its service to any other Chicago road, and the results of operation, from a general standpoint, will be looked forward to with interest by engineers.

The surface road of Pittsburg and Cleveland, operated at 500 volts direct current, have also installed battery auxiliaries with satisfactory results.

Underground Road.—If underground construction in London has taken the lead with the Central London underground railway, which was to have opened for traffic January 1, 1899, 6½ miles of double track, equipped with 22 electric locomotives, each capable of drawing a train of seven cars, with an aggregate weight of 104 tons, at an average speed of 11 miles per hour. This road is probably the

most interesting piece of electric-railway engineering built during the year. It will be driven by three-phase generators through sub-stations and rotary converters, and was the first road, so far as the writer is aware, of any great magnitude, to adopt three-phase transmission. Each station will be equipped with elevators for carrying the passengers to and from the trains. Careful calculations were made to ascertain the probable power required for operating this road, and the result of the tests, showing the actual conditions and cost of operation, will be valuable. It should be borne in mind, however, that the principal reason for adopting alternating-current transmission in this case was owing to a Board of Trade rule limiting the fall of potential of any return circuit to seven volts.

The Waterloo and City railway, an underground road about 1½ miles long, connecting the Waterloo terminus of the London and Southwestern railway with the Mansion House, has also been built and provided with trains which give it a five-minute train service. Each train consists of four cars, capable of carrying 204 persons each. The power consumed by the trains is lessened by the grade of the road being so arranged that the trains start at the station on a down grade, the same plan that was used on the Intranural road at the World's Fair.

The completion of the Boston subway system gives us the first underground road in this country. This subway is built in the most congested portion of the city of Boston, and allows the cars of the different railway companies to pass through it underneath the city, greatly relieving the streets of car blockades, which previously made it so difficult to get around the business portion of Boston near the Common.

Multiphase Roads.—During the year of 1896 a three-phase road three miles long was installed at Lugano, Switzerland, and in 1897 an experimental line was put down in the plant of one of the principal European electrical manufacturers at Budapest, Hungary. The results of the operation of the Lugano road have caused the adoption of the three-phase system for the line between Zermat and Gornergrat, 6.2 miles, also for the Stansstadt and Engelberg road, 13.3 miles, and the Berthoud-Thoune line, 25 miles long. To the success of the Lugano road may also be attributed the adoption of the three-phase system for the Jungfrau electric railway, now under construction, which, from a civil-engineering standpoint, is the most interesting piece of railway work undertaken during the year. This line will ascend to the summit of the famous Jungfrau, nearly 14,000 feet above sea level, mainly by means of trolley wires and a rack railroad, the last 240 feet, however, being vertical, by means of an elevator. The road, when completed, will be 7.9 miles long, 6.7 miles of which will be through tunnels blasted from the solid rock. About 1.2 miles is now in operation.

Combined Alternating and Direct-current Roads.—The principal example of an electric road operating from three-phase currents with a storage-battery auxiliary is that of the Buffalo Street Railway company, which operates 300 cars, deriving its energy from the Niagara Falls Power company over a three-phase line of 25 cycles per second, and converting through rotary converters, whose direct-current ends operate in parallel with the battery auxiliary.

Among interurban roads, one of the principal examples in this country is that of the Barre-Montpelier (Vt.) Traction company, which generates its current by water power at 2,200 volts, steps up to 6,300 volts, transmits eight miles to a sub-station, and then converts to 480 volts. It is then passed through rotary converters, the direct-current end of which operates in parallel with storage-battery auxiliary, and feeds the current out to the nine miles of trolley line, operating five cars with a direct-current trolley pressure of 550 volts. Another example is that of the Chicago-Milwaukee electric railway, a road projected to run between Chicago and Milwaukee, but which has been operating since July 1st 17½ miles of track between Waukegan and Highland Park, Ill. The power station is located at present near one end of the line, and generates its energy at 5,500 volts, three-phase, and transmits direct from generator to the sub-station, eight miles distant, where it is stepped down by means of static transformers and rotary converters, and drives the trolley line with the direct-current end of the rotary converter at 600 volts. It is the ultimate intention to install batteries in the present and future sub-stations and also in the power station, as the road is extended.

Recent Developments.—Interesting experiments have been made during the year on the Western railway of France with the most recent type of the Heilmann locomotive, but at the present time it is reported that this locomotive is out of service, but whether it is on account of failure to meet the expectations of its projectors, or for other reasons, is not stated.

The Paris, Lyons and Mediterranean Railway company has also been experimenting with an electric locomotive which was supplied with energy from an auxiliary car carrying storage batteries, but the results have not been published.

A recently published report of a committee of French railway engineers appointed to visit this country to determine the status of the electric railway contained the following sentences: "While we

are losing our time on the Heilmann locomotive, the Americans are utilizing, with success, the experience gained in exploiting electric tramways in the development of electrical traction in main-line railways, leaving the generating station at home." * * * * "No more can the electric locomotive be looked upon as experimental. Daily work, over many months, has demonstrated its superior tractive power over steam, and its reduced weight for equal power. Improvement, it is true, is still possible, but the electrical locomotive no longer requires inventing. It is there and has come to stay." To this indorsement from disinterested foreigners comes the news, at the close of the year, of one of the leading electrical companies having closed a contract with the Third Avenue Railroad company in New York city for the complete equipment of its system, aggregating something over \$5,000,000. The energy will be generated alternating and three-phase and transmitted to sub-stations in different parts of the city, and distributed as direct current at 550 volts to the underground trolley, similar to the London underground road.

At the close of the year 1898 everything indicates the projection and completion of many electric railways in the year 1899.

Progress in Power Transmission.

By L. L. SUMMERS.

With each succeeding year it becomes more difficult to distinguish between the plants for energy transmission and those for energy distribution, and the arguments as to relative advantages of the various systems have largely become financial, rather than technical. Distance, to all practical intent, has been annihilated and has also become a question of finance.

The possibilities of extremely high voltage have become assured, and where 10,000 volts was used at Niagara 40,000 is successfully used in the West. Nor are extreme precautions taken, even with this voltage; glass insulators are used more frequently than porcelain, and in the mountain climates are entirely successful; bare wire is standard practice, while pins, cross-arms and poles retain the standard forms and dimensions. The bugaboo of induction and the "Frankensteins" of imagination so frequently conjured have been found to have little existence in fact. Long transmissions operating violently fluctuating inductive loads have failed to materialize any of these visions of fancy. In transmissions above 10 miles good practice sanctions transposing the wires, and thus equalizing the inductive effects of one wire upon another; mutual induction is not prevented by this means, but simply equalized, and the balance of circuits maintained.

For pure transmission the three-phase system has become almost the accepted standard, the distribution being by three-phase, by two-phase or by direct current.

Distribution is the most mooted question in connection with energy transmission. The ever-decreasing cost of power, due to increased efficiency of steam apparatus, the development of the gas engine and the advent of various hot-air engines, has made economies in local distribution necessary. Large amounts of energy, even for short distances, require either high voltage or a large amount of copper, and the tendency toward the high-voltage distribution, with numerous transformer sub-stations, is becoming more and more pronounced.

The large central lighting station no longer inclines to only low-voltage direct distribution; nor does the street railway necessarily adopt the large feeder and standard voltage. Both tend toward transmission and transformers as auxiliaries. The economies in power production have not, on the whole, diminished the possibilities of power transmission, for every economy thus made makes the central-station distribution more profitable.

Distribution determines the selection of the power transmission apparatus and the frequency to be adopted, as the type of apparatus is dependent upon it. A pronounced tendency exists for apparatus capable of meeting the requirements of lighting and power from one machine, that the station may contain but one type of generator. The low-frequency apparatus had advantages for power purposes but was handicapped for lighting. The rotary transformer is now made so that satisfactory service can be obtained on from 40 to 60 cycles, and as this is quite satisfactory for lighting, it is probable that the majority of plants will fall within this range. That lower frequency is desirable for purely power purposes and for the best service from rotaries is generally admitted, so that for power purposes simply it is probable that 25 to 40 cycles will be used.

The production of high voltage directly in the generator, instead of using "step-up" transformers, is meeting with much success, and 10,000 to 12,000 volts is being thus generated. Motors of large size are being used directly on this pressure.

Aluminum wire promises to become a competitor of copper for transmission purposes. At a price of 28 to 30 cents per pound aluminum is equivalent to copper at 14 cents per pound. Aluminum wire has a conductivity of about 60 to 65 per cent. that of copper; its specific gravity is, however, only 33 per cent. that of copper, and a wire of aluminum, therefore, requires 55 to 60 per cent. more area than one of copper to provide equivalent conductivity, and for this con-

ductivity will weigh approximately 50 per cent. of the weight of the copper. Approximately, therefore, at double the cost per pound aluminum will compete with copper. The tensile strength of aluminum is about the same as that of copper, but as the area of the wire used is 60 per cent. greater, the total tensile strength of the line is increased to that extent, but in addition to this the weight of the wire is one-half that of copper, and in any given span of wire, for the same sag, the pull at the end of the span or the point of support is directly proportional to the weight, so that for ordinary conditions the strength of the aluminum line is three times that of the copper for the same conductivity and the same cost. The difficulties of procuring aluminum as easily as copper may necessitate carrying a larger stock in the storehouse. Aluminum cannot be soldered in practice, and it has not been demonstrated as yet that its conductivity will run as regular as copper. As there is no saving in cost, its advantages are entirely those of greater tensile strength. It is questionable whether any well-constructed line can be wrecked by the force of the wind alone, but the aluminum would expose greater surface, and, having less weight, would vibrate more for any given amount of sag in the spans. This might necessitate drawing the spans tighter and thus diminish the factor of strength. Sleet and ice forming on the wires and then vibrating cause the greatest number of wrecks. Pole lines often have a heavy side component thus engendered sufficient to wreck them. Spans of wire which would ordinarily show a pull of 100 to 125 pounds have had this increased to 300 to 350 pounds from accumulations of sleet. A very important point would be whether sleet formation is the same for all sizes of wire, or whether a larger wire will accumulate more sleet. With this feature it might be possible to show that under the conditions which would really try a line to its limit of strength aluminum would have no advantage. Under power-transmission conditions the advantages of aluminum are questionable at any rate, for the pole line is seldom heavily loaded, and with the higher voltages the wires are tending toward smaller sizes rather than larger. It is important that the wires be strung as closely together as safety will permit, as the inductive drop is thus lowered, and under these circumstances there would probably be a very slight factor of strength in favor of aluminum, as the wire would be drawn tight enough to prevent liability of a swinging cross. The conclusion seems to be, then, that while aluminum may have equal advantages with copper, it ought to be sold at a lower figure in order to have any real superiority.

The question of high-voltage switches and the features of lighting protection have received a large amount of attention, and though no standard can be said to have been adopted, there are but two or three types which are extensively used. The oil and pneumatic switches have been adopted in large eastern plants, while in the West the switch commonly known as the "stick switch" is most used. The latter device is simply a wooden stick with a contact-making device at the end, connected by a flexible cable; when thrown open the break is quick, and extends over a range of several feet. It has been used on 40,000 volts.

Upon the whole the year's development has been most satisfactory and has been of a steady growth, rather than in any startling innovations or improvements. That power transmission is a financial success as well as a technical success is equally certain.

The Telephone in 1898.

By ANGUS S. HIBBARD.

Perhaps no department of general public service responds more quickly to business conditions than the telephone. This fact has been more emphatically demonstrated during the year 1898 than ever before. The growth in number of telephones operated in exchanges throughout the country has been unprecedented, and the increased use of telephones installed has been equally remarkable.

New York continues at the head of the list of American exchanges in the number of telephones, over 25,000 now being operated in that city. In Chicago the total number has increased to nearly 18,000, and, as in previous years, the number of messages is greater than in any other one city.

The automatic-signaling central-office apparatus, plans for which were developed in 1897, has proved a great success and has been introduced in many large exchanges, notably in New York, Chicago, Boston, Cleveland, Louisville, Indianapolis, Worcester and other points. The coming year will see a greatly extended use of these appliances, by means of which more perfect telephone service is being given than on any previous plan. These new exchanges are operated entirely from power and battery plants located at the central office, and the plants of motors, dynamos, batteries and controlling apparatus have been greatly perfected.

The general increase in business in all branches has demonstrated to the busy man in all departments of work that the best kind of a telephone is a most valuable aid to his transactions. The number of telephones placed on desks of busy men has increased by thousands. Private branch exchanges, by means of which various departments and officials of firms or corporations may not only talk with each other, but with the general telephone exchange or over long-distance lines, have greatly multiplied in number. Time to the busy man has become valuable, and the

telephone is, first of all, a time-saver. The domestic use of the telephone has increased very greatly, and its use in private residences is constantly extending.

The use of the long-distance and toll-line systems has increased greatly during the year. Important extensions of the long-distance lines have been made throughout the West and South, and almost every city and town east of the Missouri River is now reached by these lines. The result is that very many transactions, which formerly required a trip to the distant point at a large expense and consequent loss of time, are now completed by a five or 10 minutes' use of the long-distance telephone, and the trip is thus avoided.

The improvement in general business conditions is shown in an interesting manner in the records of the calls handled by the Chicago telephone exchange. A year ago a total of 220,000 daily calls was reached. At the present time this has been increased to 270,000 calls. One firm alone in Chicago, in one of its offices, is handling in connection with the Chicago exchange a total of about 2,200 calls daily. The methods of even five years ago would have been unequal to the demands of such service, but it is gratifying to know that the improvements made in the field of telephone engineering year by year have not only kept up with the demands, but are in advance of the present requirements.

The Use of the Storage Battery.

By FRANK H. CLARK.

A retrospect of the year 1898 discloses no important developments in storage-battery design or manufacture. Nor can it be said that any novel applications of storage batteries have been projected. At the same time the storage-battery business of this country has nearly doubled during the year just closed and many important installations have been made. Among these may be mentioned the battery of the Chicago Edison company, the largest single battery in the world; the Buffalo Railway company's battery, until recently the largest railway regulating battery; the two batteries of the South Side Elevated Railroad company, which have attracted so much attention by reason of their large size and the simplicity of method of installation, and the two enormous batteries now being completed for the Metropolitan Street Railway company of New York. The batteries for the Metropolitan company have a combined capacity of 9,000 kilowatt-hours.

Within the past year several large companies have added to their storage-battery capacity, one large street-railway company having installed its third battery, while a prominent lighting company has installed three large batteries in the last six months.

The development of the horseless carriage during the last year has not been as great in this country as in Europe. At the same time these vehicles have ceased to be a novelty and no longer attract attention in large cities. In the beginning it was thought that the limitations of weight and durability of the battery were the only problems to overcome in operating automobiles by storage batteries. Experience has demonstrated, however, that batteries of standard weight and capacity readily meet the requirements of cab or carriage service in cities, as they are able to make from 25 to 35 miles of service with one charge. On the other hand, great difficulty has been encountered in determining the proper ratio of gearing, the best method of steering, the best form of wheel and the most suitable tire. These problems are being successfully met and there can be no longer a doubt as to the future of the horseless carriage.

It is reported that a recently organized company has purchased the Fifth Avenue stage line in New York city and proposes to substitute for the present stages drawn by horses omnibuses operated by storage batteries. There can be but little doubt of the ultimate success of this project and that the current year will see similar lines established in all large cities where they are not precluded by too steep grades.

A very large and increasing demand for storage batteries comes from the telephone companies. The batteries are deemed necessary adjuncts of central telephone stations. Dynamos with storage-battery auxiliaries are rapidly superseding other methods of operation in large central telephone plants. This centralization of power and operating mechanism allows of the greatest economy as well as greater reliability of service. By taking up the fluctuations the battery enables the dynamo to furnish a steady current. The battery is also used to take care of the peaks of the load, and to carry the entire load at night, when the demand for current is light.

The current year will probably witness the installation of several large storage batteries in connection with plants obtaining current from water-power companies, where the maximum power to be had is insufficient to care for the peaks of the load, or where the water-power company's charges for current are based upon the maximum used. In either case a battery or steam auxiliary is a necessity, and where the peak is of short duration the battery is preferable, by reason of requiring a minimum of attendance and no fuel.

Train lighting by electricity is becoming more and more popular, and every new train which is put in service is either equipped with dynamos and engine or storage batteries or both. Railway men object to the method first named because of the

draw on the locomotive in cold weather, the attendance required while en route, and the fact that the lights go out when the engine is changed. It would seem, therefore, that the method to be desired is one where each car carries its own source of light. This can be secured by batteries, which may be charged at termini, or by a combination of dynamo and batteries in each car for runs of 24 hours or less. The former method will give excellent service at small cost.

There is every prospect that the current year will be marked by greater commercial prosperity than any previous year. If so, it is fair to assume that the storage-battery business will at least keep pace with kindred industries.

Isolated Light and Power Plants.

By R. H. PIERCE.

It is a difficult task for one to make a fair statement of what has been done in isolated work during the year unless he has devoted considerable time and energy to the collection of data for that express purpose. It has already been noted by writers who have attempted to make statements concerning the amount of apparatus sold or lights and horse power installed that the manufacturers exhibit no anxiety to make a showing of just what they have done. A search through the electrical journals does not by any means show all that has been done. Only a few of the more important isolated plants installed during the last year have been described.

The technical journals have to depend very largely upon information received from the manufacturers and engineers, and it is practically impossible for the journals to give a complete record of what is done in that line, as the manufacturers are not willing to publish a list of customers and tell everything they are doing in some particular line of work, and it is only when they have some new system or apparatus which they are anxious to advertise that they will take the trouble to give the technical journals complete data. Again, the engineers, as a rule, will only take the trouble to give complete information concerning plants which they have designed when they have some specific object in having such a plant described.

The most that we can do, therefore, in a short article like this, is to call attention in a general way to what has come under our direct notice or has appeared of sufficient importance to warrant its being described in a technical journal.

A considerable portion of the isolated business of the past year seems to have consisted of equipping existing buildings. There has, however, been quite a number of large important plants installed in office and public buildings. The work done in these lines has been sufficient to show that the isolated-plant lighting is holding its own. In 1898, as in past years, the problem of heating has been the main factor in determining the use of isolated plants in this class of buildings. The same state of affairs will continue to exist until heat as well as light and power can be cheaply distributed from central stations.

Referring to particular appliances, the enclosed arc lamp has been extensively introduced, and we may say that it is now practically the standard for isolated plants. The fact that the enclosed lamp needs to be seldom trimmed is appreciated by owners of isolated plants, and the distribution of light from these lamps is such as is usually required for inside lighting. The 220-volt incandescent lamp has become more widely known. Many 220-volt lamps have been used in connection with 220-volt power transmission. There appears to be an increasing field for their use, as many of the factory transmission plants and plants supplying power to a number of adjacent or neighboring buildings come within a distance that calls for 220-volt motors. On the other hand, the expectations of many people that the 220-volt lamp would be extensively used for lighting plants does not seem to have been fulfilled, and we incline to the belief that when the use of the three-wire system is open to the public, as it will be in the near future, the use of the 220-volt lamp will be limited to special cases, the particular case where it will be most used being when the lighting is the smaller and the motors the larger portion of the load on the plant. The tendency in isolated lighting plants, as well as in central-station practice, is always toward economy, and in good-sized installations for lighting the saving by using a three-watt, 110-volt, instead of a four-watt, 220-volt, lamp will usually more than justify any additional complication or expense involved.

The typical new isolated plant of 1898 shows a decided tendency toward the installation of plants that are economical in the production and consumption of steam, as well as efficient electrically. In the large cities a high grade of construction has prevailed.

The introduction of the enameled iron conduit has helped to cheapen good construction, and we are now promised a practically flexible steel conduit, which, if it does not cheapen, will certainly raise the standard of certain kinds of interior construction. The underwriters' list of approved fittings has been of great assistance to architects and engineers, helping them to insist upon better appliances and probably resulting in better work in the large cities. We hope that its influence has penetrated the rural districts, but we doubt if it has affected them very much. There has been on foot an earnest move-

ment on the part of the underwriters to insist upon the use of better insulated wires. Thus far their efforts have produced little effect, at least in the manner desired, but we are promised action in the near future which, it is hoped, will help toward bringing about this much-desired result.

The branch of isolated work which has proved the most interesting and probably the most active in the past year has been the installation of plants for short-distance transmission, especially for manufacturing plants. Motor manufacturers all report a good business, and the electrical equipment of factories has become such a regulation thing that the installation of many large and important plants has received only a passing notice in electrical journals. The coming year promises to be equally active in this same line. Plans and estimates are now being made for a number of very large and important transmission plants for factories, packing-houses, etc.

Most of these transmission plants have in the last year used low-voltage direct-current motors, but we have noted during the last year the installation of quite a number of low-voltage alternating-current systems for factories and manufacturing plants where motors have all been located within an area of a block, or, in some cases, where the distances have been very short. Some manufacturers are now pushing the introduction of alternating-current motors for power-transmission plants, practically regardless of the distance, claiming superiority for their alternating-current motors. The special claims which they make for these motors are efficiency, large starting torque and, especially and mainly, the absence of commutators and moving wires. There are undoubtedly cases where alternating current can be used to advantage in short-distance power transmission, as, for example, where there is a large amount of lighting so distributed as to call for alternating-current distribution, and when at the same time it is desirable to use but one type of machinery.

We look for the year 1899 to solve the problem of when alternating-current motors should be used and when not.

There has been a very notable increase in the use of slow-speed motors connected to driving shafts or direct-connected and the consequent discarding of shalting and belts. Slow-speed motors are no longer special, but have become standard machines, and the prices are now such as to lead to their rapidly increasing use.

Perhaps the most encouraging thing that we have noted in the past year is that owners, especially the owners of manufacturing plants, have become prejudiced in favor of, instead of against, electrical transmission. This is undoubtedly due to the fact that they have had a chance to see satisfactory results accomplished. They are all coming to realize that it is not simply a question of how much is lost in the dynamo, wires and motors, but how much is lost between the coal pile and the driven machine. Looking at the problem in this way, they are finding out that in a properly designed plant, using electrical transmission, the machines can be operated with sufficiently less expenditure for fuel to justify any additional investment that may be called for, and, at the same time, they very often find that their machines will turn out better work and will run more hours in the year. It appears that at last a properly designed plant for heating, lighting and distributing power has come to be considered a necessity in manufacturing plants as well as in most important public and semi-public buildings.

Ten Months' Electrical Exports.

By A. F. TENNILLE.

The electrical exports of the United States are steadily increasing. During the first 10 months of 1898 we supplied telegraph, telephones and "other electrical equipment" to the world at large to the extent of \$2,224,664; during the corresponding period of 1897 the value increased to \$2,623,944; and while during the present year the increase has not been quite so marked, still the value was \$2,628,002, and the increase in value is largely to be attributed to the more liberal conditions that have existed in several foreign markets by reason of our late war in Cuba. Thus, for instance, the exportations to the Central American states and British Honduras, which last year were from \$71,627 last year to \$165,552 this year. In the West Indies and Bermuda the exports were more marked—from \$162,470 to \$277,736.

The following table is a report of this class for the ten months of the year 1898, and is as follows:

Ten months ending October 31st.		
	1897.	1898.
Total	\$2,623,944	\$2,224,664
Telegraph	1,172,272	1,172,272
Telephone	1,172,272	1,172,272
Other electrical equipment	279,400	279,400
Central America and British Honduras	71,627	165,552
West Indies and Bermuda	162,470	277,736
Other foreign countries	1,718,775	1,718,775
Canada	1,172,272	1,172,272
Europe	1,172,272	1,172,272
Asia	1,172,272	1,172,272
Africa	1,172,272	1,172,272
Australia	1,172,272	1,172,272
South America	1,172,272	1,172,272
Other	1,172,272	1,172,272

countries showing a decrease are those classified as "Other Europe," Canada, Central America, West Indies, Brazil, "Other South America" and Africa; and perhaps the most noteworthy increase in value during the time specified has been that of the exportations to China, which has been four-fold during the 10 months.

Prior to July, 1897, no separate account was kept of the exportations of electrical machinery from this country. Between that time and the end of October the value was \$489,913, or an average of \$163,304 a month. During the 10 months of 1898 the total value of these exportations is given at \$1,939,474, an average of \$193,947 a month, which is an average gain of \$30,000 a month. The European markets should present a profitable market for all electrical equipment. After years of standstill there is a general awakening all over Europe to the value of American-made electrical equipment, and electric street railways, electric-light plants and telephone stations are springing into existence month by month.

The Telegraph in 1898.

[To cover the telegraph field two brief articles are given, the first by Mr. E. J. Nally, assistant general superintendent of the Postal Telegraph-cable company, and the second by an officer of the Western Union Telegraph company.]

The year just closed has been an eventful one for the telegraph companies. The first half marked the beginning and practical finish of the Spanish-American war, which caused a greatly augmented business, especially in "press" or newspaper reports. The last half, particularly the closing months, was notable as having produced the most destructively severe storms from a telegraph standpoint that had ever been experienced; first, wind-storms of great severity, followed later by wet snow, unusually early and extraordinarily heavy for the latitudes visited; then sleet-storm after sleet-storm, causing the copper wires to break in thousands of places, interrupting communication and entailing very heavy expenses for repairs and renewals, not to mention the resulting loss of business.

It can be safely said that the telegraph business is the barometer of general business. The war somewhat disturbed general business, helping some lines and interfering with others. Usually the receipts of the telegraph companies show a gradual and steady increase, beginning with May of each year, and continuing each month until the business reaches its greatest height in October; then a gradual and steady decline sets in, until the lowest is reached in January and February. In 1898, however, May and June showed the greatest traffic; July and August greater than the same months of the preceding year, but less than May and June. September was steady, with October, November and December very good.

Taken as a whole, the press associations and newspapers are among the best patrons of the telegraph, and the late war afforded them an opportunity to show the public that they were bountifully generous and enterprising to a great degree in their efforts to secure the news for their readers. They gave carte blanche to their many correspondents in the matter of descriptive filings. One Chicago paper gave its Manila correspondent an order to file 10,000 words, or more, of Dewey's great victory—quite an order when one knows that the press-rate on cable dispatches from Manila is 58 cents a word, which, by the way, is not too much, when one considers the many thousands of miles of submarine cables and land lines necessary to make up such a circuit, involving, as it does, not less than seventeen manual relays.

Another Chicago paper shared in an expense of many thousand dollars for a single dispatch of the Manila battle.

No country in the world has such able, enterprising newspapers as ours, and no city in this country is better represented in this respect than Chicago.

The Postal Telegraph-cable company made large additions to its mileage of poles and wires during 1898. It built three routes into Texas—one from St. Louis, one from New Orleans, and one from Albuquerque. Nearly every city of importance in the state of Texas was connected with the postal system, and extensions will continue until every place of commercial importance in that state is included.

Many important extensions are planned for the new year, and the boast that "Our record shows that every time the sun rises a new Postal telegraph office is open to the public" will be fulfilled.

The war with Spain caused a large increase in the number of press dispatches and government messages handled by the Western Union Telegraph company in 1898.

The telegraph was an important factor in aiding the government to move troops, battleships, etc. This being a country of magnificent distances, the telegraph had to be employed almost exclusively by the War Department at Washington. The following figure will give the reader an idea of the important part the Western Union Telegraph company played in the prompt handling of the War Department's business from the time war was anticipated until the close of hostilities.

From May 1st until December 31st about 209,000 telegrams were exchanged between the War Department office and other offices in the United States. The Western Union company detailed 20 telegraphers to the War Department office, which was open for business at all hours. The number of press dispatches were correspondingly large, and a large extra force of telegraphers was employed to handle the

increased business, which was promptly transmitted.

The company's report for the year ended June 30, 1898, shows an increase of 33,418 miles of wire and of 441 offices. The number of messages transmitted was 4,022,065 more than for the preceding year. The revenues for the year were \$1,276,873.62 more than for the preceding year. The increased revenues made necessary an increased outlay for operating and general expenses of \$655,111.63. For reconstruction and maintenance, to preserve the efficiency of the property, \$342,913.91 more was spent than for the preceding year, and the cost of equipment of the new offices and for improving old equipments was increased \$48,371.51.

The average tolls received were 30.1 cents per message. The average cost per message was 24.7 cents. The decrease in the average tolls received, and the increase in the average cost per message, are accounted for by the large number of government and press messages, consequent upon the war with Spain, transmitted during the latter part of the fiscal year, on both of which classes of messages the tolls are the lowest, although the highest grade of operating service has to be employed for their efficient transmission.

The cost of construction of new property for the year was \$1,117,651.61. The surplus account was increased \$315,694.06.

During the year the Western Union company transmitted 62,173,749 messages, receiving therefor \$23,915,732.78. The profits were \$6,090,151.26. The number of offices on July 1st was 22,210, and the number of miles of wire, 874,420.

The Progress of Central Stations.

By LOUIS A. FERGUSON.

The development by central stations during the last year, although showing nothing which might be considered startling, has been of a decidedly healthy character and sound in tone.

From the engineering side we have witnessed the practical operation of some of the apparently radical theories and suggestions of the last few years and have gained a better and more perfect knowledge of their characteristics. We have improved many of the details of the apparatus, and have developed, almost to completion, the systems which a year ago were, even to those best acquainted with their possibilities, somewhat embryotic.

The demand during the year by central stations for apparatus which combines in a system the advantages of the alternating and direct current has been almost as remarkable as the recent bull movement in stocks of consolidated industrials on the stock exchanges of New York and Chicago.

The rotary transformer is now becoming an addition to the electrical distribution system in every large city and is being used for a great variety of purposes. Its record during the past year has assured to it a permanent place in the sub-station, employed either to feed the distribution system directly or to charge a storage battery or both. It is operated successfully in parallel not only with others of its own type but also with dynamos driven from engines in the sub-station. In railway work the rotary has a great future, and many plans have been made during the year by engineers in this country and in Europe in which the rotary will play an important part in the operation of railways. One notable example is the case of the Central London underground railway, where rotary transformers will be employed in a system designed by the American engineer, Mr. Horace F. Parshall.

The combination generator was last spring put into successful operation in the system of the Chicago Edison company, furnishing coincidentally direct current to the main bus bar in Harrison street station and three-phase alternating current to the transmission line to the company's sub-station 3½ miles distant, where it delivers energy to rotary-current transformers.

The field of usefulness for this type of generator is very wide, and in many cities it may form an exceedingly important factor in the companies' equipment.

Notwithstanding the increased use of the rotary-transformer system by central-station lighting companies, the storage battery, which at one time was severely threatened by the introduction of the former, has made rapid progress, and its value is being more generally appreciated and confidence in its stability more assured. The advantage of the battery for peak work, when properly applied, is at once apparent to a student of central-station conditions. The storage battery has proved its value when employed at the central distributing point of the lighting or power system, with feeders radiating to various points in the network of conductors. When so located the battery is provided with two or more end-cell switches, so arranged that they may be connected in multiple and feed into the main distributing feeder bus, or they may connect also to one or more auxiliary bus bars, with a different number of cells in series feeding into each bus, thus providing two or more potentials at the center of distribution. The battery when so arranged becomes exceedingly valuable, the long feeders being connected at the time of maximum load to the auxiliary bus bars and additional current forced over them, utilizing their full capacity and maintaining a uniform feeder-end pressure by means of an investment in end cells which is very slight when compared with the investment in addi-

tional feeders and mains required to accomplish the same result.

There is one improvement which is warmly cherished by all central-station managers, and it is that effected in the uniformity of manufacture of the incandescent lamp. The work which has been done by the Testing Bureau of the Association of Edison Illuminating Companies to aid in the accomplishment of this most decided improvement, both in the uniformity of the lamps and the maintenance of candle power during their life, is very creditable indeed, and the public, as well as the central-station companies, is naturally benefited thereby.

Those who were fortunate enough to be present at the September meeting of the Association of Edison Illuminating Companies at Sault Ste. Marie and listened to the paper by Mr. Wilson S. Howell on the work of the Lamp Testing Bureau during the year, enjoyed a scientific treat, abounding in most interesting diagrams and figures, and demonstrating most ingeniously the marvelous state of perfection which has been attained in the manufacture of incandescent lamps for the Edison central stations.

The improvement in constant-potential arc lamps has advanced materially during the year, and this is especially so in the case of the enclosed lamp for alternating currents. The open arc lamp for constant-potential circuits has practically disappeared from the market, and has been entirely superseded by the enclosed arc lamp, since it may easily be determined that the saving in carbons and trimming in the enclosed arc lamp will, in two to three years of average burning, pay for the entire cost of the change by the central-station company.

It is thought by many that the series arc dynamo will gradually disappear from the central station and that the large central stations will operate their arc lamps in series from regulating transformers connected to the alternating-current bus bars of the future central station and in some cases employing rectifiers. Such a system has many of the characteristics of the ideal, and its progress will be watched with interest by all those who operate alternating-current machinery.

The use of the synchronous motor for driving arc machines in central stations has been carried forward to a considerable degree, not only in substations remote from the main generating station, but, in one case, the synchronous motors have even been installed in the same station with the main alternating generators. In other large stations about reaching completion we find the series arc machines retained, but driven by rope from the main engine, to which is directly coupled the generators either for railway or lighting work. There is a marked diversity of opinion as to which is the best of these various methods, but to determine it one should consider the prevailing character of the output and all of the conditions surrounding the company's operation.

Moto-cycles are daily becoming more prevalent throughout the streets of the large cities, and in London and Paris they are exceedingly popular. Their more extended use will constitute an outlet for the central-station companies' product, and we may expect in the near future to find at convenient points throughout all of the large cities of America charging stations for the moto-cycle, where the weary battery may, through the medium of the slot-machine meter, be refreshed and prepared for a continuance of its journey.

A great interest has been shown in all of the discussions relating to the questions of rates and methods of charging, and much good has been derived thereby in the more intelligent understanding by the central-station managers of the principles underlying the cost of production of electrical energy and the conditions which should govern the determination of its selling price.

The point had been clearly brought out that fixed costs, as distinct from running costs, form the greater percentage of the total cost of a unit of electrical energy, and that any method of charging to be equitable should be one which takes into consideration the average number of hours' daily use of the company's investment by the consumer.

During the last year many of the central-station companies have adopted for all their new business the Wright demand system in an Americanized form, and the practical success and popularity of the system has been clearly demonstrated, resulting not only in reduced cost to the small consumer who uses the company's investment many hours daily, but at the same time materially increasing the earnings of the company through the more extended use of its product.

The tendency toward merging of capital and consolidation and concentration of plants, which has been so marked this year in many industrial lines, has extended also to the central-station lighting and power business. It is a natural sequence and should ultimately result in great good for the community if the consolidated properties are controlled and operated by conservative and representative men. A distinct advantage to the public is gained by consolidation, through the standardizing of the systems of electrical distribution in the cities, which should follow to a large extent, at least in sections, as the stations of the various companies are concentrated and their distribution systems merged.

The Independent Telephone Movement.

By H. D. CRITCHFIELD.

Statistical statements, accurate and full, of the development and growth of what those who are most interested in it term "the independent telephone movement," during the year just closed, cannot be given. Those who are associated with the more than 2,000 corporations in the United States—a very large proportion of which are in actual, tangible existence and successful operation—have not as yet seen, as it would seem they should, the advantage of thorough organization and of mutual reports on lines that would provide such statistics, so they could not well be obtained. But, from the standpoint of one frankly confessing identification with the independents, there are salient facts as to the progress of the independents in 1898 which merit consideration.

While there was great and unparalleled growth among the vast majority of the older, well-established, independent exchanges, and as to their toll-line connections, during the 12 months, to those most watchful of the field the most significant and gratifying progress assumed another form—the rapid development of interest and effort in circles controlling large capital, and organizing to afford service in the largest cities of the country. In the earlier stages of the independent movement it was confined to smaller towns and hamlets, to communities whose outside interests were limited, and which therefore had but little need of and use for "long-distance" service. For example, in the state of Ohio, there were a number of towns where the Bell company had never given more than a toll-line service with from one to half a dozen telephones, that conceived they could use independent exchanges at popular prices. Local capital built such exchanges and established rates that secured remarkable patronage, with satisfying returns for those who "adventured their cash."

The telephone user is distinctly and distinctively a gregarious being. Soon the smaller exchanges began to reach out their toll-line tentacles to post-offices and cross-roads in their nearer vicinity, then to reach toward each other for an interchange of business, and at last to clamor at the doors of the larger cities with which they had business relations for independent exchanges and the resulting better and cheaper connections with such jobbing and manufacturing centers. But right here for some time there was hesitation or actual stagnation of the independent movement. Capital in large sums was conservative or timid. It might attract an attention and arouse a competitive war that would prove seriously disagreeable or destructive from interests that had paid little or no heed to smaller and, relatively, unimportant concerns. And so, though there is now a goodly number of independent exchanges in continued and highly successful operation in portions of the United States that are more than four years old—notably in the Middle West—before 1898 one could count on one's fingers—one hand at that—all the plants built, then building, or even seriously mooted by competent companies in cities of upward of 50,000 population.

As to this, the end of the year witnesses a change that is indeed marvelous. In this the progress of 1898 has been pleasing beyond the most sanguine expectations—one might almost say, hopes—of the pioneers in the larger independent companies, or of members and officers of the several state associations or of the national independent organization.

A resume of this would be most interesting and instructive could it be made complete, but so rapid has been the recent growth, even the most careful and observant gleaners of the news in this field could scarcely hope to keep accurate files of the facts. As notable an example as can be given is the signing, but a few days since, by Mayor Quincy, of an ordinance for a competing telephone company organized in the very home, in the supposed citadel, of the Bell company, in Boston! In Worcester and other Massachusetts towns, where the very best results the old company could produce were offered patrons from newly built, up-to-date exchanges, the people are taking hold of the new companies with enthusiasm, energy and cash. No longer are independent exchanges with 2,000 or more telephones declared by their competitors to be an impossibility as a practical proposition. They do work, and several more, involving hundreds of thousands of dollars, furnished by the most sagacious and successful business men in their respective localities, are now building, and still more were completely organized during this most memorable year of the independent telephone development, and will be in operation before the twentieth century shall arrive.

When the president of the New York Board of Trade and Transportation and his business associates, and men of like standing and prominence in other great cities, seriously discuss, and even enter upon the independent movement for their local advantage, they couple with it a legitimate and ample plan for long-distance lines and connections. There are at least three companies, with a million of capital each, in this field of endeavor, which made such progress last year, in both plans and construction, as delighted the independents and almost dazed the other fellows. This year will see these and other companies putting up and into use thousands of miles of first-class, full-copper metallic trunk and

toll lines, the equal of the very best ever seen in this or any country. The state of Ohio, Indiana, Illinois, Michigan, Pennsylvania—all the states, indeed, from Maine to California, from Texas to Minnesota—seem likely to enjoy a boom in this development, the carrying into execution of the plans and preliminary labors of 1898.

It seems to an independent that perhaps the second great factor of progress to be recorded for 1898 consists of the changes and development as to character and quality of the independent plants and service. Earlier in the movement many—nearly all, as it would seem, now, from a hasty backward glance—appeared to think that anything that would "talk" for a short time would suffice; a couple of tin cans connected by taut twine made quite a telephone plant; that sort of thing, at popular prices, was "better than going about," "a heap better than nothing," and though faulty and soon entirely inadequate, developed a sturdy appetite for something better, more permanent and certain of service. This better service was essential for larger cities with bigger exchanges and busier switchboards. In some instances the necessities of this situation were considered quite discouraging in the earlier months of the year, but good examples proved both infectious and contagious. The manufacturers of apparatus realized their duty, nearly all of them, and promptly began to act upon the theory "not how cheap, but how good, a system can we produce." Inventive and mechanical ability made giant strides in the production of apparatus, and systems are now building, and certainly to be built, with a thoroughness and attention to detail and results not excelled by any other like enterprises in America or in the world. Indeed, the independents have shown a consideration for the respective cities where such work has begun, in underground construction and other respects, never before exhibited in American cities. While in this matter the development of 1898 is great and splendid, evidently this year and the years to come are to make still more marked changes; both business and money are at the command of the independents.

To some, from the selfish standpoint, the next feature of the movement is the clearing of the patent situation. There were quite a number of notable legal victories which the Bell company did not win last year. The writer does not recall a single decision in 1898 of the slightest encouragement or value to the Western Electric company or the American Bell Telephone company, in the telephone field, with the possible—and highly dubious—exception of the Carty case. And when threatened litigation ceased to be a bugaboo with which to frighten and deter capital, the disposition to resort to it seemed to materially decrease. The beginning of new suits has not been often reported the last year, and well-versed lawyers, whose counsel is sought and valued by men of large business experience and means, while urging the full and wise use of all legal defenses upon occasion, no longer look doubtful when the name of Berliner and his notorious patent are mentioned.

A single suggestion, scarcely more, can be made of the fourth factor in this progress, that is, the growth in invention, the improvements in appliances and methods of using them. The Patent Office Gazette's weekly reports have shown increasing activity in the telephone department, which already shows many thousands of patents of more or less value. It may be mentioned that since the inventor is no longer confined to a single market, which is absolute dictator of the terms of possible purchase, the hope of greater reward has proved a wonderful stimulus. There are indications that many bright, useful ideas which have been quietly brooding in the brains, or hidden in secret, locked laboratories and workshops of men who within the last year or two have changed employers and professional relations, are at last to be practically developed, and to begin to benefit their authors and mankind.

Not least, after all, though last in the category of progress in 1898, is the public realization of the true situation, the scope and possibilities as well as the purpose of the independent movement, and the wisdom, the necessity, for thoroughly maintaining and sustaining it. This might be deemed a difficult as well as delicate phase of the topic, but, after recalling the frank confession at the outset of the point of view of this review, it may well be mentioned. There is no longer any doubt as to the people, the very intrepid exceptions but accent and emphasize the rule. Where they are fairly treated by the independents, where they are dealing with their neighbors and friends, which is almost invariably the case, and are given fair service, tending to betterment, at reasonable prices, they have repeatedly, time and again, demonstrated their attitude and convictions. Rumor, competition, even free service, and all sorts of subtle seductions, offered in various guises, do not deceive or beguile them. They do not "use self" of the main facts and issue, nor of their duty to themselves and their fellow citizens. In this respect the education of the last year has been more instructive and important in influences and effects than all the years of competition in telephony preceding it.

While there are tens of thousands more of telephones, and better, in use now than in 1897, with thousands of miles more, and better, of toll-line connections, and an increasing growth in the taps for 1899, as a result of the wise planning and

organizing of 1898, still the truest and best measure of the progress in independent telephony in 1898, as it seems to the writer, is along the general lines hastily suggested in the foregoing rather than in statistics, either of corporations or apparatus, though they would tell a tale that would scarcely seem credible to those not familiar with the interest outside their immediate localities. And the coming years promise accelerated growth in almost geometric ratio.

The Moto-vehicle Industry.

By C. E. Woods.

A general review of the moto-vehicle or automobile industry in the United States as pertaining to its development in the past 12 months brings out some very interesting facts, and principal among them, from an industrial point of view, is that the general public has finally awakened to the practicability of the self-propelled vehicle, and is making vigorous inquiry in all directions concerning its application to its wants.

In the meantime, inventors, engineers and mechanics innumerable have been busy with the solution of the problem in their various capacities—some with electric power, some in gasoline, some in compressed air, and so on, through an almost innumerable number of combinations, many of which have proven their practicability in general and in individual ways.

All of Europe has now what is known as the automobile craze, and fashionable people in that country have taken the matter up, and so anxious for vehicles have they become that they are willing to accept any and all kinds, as they are able to obtain them, either perfect or imperfect; and while this condition has not obtained in America, yet the most marked inquiry has come from commercial circles for wagons for the delivering of merchandise, and next for vehicles for public transportation, and at the closing of the year a very marked inquiry indeed is being established from all classes of people concerning vehicles for their own private, individual use, and it is very satisfactory to note that in general these inquiries are coming from a class of people who are users of fine carriages. And it is also very noticeable in this inquiry that the electric vehicle seems to have the preference for such work. This preference, however, is sometimes made without a very clear understanding as to the limitations of the electric vehicle; and in such cases, where they are used through the country, from town to town or for touring and long-distance work, the gasoline wagon has, of course, the preference, because of its partial independence from charging facilities and its accessibility to fuel at nearly all points.

In both classes of vehicles a very great improvement has been made during the last year in simplicity of operation and in durability, as well as in elegance of design, and long tests of the storage battery have demonstrated the fact that a battery properly constructed and with good care and attention is wholly adequate to the demands which will be made upon it for nearly all classes of work. The only possible objection to the electric vehicle is accessibility to charging points, which is at the present moment being taken under advisement by electric-light companies of the larger cities, and steps toward provisions for charging electric vehicles are being taken in the shape of public charging stations at various points throughout the cities. As soon as these are established, there will be no limitations to the electric vehicle in its operation, as batteries to-day can be charged very rapidly, and with public charging plugs to drive up to at various points in the city there is no necessity of ever running out of current.

Aside from the cabs in use in New York city, there has not been a very large number of vehicles put into practical operation—probably not to exceed, including these, four or five hundred throughout the United States, if that many. Some concerns have shipped a few of their vehicles to Europe, and, to the credit of American industry and enterprise, it is to be said that the American products in this line have met with a very favorable reception, and the indications are that the demand for American vehicles will make big encroachments upon those manufactured in Europe. This statement, broad as it seems, is in keeping with exports of all kinds of machinery which are now being made to foreign points.

Twenty thousand carriage makers are required to fill the demand for ordinary vehicles in the United States to-day, of which some twelve or fourteen thousand are good, reputable concerns. This is only cited to show the field which the moto-vehicle industry has to operate in, and with such an extensive field at home and such splendid invitations in the foreign market, there is room for many more manufacturers in this line of work before anything like severe competition in prices is necessary. As a matter of fact, the prices that are being quoted to-day on moto-vehicles, as thoroughly finished, machine productions, will never be reduced to any great extent. Some novelties, a la Paris and the continent, may be brought about which are of course purchased much cheaper than a good carriage can be sold for. Electric vehicles, however, are able to cope with the general market, and, so far as the market

is concerned, neither form of vehicle has any great prestige on this score.

On the whole, both as an industry and as a product, the moto-vehicle has to-day one of the most promising futures of any line of development that has taken place in the last few years.

Electrical Construction and Inspection.

By EDWARD B. ELLICOTT.

During the last year the character of electrical installations has changed for the better in a more decided and noticeable manner than in any previous year. The introduction of new rules of practical and consistent requirements found a large number of contractors ready and anxious to do work in accordance with them. There are comparatively few instances in which it was found impracticable to follow the rules to the letter; the necessary departures did not mean a less safe installation; and I have yet to meet a contractor who was unreasonable in his requests.

Contractors with good intentions and reputations can do more to improve the electrical installations than can be secured from a reasonably close inspection. The utter impossibility of formulating rules covering the details of construction applicable to every building leaves much to the contractor's judgment, and in most instances the responsibility has been well placed and the result creditable. This fact is emphasized by the work of the inspection department in Chicago. More work has been done this year than in any previous year and the cost has been less, admitting a reduction in the inspection fees on two occasions, and making the present cost about 33½ per cent. less than has been charged for many years. City ordinances have been passed regulating the filing of applications and issuing of permits to do electrical work, and have tended to secure better inspection as the work progresses. New rules will soon be adopted in place of those now used, and an effort is being made to secure the most practicable requirements possible.

The electrical installations in Chicago during the last 12 months were about as follows:

Incandescent lights equivalent to 16 candle power each	123,250
Kilowatts, in motors.....	6,386
Kilowatts, in generators.....	5,263
Number of arc lights installed.....	4,337

The most serious problem confronting electrical inspection departments now is the question of proper insulation for wires and the construction of fittings that will pass reasonable inspection and that can be purchased at moderate cost. The majority of new fittings (and there are too many of them) seem to have been constructed on extreme lines—poor design or high cost. A standard list of fittings and wire will simplify electrical installations more than any other departure from the present generally adopted class of work.

BUSINESS SITUATION.

In reply to a number of inquiries addressed to representative electrical manufacturers and dealers by the Western Electrician, asking for a business review of the year just closed, with the prospects for the new year, the appended statements were received. The answers show, generally, a satisfactory state of affairs. The volume of business is uniformly stated to be good, although some manufacturers claim that prices are still too low; others note a distinct advance in prices. The note of business expansion in several of the responses, referring to the island possessions of the United States acquired during the year, will be read with especial interest.

Lakon Company, Elkhart, Ind.: Business with the Lakon company has been very satisfactory during the year.

Carlisle & Finch Company, Cincinnati, O.: The trade in searchlights and projectors was better in 1898 than ever before. The outlook for the future is very encouraging.

Ohio Electric Works, Cleveland, O.: As we see it, the outlook in all branches of the science is incandescent for those prepared to make intelligent use of the art preservative.

Wheeler Reflector Company, Boston: We report an increased volume of business last year over any previous year. In our opinion, there is every indication of a prosperous business ahead in the electrical field.

Perkins Electric Switch Manufacturing Company, Hartford, Conn.: We consider business to be in a much better condition than it has been for several years. The demand for our supplies is better than for some time past, and we have confidence that the business for the coming year is going to be a large one and much better than it has been in recent years.

American Electric Fuse Company, Chicago: In our estimation the electrical trade has been on a gradual increase since 1897. We have found the business of our company has multiplied threefold since December, 1897, up to the present time, and we will further say that the inquiries and the outlook for the future year are more than encouraging. We feel safe in predicting one of the most prosperous

years for 1899. We base our assertion on the inquiries for our electrical devices.

Bigelow Electrical Supply Company, Lincoln, Neb.: We are most interested in city electric-light plants, either municipal or otherwise. Municipal ownership is growing rapidly, and we believe will soon be the accepted view. The year 1898 has been a fairly good year for work in this line, there being more work than any time since 1892. This year we expect even better results.

American Engine Company, Bound Brook, N. J.: We have had a very satisfactory year, and the outlook seems to us to be particularly encouraging. The question of electrical transmission and distribution of power has been attracting considerable attention, and this method seems to be growing in favor. With the abundance of cheap money, the coming year ought to be a phenomenal one in business activity.

Fort Wayne Electric Corporation, Fort Wayne, Ind.: The demands the early portion of the year were unusually good. These were slightly diminished in the early weeks of the war. Since July, however, business has weekly increased. The demand for large arc apparatus to supplement small machines has materially increased during the year. The growing demand for alternating apparatus continues. From the present outlook we feel 1899 will be the best year in the electrical field since the panic.

Electric Appliance Company, Chicago: In the electrical supply business the year which has just closed has been a year of considerable improvement in business, but more particularly a year of promise for the future. It is evident that capital is again seeking investment in electrical enterprises, and with the many disturbing elements of last year disposed of, as it is probable they soon will be, the coming year should be one of large investment in electrical properties and a year of prosperity for all electrical interests.

Kokomo Telephone and Electric Manufacturing Company, Kokomo, Ind.: The Kokomo telephone is making history, but your time is too limited for us to write it. Our business is all right, and we hope as much for others. The prospects were never better with us. 1899 will surely be the banner year for the independent telephone (if the Bell people don't pluck another patent decision on us; but even that doesn't hurt as bad as it did). We have more business before us and more business behind us than ever before.

Baker & Co., Newark, N. J.: We regret our inability to give a very satisfactory account of the growth of the electrical industry during the year 1898. As you know, we confine ourselves to the refining of platinum, and can, therefore, only judge from the consumption of that metal, which has been greater during this year than in any other in our business history, from which we should imagine that the business had been in a very prosperous condition. In a general way, all outlooks point to a prosperous year in 1899.

Delaware Hard Fibre Company, Wilmington, Del.: The outlook, we are glad to say, is exceedingly gratifying. The demand for fiber during the last three months has been unprecedented, and we are running our plant to its full capacity for 24 hours in a day. Along with this increase in business there has been a substantial strengthening of prices, so that, considering everything, we think that the outlook for 1899 is very favorable. The demand for fiber has increased, not only in the electrical line, but in other lines, to an extent which we could not have anticipated several years ago.

Farr Telephone and Construction Supply Company, Chicago: The closing of the year leaves us with an abundance of orders on hand to be filled. For the last three months we have been working our force night and day to keep up with our orders. The outlook for the new year could not be any brighter. The electrical trade in this country is certainly enjoying a great boom throughout the United States and Canada. We are highly pleased with the results of our advertising for the last year in the five electrical journals. We never begrudge the money we pay out for printers' ink.

Electric Railway Equipment Company, Cincinnati, O.: We have been very busy. We have had both our factories running full blast all the year. We have been shipping steel tubular poles, pole brackets and a general line of supplies, such as overhead material, trolley wheels and journal brasses, all over the world. We have just completed a large order for California, and have secured another order of 4,000 poles for Mexico. The business outlook for next year is good, and we think it will be better than it was this past year. We are now building a large addition to our works, which will enable us to furnish goods on shorter notice.

Vindex Electric Company, Chicago: From our experience we are compelled to recognize a general improvement in business over that of the preceding year, and our present inquiries for transformers are such that we are confident that the outlook for the ensuing year for increased business is very favorable indeed. A very gratifying feature of our inquiries is the fact that quality and not price is usually the first consideration. With this encouragement manufacturers are bound to improve the quality of their product, with the result of better satisfaction

to the manufacturer as well as to the purchaser. This is, we take it, a certain indication that business is generally in a more prosperous condition, and we can see no reason why this improvement will not be continued during the coming year.

Valentine-Clark Company, Chicago: While we are not directly in the electrical field, yet our business is done entirely with electrical people in furnishing white-cedar poles. We are very well satisfied with the results of the last year, there being a natural steady improvement in business which seems to be gradually on the increase as the year draws to a close. As to the outlook for the year 1899, the prospects certainly are very flattering, not only as regards to a return of better prices, but also a very perceptible increase in the shape of inquiries, which not only tend to show condition of business in general, but also show the improvement when the orders come in reply to the inquiries.

Garton-Daniels Electric Company, Keokuk, Ia.: The year just closed has been the most successful year in our history. This has probably been due to the increased volume of electrical business, as well as due to the fact that buyers are now looking for and adopting goods with merit as their distinguishing feature instead of price. In the lightning-arrester line alone we find an increase of over 33% per cent. over last year's business. We have shared in the foreign business coming to this country, to a great extent our foreign orders during the year having amounted to more than double what they were in 1897. We have made more desirable connections abroad, and expect a very large increase in 1899. The outlook everywhere seems to indicate the most successful year in electrical history for 1899.

Elwell-Parker Electric Company of America, Cleveland, O.: We are glad to say that our business has improved, and especially so in the number of export orders. There is no doubt that abroad American electrical machinery is far in advance of the same product as turned out by the other countries. This is due to the undoubted fact that the American type of generators and motors possesses that most important combination of practical qualities, with the minimum of weight and first cost. We regard the outlook for the coming year, in our own business at least, as being most promising, both for this export business and for the business at home. We are sorry that we cannot report as correspondingly a satisfactory change in prices, and certain it is that the buyer of machinery is now in a position to purchase electrical machines on as advantageous prices as those of steam machines.

Emerson Electric Manufacturing Company, St. Louis: The general line has shown a decided increase over previous years. At the same time the natural tendency has been toward low prices and smaller margins of profits. The manufacturing of small wares in the electrical trade has suffered from large stocks thrown on the market by failures of supply houses and manufacturers, and prices have, as a consequence, been forced to a very low level. But during the last year the bottom appears to have been reached on prices; the surplus stocks on the market have been used, and an increased demand has resulted. After the usual quiet, consequent on winding up the year's affairs, we look for a large and steady improvement in regular lines, as well as in all specialties, and as the effects of the panic and war are now things of the past, good times are due and may be expected for the next few years.

Standard Underground Cable Company, Pittsburg, Pa.: The demand for our manufactures during the year 1898 has been very large, and while prices have ruled very low, the volume of business done by our company exceeds that of any other year in its history. Immediately preceding and during the war with Spain there was a slight reduction in amount of commercial inquiries and orders, but with us this was largely compensated by large government orders for submarine-mine and torpedo cables, as well as cables and wire for use in and about the fortifications. With large unfilled orders on hand extending well into the new year, and a great deal of new construction planned for the coming year, and the good general business and financial situation encouraging new enterprises, we have every reason to consider the prospect for 1899 quite favorable for ourselves and for electrical industries in general.

Pennsylvania Electric Company, Marietta, Pa.: There is room for but one opinion in regard to the electrical history of the last year, from an industrial standpoint, and that is, that it has been fraught with great success in the way of improvements in apparatus and volume of business done; the new inventions, improvements and applications of electricity have probably never been exceeded in any one year. As to the future outlook, appearances are favorable for a large business within the next year. The late elections deciding in favor of sound money, the high price of copper and the plethora of money in the United States are, to our minds, all very favorable indications. The high price of copper, indicating heavy demands from electrical manufacturers, is especially significant. In the independent telephone field there are signs of great activity, especially in the larger cities and in the construction of toll lines.

Safety Conduit Company, Rankin Station, Pa.: Manufacturing, as we do, a comparatively new line, that of enameled, or, as it is sometimes called, unlined iron-armored interior conduit, we feel very much gratified by the success of the business so far.

our conduit having been installed in a large number of the most important installations of the present year. As to the future, we believe that, so far as our business is concerned, it will take care of itself, as the demand is not only growing, but there is a considerable number of buildings now on the board for which our particular style of conduit is specified, so that we naturally look for an increased business. Speaking generally, we believe that all lines of the electrical trade should be congratulated, as everything has certainly been booming during the present year; besides, the opening of the foreign market to American production is another great success. And with regard to foreign trade, it should be the hope of all that the infant of 1898 will continue to grow and attain large proportions.

Shelby Electric Company, Shelby, O.: The closing year has been one of great satisfaction to this company. During the year our factory has operated on an average of 12 hours a day, and we have never been inconvenienced by the lack of orders. We judge that any manufacturer in the electrical lines, making an article of merit and disposing of it at reasonable prices, has had all that he could do. The history of the incandescent-lamp business, so far as we have been able to determine, is that the field is increasing with marvelous rapidity, and that it will continue to increase, and that although competition is strong and prices are low, a lamp of good quality can be sold at a reasonable profit. We think the tendency among consumers is to use better lamps. There are more consumers of lamps testing their purchases now than ever before, and this works greatly to the advantage of factories which have the ability to manufacture properly. We prophesy that the next 10 years will be the best years ever known in the various electrical lines.

Chicago Rheostat Company, Chicago: Viewed from the standpoint of the rheostat manufacturer, the distinguishing feature of the electrical industry during the last year has been the equipment of factories with electric-transmission systems. That which was but recently considered an experiment became the accepted practice of 1898. The application of electric motors to the various classes of machinery has called for numerous special controlling rheostats, in addition to largely increasing the demand for the standard types. If the demand for rheostats be a fair index of the demand for motors (and they usually go together), the motor manufacturer should be more than gratified by the business of the last year and the outlook for the next. Europe is practically without what we here consider up-to-date rheostats, and its demand for the American product is very active. The rapid increase in the number of electrically equipped factories and the development and extension of the export trade offer encouraging prospects for the coming year.

Lynn Incandescent Lamp Company, Lynn, Mass.: We take pleasure in attesting to an increased amount of business here and an ever-increasing inquiry from abroad. This latter demand has taken a great jump since our "expansion," and the year 1899 will surely open the eyes of this country as to what the business of colonial possessions means. We find a gratifying change in the demands of consumers for better goods. Many cheap lamps have been placed on the market, and, as is always the case, they sell for a while, and then comes the change and the call for a better article and belief in the old saying that "the best is always the cheapest." We note a tendency in many lines outside of electricity to an increase in prices and hope to see some of it in ours. No line of business puts more brains and labor into it than in all kinds of electricity, and the same should be properly rewarded. The result of this brain work is always in the way of a benefit to consumers. An instance is the designing of the anchored filament, which gives incandescent lamps a much longer average life.

Orient Electrical Company, Youngstown, O.: So far as we are able to judge, we believe that the past year has been a prosperous one in electrical lines in general. In our particular line (the manufacture and sale of incandescent lamps) we find that our sales during the past year have been very satisfactory indeed, and although there has been exceedingly sharp competition, prices have remained about the same during the year. Last year we had "trusts," and rumors of "trusts," but this year we hear but very little of these things. Manufacturers outside of the "combine" have set the price, and those on the inside have met these prices wherever it was found necessary to do so. Now that the prices of lamps have gone about as low as they can well go, the tendency—in order to secure and hold trade—is to improve, to the highest possible degree, the quality of the lamps furnished so that to-day lamps of the very highest grade can be had at low prices. The outlook for continued prosperity in electrical lines was never better; other industries are thriving, and with this will come an increased demand for electrical machinery and supplies of all kinds.

United States Carbon Company, Cleveland, O.: In no instance has the revival of business and the increase of confidence affected the industrial arts more than in the electrical field, which, throughout the dull and panic-stricken years, has shown a steady increase in all branches, and in none more so than ours, the manufacture of electric-light carbons. The development in electro-chemistry and electro-metallurgy has greatly increased in the last year, thus broadening the field in which carbons of larger and

more complicated forms are required. These requirements we have fully met by the installation of the largest and most powerful carbon machinery in the world. We may safely predict that the year 1899 will see a large reduction in the importation of foreign carbon, and a superior carbon of American make for enclosed arc lamps, and that it will not be long, under the "open-door" policy of the Republican party of our government, before our carbons, by their superiority, will be forcing their way into Europe and the colonies. As the carbon trade reflects the prosperity of the manufacturers and merchants, we can safely predict a brilliant outlook for 1899 and 1900.

Crouse-Hinds Electric Company, Syracuse, N. Y.: We are pleased to be able to write that the electrical business for the past year, from our standpoint, has been unusually satisfactory. Our business has doubled within the 12 months past, and we have been assured many times that the demand for the highest class of material in our line is increasing very rapidly. We manufacture only the highest grade of work in knife switches, switchboards and panel boards. We are not interested in the cheaper class of business, and only desire orders where quality of work is considered. We believe that the consumer of the class of material we manufacture is becoming more and more acquainted with the fact that it is poor business policy to spend any money for material of this description which is not the finest that can be purchased. In regard to the future, we think that the outlook for this year is most promising for the electrical business in our line, and in order to be in position to handle our increasing business promptly and satisfactorily to our customers, we have materially increased the capacity of our factory and made liberal investments in new and special machinery.

Hodge, Walsh & Loring Electrical Engineering Company, Kansas City, Mo.: Our business during 1898 has been considerably better than in 1897. We are engaged in nearly every line of electrical work except that of manufacturing, which we only do on a small scale. We have constructed about the usual number of electric-light plants for lighting towns in the adjoining states. Our supply business has been considerably increased, and the most activity in any of the electrical lines which we pursue has been in the construction of telephone exchanges. In Western Missouri and throughout the whole state of Kansas there are few towns of more than 2,000 inhabitants which are not supplied with telephone exchanges. We know of many places of less than 2,000 inhabitants which have from 50 to 100 telephones in operation. The outlook for the ensuing year in the different branches of electrical industries is exceedingly bright. We anticipate that the volume of business in 1899 will be considerably in excess of that of the present year, or, in fact, any recent year. This we believe to be a very conservative statement as to the present outlook of the different electrical interests in our territory.

Illinois Electric Company, Chicago: That the electrical business of the year has been a success stands without dispute. Prices are no higher than the year before, but there has been a healthy growth of new trade, which can be traced perhaps to the generally livelier conditions in other branches, and then, again, to the opening up of new territories of the United States. We, of the middle states, do not feel this so much as seaport towns, but as Cuba, Porto Rico, Hawaii and the rest are to be Americanized, they must also be "electricized." The worthy chiefs of the Philippines must ride in trolley cars as well as we. But, returning to the serious side once more, we do not ask for a boom in the electrical business; we simply wish the same healthy growth that we have had in the last year. One of the blessings we should be thankful for is the way in which the eastern factories stand by the western supply houses, thus enabling us to better gratify the general trade, and perhaps it would not be out of place to remark in this place the general fellowship of a thoroughly reunited country. We wish for all the general brotherhood of those connected with electricity all the benefits that are possible in the new year.

Standard Paint Company, New York: We have little comment to make on the business of the year 1898 in our electrical lines, certainly no complaints, for in spite of the war and other conditions which indicated, in the early part of the year, that business might be dull, we have sold more of our P. & B. armature and field-coil varnish, P. & B. electrical compounds and P. & B. insulating tape than in any other year since the formation of our company. The demand for the P. & B. products, not only in electrical lines, but in building, brewery, cold storage and other directions, has increased to such an extent that we found it necessary about a year ago to establish a branch factory to take care of our foreign business. This branch was completed about six months ago at Hamburg, Germany, and is now running regularly and is turning out the same goods as are manufactured by our home factory. As you doubtless know, business in the general electrical and electric-traction lines is very decidedly on the increase in most countries of Europe, and we are therefore already doing a very large business at our Hamburg works. The president of this company, Mr. R. L. Shainwald, who has given his particular attention to the establishment of our foreign

business, has just returned from Europe, and states that he is exceedingly gratified at the results already accomplished, and is as well confident that the business of 1899 will be far in excess of any previous year in the history of this company.

General Electric Company, Schenectady, N. Y.: There has been, so far as our information and experience goes, a most healthy and satisfactory growth in the electrical business during the last year, which has been reflected, not only in the increased orders to manufacturing companies, but in increased business of local lighting and power companies. Our orders this year are considerably in excess of last year in almost every line of electrical apparatus and supplies, and the indications for the coming year are most encouraging. It seems to us that, with the improved quality of electrical apparatus and supplies, together with the low prices now prevailing, and with the increasing attention which the local lighting and power companies are giving to the question of cheapening the cost of production of current and of adopting a comprehensive system of charges to customers (based directly upon the cost of the product), the electrical business, as a whole, was never in so sound and healthy a condition in this country as it is at the present time, and, as a consequence, capital for investment is attracted to the industry as it has never been before. We trust sincerely that the general improvement of the electrical business has found its way to the technical press as well, and that your own experience is as encouraging as ours has been during the last 12 months.

Roth Bros. & Co., Chicago: The year 1898 has proven to be a most excellent year for us; in fact, the total volume of business done during the year has exceeded any previous year since 1894. We have been so busy in our regular line that we are very much delayed in getting out a line of enclosed motors and dynamos. Although business has been somewhat flighty, especially in the earlier part of the year, the total has been very gratifying. Business in fan motors was not as good as we expected it would be, because of the cool summer; nevertheless, we did better than any previous year. Our local business has increased very largely over former years, and, inasmuch as inquiries are very good and buyers not looking for the lowest priced machine they can get, regardless of quality, the indications are that money is more plentiful and that the year 1899 will be the best ever experienced in the electrical business, so far as the line we are particularly interested in is concerned. Collections have been good and losses slight. We have not given much attention to the export trade, although we have made shipments to Asia, Africa, Australia and South American ports, besides a considerable amount to Mexico and Canada. In all, we are extremely well satisfied with the business done in 1898, and, from the present outlook, everything indicates a very big year in 1899.

Michigan Electric Company, Detroit, Mich.: As a whole we are perfectly satisfied with the year, as we find the volume of business in each of the different lines we deal in compares most favorably with the business of the preceding years, though naturally the margins have been somewhat closer than ever before, but during the latter part of the year there has been a marked and steady improvement which is still continuing. We believe the times are very often what one makes them, so that if one feels there is not any business to get, and consequently gives up trying, the natural result is that none will be secured. On the other hand, we have never seen the time when we did not feel that there was plenty of business to get if we only went after it properly, and, acting on this assumption, we have yet to find the time when we were not kept busy to our limit, with a possibility beyond, which we were unable to take care of. We believe that every indication points to the business of the next few years being better in our line, and in fact all others that we know of, than at any time during the past, though, of course, not with the possibility of as large margins as during the earlier years of the electrical business; but with a reasonable margin and improvements in quality now existing we think the business as a whole will be of more solid and desirable growth. As we are jobbers and contractors in almost everything in the electrical line, and also repair all sorts of electrical machinery and appliances, as well as manufacturers of electrical appliances, fixtures, etc., we are in a position to tell what the demand is in all these lines. We can only add that in every one of them we are at present as busy as we could reasonably desire.

Sterling Electric Company, Chicago: As a whole, the year has been one of success and general prosperity. There has been a general enlargement of plants, an increased number of consumers and an influx of considerable capital in the electric-light branch. The power, heat and transmission companies have each had one far-reaching, undertaking or important engineering problem and successfully carried them through. The traction companies have made thousands of miles of extensions, and with the closing of this year we find a much larger capital invested than in the year 1897. The telegraph companies have had a number of the times in the line of their business, and have done it to the pace. The electric power and light companies have had a very busy year, and a large amount of capital has been invested in the electrical field. The independent field has also been very busy, and it is estimated that hundreds of thousands of dollars have found their way into this field during the year just passed. The old-line company, the Bell, has expended hundreds of thou-

sands in improvements, toll-line extensions and fighting its opponents. The moneys invested in this field have earned a handsome revenue, and electrical securities, in general, are in demand. The outlook for the year 1899 could not be more promising. We refer especially to the telephone field. The new business, the extensions and increased facilities of all the companies will tax the manufacturers to their utmost to supply the demand. Our line of manufactures relates directly to the telephone branch. We are pleased to state that the year 1898 has been a very prosperous and satisfactory year for us, and from the amount of new business offering, and inquiries, we predict that the business for 1899 will exceed the most sanguine expectations. We wish to add that we thoroughly recognize the fact that the Western Electrician has been one of the leading factors and a great help in this year of prosperity in the electrical business.

Logansport Telephone Manufacturing Company, Logansport, Ind.: The last year has seen greater improvements, greater investments and better service than any year in the history of the independent telephone. Independent telephone plants and long-distance toll lines are no longer hampered by the necessity of buying cheap and unreliable apparatus. It is an undeniable fact that the start of the independent movement was not very encouraging to capital, but to-day the independent manufacturers can offer superior apparatus, with which up-to-date exchanges and long-distance lines may be equipped with and operated with minimum operating expenses, making it possible for a good percentage to be made on the investment, and at the same time the people be given good service at a reasonable rate of rental. Within the past year the independent companies have constructed twice the amount of miles of toll lines and installed four times as many telephones as the Bell companies have. The independent situation in Indiana is good. Within the next year every town of 5,000 inhabitants or over in Indiana will have an independent telephone exchange, and we presume that this condition of affairs exists in most other states. The year of 1899 will see a general reconstructing of toll lines, which means another impetus to business. Manufacturers would gain more by ceasing the foolish and childish habit of calling each other bad names and saying that they are the only people who have good apparatus, and all other is cheap and unreliable stuff. The fact is that there is plenty of good and reliable telephone apparatus on the market. There has been a radical departure from the old methods of telephony, both in the workings, workmanship and appearance. Switchboards, for instance, look no more like the switchboards of three years ago than a rubber-tired phaeton does like a wheelbarrow, and workings and service given from them are just as far ahead as the appearance. It has been the independent movement that deserves all the credit for the advancement in the art of telephony.

Electrical Engineering and Supply Company, Charlotte, N. C.: The influence of the last year in electrical business shows much improvement, particularly in the class of work that has been done—slower speed dynamos, more attention being paid to the design of switchboards and the details of plants. In other words, a higher grade of electrical work is being demanded, and some very fine work has been done, and you can now find as high-grade work in the South as anywhere in the country. The electrical business of the South is largely in isolated lighting, nearly all the cotton and woolen mills having their own dynamos. In many of the mills these dynamos have right hard service, as they run from 12 to 18 hours per day and sometimes 24, in the event of cloudy weather. There are a number of fine water powers, especially in North and South Carolina, Tennessee and Virginia, mostly undeveloped, largely because of distance from railroads. Two instances in this state are Roanoke Rapids, in the east, and Winston, in the west, the latter being at present developed to the extent of 1,000 horse power, but arranged to be increased to 2,000. The Winston installation is on the Yadkin River, situated 12 miles away, and is being used to run cotton mills, a woolen mill, a large flour mill and the light and power station. There is a healthy growth of town-lighting plants, and this is especially so, as there are very few towns of small size with gas-plants, only the larger places having gas. We do not think that acetylene gas will cut much figure in town lighting, as it has to show its equality to coal gas or electric light—a thing which, in this part of the country it has failed to do. In fact, we are disappointed that acetylene has not made better progress, because we think it has its place, and its success will add to rather than detract from the electrical business. We look to see the 220-volt system come into more general use in the South, as it has in the Northwest. We look for a healthy electrical business in 1899—no boom—and, owing to a higher grade of work demanded, hope for better prices, for we regret to say prices have been exceedingly low during the last year.

W. C. Sterling & Son, Monroe, Mich.: We think that the electrical history of the United States during the last year adds pages to the history of the progress of this nation. The business originating from the use of electricity during the last year has, in our opinion, passed all previous years. In the state of Michigan many miles of pole line have been built to carry telephone and electric street-railway wires. The largest independent telephone toll-line company in the United States, known as the New State Tele-

phone company of Michigan, of which we are directors, has built 2,500 miles of toll line, has opened 145 toll stations and 33 exchanges. We have shipped cedar poles as far south as New Orleans, where the Detroit Switchboard and Telephone Construction company is building a large independent telephone exchange, as far east as New York, and west of the Mississippi. As cedar-pole dealers, we are well informed as to the variety of companies doing construction work, and the increase in the independent telephone field during the last year has been enormous. We have shipped more poles in the last year, cross-arms and pins included, than in any previous year. It is only a matter of a year or so when Michigan cities will be connected with cities in Ohio, Indiana and Illinois by independent telephone lines. The telephone business will be much larger during the coming year, as local companies are becoming stronger and receiving more encouragement, and are branching out and constructing toll lines to connect their several exchanges together. Farmers, as well, are learning to understand that the telephone lines are a benefit to them as well as to any business man, and many farm lines are being built in Michigan. New electric-light and street-railway enterprises are not so numerous, although a large number of new roads were built in northern states, but the electric-light construction is quiet. Cedar poles are used entirely for all pole-line construction, and we are pleased to say that in the 20 years of our pole business the last year has surpassed them all, and we are preparing for a good year coming. Prices have advanced considerably and will be still higher next year, owing to the increased cost to cut and get poles to destination and the increased demand.

Eureka Electric Company, Chicago: The independent telephone field shows a marked change toward the use of a higher grade of apparatus than used in earlier years, and the manufacturer who is not awake to this growing demand for the best that can be produced will find that his business will show a falling off. An important development has been the attempt of the Bell company to purchase over 5,000 miles of independent toll line, consisting of not less than 70 independent plants, within the last year. Fortunately, the effort came to nothing. At first the Bell company was inclined to sue on "cobweb" patents. When it found that it could not gain by that method it bluffed. That plan also failed, and now the last resort is the endeavor to buy out competition. Particularly is this condition noticeable in central Indiana and Illinois, where the Bell people are just about to have thrust upon them the warmest competition from the New company at Indianapolis. The late Spanish-American war has also been of great value to the independent telephone industry. Many a small village was kept hourly informed upon important events going on at the front, of which it would have been wholly deprived had it not been for some independent company. The prospect for business and plenty of it is apparent, as plants that have been installed for several years are making changes in their central-office equipment for either high-grade apparatus of later date or enlarged capacities. Already we have many orders for early spring deliveries, and no doubt other manufacturers of good apparatus find themselves in a similar position. That the condition of the independent field is upon a good sound basis and that additional capital will find investment during the year 1899 can in no way be doubted. It now only remains for the companies to pull together, hold on to what they have already built and acquire additions, and in no line will they be able to find as good investment for their money. While our line embraces electric fans, arc lamps and other electrical devices, we are working heavily upon our switchboards and telephones. Already our McCordsville factory is running 18 hours a day in our endeavors to keep pace with our orders, and we anticipate an extremely large trade in this country and an opening trade in our new possessions during the coming year.

Standard Thermometer and Electric Company, Peabody, Mass.: The marked advance in the electrical history of the last year has been in the greatly increased use of enclosed arc lamps. These lamps are coming into very general use for both street and interior lighting, and the call for them, for both purposes, has been very brisk. In our opinion the demand for them has but commenced; the coming year will probably show even greater advance in the design and in the multiplicity of uses for these lamps over any similar period in the past. The foreign trade has been remarkably successful, both in volume and results. The use of the alternating current is so much more general abroad that the advent of a noiseless enclosed arc for this current has given us a great amount of business. We have reason to think that 1899 will call for a great many more lamps than 1898 for the continent and Great Britain. While here in the East general business has been pretty quiet in all lines, we have not been able to meet the demand for arc lamps at times, and have never been able to accumulate any reserve stock of lamps. We shall offer to the trade, early in the year, an entirely new line of cases for the Upton "Midget" lamps which cannot help attract attention and increase our sales. The worst feature of the outlook for new business is the keen competition forced on the whole trade by the largest maker of lamps in the country. This renders it exceedingly difficult to get satisfactory prices for arc lamps. The most hopeful feature is the very general increase in the use of enclosed

arc lamps, which means increased output and lower cost. The carbon duty made users and manufacturers of enclosed arc lamps rather anxious at the beginning of the year just closed, but the American manufacturer of carbons seems to have arisen to the occasion, and, for many purposes, the domestic carbons offered by him are as satisfactory as the much more expensive imported carbons. It looks as though the American carbons would find an export market in a very short time, if the improvement in quality is increased as much in the future as in the immediate past. If only Congress could be made to understand that certain articles of raw material, like mica, for instance, cannot be produced in this country, and would permit their importation free of duty, the electrical manufacturer would be helped.

Gordon Battery Company, New York: Our point of view is necessarily somewhat contracted, and our judgment cannot therefore be used as a criterion upon which to base any general inference. Our trade covers two distinct lines: First, the Gordon cell business, or that of primary batteries of the oxide-copper and zinc type; second, the sal-ammoniac carbon batteries, with incidental medical outfits, elec-

tric-lighting devices, etc. The Gordon cell industry is a comparatively new one, the device itself having been placed upon the market as a common article not earlier than the fall of 1895. The sales of this year are fully 50 per cent. greater than those during the corresponding months of last year. Our experience during the last year has supported the theory that better prices may be expected, as the recent advance of at least 12½ per cent. in the carbon and sal-ammoniac line is but a forerunner of a further advance, which will no doubt be made in the early part of the new year, and which we hope will be sufficiently liberal to allow all persons now in the business to make a fair profit on the goods manufactured. If the subject is approached from the standpoint of the volume of material moved in the year 1898, it shows an increase, but if it is viewed from the standpoint of values, then the business has not been equal to 1896 or 1897, as there has been a steady decline in prices on all carbon goods. This applies to everything except a few specialties. There is a tendency in the market to substitute lower grade goods for the better quality, and this, of course, cannot be fought successfully temporarily; it may last

for a year or two, just as the great war of shoddy swept over the woolen market some twenty years ago; and in a similar way the electrical trade has been in a demoralized condition throughout the country during the last few years, with but little light to be seen in the distance. Not a small proportion of the single-cylinder business done during the last year has been at prices based upon the actual losses; in fact, we doubt if there has been any carbon business in the battery line which has produced any profit. The competition among the manufacturers has produced two results: First, strong personal feeling—a desire to destroy the competitors; second, a desire to secure new business. We believe that the manufacturers have reached the point where they have learned the folly of pursuing the policy of destruction. We are confident that in the near future some satisfactory arrangements will be made by which prices can be advanced to a point where there is a fair margin of profit to the manufacturer. During a portion of the last year, single-carbon cylinders have been sold at a price which actually incurred a loss of from 15 to 20 per cent. to the manufacturers.

DEVELOPMENT OF THE TELEPHONE FIELD.

Telephone News from the Northwest.

(From the Minneapolis correspondent of the Western Electrician.)

The Harrison Telephone company contemplates a toll line between Armour, S. D., and Harrison.

A private company is to be formed at Appleton, Minn., to put in a telephone exchange.

The Northwestern Telephone Exchange company has put up two more wires between Litchfield and Willmar, Minn.

The District Court in St. Paul has held the Northwestern Telephone Exchange company exempt from a sewerage tax, because it pays a gross-earnings' tax "in lieu of all taxes and assessments whatever upon all its property held or used for, in or about the construction, repairing, renewal, maintaining and operating its system or lines." The tax in question was for the company's building at Fifth and Cedar streets.

The Eureka Telephone company of Eureka, S. D., is preparing to enlarge its switchboard. It has 71 instruments now in use.

The city of Des Moines, Ia., has begun suit against the Iowa Telephone company to prevent it from extending its system in the city. The city claims the company has no right there, and that its wires are a nuisance, which it asks to be abated. The telephone company has no franchise, and was some time ago notified to vacate, but it ignored the notice. The company says it will stand on its vested rights and will fight to the bitter end. The company is also working to increase its list of subscribers at New Hampton, Ia.

National Automatic Telephone Exchange System.

So great has been the demand throughout this country for a reliable automatic telephone exchange system that the accompanying cuts and description of the apparatus designed by Frank A. Lundquist, electrical engineer of the National Automatic Telephone company of Chicago, will be examined with particular interest. For over a year the instruments of this company have been in use, but the company has not heretofore aggressively pushed the development of its system. It now, however, presents for public inspection automatic exchange and subscribers' instruments that it feels confident will stand the most exacting tests.

As is well known, some owners of exchanges, in their efforts to meet existing conditions, have brought the rates so low, that under such methods the most rigid economy of operation is necessary. It is contended that the system herewith illustrated meets these requirements.

Referring to the cuts, Fig. 1 shows a five-line section of a 100-point switchboard; each line of two wires, forming the metallic circuit, comes in to one of the five mechanisms represented in the picture. The mechanism is quite simple and sure in its operation, as will be understood after a personal inspection. Every part is made by die and is as accurate in its action as the finest clockwork; in fact, the management of the National Automatic Telephone company says that men who were inexperienced have set up the apparatus and operated it most successfully.

Figs. 2, 3 and 4 show three forms of the National subscribers' telephone outfit. Fig. 2 is the subscribers' instrument, operated by two buttons at the side of the case of the transmitter in company with the use of the indicator shown on the face of the box.

In Fig. 3 is shown another form that is operated through the agency of a crank.

The company also furnishes a high-grade system of ordinary long-distance telephone that is suitable for general exchanges and toll-line service.

As will be readily appreciated by one having only a limited knowledge of telephonic devices, the most important features of this exchange system could only be thoroughly understood by personal inspection, for the mechanism presents a combination of devices impossible to represent pictorially.

The advantages claimed for the National Automatic over the manual-board system, both to user and promoter, are worth studying. Not only does the company claim that it obviates the expense of maintaining a central office, with its many employees, but eliminates as well a multitude of imperfections and annoyances. The expense of maintenance is reduced to a minimum and a great deal of annoyance is obviated by the National system. For instance, one cannot forget to ring off, can ring up immediately after having called once, and as many times as desired. The instrument signifies instantly whether

Telephone President Indicted.

As anticipated in the Western Electrician, the grand jury in Washington, D. C., on December 31st returned a true bill against Samuel M. Bryan, president of the Chesapeake and Potomac Telephone company, on the charge of violating the act fixing the yearly rental of telephones in the District of Columbia. The law, which was enacted last June, fixed the yearly charges at from \$50 to \$25, according to the number of telephones on a circuit and the character of the service provided. The company contended that the act was unconstitutional, and ad-

Fig. 1

Fig. 2

Fig. 3

Fig. 4

NATIONAL AUTOMATIC TELEPHONE EXCHANGE SYSTEM.

the line wanted is busy. If a line becomes crossed or is in trouble, it is automatically disconnected so that it does not interfere with the working of the others. There is no time lost in calling Central and awaiting the pleasure of the operator to connect with the number desired.

Copper wire is not required in the National system. It is practicable for small towns and cities, where, owing to the cost of maintenance of a system where operators are required, the manual-board system could not be maintained.

Bell Company Absorbs Interstate.

A dispatch from Tuscola, Ill., December 31st, says: "The Bell telephone people have just succeeded in absorbing the Interstate Telephone company, which has headquarters in this city. The Interstate owned and operated several hundred miles of lines in central Illinois, and, as the Bell people threatened to cover the same territory, a compromise was effected whereby the Interstate goes out of existence and the Bell people will soon have a clear field."

hered to the former rates. The matter was taken up by a citizens' association, and many injunctions were obtained to prevent the removal of telephones upon tender by subscribers of the amount fixed by the act. These injunctions will soon be heard before the District Court on the constitutionality of the act in question.

Extensions and Improvements.

Construction work will be begun immediately on the telephone line between Bandon, Ore., and Rosa.

The Rocky Mountain Bell Telephone company will build a line to Idaho Falls in the early spring.

The Vinton, Cal., Telephone company has been incorporated; capital stock, \$20,000; directors, A. B. Huntley and L. H. Dunning.

Men are at work on the telephone line to connect Helena, Mont., and Spokane, Wash. D. S. Murray is general manager of the company.

S. G. Hugh's independent system of telephones is having poles put up at the rate of 75 a day for the new line to Portland and Forest Grove, Ore.

Two-rate Meter System.

Methods of providing central stations with continuous full load, so that the machinery may always run at maximum efficiency, or, in other words, the problem of supplying load at slack hours, attaining a uniform load, avoiding idle capacity and securing a constant revenue from all the station apparatus, is a subject of general interest to owners and managers of electric-lighting properties.

To load a lighting station up to its maximum output is not difficult during early winter evenings. All are conversant with the ordinary station curve, which shows a low level line from midnight to daylight, a sudden and disproportionate drop in the early morning hours, a sudden leap to maximum output by 5 p. m. and a steadily descending line to midnight. During 16 hours of the 24, fixed charges continue constant, and operating expenses are only slightly decreased, but the revenue shows a curve coincident with that of the load. The fixed charges on the apparatus which carries the peak have to be earned in a few hours each day. Reduction in price is, without doubt, the only means which ex-

perience shows can be successfully employed to induce an increase in demand and a consequent employment of otherwise idle machinery in the station; but to effect this reduction in price and to give a consumer electricity at one price during the hours of maximum demand on the station, and at a reduced price during the hours of medium or minimum demand, a means of recording the consumption during two distinct periods is necessary. Such a load-modifying system, however, to be successful, must essentially be independent directly or indirectly of the consumer's local conditions and depend entirely on station conditions. The high rate of charge must be coincident with the maximum peak period of the station, the low rate upon the period of smallest demand, thus giving greater encouragement to the use of current at periods other than that of the station peak.

It will be seen that the two-rate system is based

two-rate meter system in station practice may be mentioned: First, one large and influential station, which has only recently adopted the two-rate meter, has not only added over \$20,000 worth of new business on the two-rate basis, but has also, and this is noteworthy, reclaimed \$10,000 worth of old lost business from the gas companies. Second, in cases where a consumer uses incandescent lamps, motors and incandescent arc lamps, he is usually charged a different rate for each character of the service, i. e., one rate for the incandescent lamps, another for the power service and still a different rate for the arc lamps. Each service measured separately requires a separate meter. These three meters could be successfully replaced by a single two-rate meter with consequent diminished expense to the station, and, very probably, greater satisfaction to the consumer.

Vitae Carbon Brushes.

The brush herewith illustrated is a treated carbon brush for motors, generators and dynamos, especially designed for saving the commutator and for securing long life. The manufacturers have made a specialty of street-railway motor brushes, and

VITAE CARBON BRUSHES.

have been very successful in that branch. The company has a number of exceptionally strong testimonial letters from users of this brush, including one from an important street railroad, stating that the Vitae brush had run nearly 19,000 miles on one street-car motor in its service. These brushes have been on the market only a couple of years, but the business of the company has increased enormously. The manufacturers claim that this brush does not cut or wear the commutator and that it wears many times longer than any other brush; that it is a thorough self-lubricator and never gums the segment tips; that it requires no attention and runs seven to ten degrees cooler than any other brush, and that, having a greater conductivity, it conveys the entire current absolutely without loss; furthermore, that it leaves no deposit of dust in the motor, which is one of the causes of short-circuiting. The Le Valley Vitae Carbon Brush company of New York manufactures this specialty.

Dicke Ball-bearing Pay-out Reel.

This reel, it is claimed, is the only one of its kind manufactured, and its novel feature is the method of supporting the circular platform upon which the wire is placed. In the accompanying illustration two of the cross-arms of the reel are cut away, so as to give a good view of the truncated cone, on top of which can be seen a number of small balls. The reel revolves upon these balls, reducing the friction to a minimum. In practical work the friction is inappreciable, and whether the load be heavy or light there seems to be no increase necessary in the effort to operate the reel. The reel is manufactured out of the best white oak, is strongly mortised, ironed and bolted. The balls and bearings are made of tempered steel and will stand much use. The Western Electric company of Chicago is the exclusive agent for the sale of this reel in the United States.

Moto-vehicle Contract.

On Thursday of last week it was announced that Count de Jotemps of Paris, president of the American Motor General Agency, Paris, had made a contract with the Fischer Equipment company of Chicago for

DICKE BALL-BEARING PAY-OUT REEL.

the delivery of 5,000 electric vehicles in the next 10 years.

A representative of the Western Electrician interviewed C. E. Woods, electrical engineer of the Fischer Equipment company, and learned that the information was "about 50 per cent. correct." The company had indeed closed a large contract, and it was particularly gratifying that a Frenchman, after an examination of the most advanced foreign types, should select an American type of machine as against all competitors.

After closing the contract with the Fischer company, and before leaving Chicago for New York, Count de Jotemps made the following statement:

I came to America somewhat prejudiced against the automobiles manufactured here. The company of which I am pres-

Thomson Two-rate Recording Wattmeter, Open.

entirely upon the condition of the station—that of supply and demand, and not upon any conditions local to the consumer. The condition of the load on a station using two-rate meters is also shown by the curve. With the discouragement of local peaks coinciding with the main-station peak, the really objectionable peak is a steady stimulation to creation of local peaks not occurring at the same time as the station peak, and this, putting a premium on heavy consumption when the station is lightly loaded, not only breaks down the main peak but also tends to build up the average station line by the introduction of the local peaks. It does not, however, discourage the small consumer, since he benefits as much by the low rate during the period of minimum demand as does the large consumer. He is encouraged in the same ratio and, securing his current cheaper, is prone to increase his consumption, tending to raise the average load line of the station. The heavy line curve shows the result which will probably be obtained.

The two-rate meter system is equally desirable for, and may be applied to, direct and alternating-current circuits, but the meter is not interchangeable, direct-current meters being used for direct-current circuits and alternating-current meters for alternating-current circuits.

Two examples of the influence of the use of the

careful consideration of this question of station load has brought about the development by the General Electric company of a two-rate recording wattmeter with two dials and an electric or self-winding clock. By means of the clock, the consumption of the meter may be changed from one dial to the other at any predetermined hour of the day. The meter itself rotates with unchanged accuracy at all times according to varying consump-

ident was organized for the purpose of selling automatic vehicles. We tried every machine of European invention, but none of them came up to popular demands. Then we saw some of American manufacture and I was instructed to come to the United States and see in what respect the automobiles in this country surpassed ours.

Upon reaching Boston I was simply overwhelmed by the makers of every form of automobiles. There were those propelled by steam, gasoline, electricity and every conceivable power. Finally, I decided upon a race as a test. Among the electric vehicles the Woods machine, manufactured in Chicago, was easily the best, and so I came here to make the contract with the makers.

While the electrically propelled vehicle is superior to all others because there is little vibration and because it is the simplest of construction and manipulation yet there are many Europeans who prefer carriages propelled by other mechanism. To satisfy these customers I have made further contracts with three eastern makers for the delivery each year for the next ten years of automobiles propelled by steam.

The Fischer company was established about a year ago for the manufacture of automobiles of the Woods model. This is the largest contract it has made, and the company and Electrical Engineer Woods, certainly deserve credit for the energetic manner in which they have pushed the electric-carriage business in this country against many obstacles and during a period when, to say the least, money for luxuries was scarce.

Progress Dry Battery.

The Phoenix Carbon Manufacturing company of St. Louis is now pushing a form of dry battery that is worthy of careful consideration on the part of the electrical trade.

The primary requirement of a dry cell is that it

Fig. 1. PROGRESS DRY BATTERY. Fig. 2.

shall have long life, and in carrying out this object the Phoenix company uses a containing vessel whose walls are sufficiently porous to allow moisture from the atmosphere to pass through them, and a filling having in close association with the excitant a material capable of absorbing moisture from the atmosphere. A battery is thus produced capable of maintaining its excitant mixture in a moist condition and consequently active for a long period of time.

bon, in the form of a cylinder, provided with vertical ribs on the outside for strength. The carbon of this vessel is of the quality commonly used for the negative elements of batteries, which, owing to its granular nature, is very porous.

Inside of the vessel is placed a filling in a gelatinous or semi-solid state, and containing an exciting material, such as sal-ammoniac, and also a material capable of absorbing moisture, such as chloride of calcium. These materials are intimately associated in the semi-solid mass, so that any moisture ab-

Section of Valve, Middle Position.

BRUSH ARC GENERATOR REGULATOR.

sorbed by the chloride of calcium will be imparted to the other material of the mixture, and so maintain the entire mass in a moist condition. The positive electrode is a pencil of zinc, and occupies an axial position in the vessel, and so is surrounded by the semi-solid filling. A layer of depolarizing material placed between the semi-solid filling and the carbon element performs its usual functions.

Since it is not necessary or desirable to seal the top of the cell a cover is used which screws into place or interlocks with the vessel. This also is made of carbon, but harder and less porous than that of which the vessel is made. In this cover a metallic post is imbedded and fitted with a binding nut for a circuit terminal. The positive electrode projects centrally through the cover, being insulated from it by a porcelain bushing, provided at its outer end with proper binding devices for the other terminal of the circuit.

The Phoenix company finds that a battery constructed in accordance with this description remains active for a much longer period than types of battery which are sealed, the increased life being due to the fact that the chloride of calcium in the filling draws moisture from the atmosphere through the porous walls of the containing vessel and into the semi-solid mass, maintaining the latter in substantially its normal and original condition. When the positive electrode is consumed it is obvious that by means of the readily removable cover another

Brush Arc Generator Regulator.

As the series arc-lighting generator has been gradually increased in size the adoption of improved methods of regulation has become more imperative. The nerve center of a series arc system being the regulator, however nearly perfect the other apparatus may be satisfactory lighting cannot be obtained unless the regulator itself performs its full duty. The General Electric company has, therefore, developed for four-pole Brush arc generators the regulator herewith illustrated. It is simple, both in construction and operation, its mechanism being contained in a rectangular case placed on the

Case Removed, Showing Working Parts.

machine directly beneath the commutator. A separate wall controller is not required; hence no additional leads need be run from the generator. In maintaining constant current the regulator performs two simultaneous operations, namely, it sweeps a set of rheostat contacts, varying the resistance of the field shunt and rocks the brushes back or forth to keep the spark length at a minimum.

The mechanism consists of a rotary oil pump, driven by a belt from the armature shaft, a rotary piston in a short cylinder with ports and a balanced valve, which regulates the flow of oil into the cylinder. The valve is operated by a lever which supports the armature of a controlling electromagnet, energized by the main generator current. The pull on its armature varies, therefore, with this current. At normal current the valve is in its middle position and the oil may flow through the overlapping ports and back into the case, without moving the piston. Should the current rise above normal, the controlling armature is drawn down, raising the valve and diverting the oil through the upper ports into the piston, at the same time allowing it to run out from the piston case through the lower ports, as the piston rotates in a clockwise direction. As the piston is mounted on a shaft moving the rheostat arm and the brush-holder rocker arm, its movement immediately corrects the rise in current. When the current returns to normal the controlling magnet releases, and the valve lowers and prevents further

Brush Multipolar Arc Generator with Regulator.

Regulator.

BRUSH ARC GENERATOR REGULATOR.

Diagram of Parts.

It is well known that many types of dry cells lose their efficiency by reason of the drying out of the filling, and that this occurs notwithstanding the fact that attempts are made to effectually seal the cell. Instead of sealing the cell the Phoenix company exposes its contents to the atmosphere for the purpose above stated, making the porous containing vessel of carbon and utilizing it as the negative element of the cell, which affords obvious advantages.

A cell of battery made in accordance with these ideas is illustrated in the accompanying cuts, showing the cell complete, Fig. 1, and also with elements apart, Fig. 2. The containing vessel is made of car-

bon, in the form of a cylinder, provided with vertical ribs on the outside for strength. The carbon of this vessel is of the quality commonly used for the negative elements of batteries, which, owing to its granular nature, is very porous.

Attorney-general Crow has filed a petition in the Circuit Court to deprive the Lindell Railway company of St. Louis of its franchise, contending that the franchise is in violation of the law prohibiting the granting of a right to lay a street railway within three blocks of an existing parallel line. He also asserts that the statutes prohibit the Lindell and other companies from purchasing independent lines. The Lindell system was recently sold to a syndicate represented by Brown Brothers of New York.

bon, in the form of a cylinder, provided with vertical ribs on the outside for strength. The carbon of this vessel is of the quality commonly used for the negative elements of batteries, which, owing to its granular nature, is very porous.

Attorney-general Crow has filed a petition in the Circuit Court to deprive the Lindell Railway company of St. Louis of its franchise, contending that the franchise is in violation of the law prohibiting the granting of a right to lay a street railway within three blocks of an existing parallel line. He also asserts that the statutes prohibit the Lindell and other companies from purchasing independent lines. The Lindell system was recently sold to a syndicate represented by Brown Brothers of New York.

moved toward its middle position, which it reaches just as the current returns to normal.

It is evident that the piston and, therefore, the rheostat arm and the brushes will move more rapidly when the ports are wide open than when they are nearly closed. The means for correcting variations of current are thus most effective when most needed. The actual time required to bring the current back to normal from a dead short-circuit is from $3\frac{1}{2}$ to four seconds. The use of rapidly moving reciprocating parts has been avoided, and when properly adjusted the regulator operates without oscillating action.

At one end of the armature lever is an adjusting spring, the tension of which is regulated by a hard-rubber knob outside of the box. With this spring the armature may be adjusted for a predetermined current, and this is the only adjustment necessary. As the spring is not in circuit and is not subject to temperature changes, the adjustment is not likely to change. The adjusting knob may be handled without danger when the machine is in operation. The stops for the controlling lever may be so arranged that the regulator may operate more quickly in one direction than in the other, while a device is provided which allows the regulator to be thrown entirely out of operation. A change in direction of rotation of the generator requires in the regulator only a change in the position of the two stopper plugs in the oil pump. A safety valve is provided to relieve the pump from excessive pressure. All electrical connections of the regulator are made to stationary binding-posts, and there are no sparking contacts. As the case is dust-proof, destructive grit resulting from sandpapering the commutator cannot affect the regulator, and as it is partly full of oil at all times the bearing surfaces are thoroughly lubricated and wear is consequently reduced. Thus, thorough protection of the mechanism and careful provision for its lubrication increase the reliability of the regulator, and it will remain longer in proper adjustment and require far less repair than one exposed to dust and dirt.

This regulator has been built so that it may be substituted for the "Form 1" regulator (operated by magnetic clutches), either with new rheostat or fitted to the old rheostat.

CORRESPONDENCE.

New York Notes.

New York, January 3.—With the New Year the Rapid Transit Commission bobs up smilingly with a proposition to apply to the Legislature for authority to bond the county of New York for money to construct the proposed tunnel. All the commissioners except the representatives of the city government have been in favor of this plan. Comptroller Coler is opposed to it. After yesterday's meeting he said that he did not think any member of the board would consider the county bond scheme seriously. Secretary DeLafield said later that the expediency of the plan had been questioned by some members of the commission. He said, however, that no offer of private capital to build the road had been received from any source. The commission voted to appoint George L. Rives and Comptroller Coler a committee to prepare a memorial to the Legislature setting forth the exact condition in which the plans for rapid transit are now. This memorial, Mr. DeLafield said, would be of such a character that all the members of the commission could unite in signing it.

The latest objection to the plans of the commission is based upon the claim that the transformation of surface lines into electric railways has removed the principal reason for the building of the tunnel.

The four-track scheme was an excellent one when it was planned, but it is now obsolete, and it is no longer the best or wisest plan of furnishing real rapid transit for New York city. When the rapid-transit scheme was originally planned the surface street railways of New York were operated by horses, or, in a few instances, by cable traction. The coming year will see practically all the main north-and-south surface lines operated by electricity, and, in other words, the local tracks for the New York rapid-transit railway have been laid and are now in operation on the surface of the streets. If the local lines of the proposed rapid-transit railway were now completed and in operation, they would be forsaken by travelers for the electric cars on the street surface. Passengers will not walk even a block or two and descend to an underground station when they can take an electric car on one of the surface roads at the nearest corner. Further, the rate of speed, including stops, obtained on the present electric conduit roads is nearly or quite as good as what the proposed local trains of the New York rapid-transit railway could make.

A report has been circulated in Hoboken to the effect that the controlling stock of the North Hudson County Railway company had been purchased by the North Jersey Street Railway company, which operates lines in Hudson and Essex counties. The capital stock of the North Hudson County Railway company is said to be about \$5,000,000. The North Jersey Street Railway company, of which E. F. C. Young of Jersey City is president, wants to obtain control of all the street-railway lines in Northern New Jersey. It is said that the company is also

negotiating for the purchase of the Jersey City, Hoboken and Rutherford railway. Bernard M. Shanley of Newark, who is manager of the North Jersey company and a large stockholder in the company, has this to say of the deal: "For upward of five years I have owned, with others, a quarter interest in the North Hudson company, and now we have purchased from J. O. H. Pitney enough of the stock of the company to secure us the controlling power; but the company will be run as the North Hudson company, and will be entirely independent of the North Jersey company." It will probably come under the heading of "friendly interest."

The New York Autotruck company has been incorporated, with capital stock of \$1,000,000, to manufacture motors for heavy trucks. Compressed air is to be the motive power employed, it is understood, and it is said that the new motors will be much more powerful than any storage-battery equipment now in use, and at the same time will weigh less than half as much as such motors. M. S.

PERSONAL.

Gen. S. T. Carnes, president of the Memphis Light and Power company, and Mr. Frank G. Jones, general manager of the Memphis Street Railway company, spent the last day of the old year in Chicago.

The first order issued by Governor Roosevelt upon taking oath of office was the appointment of his staff as commander of the National Guard. Lieutenant-commander Samuel Dana Greene was selected as aide-de-camp to represent the naval militia.

James Partridge, general manager of the Partridge Carbon company of Sandusky, Ohio, was a Chicago visitor last week. Mr. Partridge's visits to Chicago of late have been so few and brief that they are regarded as unusual events by his many friends in the trade.

James W. Thomson, Jr., superintendent of the Mitchell, Ind., Telephone company, died on December 24th, after three weeks' illness. Mr. Thomson was favorably known throughout the state, especially in independent telephone circles. He was buried at Jeffersonville, Ind.

Mr. Dewey Newman, formerly of the Central Electric company, will in the future represent the Illinois Electric company in the states of Illinois and Iowa. Mr. Newman entered upon his duties the first of the year. He will attend the meeting of the Northwestern Electrical association in Milwaukee in the interest of the Illinois Electric company.

The Fort Wayne club has adopted resolutions expressing the sense of loss sustained in the death of R. T. McDonald. It has been suggested that a marble slab be placed on the walls of the works of the Fort Wayne Electric corporation, bearing a suitable inscription relating to the establishment of the business by Mr. McDonald.

Charles G. Burton, for the last five years occupying an important position with the Central Electric company, will be associated with E. B. Kittle, western manager of the Sprague Electric company at Chicago. Mr. Burton brings into his new field of work an experience of 15 years in the electrical business. He was one of the pioneer electrical salesmen in the West, and among the first to push Brush apparatus. During the last two years with the Central Electric company he was in charge of that company's advertising department, and his successful and original work in that direction attracted unusual attention.

Robert Hemingray, a pioneer glass manufacturer, died Tuesday, December 27th, at his home in Covington, Ky. Mr. Hemingray had been ill for three weeks with heart trouble, but it was not of a serious nature until just before his death. He was said to be the oldest glassware manufacturer in the country. He leaves a wife, three sons—Ralph, Robert and Daniel C.—and two daughters—Mrs. Bradford Shinkle of Covington and Mrs. W. H. Felix of Lexington. The funeral took place from the family residence Thursday noon, December 29th. Mr. Hemingray was for many years one of Covington's foremost citizens. Of late years he had retired from active business, leaving his large interests in the manufacture of glassware to his sons. He was born near Johnstown, Pa., and settled at Covington in 1847. One year later he founded the Hemingray Glass company, which has since been conducted by himself and his sons.

W. J. Clark of the General Electric company has accepted the position of general manager of the foreign department of that concern, with headquarters in New York. In the reorganization of the foreign department Mr. D. Mazenet, who, for five years, has held the general managership, and who has piloted it from a small beginning to its present position as one of the foremost departments of the company, becomes managing director of the Mexican General Electric company, with headquarters in the city of Mexico. Mr. Clark's wide experience in foreign commercial matters peculiarly fits him for his new position. He has traveled through Europe, as well as in the countries south of the United States, and his familiarity with foreign methods and manners will prove an advantage. His book, "Commercial Cuba," recently published, is already generally

acknowledged to be the standard authority on Cuban commercial affairs. He will be greatly missed from the railway department, in the management of which he made a unique record.

ELECTRIC LIGHTING.

The Bureau of Yards and Docks of the Navy Department is inviting sealed proposals until January 14th for extending the electric-light system at the New York Navy Yard. Specifications, blank forms of proposal and a general plan will be forwarded to intending bidders upon application to the bureau at Washington, D. C., or to the commandant of the yard at New York. Bidders are expected to inform themselves of the character of the work by visiting the yard.

Chicago's city gas inspector, Maurice O'Connor, reports that during the last year 4,797 gas lamps and 118 gasoline lamps were discontinued, mainly on account of the installation of electric lights by the city, and also to keep within the appropriation made for the Gas Inspection Department. The number of gas lamps in service January 1, 1898, was 33,042, and of gasoline lamps at the same time, 10,224; total, 43,266. The number of gas lamps in service December 31, 1898, was 28,245; gasoline, 10,106; total, 38,351.

ELECTRIC RAILWAYS.

The Westinghouse Electric and Manufacturing company on December 24th shipped a large quantity of electric-traction supplies for a street railway in Corea.

Buildings occupied by the Rochester, N. Y., Railway company for car sheds, shops and offices were burned on January 1st, and their contents destroyed. The loss is estimated at \$50,000. The property was fully insured. There were 14 cars burned and several trucks damaged. The company's service is crippled temporarily by the destruction of the cars and trucks, but it hopes soon to replace the rolling stock and buildings.

Indianapolis is at present the scene of operations of a syndicate looking to the combination of street-railway lines. The Citizens, which holds all the streets, but has no franchise after 1901, and the City company, which has a franchise, but no tracks or rolling stock, are the properties interested. It is said that John P. Frenzel, one of the largest holders of stock in the City company, has been in consultation with the directors of the Citizens' company in Philadelphia, and that, at least, the basis of a deal has been discussed, and consolidation partially agreed upon. The fact is recognized that the Citizens' company has a decided advantage over any rival, because it possesses long-time franchises in all the suburbs, which were secured before the suburbs were added to the city. These are the manufacturing centers, and as the Citizens' company has tracks on all the streets leading to them, the City company must either buy its way out or stop its lines inside of the city proper.

PUBLICATIONS.

The Electric Appliance company has ready for distribution a complete catalogue of Whitney electric instruments. The Whitney instruments are too well known to require any particular comment, and this catalogue should be in the hands of every buyer of test instruments.

The latest pamphlet issued by the Electric Storage Battery company of Philadelphia is of special interest to street-railway companies, as it describes the battery plant of the South Side Elevated Railroad company of Chicago and explains the advantages of such an auxiliary. The considerations which influenced the engineers of the company in adopting batteries in this particular case are thus summarized: "First, batteries could be installed in one-third the time, and the demand was pressing. Second, the batteries would cost no more than the feeders necessary to transmit the additional current to the termini of the line, if generating units were added to the power station. Third, by smoothing out the extreme fluctuations and taking a portion of the peak of the load during the time of heavy traffic morning and evening, the batteries would increase the capacity of the power station 25 per cent."

CALENDARS.

The standard of the Wabash is proudly borne by the Continental Limited in the artistically designed and executed calendar issued by that railroad company.

"Neat, attractive and dignified" are terms that exactly describe the calendar issued by the American Electrical Works of Providence. As usual, this concern is on hand with the compliments of the season, and it takes the best way of constantly reminding its patrons and friends of its mission by supplying them an attractive and useful calendar.

The H. T. Paiste company of Philadelphia is issuing to the electrical trade a very artistic calendar for 1899. The subject is "Good Night," by Grust, and is a beautiful reproduction of the lights and shadows which make this painting famous. Copies

will be sent upon receipt of four cents in stamps, to cover expense of mailing.

"Ruins of Conway Castle, North Wales, built in 1284, by Edward I." is the title of the artistic illustration which graces the calendar issued by the Warren Electric and Specialty company of Warren, Ohio.

One of the daintiest of the season's calendars is that distributed by the Okonite company. It consists of a prettily tinted picture, with a cardboard mat around it. Below the picture, on the mat, is the calendar proper on monthly tear-off sheets. In the upper left-hand corner is the well-known Okonite trademark, and there is no other advertising matter on the calendar.

"Soldier girls" are again supplanting soldier boys in popular favor, judging from the prevailing fashions. The G. F. Brunt Porcelain Works of East Liverpool, Ohio, have taken advantage of this sentiment in preparing their calendar, which is an attractive collection of portraits of "soldier girls," prettily attired in costumes designed after the style of the army and navy uniforms.

ELECTRICAL SECURITIES.

The Third Avenue (N. Y.) Railroad company's report for the third quarter of the last year shows a marked decrease in the gross receipts and a slight reduction in operating expenses. The difference in the net earnings was \$97,637. The company's earnings amounted to \$572,620, and operating expenses \$351,585.

The Edison Electric Illuminating company of New York reports gross earnings for November of \$286,940, an increase of \$39,645 as compared with the same month of last year, and net \$142,373, an increase of \$9,802. For the three months ended November 30th the gross earnings were \$2,711,602, an increase of \$505,972 as compared with the corresponding period of last year, and net \$1,134,059, an increase of \$156,237.

A petition for a writ of error was filed in the Appellate Court at Chicago last week by stockholders of the "Alley L" in the case of the foreclosure decree for \$11,400,707, granted in the Circuit Court June 29, 1896, to the Northern Trust company and the Illinois Trust and Savings Bank against the elevated railroad property. The petitioners ask to have the decree reviewed and the amount reduced to \$3,000,000. The decree allowed the foreclosers possession of \$700,000 worth of real estate owned by the railroad, \$186,375 cash on hand at the time of the finding of the court, as well as the right to operate the road. The error, it is alleged, was in including the money and real estate, as the mortgage on which the foreclosure was had did not include these items. It is also set forth that the decree wrongfully included the amount due on other bonds issued by the Illinois Trust and Savings Bank.

MISCELLANEOUS.

The War Department, through the United States engineer at Norfolk, Va., is inviting sealed proposals until January 24th for furnishing and setting up four storage batteries at Fort Monroe, Va. Information will be furnished upon application to Maj. Thomas L. Casey, 166 Granby street, Norfolk, Va.

TRADE NEWS.

"We're all one year older! Well, never mind. Here's best wishes for 1899," is the greeting of Charles D. Shain of New York to his numerous friends.

Users of wire and cable are reminded of the facilities of the Standard Underground Cable company of Pittsburg for handling their orders, by a neat souvenir in the form of a combination foot-rule and wire gauge.

During the year the Link-belt Machinery company of Chicago found it necessary to run the entire factory at night as well as during the day for seven months. At all times of the year full time was made. The company's business showed great improvement.

The G. F. Harvey company, manufacturing chemist, Saratoga Springs, N. Y., is placing on the market an article to which it desires to call the special attention of managers and engineers of power plants. It is a liquid called Vitogen, for burns and scalds, for which the company makes strong claims. The company cites many cases where Vitogen was used with wonderful results. This article seems to possess merit. All interested are requested to address the company for its booklet on Vitogen.

The Commercial Electrical Supply company of St. Louis continues to enjoy an unusually good trade. The company is at present rushed to fill orders and the management considers that the coming year will be one of its best. The Commercial Electrical Supply company of St. Louis has an enviable reputation for fair treatment of customers. President Joseph Franklin, Jr., and Manager of Sales Paul D. Cable are always on hand to greet whoever may come to town to visit this "emporium of electrical supplies." The Commercial company is at present engaged upon

the compilation of a new catalogue. It will possess many desirable features and be a volume of great usefulness to the trade.

The Zeco arc lamp is meeting with great success in the hands of the Central Electric company of Chicago. President George A. McKinlock recently stated that not only had large orders been booked for the lamp, but the most satisfactory reports as to its actual service have been received. For some time the Central Electric company has been so crowded with orders that it has been unable to make prompt shipment, but now the stock has been increased so that all orders can be taken care of with dispatch.

The Western Electrical Supply company of St. Louis, Mo., reports very flattering sales this season of switches, of which it carries a very large and well-assorted stock at all times, and is able to ship on receipt of order any standard switch on the market. Parantite and Peerless rubber-covered wires, for which this company is agent, have never before received the patronage of this season, which is considered a very high compliment to the merits of the wire. The company also reports good sales on the general line of supplies and a constantly increasing trade on general electrical supplies of every description and electrical apparatus, in which it is a heavy dealer.

All those who propose going to the convention of the Northwestern Electrical association at Milwaukee, January 18th, 19th and 20th, will do well to engage their rooms at the Pfister Hotel ahead of time. A representative of the Western Electrician recently visited Milwaukee and found the manager, Al Severance, preparing for the coming convention. It will be remembered how, through the courtesy of Mr. Severance, the last year's gathering at the Pfister was made a most delightful affair, and one that will long be remembered. Mr. Severance certainly did all in his power to make everyone have a good time, and without doubt this year's convention will see a repetition of his unflinching courtesy.

BUSINESS.

William Roche of New York reports flattering orders for all sizes of New Standard dry cells, from the 1 3-16 to three inches diameter and two to seven inches in height of body. The users of dry cells recognize the claims for superiority in strength, life, quick recuperation and practically no internal action.

The Central Electric company reports largely increased sales in the line of transformers, enclosed arc lamps, high-grade knife switches and switchboards. It is enjoying unexcelled facilities for manufacture, and has recently furnished some large and elaborate boards. The company's new catalogue, just published, lists a line of special tablet and cut-out boards not shown in any other publication.

One of the busiest concerns in Chicago is the Swarts Metal Refining company, located at 20 North Desplaines street. As is well known, this concern makes a specialty of purchasing old copper wire of any description and in any quantity, and it pays the highest market value. The business of the Swarts company has been built up to large proportions through the efforts of Seymour Swarts, its popular president.

The Electric Appliance company has taken the selling agency for the two-ball lamp adjuster. Great claims are made for this adjuster as to simplicity, durability, etc., one of which is that as there are no springs and special mechanism used in the device, it cannot get out of order and is practically indestructible. It is inexpensive and at the same time ornamental, and is intended to displace similar devices which depend upon springs and other mechanism.

Electrical contractors know of the Wrigley toggle bolt and other specialties, placed on the market by Thomas Wrigley, engineer and machinist, 300-306 Dearborn street, Chicago. Mr. Wrigley has supplied many thousands of these specialties to the electrical trade, and his business has been most gratifying during the last year. He is getting out a number of new specialties, and those interested in articles of this kind might learn something of interest by communicating with him.

The United Gas Improvement company of Gloversville, N. Y., is erecting a new plant, consisting of generator house and boiler and engine house. The building is about 50 feet wide and 80 feet long. It will be fireproof throughout. The sidewalls are of brick and the roof framing of steel, which will support slate-roof covering. The trusses are clear span—no interior columns—and rest directly on the side walls of brick. The steel work was furnished and erected in place by the Berlin Iron Bridge company of East Berlin, Conn.

The Farr Telephone and Construction Supply company, 357 Dearborn street, Chicago, is doing its best to keep up with the demand for its well-known products. Nearly every telephone man in the country is aware of the popularity of the Farr products, and many independent telephone exchanges are taking advantage of the present inducements the company offers to purchasers. The Farr company is just now placing on the market

a magneto bell which is cheap in price only, and is guaranteed. It is said to be giving the best of satisfaction.

Secretary and Treasurer A. C. Garrison of the Columbia Incandescent Lamp company was recently interviewed on the outlook for the lamp business during the year 1899. Mr. Garrison was most enthusiastic over the prospects, particularly for his own company. The Columbia Incandescent Lamp company has unflinchingly maintained its policy of lamps "unequaled in quality," and it would seem that this had been a winner, for the market is now in a condition where, while many cheap lamps are purchased, nevertheless, the greater proportion of buyers are inclined to pay a fair price and secure a thoroughly reliable and satisfactory incandescent lamp.

The Turner water-tube boiler, manufactured at Bucyrus, O., is meeting a very prompt acceptance on the part of some very critical and extensive steam users. These boilers are made in sizes from 100 to 500 horse power. At present contracts are in hand for two of 100 horse power for the Standard Snuff company of Nashville, Tenn., two of 500 horse power for Midland Steel company, Muncie, Ind., and three of 225 horse power, together with piping, boiler feeders and large stack, for the Indianapolis Ice and Cold Storage company. The boiler embodies two or three new features. The Turner Engineering company of Bucyrus is the maker of this boiler.

One of the signs of the revival of good times in the electrical trade comes from the Phoenix Carbon Manufacturing company of St. Louis. As is well known, Col. S. G. Booker, superintendent of the company, has for some months been improving his facilities, and to-day the Phoenix Carbon Manufacturing company stands in the front rank of the carbon manufacturers. Colonel Booker recently brought out a dry battery for which an exceedingly long life is claimed. This battery has a number of novel features. The fundamental idea embodied in it is to maintain the excitant mixture in a moist condition and therefore active for a long period of time. Colonel Booker is an aggressive business man, and leaves no stone unturned in the development and improvement of his product. For years the name "Phoenix" has been synonymous with one of the very best grades of carbons manufactured, and, as a consequence, the "Phoenix" or "Progress" dry cell, as it is called, will without doubt meet with great demand from the users of dry batteries.

The American Electric Vehicle company is feeling much gratified over the success of its electrical carriages in general service. General Manager C. E. Corrigan of the company recently showed a letter to a representative of the Western Electrician that contained some rather interesting information as to what an electric carriage will do in general service. The letter was from B. F. Thurston, manager of the Mathieson Alkali Works, Niagara Falls. Mr. Thurston stated that he had "run the carriage something over 2,400 miles and have given it severe practical service. The carriage has not been used as a toy, but as a practical machine and has taken the place of two horses. Mechanically, I consider the outfit nearly perfect, and the only criticism I have to offer is in regard to the batteries. I think their mechanical feature can be improved, and I believe that you are now turning out a cell that will be more nearly perfect for vehicle-propelling purposes. I am more than satisfied with the carriage and cannot understand any one giving up the use of a motor carriage (of your make at least) when they have once owned one." Incidentally, Manager Corrigan announces that the contract and agreement between the American Electric Vehicle company and the Indiana Bicycle company, whereby the latter company undertook to build vehicles for the American company, was canceled October 4th, the American company reserving the right alone to build or sell American vehicles under the company's patents.

At the present time the abolition of tight belts has become a subject of such general importance as to require special consideration. For years the loss of power in transmission by belting has occupied the attention of the scientific and mechanical world. Belt dressings innumerable have been placed upon the market, but belts of all descriptions continued to slip whenever an effort was presented to run them slack. Engineers, who realize the tremendous loss of power every day and every hour in the day, must necessarily be interested in the product which not only allows belts to be run so slack that they almost touch, but also secures an increase of from 10 to 30 per cent. in power. It remained for the inventor of Cling-surface to produce an application which is so different from and so much more than a belt dressing, that it cannot be properly classified under that head. That instant recognition was given Cling-surface is attested by the marvelous growth of the trade, both domestic and foreign, of the Cling-surface Manufacturing company of Buffalo, since its inception three years ago. During three years the business has developed into one of large proportions, and the first year was devoted entirely to the purpose of a test, Cling-surface having been put into the hands of half a hundred manufacturers for trial. It was applied to every known kind of belts, under all sorts of conditions, and received unanimous approval. This great extension of trade has compelled the company

to remove from its former quarters to a new factory, affording facilities tenfold greater. Although the present factory is 10 times as large as the former establishment, all available space therein, including a spacious laboratory, is used for manufacturing the daily output. That the sphere of usefulness of Cling-surface is a large one is further attested by the fact that the output is being daily shipped to all parts of the globe, orders being received from South America, Europe, Asia, South Africa and Hawaii. Throughout the country Cling-surface is being widely used, and not a state in the Union but has borne testimonial to its worth. The Buffalo company has scores of unsolicited letters from some of the largest manufacturing, electrical and other power-using concerns in the United States, setting forth the benefit derived from the material, and testifying to the remarkable and permanent saving in power, in the life of the belts, and, consequently, decreasing to an appreciable extent the cost of power. And, furthermore, the sincerity of these testimonials is borne out by the fact that many duplicate orders have been and are being constantly received. The experience of the company has proved that when the compound is once correctly and properly used, its patronage from those users is assured. Practical men are aware of the fact that

nearly all steam and water power developed is transmitted by belting, therefore, that compound, which is so closely allied to the belting world, makes an interesting study in itself. What Cling-surface is and what it will do is best answered by the thousands of patrons who attest its worth. Cling-surface has proven that any and all belts upon which it is properly used will stop slipping, though the belts may be run so slack as to almost touch; that the power will be permanently increased to such an extent that the increase in a fair-sized plant will be worth far in excess of the cost of the material; that the belts, if they be of leather, will become as soft as calfskin, yet firm and flexible and also waterproof. These results are produced by this compound, which is of purely animal material, and was developed only after years of laboratory study and work by a technical chemist. Cling-surface is a material which is to be melted and applied with a brush to the inner surface of the belt, the operation being repeated often until the belt itself is filled. Then the fibers are surrounded and lubricated as though resting in oil bearings, and will remain so during the life of the belt, as Cling-Surface will not oxidize or rot, as grease, nor evaporate, as oil. In addition, this produces a softness, and at the same time a firmness and flexibility, which, besides pre-

venting slipping, precludes any cracking of the belt. This application further produces an absolutely waterproof belt, which is desirable in tropical countries, and even in the North where the atmosphere is humid, or in plants where steam and other moisture is prevalent. Besides this, an old oil-soaked or greasy belt can be restored to such a condition that it will transmit fully as much power as a new belt, thus making Cling-surface invaluable for the treatment of oily or greasy belts. To sum it all up, the surface of any belt used, whether leather, cotton, rubber or a rope drive, is made smooth and even by the use of the compound, and is neither sticky nor smeared, yet the belt clings, without adhering to the pulley face, making the slipping of the belt impossible. In short, there is no taking up of the belt, which necessitates stopping an entire plant, often when all hands are being rushed toward the completion of an important task. One of the first concerns to use Cling-surface was the Erie Railroad company at the Union drydocks in Buffalo, and the Erie officials assert that they have "saved the cost of taking up 500 belts in the last two years and a half." As all these results have been produced innumerable times, the Cling-surface Manufacturing company guarantees complete satisfaction with every pound of its output.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued December 27, 1898.

- 616,507. Incandescent Electric-lamp Socket and Base. Christopher Van Deventer, New York, N. Y. Application filed April 1, 1898.

A terminal button on one side of the lamp base has a terminal at the end, an insulating casing having a hole for each of the terminals, respectively at the side and at the end, the terminals being those of the filament of the lamp, and terminals of the leading-in wires for the socket, attached within a given socket and respectively in contact with the filament terminals.

- 616,513. Apparatus for Making Observations by Means of Röntgen or X-rays. Jacques Wertheimer, Paris, France. Application filed November 19, 1897.

Two casings are employed, one of which is moveable toward and from the other, and a screen carried within one casing and a vacuum or fluorescent tube carried within the other casing; means are provided for supplying electric current for the tube carried within the moveable casing, a switch in the latter casing controlling the lighting of the tube, cords connected at one end with the switch and extending within the fixed casing and having fixed points of attachment for their opposite ends, and weights arranged to exert a tension upon the cords.

- 616,554. Razor. John F. O'Rourke, New York, N. Y. Application filed September 28, 1898.

The frame supports the razor-blade with freedom for longitudinal reciprocation, a pair of electro-magnets, a pivoted arm carrying the armatures of the magnets, a connection between the blade and the arm, and a vibrator to make and break the circuit through the magnets alternately.

NO. 616,554.

- 616,607. Support and Take-up Device for Cable-suspended Electric Lamps. John H. Dorion, Springfield, Mass. Application filed June 13, 1898.

A holder or clamp for a detachable, encircling, constrictive engagement about the shank of an electric-lamp socket is provided with two jaws adapted when open to leave an unobstructed opening for the entrance of an object, jaw-operating members and jaw-closing springs.

- 616,612. Armored Electric Cable. Edwin T. Greenfield, New York, N. Y. Application filed April 13, 1898.

A flexible armored electric cable consists of an insulated conductor having two or more metallic armor-strips spirally wound thereon and curved in opposite directions.

- 616,620. Electric Incandescent Lamp. Henry F. Joel and Ferdinand Fanta, London, England. Application filed July 29, 1896.

The globe employed is adapted by its shape to be blown in thin glass with resisting strength to external atmospheric pressure; a reflecting surface is carried thereby of parabolic or spheroidal form, and an incandescent filament within such reflector is bent into such a form from a continuous length to provide a body of several convolutions lying in a surface coaxial with and equidistant from the reflecting surface of all parts of the same, to produce a concentrated, uniform and directive light.

- 616,669. Recording Device for Measuring Instruments. Adrian H. Hoyt, Penacook, N. H. Application filed August 13, 1897.

A screw moves over a renewable scale, back and forth in the same plane, and traces, by the movement a line which by its length indicates the maximum reading of the instrument during a given time.

- 616,673. Electric Motor and Method of Controlling Same. Charles W. Kennedy, Rutledge, Pa. Application filed April 22, 1892.

The method described of controlling an electric motor consists in starting the motor at a two-pole machine with a set of field coils series with each other and subsequently changing it to a multipolar machine with all of the field

coils in parallel, and changing the internal resistance of the armature and maintaining the armature in balance uniformly around its axis.

NO. 616,620.

- 616,714. Automatic Telephone Exchange. Frank A. Lundquist, John Erickson and Charles J. Erickson, Lindsborg, Kan. Application filed March 28, 1893.

A switchboard and a number of contact points arranged thereupon, a longitudinally movable frame, circuit-closing devices carried thereby adapted to be moved into contact with the contact points, a ratchet bar carried by the frame, a pallet engaging the teeth of the ratchet bar, means for operating the pallet to move the frame, means for lifting the frame out of engagement with the pallet, and devices for returning the frame to its normal position.

- 616,718. Telephone Gravity Switch. Charles T. Mason, Sumter, S. C. Application filed May 3, 1898.

The gravity lever has a support for the receiver and a head or projection as well as means for lifting the gravity lever upwardly, and for electrically connecting the gravity lever to the same line terminal for both the ringing and talking circuits; two insulated contact springs are arranged on one side of the head of the lever to make electrical contact with the head when the receiver is off the lever and to press with a constant tension toward the head, one of the springs closing the primary and the other the secondary circuit through the lever, a fixed non-conducting rest block holding the springs insulated and in a definite position to the head of the gravity lever when the head is out of contact with the springs from the weight of the receiver on the lever, and another insulated contact spring arranged upon the opposite side of the head of the gravity lever and having a trend toward the head and a limited range of movement toward the same, to come in electrical contact with the head and close the ringing circuit when the receiver is on the lever.

- 616,722. Railway Signaling Device. Francis M. Myers, Windsor, Mo. Application filed April 2, 1898.

An electric conductor extends along a track, a series of signaling stations at separated points along the conductor, two or more trains adapted to travel upon the track, an electric-sounding signal upon each train in circuit with the conductor and adapted to transmit a number of different signals, and means for actuating the signaling device of each train as it passes a signaling station, whereby the signaling devices of all the trains upon the track are simultaneously operated.

NO. 616,800.

- 616,755. Binding-post for Electrical, Telephonic or Telegraphic Instruments. Joseph A. Williams, Cleveland, O. Application filed May 25, 1898.

This device comprises a plate, a saddle or bearing for the wire, a screw having a head or member overlapping the saddle, and a stop arranged to limit the inward movement of the screw.

- 616,770. Lighting or Extinguishing Automatically Incandescent Electric Lamps. Charles S. Cole and John H. Kinsman, Bridgeport, Conn. Application filed April 1, 1893.

Claim is made for the combination with the non-conducting casing of the conducting plate, a metallic clock supported thereon, the slotted conducting plates, the rotatable adjustable contacts, the transversely arranged switch car-

rying conducting strips, the pairs of contact blocks, the electromagnets and the electric circuits, including the plate and the clock, the balanced arm tube carrying an arm and a non-conducting segment provided with a conducting strip, oppositely extending separated conducting strips in the light circuit, and a rod extending through the front of the casing and forked at its inner end to engage the arm which projects upwardly from the armature.

- 616,779. Electrical Safety Lamp for Miners. Carl Francke, Berlin, Germany. Application filed April 18, 1898.

A lamp having a main and an auxiliary burner, a cap mounted to swing and to inclose one of the burners, and a switch controlling the circuits of the burners and having a stop-lug co-acting with the cap to prevent the further movement of the switch after the switch has been closed.

- 616,800. Electric Heater. James F. McElroy, Albany, N. Y. Application filed October 13, 1898.

An electric heater consists of a supporting helix and a resistance in the form of a compound helix arranged in continuous contact with each convolution of the supporting helix in such a manner that the spaces between the convolutions of the supporting helix shall register substantially with the spaces between corresponding convolutions of the resistance helix.

NO. 616,718.

- 616,824. Underground Electric-railway System. Frederick H. Chamberlain and Griffin B. Coleman, Washington, D. C. Application filed December 2, 1897.

The arrangement includes the motor current-collector and supply-conductors of an electric car, a plurality of interchangeable pairs of leads between the motor and supply-conductors connected to the current-collector, a switch for electrically connecting one or another of the pairs or sets of leads with the supply-conductor and electrical means for controlling the switch.

- 616,842. Automatic Regulator. Herbert E. Hunt, Pittsburg, Pa. Application filed January 26, 1897.

An automatic pressure regulator is described comprising an electromagnet, a pressure cylinder containing a piston and connected to the pressure reservoir, an admission valve therefor connected to and operated by the armature of the electromagnet, a rheostat having its contact-arm connected to the piston of the cylinder, and another pressure cylinder connected to the pressure reservoir and arranged to break connections to the motor when the pressure exceeds a certain determined amount.

- 616,861. Automatic Weighing Machine. Francis H. Richards, Hartford, Conn. Application filed December 10, 1897.

An electric circuit governs the movement of the valve and is controlled by a make-and-break wheel, and an electrical circuit controller is governed by the weighing mechanism and controls the rotation of the make-and-break wheel.

- 616,864. Automatic Weighing Machine. Francis H. Richards, Hartford, Conn. Application filed December 11, 1897.

Electric circuits control the movements of the valve mechanism; a circuit controller is governed by the weighing mechanism and shiftable onto the contact terminals successively during the descent of the weighing mechanism, and a counterpoised switchback for shifting the circuit controller out of its normal path of travel during the ascent of the weighing mechanism.

EVERY SATURDAY.

Vol. XXIV.

CHICAGO, JANUARY 14, 1899.

No. 2

Automobile Vehicles at the Cycle Show.

This year's cycle show in Chicago bears the amplified name of cycle and automobile show and contains three exhibits of horseless carriages. One is a Hertel road wagon, equipped with a $2\frac{1}{2}$ horse power gasoline engine and built by the Oakman Motor Vehicle company of Greenfield, Mass. The others consist of electric vehicles for pleasure riding, four of which are shown in the accompanying illustrations.

The Hertel motor carriage is a small open vehicle with a seat for two passengers. The engine, gasoline and water tanks are under the seat. The outfit is said to weigh but 500 pounds and to have a range of 30 miles on one gallon of gasoline. The maximum speed is stated to be 30 miles an hour. The vehicle has the characteristic merits and disadvantages of the gasoline moto-cycles—semi-independence of operation at the cost of some heat, odor and noise.

The Fischer Equipment company of Chicago ex-

hibits four electric carriages, three of which are shown in the left-hand picture. They are of the type developed by Mr. C. E. Woods. The vehicle on the left in the picture is a hansom cab; in the middle of the exhibit space stands a stanhope, and a light road wagon is on the right. All of the exhibits are finely finished and upholstered and carry electric lights and loud-sounding electric gongs. The hansom and stanhope have each two independent motors on the rear axle and the smaller road wagon has but one. Each vehicle has 40 cells of battery. The weights of the complete vehicles are as follows: Hansom, 2,600 pounds; stanhope, 1,500 pounds; road wagon, 775 pounds. The heavy cab has two $\frac{3}{4}$ horse power motors, the stanhope two of $2\frac{1}{4}$ horse power each, and the one motor of the road wagon is rated at $2\frac{1}{4}$ horse power. The cab has a maximum speed of 12 miles an hour and is stated to run 30 miles on one battery charge; the figures in the case of the stanhope are 14 and 25 miles, respectively, and for the road wagon 14 and 20. Each vehicle is equipped with voltmeter and ammeter to show the state of the battery. The smallest vehicle has pneumatic tires; the others have solid-rubber tires.

AUTOMOBILE VEHICLES AT THE CYCLE SHOW.

hibits four electric carriages, three of which are shown in the left-hand picture. They are of the type developed by Mr. C. E. Woods. The vehicle on the left in the picture is a hansom cab; in the middle of the exhibit space stands a stanhope, and a light road wagon is on the right. All of the exhibits are finely finished and upholstered and carry electric lights and loud-sounding electric gongs. The hansom and stanhope have each two independent motors on the rear axle and the smaller road wagon has but one. Each vehicle has 40 cells of battery. The weights of the complete vehicles are as follows: Hansom, 2,600 pounds; stanhope, 1,500 pounds; road wagon, 775 pounds. The heavy cab has two $\frac{3}{4}$ horse power motors, the stanhope two of $2\frac{1}{4}$ horse power each, and the one motor of the road wagon is rated at $2\frac{1}{4}$ horse power. The cab has a maximum speed of 12 miles an hour and is stated to run 30 miles on one battery charge; the figures in the case of the stanhope are 14 and 25 miles, respectively, and for the road wagon 14 and 20. Each vehicle is equipped with voltmeter and ammeter to show the state of the battery. The smallest vehicle has pneumatic tires; the others have solid-rubber tires.

On the second floor of the building used for the show is an open space in which the automobiles are shown in motion. Here the Fischer company has a two-seated park break in which its friends are given free rides. The break weighs 1,800 pounds, has two motors, a maximum hourly speed of 14 miles and a stated range of 25 miles on one charge of the battery.

The electric runabout buggy shown in the right-hand picture above is exhibited by the American Electric Vehicle company of Chicago. It is equipped

with 44 cells of battery and one single-reduction motor of about $3\frac{1}{2}$ horse power, with hollow armature shaft, attached to the rear axle. Differential gearing is provided, so that the rear wheels may be driven at different speeds in turning corners. The motor and all gears are completely enclosed, to be dust and waterproof. A hand brake, arranged to be operated by foot pressure of the driver, is provided on the motor shaft. In addition arrangement is made for a quick emergency stop by reversing the motor. The vehicle is equipped with an automatic cut-off device in the battery-charging circuit, so that the current is cut off without supervision when the battery is charged. A recording wattmeter is placed in a conspicuous position, so that the driver may be cognizant of the condition of the battery at all times. The buggy weighs about 1,100 pounds and has solid-rubber tires. It has a maximum speed of 15 miles an hour and is said to be capable of covering 35 miles on one battery charge. This vehicle is of the older type made by

the company and has been in actual service for some time. It is said to have covered at least 3,000 miles on Chicago streets. The framework is of steel tubing, but in the newer models the carriage-builder's style of running-gear is adopted. The American company has a buggy similar to the one illustrated in operation on the upper floor.

Visitors at the show examine the automobile vehicles with much interest and attention, and their intelligent questions show that the new vehicles are no longer regarded as novelties, but rather as serviceable products.

Telegraph Tolls in Kansas.

The bill reducing telegraph tolls in Kansas makes at least a 40 per cent. cut in the present rates. It provides that the charge for a 10-word day message shall not exceed 15 cents between points within the state, "and no person, company or corporation shall demand, charge or receive for any distance between points within this state more than one-third of one cent for each word for messages of over 10 words received between the hours of 6 o'clock a. m. and 6 o'clock p. m., and one-sixth of one cent per word for messages received between the hours of 6 o'clock p. m. and 6 o'clock a. m., to be transmitted as special reports for newspapers." For refusing to deliver messages or for divulging the contents of messages a heavy fine is imposed on the managers or agents. Telegraph companies are classed among the corporations which are placed under the control of the new Court of Visitation. This court is charged with the duty of bringing action against such companies in case of failure to comply with the law.

Electrical Trade with Cuba.

[Special correspondence of the Western Electrician.]

Washington, January 9.—Under the recently amended tariff for Cuba, the landing charge of \$1 per ton, on both imports and exports, has been abolished. The port of Havana is designated as the principal customs port of the island, with the following named sub-ports: Matanzas, Cardenas, Cienfuegos, Sagua, Caibarien, Santiago, Manzanillo, Neuvas, Guantanamo, Gibara, Baracoa, Trinidad, Santa Cruz, Zaza and Batabano.

Among the rules laid down for the classification of articles for duty it is provided that if an article presented for entry is not enumerated in the tariff, the customs authorities may be called upon to designate the number under which it shall be classified, and clearance shall be effected according to that designation. If an article is composed of two or more materials or of different parts, it shall be taxed for the total weight, according to the component

material of chief value, and if this is a subject of doubt, then it shall be according to the most highly taxed of the component materials, and if it is proved that a mixture of different materials has been made for the purpose of evading the payment of any specified duty, the highest rate of duty shall always be collected.

Under the provisions of the tariff the following duties are levied:

Electric insulators, \$1 per 100 kilogrammes, gross weight, with a tare allowance of 20 per cent.

Incandescent electric lamps, mounted or not, \$2.50 per 100.

Conduits of clay, cement or stoneware, glazed or unglazed, 50 cents per 100 kilogrammes, gross weight.

Cables, wire, \$1 per 100 kilogrammes, gross weight.

Wire covered with tissue or insulating materials, conducting cables for electricity over public thoroughfares, \$7.50 per 100 kilogrammes, gross weight, subject to a tare allowance of 20 per cent. (By conducting cables for electricity are meant cables composed of one or more wires of copper or any alloy of copper, whatever may be their thickness, provided that they are covered with an insulating wrapper, without taking into consideration whether they are enclosed in pipes of iron or lead, or strengthened with cordage or iron or steel wire.)

Carbons, prepared for electric lighting, \$3 per 100 kilogrammes, gross weight.

Dynamo-electric machines, exceeding 50 kilogrammes in weight, 20 per cent. ad valorem.

Dynamo-electric machines, weighing 50 kilogrammes or less, inductors and detached parts, 20 per cent. ad valorem.

A. F. T.

Mechanical Topics for Electrical Men.

By B. F. FELLO.

Useful forms of making wood connections in the construction of switchboards and kindred work are shown in Figs. 1, 2, 3 and 4. The method illustrated in Fig. 1 is used by many who desire to do away with set-screws, bolts, connections or metal joints of any description. It consists in mortising the body or ground piece, and the tenon is wedged in by means of the V-shaped pieces of hardwood B B. The joint is made tight without packing of any sort, and if correctly put together makes a strong union. A plan for double-split wedgings is shown in Fig. 2, in which the tenons are divided and the wedges driven firmly into place, as shown. This type of joint is considered more durable than the former and is especially useful for making fastenings on switchboards. The design of jointing represented by Fig. 3 is effected with a bolt and nut. The body piece is bored straight for the bolt, and the joint is made by cutting a cavity in the second piece, as shown at C. The nut is prevented from turning by the sides of the cavity, so that, by turning the bolt-head, the pieces may be drawn together and secured with great firmness.

The method presented in Fig. 4 is open to criticism, as the threads of the screw are liable to become worn and lose their grip on the wood, or, if the hole for receiving the screw is a little too large, the heads may not take hold at all, resulting in the

WESTERN ELECTRICIAN

MECHANICAL TOPICS FOR ELECTRICAL MEN.

loosening of the whole affair. When this method is used, therefore, care should be taken that the crew hole is bored the right size to afford the threads a firm grip the entire length of the screw.

REPAIRING A BROKEN TUBE.

In a recent piece of electrical work which came to the notice of the writer, one of the tubes of the frame of the machine was broken off, as shown in the illustration at E, Fig. 5. The process by which this fractured tube was joined may be interesting. First, a piece of steel tubing of smaller diameter was obtained and fitted into the main tube, midway with the break, as at F. Then a number of rivet holes were drilled around the tube and rivets inserted and headed up, as shown. The joint was then smoothed over with a file, and is now very strong.

KEEPING WORN SCREWS IN SERVICE.

There are a number of sizes and kinds of cap, box and set-screws in use on electrical machinery, and some of these screws are hard to replace when once destroyed.

Suppose that a screw is broken or worn down at the threads, as at G, Fig. 6. Such a screw is useless in its present condition, and a machine may be standing idle for lack of a new screw to replace the defective one. In such a case as this, it is a good

plan to put the screw in the lathe and turn it down to a shoulder, as at H, Fig. 7, thus making a new screw, so far as the threads are concerned, from the old screw.

FIXING A BROKEN LEVER.

A short time ago an important electrical machine was put out of service because a lever arm was broken off short, as at A, Fig. 8. As another arm could not be had for several days, and as it was necessary that the machine be kept running, the lever was repaired by first filing down the sides near the stubs of the break and then fitting pieces of sheet metal B into these places. After getting the parts fitted, they were wired, and holes for the rivets drilled. After riveting, the wire was taken off, the edges of the patches filed down even, and that lever is now running in good form.

WRAPPING A SPLIT HUB.

When a hub of a lever breaks or splits, as at C C, Fig. 9, a good way to repair it is to wrap the hub with sheet metal shaped to correspond with its outlines. Usually, it is the pressure of the set-screw D that splits the hub, and provision must be made with the new wrapping to overcome the pressure. If the metal wrapping is lapped completely around the hub and brought up to the shank on either side, rivets can be put in at E and F, and a practical job produced.

ADJUSTING COGS.

If a cog breaks off from a straight or beveled gear in an electrical machine, the gear should, by all means, be replaced with a new one. But it may be that the old gear will have to be patched up, owing to there being no extra ones on hand. A practical mode is to cut out the seat of the broken or worn cog and dovetail in a new tooth, as suggested in Fig. 10, in section. When this method is employed, a good plan to secure the cog in position is to use one or more set-screws G, which may pass through the gear rim and up into the seat of the cog. In some cases it may be wise to use cogs of the pattern shown in Fig. 11. This type requires a larger seat in the gear rim and calls for more cutting and filing of metal. But when the cog is in place and firmly secured it may be relied upon.

CRACKED CYLINDER FLANGES.

Fig. 12 shows a way to rectify the broken flange of a cylinder. If the flange is broken at J, which is usually caused by the pressure from the key H, the flange can be grooved out all around and the wrought-iron ring slipped into the groove and secured with pins, as marked I. This ring will hold the parts securely and make the flange as good as new. Another way consists in slipping on a set-screw collar L, as shown at K, where the cylinder is cracked at K. All that is necessary is to obtain a collar the right diameter and, after slipping it on, screw it tight. This collar will not be in the way and it will be adjustable.

Progress in Submarine Boat Building.

French naval officers are working energetically for the perfection of submarine-boat operation, primarily for the purpose of providing an effective method of making torpedo attacks. These experiments are watched with much interest in this country, where recent trials have been made of the submarine boat Holland, near New York, and where the Plunger, of the same type, is nearly ready for test at Baltimore. Both the American and foreign boats are electrically driven from storage batteries when submerged.

France has given more official encouragement to this development than any other nation. Lieutenant Darcus, of the navy of that country, has been promoted to the grade of commander and assigned to the position of chief of the military cabinet of the Ministry of Marine. His promotion was due to the great success which has attended his efforts during the last eight years in the study of under-water navigation. Largely as the result of his labors, six submarine torpedo boats are provided for in the French naval budget of 1899. Full details concerning them have not been given out, but the following information is obtained:

These boats, which are to be laid down in the various arsenals, are of the following dimensions: Displacement, 106 tons; length, 111 feet; breadth, 12 feet; maximum draught aft, five feet, and horse power, 217, which, operating a single screw, will drive the vessel 12 knots on the surface. They will carry four sets of torpedo-launching apparatus.

These vessels are identical with the Narval, now constructing at Cherbourg. They have a steaming radius on the surface of 250 knots, and their under-water radius at 10 knots speed is 100 miles. The French naval authorities have so much confidence in them that the present intention is to lay down a great many more of them, but probably not until after the Narval has completed her trials, so there may be an opportunity to improve the new boats.

The vessels are propelled by steam power when on the surface and by electric accumulators when beneath the surface. This electrical accumulator can be charged with the vessels' own dynamo. The confidence in these new boats arises from the success of the Zélic, referred to in the Western Electrician of last week. This latter boat is now at Toulon, where she has been, during the last two years, undergoing important modifications. Her propelling force is wholly electric, and her speed under water is 15 knots. She has recently made the trip under

water from Toulon to Salins d'Hyeres and return, a distance of about 40 miles. She was accompanied by a sea-going torpedo-boat, which carried the board of inspection.

It is claimed that a submarine boat has repeatedly passed the blockading squadron off Toulon and entered the harbor without discovery. French officers are of the opinion that they have solved the problem, and this affords them much satisfaction in view of the importance which they attach to it in connection with the naval defenses of their ports.

Boom in Copper Market.

Houghton, Mich., January 9.—An illustration of present condition of the copper market is found in the experience of the Michigan Copper company, which is in process of reorganization. Where call was made for but \$1,000,000, almost \$7,000,000 has been subscribed. The old Michigan (or Minnesota) mine paid dividends of \$1,820,000 and was abandoned by stockholders, who refused to put up \$50,000, after receiving dividends of nearly \$2,000,000, 25 years ago. The mine was pushed too hard, every dollar taken out was devoted to dividends, and the time came when new machinery was required, new ground was to be opened, and there was no money in sight to do the work. It is generally believed that the Michigan will resume its place among the great mines of Lake Superior.

The Union Land and Copper company, which so successfully launched the Old Colony, with Saint

WESTERN ELECTRICIAN

MECHANICAL TOPICS FOR ELECTRICAL MEN.

Marie's Canal Mineral Land company, has plans under consideration for launching several other new mines.

The Mendota, on Keweenaw Point, is to be reopened. The ore is found in true fissure veins, traversing the copper-bearing formation at almost right angles. The ore is a gray sulphuret, free from antimony and arsenic, and therefore capable of reduction by simple smelting. It is necessary to reduce most of the Montana ore by electrolysis, on account of the considerable quantities of arsenic and antimony, both highly refractory in furnace.

There seems no longer a question that the Standard Oil people are in copper mining to a considerable extent, though they are not showing their hand. It is certain that the Calumet and Hecla, Quincy and Canal company people have been approached and have refused to go into the proposed consolidation. Whether the Bigelow-Lewisohn interests, heretofore the dominant factor in American copper matters, have been swallowed by the Standard Oil combination, or have themselves swallowed the other factors, is problematical.

[From the New York Sun.]

Over in Boston they have gone daft over copper. Men there with money to invest want to buy copper stocks only. They talk copper all day, think about it all the evening, and dream about it all night. It may be that not all those in Boston who are falling over one another in the effort to acquire copper

stocks are wise speculators. There are some, perhaps, who would say that the stock of a copper mine, which was put on the market last summer at \$8 a share and which is quoted to-day at about \$50 a share, in the face of the fact that the mine has not produced a pound of copper, may have a fictitious value. However that may be, it is true, nevertheless, that there has not been a time in years when the demand for copper was as large as it is now, and those who should know say that not in years have the visible stocks at the mines been so low.

The reason that Boston appears to have a monopoly in the trading in copper shares is that Boston is the home market of the United States for copper. So far as eastern capital is concerned, moneyed men in Boston invested in copper long before financiers in any other eastern city took very much interest in that particular metal. The result is that if anyone wants to trade in copper he does it through the Boston Stock Exchange.

The chief reason for the increased demand for copper is to be found in the increased uses to which electricity has been put in the past year and a half or two years. It is impossible to use electricity commercially without using copper. Copper is electricity's great conductor. To furnish electric power, heat or light, copper wire must be used to transmit the current. When it is remembered that within the last two years the demand for electricity for lighting, for heating and for power has been little short of marvellous, some notion may be obtained of what the demand, during this time, has been for copper.

For several years the United States has controlled the copper markets of the world. Outside the United States the principal copper fields are in Chile and in Spain. The Chilean copper mines are controlled by English capitalists. It was the practice of the operators of the mines in Chile to sell their product for pounds sterling and to pay the workers in the mines in Chilean money. When the men refused to receive their pay in a depreciated currency it was no longer possible to operate the mines at a profit, and since then the copper industry in Chile has been comparatively dead.

The Spanish copper mines are great producers, particularly the Rio Tinto mine, which is the largest producer of copper in the world. In fact, copper at the Rio Tinto is really a by-product. The copper there is found in combination with sulphur, which is also produced in great quantities. In extracting the sulphur by fire the copper is left as a residue.

In the United States the sources of copper are the mines of Montana and Arizona and those along the shores of Lake Superior. The Anaconda mine in Montana is the largest producer of copper in the United States, and, with the exception of the Rio Tinto, the largest producer in the world. The Anaconda is controlled by J. B. Haggin and Marcus Daly, both of whom are as well known on the turf as they are in the copper industry. The shares of the mine not held or controlled by Haggin and Daly are controlled by English capital. Other large mines in Montana are the Boston and Montana and Butte and Boston, controlled by Albert S. Bigelow of Boston. In Arizona there is the United Verde mine, owned by William A. Clark, known as a miner and banker in Montana and as an art connoisseur and collector of pictures in New York. Other mines in Montana are the Copper Queen, the Detroit and the United Globe, controlled by Phelps, Dodge & Co. of New York. All the copper from the Montana and Arizona mines must be separated from the ore by chemical processes.

It is especially in reference to the way in which the copper is obtained from the ore that the Lake Superior mines differ from all other mines in the United States. The copper from all the Lake Superior mines is what is known as pure copper. In other words, all that is necessary to do to obtain the copper from these mines is to crush the ore and pick out the copper. Those who should know say that the copper obtained from the Lake Superior mines is the best copper in the world, because it is the best conductor of electricity. It is for this reason, it is said, that the Lake Superior copper brings a higher price in the market than the copper from any other mines.

The best known, probably, of the Lake Superior mines is the Calumet and Hecla. The company controlling this mine is made up largely of Boston capitalists, and its president is Alexander Agassiz of Boston, the son of the great naturalist. In fact, Mr. Agassiz discovered the mine. It was in 1865 that Mr. Agassiz went to Lake Superior to investigate the copper deposits. While there he found the vein of the Calumet and Hecla. He saw that it was immensely rich, and after a time returned to Boston to form a company to operate it. He associated with him some of the best-known men in Boston, including Hollis H. Hunnewell and Quincy Adams Shaw. Mr. Agassiz became superintendent of the company in 1869, and served in that capacity until he was elected president. This mine has proved to be the richest copper mine in the world, and has made everybody connected with it rich.

Other mines in the Lake Superior region are those included in what is known as the John Stanton group—the Atlantic, Baltic, Wolverine, Mohawk and Winona. The Bigelow interests own the Tamarack and the company controlling the Osceola Consolidated controls a number of good mines. Perhaps the mine that is attracting the most attention just now of all those along Lake Superior

is the Arcadian. Interest attaches to this mine because common report has it that the Rockefellers are its chief owners. A great amount of money has been spent in the development of the mine, and the latest improvements in copper-mining machinery have been installed there. The gossip among the men interested in copper is that the Standard Oil company purposes to interest itself in copper almost as heavily as it has in oil.

These are the principal mines in the United States to contribute to the world's supply of copper. In proof of the fact that the United States controls the copper market, it may be stated that we furnish about 60 per cent. of the entire product of the world. In 1897 the world's product was 412,050 tons. Of this amount the United States furnished 277,000 tons. Up to November 30th of this year the output of copper in the United States for 1898 was 215,700 tons, or 17,818 tons more than in 1897. The statisticians figure that this is an increase of 9.4 per cent. The exports up to November 30th amounted to 131,893 tons. In this amount, however, is included the product of the Boleo mine in Mexico. Taking this out, it is figured that the export of copper from the United States in 1898 over 1897 was somewhere about 5,500 tons, which is an increase of 4.7 per cent. The increase in home consumption was about 12,300 tons.

Those who know are not willing to give out the exact figures, but approximately the relative monthly output of copper mines in the United States is as follows:

Montana mines.....	17,000,000 pounds
Lake Superior mines.....	12,000,000 pounds
Arizona mines.....	10,500,000 pounds

This output bids fair to be greatly increased

United States in regard to an arrangement of copper interest, are being watched in Paris with the greatest interest.

A prominent financier, who is considered the highest authority in France on matters pertaining to the copper market, being questioned as to everything on the subject, said:

"The Rothschilds are believed to have increased their holdings of copper securities recently, but there is no probability whatever of their using their influence to further the alleged copper combine, and it is safe to say the Rothschilds, together with all French copper interests, would do all they could to oppose any movement like that of the famous Secretan copper corner, which had such a disastrous reaction in Paris some ten years ago.

"If, however, the present movement in the United States is merely to regulate the supply on the lines which the Standard Oil people have treated petroleum, and not aiming at corners or inflation of prices, it is believed the market here would favor and perhaps co-operate with it.

"There is an unusual demand for the purest electrolytic copper for electrical construction work. The world's supply of this material for 1897 was only 160,000 tons, of which 130,000 tons came from America. The present price of standard copper, \$300 a ton of 2,240 pounds, is considered remunerative and satisfactory to producers, and, if maintained, it will likely bring numerous partially developed or silent mines, which exist in Tasmania, Norway, and all over the world, into the list of producers, and thereby cheapen the price of copper.

"These considerations are sufficient to prevent clear-headed capitalists, whether in France or the United States, from attempting to push any amal-

ELECTRIC WIRES IN A STORM.

during the next year. The demand for copper has resulted in the development of a great many copper properties that have been lying undeveloped for years and in the prospecting for new properties. It is said that in the Lake Superior region alone during the past few months the development of not less than a dozen mines has begun. Of course, this work would not have been undertaken had the price of copper during the past year not led men to believe that the high price would be maintained or increased. Whether this shall prove true or not depends upon the future demand, but it does appear to be true that the visible stocks at the mines are pretty well cleaned up, and it is said that the visible supply of the world, were it not to be increased, would not last much longer than about 30 days.

Some idea of the basis of the copper men's figuring may be obtained by a consideration of the average price of copper during the past year. Here are the figures:

The average price for January was 10.90 cents a pound; February, 12.28 cents; March, 11.08; April, 12.14; May, 12; June, 11.89; July, 11.03; August, 11.89; September, 12.31; October, 12.41; November, 12.86. During the last week Lake copper has been quoted at 13 cents, and other coppers at from 12¹/₂ to 12³/₄ cents a pound.

[Special cable to the New York Tribune.]

Paris, January 7.—Considerable credence has been attached in Paris, which is the most active market in Europe for refined copper, to reports that the Messrs. Rothschild, who have large interests in Spanish Rio Tintos and other copper mines, were disposed to enter into communication with the Standard Oil trust to secure control of the principal copper-producing mines of the world.

The price of standard copper in the last 12 months has advanced \$45 a ton, and on the Paris bourse yesterday and to-day there was a sudden rise of from \$3 to \$6 in quotations of standard copper and leading copper-producing mines.

The alleged movements, which, according to cable accounts published here, are being made in the

gamation schemes to a point which would cause a corner or monopoly."

Electric Wires in a Storm.

The effect of severe storms upon overhead electric picture of the wreck produced by a recent storm picture of the wreck produced by a recent storm at Hamilton, Ont. The work of destruction, as shown in the photograph, is about as complete as could well be imagined. There is no claim that the construction was poor; it was probably of the same class that is generally found in cities of that size; and, aside from the danger to passers-by, the loss entailed must dispose the management of the electric companies interested to serious reflection upon the advisability of burying all electrical conductors.

Electric Railway in Ireland.

The city of Cork is now, for the first time in its history, enjoying genuine rapid transit, says the correspondent of the Chicago Record in that city. The electric tramways, upon which work has been in progress for several months, have been completed and are in operation. They were built by a private company under a contract by the terms of which the city will be able to purchase the plant on equitable conditions. The power house is situated in Albert street, near the river. All the equipments in the way of boilers, feed and condensing pumps, engines, batteries, switchboards and cables are of the latest and best designs. Double tracks have been laid through the principal streets; the branch lines run to Tivoli, St. Luke's, Western road, Blackpool and Douglas. The longest branch is to Douglas, a village about two miles south of Cork. The tramway crosses the river twice—first over Parnell bridge, a steel swing bridge, and the second time over Patrick's bridge, which is built of stone. The rails in the city are laid on a bed of concrete, and the roadway is paved between the rails and 18 inches outside. Center poles with double bracket arms are

used in the principal streets. Side poles with single-bracket arms are used on the rest of the line. The cars used are of the double-decked or "top-seat" pattern, each being capable of seating 18 passengers. At present, on all lines but one, they are run at 10-minute intervals.

Route of Boston Elevated Road.

Ground has been broken in Sullivan Square, Bunker Hill district, for Boston's new elevated road. This is the beginning of an enterprise that promises much for the Hub and its suburbs. The motive power for the elevated system, like that for the existing surface system of the company, will be electricity, but the overhead road will be run on the third-rail principle, while the trolley will be retained for surface cars. A feature of the construction will be the location of the third rail. Most of the elevated structure will be double tracked, and the power rails will be between the north-bound and south-bound tracks, where passengers will be least likely to get into the danger of contact with them through carelessness or accident, the third rail for each track being on the left of the car and about two feet from the left-side rail, while exit and entrance will be effected on the right-hand side. At switches, however, it will be necessary to take a contact for a short distance on the outer, or right-hand, side of the track, and at such points a third rail will be provided for that especial purpose. There will be four shoes pendant from the motor car, two on each side, so situated that it will be possible to make a contact either to the right or to the left with a shoe, thereby obviating all danger of a train being left without power on crossing a switch.

The first section will run through the heart

ROUTE OF THE BOSTON ELEVATED ROAD.

of the city, utilizing the subway for a portion of the line, and the round trip from Sullivan Square to Dudley street, in the Roxbury district, will be about 10 miles. The route selected is shown on the accompanying map. Branch lines to other outlying suburbs will be built later on, and the work is to be completed in about two years.

Repairing the Lightning Rod on St. Peter's Cathedral.

It will doubtless be a surprise to many persons to learn that St. Peter's cathedral in Rome is equipped with a lightning rod, yet a recent article by Dr. Albert Battandier in Cosmos of Paris (translated for the Literary Digest) shows that such is the case. It seems that two years ago Father Lais, taking advantage of the repairs that were in progress on what is called the ball of St. Peter's, that is, the globe, mounted by a cross, that tops the great dome, which, in his capacity of director of the Leonie Observatory, to make use of the scaffolding that had been erected to examine the point of the lightning rod. His inspection was not unnecessary, for he found that the metallic cable was not continuous and was not properly connected. After having verified this in person, he gave orders to change the point of the rod, substituting for the single terminal a multiple one formed like a plume. Further investigation showed that the rod ended in a hole filled with wax and grease. Father Lais rectified the end of the rod, and since a lubricant was thought to be necessary, he replaced the tallow by graphite. The picture shows the scaffolding about the globe, and the lightning rod which surmounts the dome. It is a reproduction of a photograph taken with a telephoto objective.

The author of the article in Cosmos adds these interesting particulars: The bronze globe, which is 16 inches in diameter (7 1/2 feet in circumference) is fixed to a iron tower 100 feet in an

angle of 90°, through which tourists may observe the landscape. A legend tells that during the earthquake of February 2, 1703, two persons were in this globe. The globe swayed frightfully, on account of its great height from the ground, and the persons in it were so overcome with the fear of death that, by a phenomenon that is by no means rare, they really did die, and their bodies were found in the globe. The cross (above the globe) is three meters (nearly 10 feet) in height, and each transverse arm is a meter (3/4 feet) long. From this cross rises the lightning rod, which can be seen in the center of the scaffolding. The rod rises three meters above the top of the cross. The men standing on the scaffolding show the height of its different parts and give an idea of the size of the pieces of wood used in its construction."

Electrical Trade in Argentina.

By C. PAULO REI.

In Buenos Ayres electrical work has, inside of the last four years, advanced to a greater degree than in Rio de Janeiro, Valparaiso, Montevideo or any other city or town in South America. Since 1895 the increase in the use of electricity as a motive power and for lighting purposes throughout the entire republic has been phenomenal.

In 1895 the entire imports of dynamos, galvanized-iron wire, electric-light cable and wire, incandescent lamps, other electrical apparatus and materials for telephones and telegraphs amounted to \$625,814 gold; in 1896 they increased to \$1,319,220; in 1897 they still further increased to \$1,563,583, and for the nine months ended September 30, 1898, they were \$2,035,208.

Although the United States secures a large share of the electrical trade, Germany makes a better showing in the import figures, largely due to the immense quantities of galvanized-iron wire that are purchased there annually by Argentina.

The import statistics here given show the relative positions of the several countries engaged in the trade:

	1895.	1896.	1897.	9 mos. of 1898 to Sept. 30th
Germany.....	\$131,919	\$467,991	\$561,396	about \$610,000
Belgium.....	256,834	284,921	254,323	" 250,000
United Kingdom...	126,972	290,714	299,912	" 310,000
United States.....	91,318	258,408	417,530	" 785,000
France.....	13,455	14,952	25,585	" 78,000
Italy.....	5,316	4,234	1,897	" 2,000

As is seen, the imports from the United States during the first nine months of 1898 increased to an enormous degree, and American firms are now supplying by far the greater percentage of electric-light materials, cables and wire, incandescent lamps, fittings for lamps, etc., that are entering the republic. Germany continues to supply the greater portion of the galvanized-iron wire.

A great portion of the machinery for the large lighting and power plants that have been established in Buenos Ayres is of American manufacture, although German companies represented in Buenos Ayres have not only sold quite an amount of electrical machinery, but have erected and are working an electric-light and power station. Through the interior also, the Germans have been successful in introducing their machinery. At Salto, Banda Oriental, they have established a lighting plant, with a capacity of 4,000 16 candle power lamps, as well as small installations in Brigado and San Fernando.

The most of the equipment necessary for the United River Plate Telephone company, the Co-operative Telephone company and the National Telegraph Department has been furnished by English concerns, such as the India Rubber, Gutterpercha and Telegraph Works company, Limited, of London, W. T. Henley Telegraph Works company, Limited, and the British Insulated Wire company, all of which have agents in Buenos Ayres.

The River Plate Electric Light and Traction company, with head offices in London, has the most complete central station (9,600 horse power and electrical capacity of 6,000 kilowatts) in South America, as well as smaller stations in Rosario, Tucuman and La Plata. This company, in addition to supplying light and power from stations in the cities mentioned, has also installed complete plants for private lighting and traction companies. A large share of the machinery installed by it is of American manufacture, although quite an amount is purchased in England. The equipment necessary for the central station in Buenos Ayres is of American manufacture, but for the other stations, in Rosario, Tucuman and La Plata, English machinery was purchased.

During June, 1898, the German Electric Light and Traction company came into being in Buenos Ayres, with a capital of \$5,000,000 gold, immediately purchasing outright the old horse-car lines of the Metropolitan and Grand National Tramways companies, and it is now engaged in changing them into electric lines. This company is fighting the English companies tooth and nail, and is doing its utmost to oust the River Plate Electric Light and Traction company from Rosario, and in all probability it will succeed, as the English company has of late been giving very poor service there, and many complaints have been made.

The German management is very aggressive, and should it be successful in injuring the business of the English companies, American interests may also suffer, as a large portion of the machinery installed by the English companies comes from America,

whereas the Germans would not purchase American apparatus. It is learned that the German company has just purchased a controlling block of shares of the stock of the Anglo-Argentine Tramways company, so it can be taken for granted that it will also alter that company's system to electric traction.

The first electric tram line established in Buenos Ayres, and in Argentina, was that of the Buenos Ayres and Belgrano Tramway company, which ran its first electric car over the route on April 22, 1897.

This work was carried out by Charles Bright & Co. (now the Bright Electric Light and Power company, Limited, with a capital of \$1,000,000 gold), the largest electrical engineer and contractor in Buenos Ayres, and the most of the material employed came from the General Electric company.

The "La Capital" electric tramway, the second electric railway in Buenos Ayres, was opened to the public on December 4, 1897. The steel power house was built by the Berlin Iron Bridge company, the entire rolling stock by the J. G. Brill company; the iron poles were supplied by Morris, Tasker & Co., the overhead appliances by the H. W. Johns company; the three vertical engines are Ball & Wood, of 450 horse power each, directly coupled to 300-kilowatt Walker generators; so it is seen that American manufacturers benefited considerably by the construction of this line.

The plant, which was first established by Rufino Varela & Co., was taken over by a concern formed in Paris, the Cie Generale d'Electricite de la Ville de Buenos Ayres (capitalized at 6,000,000 francs), which then established a large light and power station in the Retiro portion of the city. In August,

REPAIRING THE LIGHTNING ROD ON ST. PETER'S CATHEDRAL.

1898, the company obtained a two-year contract for the public lighting of the city. This company is also making active warfare against the English companies, but not to the same extent as the German companies.

The Primitiva Gas and Electric Light company is another large English concern which largely employs American machinery and materials.

Small lighting plants in which American machinery is employed have recently been established in Cordoba, Bahia Blanca, Santa Fe, Corcordia and San Juan. The municipalities of Azul Quilmes and other small places are now calling for tenders for electric lighting. Many others will do so ere long, so that opportunities still exist for American enterprise in developing electrical work in all parts of the republic. Concessions for electric tramways have recently been granted to many individuals and companies, but only a few of them will be built.

The following concessionaires, in all probability, will build and equip lines ere long: Messrs. A. Pareus & Co., T. R. Betzel & Co., Palmgren & Co. and Gaston Roux. American manufacturers would do well to place themselves in communication with them.

The price charged for electricity (due to competition) has dropped from 30 cents per kilowatt, to small consumers, the price charged in 1897, to 20 cents at the present writing, but even at this figure the supply companies make a very large profit.

An interesting exhibit at the Chicago Cycle Show is a Veeder cyclometer attached to a small Ditch electric motor. The tiny instrument reels off about 50 miles a minute under the high speed of the electric motor and makes no fuss about it. A 100 candle power incandescent lamp throws light on the operation and attracts attention all over the hall.

Electric Signal Apparatus at Atlantic City, N. J.

The accompanying cut illustrates in detail the principal features of the electric signaling system recently installed by the Weather Bureau at Atlantic City, N. J. Mr. Al. Brand, the observer at that point, designed the apparatus and superintended its construction. He has made an official report on the subject from which the following particulars are taken:

The apparatus comprises a support and the signal lanterns, as shown in the cut. The fixed or lower portion of the support is built up of well-seasoned yellow pine in the shape of a sheath or channel, the dimensions of which are as follows: The two side pieces are 14 feet and nine inches long, and three inches by five inches at the top, gradually diminishing to three inches by six inches at the base. The center piece, which extends from within about one foot of the top to the base, is 2½ inches thick and of a sufficient depth to fill out the remaining space on one side of the pipe when the latter is in a perpendicular position. From about six inches below the pipe to the bottom of the support the center piece is built out flush with the sides. The three pieces of the support are securely bolted together with one-half-inch iron bolts. The support rests on a piece of timber three inches thick by 10 inches wide and two feet long, and is bolted to the chimney with three five-eighths-inch iron bolts. The metal portion of the support is built up of two lengths of galvanized-steel pipe, the upper portion of which is 18 feet long and 1½ inches in diameter on the outside, the lower portion being 20 feet long and 2½ inches in diameter on the outside. The smaller pipe is made

and down the side of the wooden support, on porcelain knobs, to the side of chimney, which it enters.

The lamps were wired with one 32 candle power incandescent electric lamp in each, and in such a manner that the oil lamps can be substituted at any time without delay. The manner in which the incandescent-lamp sockets were fastened to the inside of the lanterns will be best understood by an examination of a sketch showing a cross-section of lantern globe and lamp socket. It will be noticed that all that is necessary to firmly fix a socket in a lamp, when so wired, is to draw up the socket until the wire prongs, when spread out, will touch the sides of the lantern above the glass globe. By simply bending, in or out, the various prongs, the socket can be brought squarely in the center of lantern. All surplus wire should be drawn from the top of lantern.

The bottoms of the lanterns are fastened to the steel upright by a brass one-inch band passing around each lantern and bolted on either side of pipe, as shown in drawing.

The switchboard is made of enameled black slate, 15 by 18 inches, provided with two 32 candle power incandescent electric pilot lamps, having opalescent shades, and two baby knife switches. The mains and knife switches are fused on the front of the board. All connections are made in the rear of the board, which is set into a neat varnished oak frame.

Both the wood and metal portion of the support were given two good coats of paint, the first coat on the metal being mineral paint.

While a support erected along these lines insures an unobstructed display in every direction, it also permits of lowering the lanterns at a moment's notice, should occasion require, while the lanterns wired in this manner are not mutilated in the least.

Should neither a suitable wall or chimney be available for the erection of a support of this kind, it might easily be stayed by iron braces.

Influence of Electricity on Animals.¹

By HENRI COUPIN

The action of electricity on animals is still imperfectly understood. This study, especially as regards the lower animals, will doubtless lead to interesting results. With the aim of aiding in such investigations, which present no great difficulties, we propose to sum up briefly the state of our knowledge on this point.

Place under the microscope one of the amebas (A) that are so numerous in ponds, and leave it at rest. We shall see it expand into a gelatinous mass whose outline bears irregular "pseudopods" (false feet), with which the ameba crawls over the supporting surface. Now pass an electric current through the water in which it is. If the current is too strong, all pseudopods will contract. But if the current is weak, the pseudopods on the side of the positive pole draw in toward the mass, while those on the negative side continue to protrude. Thus the ameba moves from the positive to the negative pole B; we may then say it is "negatively electrotactic."

Examine a trachelomonad (C) in the same way; it presents the appearance of an egg-shaped mass, a little bristly on the surface and furnished with a long tail which is always in motion. By its means the infusoria moves about in all directions. If we now pass a current, we shall see the trachelomonad turn slowly so as to place its tail in the direction of the current, and move toward the cathode; it also has negative electrotacticism. Similar facts have been proved in the cases of numerous other infusoria. They always end by crowding up to the negative pole. The rapidity of this movement depends on the strength of the current; . . . if it is too weak, the infusoria do not react; if too strong, they are paralyzed and cannot move.

The experiments succeed very well with infusoria of the genus Paramecium (I). If we examine several of them, as soon as the current passes, we see them form in more or less curved lines uniting the two poles; under this form the position of the bacteria is like that of the iron filings in the well-known experiment showing magnetic lines of force (D). Little by little this arrangement disappears and the paramecia (E) crowd up toward the negative pole. Another fact may also be remarked. When the paramecium is not under the influence of a current it moves not in a straight line but in wide sinuosities (F). If a feeble current be passed, these curves become more evident (G). Finally, if the current is very strong, the paramecium describes sinuosities still more marked (H).

All these movements can be explained by the motion of the vibratile cilia, with which the body of the paramecium is covered.

The organisms of which we have been speaking are all negatively electrotactic. Others are positively so; that is, they move toward the positive pole. . . .

Still other organisms place themselves in a position directly across the direction of the current.

Most inferior organisms are thus sensitive to the electric current and modify their movements in consequence. Is it the same with higher organisms? A large number of experiments have been made with some results. . . . They show the curious fact that, in general, mollusks and worms are negatively electrotactic, while crustaceans and insects are positively so; at least, if we may generalize from a small number of instances.

Some experiments have been made also with vertebrates—fishes or tadpoles. They are placed in a trough of water whose ends are of zinc and connect with battery wires. When the current passes the fish or tadpole tend to turn with head toward the positive pole, but the results of these experiments do not always agree, which seems to show that the electrotactic sense in animal depends much on the intensity of the current.

Utilization of Electric Power.

"The Economic Use of Electricity in Power Transmission and Distribution" was the subject of a lecture delivered by Mr. W. B. Sayers at the Edinburgh University Engineering Society recently, in which the lecturer pointed out that the question of economy is a far more difficult one to answer than might appear at first sight, the reason being that the conditions upon which the answer depends vary between wide limits, dependent chiefly upon the nature and amount of the work to be done and its location, the nature of the source of power and its cost, and, again, the distance of the source of power from the place where power is required.

Assuming that the conditions in a given case are favorable to the use of electricity, at what point shall the transformation into dynamical power be effected? was one of the points considered. The factors upon which an intelligent conclusion must be based are convenience and cost. Convenience expresses something which is generally difficult or impossible to value in money; but, nevertheless, it would be difficult to exaggerate the importance of

ACTION OF ELECTRICITY ON ANIMALS.

convenient arrangements in any manufacturing establishment. The difference between convenient and inconvenient arrangement is analogous to the difference between good and bad management. It is often the difference between success and failure, between profit and loss, for it must be borne in mind that the saving in time which is the inevitable result of improved convenience means not only reduced cost of production, but also increased capacity for output in a given time. The chief factor, however, is "cost." It has been indicated that improved convenience is worth paying for, but the question "how much" can only be answered in any particular case by good judgment and intuitive insight into the issues involved, or often enough by expensive experience only.

Interconnecting Cables for the Philippines.

Orders have been issued by the War Department to Colonel Maxfield of the Signal Corps to proceed to New York city and organize a cable detachment in connection with the laying of submarine lines in the Philippine Islands. The War Department has authorized the manufacture of 200 miles of cable, to be laid between the different islands of the Philippine group. The cable, with special machinery, which is also in the course of manufacture, will weigh between 700 and 800 tons, and will therefore require a special vessel to carry it and lay it. It is expected that this ship will leave New York soon after February 1st, and proceed to Manila through the Sue Canal. The Signal Corps has a short cable of eight miles now in operation in Manila Bay. The land lines in the Philippines are nearly 2,000 miles long, and are mainly on the islands of Luzon, Masbate, Cebu and Leyte. As soon as these lines are united into one system through cable connections, the military administration of the islands will be conducted with a degree of efficiency, rapidity and economy impossible under present conditions.

1. Abstract from La Nature.

ELECTRIC SIGNAL APPARATUS AT ATLANTIC CITY, N. J.

to pass into the larger for a distance of about three feet, and made thoroughly rigid at that point with molten metal. Steel elbow and "T" fittings, short pieces of pipe and hooks are used in making the short horizontal arms on which the lamps are hung, and which are fastened to the tops of both the larger and smaller pipe, as shown in the drawing. The centers of the hooks on which the lamps swing are at a distance of just one-half of the diameter of the bottom of a lamp from the side of the upright pipe. This insures the lamps swinging plumb, and at the same time snugly against the pipe, thus relieving the latter from all unnecessary strain. The steel pipe swings at a point within six inches of the top of the wooden support, on a one-half-inch hardened steel pin, which passes through the larger portion of the pipe at a point nine feet below the bottom horizontal arm, washing in two three-eighths-inch iron plates.

The pipe being swung into a perpendicular position (which causes all of that portion of the pipe below the pivot pin to enter into the channel), it is securely locked in place by a five-sixteenth-inch steel pin near the base.

A block of 2½ inches wide and about six inches long, and of a sufficient depth so as to fill out the remaining space on the front of pipe, is bolted between the side pieces just above the pivot pin.

All of the wire used on the support or in the lamps is what is known as canvasite cord made up of two strands of flexible wire. A separate circuit is run from each lamp to the switchboard in the office. The wire, being connected with a porcelain weatherproof socket (care being taken to have the socket fastened to the inside of lantern in such a manner that the bulb of the incandescent lamp hangs squarely in the center of the lantern lenses), passes out through the ventilation opening at the top of the lantern, and enters the pipe at the "T" fitting in each of the short horizontal arms, thence passing down on the inside of the pipe to a point about three or four inches above the top of the wooden portion of the support, where a hole has been drilled to allow of its passing out

COPYRIGHT.—Not only the title but the entire contents of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION. in advance, postage prepaid, \$3.00 for a full year of 52 numbers; in clubs of four or more, \$2.50, with free extra copy for eight subscriptions; foreign countries, \$5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—the only general electrical paper published in the West—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers desiring western trade will appreciate the UNEQUALLED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

...and many folks believe them, that the traffic in electricity is yet in its infancy.—New York Sun.

Our electrical contemporary has been deceived. He has not said anything of the kind, and his readers, by hearing others ring the changes, have been misled.

...the following... the Bell interest... the new interest... the Bell interest...

one to see an object in its natural colors a great distance by means of an electrical device, announces that he has invented an apparatus operated by a beam of light which he has applied to exploding bombshells." The gentleman with an unpronounceable name should show some results before making further announcements. His "inventions" are all in his mind, and they consist mainly of extravagant claims which he has shown no disposition to perform.

The passing of the populists in Kansas was marked by a characteristic act on the part of the Governor Leedy, whose last official act was his approval of the "15-cent telegraph bill." The act provides for reducing telegraph rates and placing telegraph companies under the supervision of the "Court of Visitation." The rate fixed in the bill on messages is 15 cents for the first 10 words, day or night, and one cent for each additional word. On newspaper reports the rates are reduced to one-third of one cent for each word during the day and one-sixth of one cent for each word at night. It provides that no lower rate shall be granted to anyone. Lawyers contend that the act is unconstitutional, and the telegraph companies will probably bring a test case in the United States court.

Corporations formed the subject of the farewell message of Governor Holcomb of Nebraska and the inaugural address of his successor, Governor Poynter. Both governors strongly reprobate the use by the federal courts of the writ of injunction to nullify state laws intended to regulate corporations and their charges.

Governor Stephens, in his message to the Missouri Legislature, urges specific legislation providing for the taxation of "that intangible class of corporate property known as corporate franchises." He continues: "As an evidence of this intangible property known as the franchise, in one of the great cities of this state recently a gigantic corporation has contracted to pay, in round numbers, \$1,000,000 for the franchise over certain streets in that city."

Not to be outdone by his contemporaries, Governor Pingree of Michigan takes a shy at corporations generally and makes a special attack upon the Associated Press, which he says "has been able to distort the truth in many prominent instances and to poison with such distortion the very fountain of popular information." In view of the fact that the Associated Press has contributed largely to Governor Pingree's efforts to keep himself prominently before the public, this attack seems rather ungrateful.

The attitude of the American Bell Telephone company toward the public and the independent companies engaged in manufacturing telephone apparatus and operating exchanges equipped with these instruments indicates that the old concern has not yet come to a realization of the change that has taken place in the field of telephony during the last few years. It is now making futile efforts to regain its prestige in Michigan and has adopted the policy of "crushing out competition." Whenever possible it will absorb independent companies; elsewhere, it will endeavor to accomplish the same end by cutting prices below the actual cost of operation, hoping thereby to exhaust the resources of the independent companies which depend upon local merchants and are supplied with limited capital. In other words, all the wealth and powerful influence of the Bell interests will be concentrated in this effort to demoralize the independent telephone business in Michigan. It is not contended that the successful execution of this plan will prove profitable to the Bell interests; on the contrary, it is admitted that this policy will entail great financial loss, but the object to be gained, it is asserted, warrants even greater expenditure than that contemplated. By successfully attacking the independent interests in Michigan the old company hopes to gain a supremacy that will fill its rivals with dismay, and make its task easier in other localities.

But the chances are that the Bell interests will soon find that they have undertaken a much greater task than they anticipated. They will find that the independent companies are thoroughly organized, but local interests will prevent them from selling out, and that they will receive hearty support and

encouragement from the people in their fight against the old corporation. They will find it necessary to reconstruct the entire Bell system throughout Michigan in order to compete with the independent service on any terms. Since the establishment of the new companies the people have been educated up to a higher standard than obtained during the days of the monopoly of the Michigan Telephone company, and they will not be satisfied with inferior service. The investment required for the duplication of the system of the independent companies throughout Michigan, and the loss entailed in "crushing out competition" by giving free service for two or three years, will prove a costly experiment to the syndicate that has undertaken to redeem the state from the independent companies and reestablish the old conditions. Assuming the possibility of successful termination of this movement, the question arises, How is the Bell company going to recoup its losses? Certainly not by reestablishing the old rates for service. Any attempt of that kind would invite fresh competition. The problem is an interesting one.

American electrical manufacturers who desire to extend their foreign trade will be interested in the preparations that have already been made for the exposition of American products and manufactures especially adapted for export, to be held at Philadelphia, and the plans that have been adopted for bringing this unique exhibition to the attention of foreign purchasers. The exposition will be formally opened on September 15th, and it will continue until November 10th. It has been pointed out that the forthcoming exposition offers an exceptional opportunity for gaining information concerning the commerce of other countries, their customs and commercial relations, their system of communication and transportation, with special details of freight rates, tariffs, exchanges and kindred subjects. The exposition will be sufficiently broad in its scope to command the good will and co-operation of manufacturers and others interested in the development of American commerce.

A special feature in connection with the exposition will be an international commercial congress, at which will be represented not only the leading chambers of commerce of Mexico, Central and South America, but assurance is also given that delegations from South Africa, India, Australia, China, Japan and other countries will be in attendance. This will bring together about 400 leading merchants from all parts of the world, who will come to make business connections in the United States, and to discuss the best means of extending the American trade in their respective countries. This meeting will in a measure resemble the international commercial congress held in 1897 under the auspices of the Philadelphia Commercial Museum, but will be on a much more elaborate scale. The delegates to the last congress were prominent merchants appointed by the leading commercial organization of Spanish-American countries. During the meeting in Philadelphia and the subsequent tour to some of the principal industrial centers of this country, the expression most frequently noted on the part of these delegates was one of amazement and surprise at the degree of perfection attained by American industry. In the reports which they have made to their chambers of commerce no fact has been more strongly emphasized than that the products of the United States are not sufficiently known abroad, and that it is to the interest of a foreign merchant to make a careful examination of the field.

The convocation of this congress affords a most excellent opportunity to American manufacturers to secure good connections in foreign countries. It will attract large numbers of buyers from all parts of the world, and these foreign merchants will have an unusual opportunity to study and examine what they can best buy in the United States. To those who are familiar with the condition of the electrical trade abroad this exhibition is particularly interesting. American electrical appliances are in growing demand in foreign countries, and any means calculated to increase this demand should be heartily supported. The increase in electrical output and the advance and improvement in this line of manufacture are more marked than in any other class of manufacturing.

INDUSTRIAL COMBINATIONS.

The opening days of 1899 have witnessed the conclusion and announcement of several deals for the combination of manufacturing or operating companies working in the same lines—the tendency to concentrate the business of the country in a comparatively few hands so noticeable in 1898.

Electric Company of America.

Articles of incorporation of the Electric Company of America were filed on January 5th with the secretary of state of New Jersey. The company has an authorized capital of \$25,000,000. Its expressed objects are to manufacture, produce, purchase, own, use and sell to public and private users coal, coke, gas, oil, electricity, light, heat, steam and compressed-air power, water, etc., and to own, acquire, construct and lease and operate plants in connection therewith. The incorporators are James E. Hayes of Camden and Elmer Smalling and Arthur Phillips of Philadelphia. The company, it is understood, is organized for the purpose of acquiring and operating the electric-light plants in different cities, particularly in and near Philadelphia. It is said to be backed by the Widener-Elkins syndicate. The new company has just the same amount of capital stock as the New York Gas and Electric Light, Heat and Power company, which is undoubtedly trying to control the lighting business of New York. As the New York company is closely allied with the Metropolitan Street Railway company, so, it is believed, is the Electric Company of America with the Union Traction company of Philadelphia. However, Mr. W. C. Whitney, the moving spirit of the New York combination, is said not to be interested in the Philadelphia scheme, which is attributed to P. A. B. Widener, William L. Elkins, Thomas Dolan and their associates.

United Lighting and Heating Company.

It is believed that the Widener-Elkins combination of capitalists is behind the new United Lighting and Heating company, with its \$12,000,000 capital. A dispatch from Philadelphia, on January 5th, reported the completion of the deal between the Pennsylvania Globe and Gas Light company and the Kitson Incandescent Gas Light company of that city, the negotiations for which deal have been in progress for several weeks. The dispatch continued: "The agreement involves the formation of a new corporation, known as the United Lighting and Heating company, which will control the street-lighting business of the Pennsylvania Globe and Gas Light company, the Welsbach Street Lighting company of Chicago, the New York and New Jersey Globe and Gas Light company of New York, the Chicago Globe and Gas Light company of Chicago, the Canton Globe and Gas company of Canton, O., the Kitson Incandescent Gas Light company and two other companies. The ultimate object of the company is to control the street-lighting business throughout the United States." The new company was chartered under the laws of the state of New Jersey, with a capitalization of \$12,000,000.

Combination of Carbon Makers.

[From the Chicago Record.]

The National Carbon company will be organized about January 16th, under the laws of New Jersey, with a capital of \$10,000,000, \$4,500,000 of which will be in seven per cent. non-cumulative preferred stock and \$5,500,000 in common stock. The corporation will absorb the principal manufacturers of carbon supplies, particularly electric-light carbons, carbon brushes for motors and electrolytic carbons for all varieties of smelting purposes. Arthur J. Eddy of Chicago, who was prominent in the organization of the American Linseed company recently, is the promoter of the enterprise, and Chicago capital is interested.

Contracts have already been closed for the purchase of the plants of the following-named carbon companies: The National Carbon company, Cleveland, O.; Brush Carbon Works; Standard Carbon Works; Crouse & Tremaine Carbon company, Fostoria, O.; the Thomson-Houston Carbon company, Fremont, O.; Paraday Carbon company, Jeannette, Pa.; Phoenix Carbon Manufacturing company, St. Louis; American Carbon company, Noblesville, Ind.; Washington Carbon company, Pittsburg; Partridge Carbon company, Sandusky, O.

In addition to the United States industries, the new company will own a half interest in the Ottawa Carbon company of Ottawa, Canada, which company controls the carbon industry of Canada.

The new company assumes no debts or liabilities of any description. It purchases the various properties upon conservative appraisals, free of all liens, and it will have in the treasury a working capital of \$600,000. The following-named men will serve upon the board of directors of the permanent organization, with two directors yet to be named: W. H. Lawrence, president National Carbon company, director Cleveland Trust company; Myron T. Herriek, president Society for Savings, Cleveland, and receiver of Wheeling and Lake Erie Railroad company; James Parmelee, president Cleveland Electric Illuminating company, vice-president Cleveland Electric Railway company; James Humbird,

president Washington Carbon company, Pittsburg; E. D. Dickey, Jeannette, Pa., president Paraday Carbon company; Webb C. Hayes, Cleveland, O.; J. C. Van Blarcom, cashier National Bank of Commerce, St. Louis.

Subscriptions to stock will be payable when stock certificates are issued and ready for delivery, which will be about January 23d. Facilities will be provided in advance for the registration and transfer of stocks in Chicago.

American Steel and Wire Company.

It is announced by the American Steel and Wire company officials that the various steel and wire interests in this country are to be consolidated into a new corporation, to be known as the American Steel and Wire company of New Jersey. The consolidation will include the present American Steel and Wire company, the Washburn & Moen Manufacturing company of Worcester, Mass., and Waukegan, Ill., the Worcester Wire company of Worcester, the Cleveland Rolling Mills company of Cleveland, O., the Newcastle Wire Nail company of Newcastle, Pa., the Pittsburg Wire company of Pittsburg, the Cincinnati Barbed Wire Fence company of Cincinnati, the Laidlaw Bale and Tie company of Joliet, Ill., and Kansas City, the Consolidated Barb Wire company of Lawrence, Kan., and Joliet, Ill., the Newburg Wire and Nail company of Newburg, N. Y., the Oliver Snyder Steel company of Pittsburg and the Oliver Wire company of Pittsburg, Pa., and several other companies. The new concern will have a capital stock of \$90,000,000, of which \$40,000,000 will be preferred seven per cent. cumulative, having lien on assets prior to the common stock, and \$50,000,000 common stock.

The Washburn & Moen company was the last of the big companies to go into the combination. It is said that the stock of this company was transferred to the syndicate for more than \$8,000,000.

This company will control the bare-wire and wire-nail markets of the country. The main offices will be in Chicago, and it is said that all other offices, excepting mill offices where plants are located, will be given up.

Rubber-covered Wire Interests.

A number of insulated-wire men met in Chicago early in the week. They consulted with the underwriters about the new wiring requirements, but a Chicago daily newspaper asserted that they also discussed plans for the formation of a pool. However, the statement is denied by the wire men and seems unlikely.

Electric-lighting Companies of Northern New Jersey.

[From the New York Sun, January 4th.]

At a meeting of the board of directors of the People's Light and Power company in Newark yesterday it was decided to increase the capital stock from \$5,000,000 to \$20,000,000, in view of the absorption of the Hoboken and Elizabeth Electric Light companies. The People's company has no bonded indebtedness, and the officers say that not more than one-third of the authorized increase in stock will be issued at present. The company has \$5,000,000 of stock outstanding, and President Philip Ney Jackson thinks that the same amount of increase will cover the recent purchases. Mr. Jackson has been working assiduously for years to get control of all of the electric lighting in northern New Jersey. The companies which have been absorbed through his instrumentality are the Newark Electric Light and Power company, Newark Schuyler Electric Light company, Thomson-Houston Electric company of Newark, Central Power company, Consumers' Electric Light and Power company, Excelsior Light and Power company, Kearny Electric Light and Power company, Jersey City Electric Light and Power company, Essex County Electric Light company of East Orange, Suburban Electric Light and Power company of Orange, Montclair Light and Power company, Edison Electric Light and Power company of Newark, North Hudson Heat, Light and Power company of Hoboken, and the Consumers' Heat, Light and Power company of Jersey City. At the meeting yesterday afternoon it was resolved that a material reduction should be made in the charges for lighting, and a number of costly improvements were authorized.

Brooklyn Railways.

It is now asserted that the owners of the Brooklyn Rapid Transit company have secured control of the stock of the Nassau Electric Railroad company, and that the formal consolidation of the two companies will soon be effected. R. P. Flower and Anthony N. Brady are largely interested in the Rapid Transit company, and Tom L. Johnson and brother and P. H. Flynn controlled the Nassau stock. It is said that President Clinton L. Rossiter will be placed in charge of the united surface lines when consolidation comes and that Mr. Brackenridge will be chief engineer. Messrs. Flower and Brady are said to be satisfied with Mr. Rossiter's management of the Heights system, which last year earned more than \$700,000 in excess of any year's earnings since the road came into the possession of the present management, and, at the same time, the expenses of the road are less than they were when Mr. Rossiter

became president. The system has been almost entirely relaid with new rail, and the company has built a car shop, at a large outlay, capable of building its own cars if the manager desire to do so. President Rossiter and Colonel T. S. Williams have labored early and late to produce satisfactory results, and they are now able to point to the fact that, while three years ago, Rapid Transit stock was selling at 25, it is now above 90 and rapidly approaching the 100 mark.

There is some talk to the effect that ultimately the elevated and surface railway and electric-lighting interests of Brooklyn will be all under the Flower-Brady management.

Electric-lighting Situation in New York.

The New York Sun, which ought to be pretty good authority, says that on January 5th it was reported on good authority that negotiation for the purchase by William C. Whitney of the Edison Electric Illuminating company, while not yet completed, had got so far that they pointed to the control of the company passing to Mr. Whitney very shortly. The Edison company, when purchased, will be added to the properties already acquired by the New York Gas and Electric Light, Heat and Power company, which is backed by Mr. Whitney, P. A. Widener, W. L. Elkins, Thomas Dolan and other capitalists.

Electric Railroads in Russia.

The American consul at Moscow calls attention to the fact that the government is favorably disposed toward the building of electric railroads. The Ministry of the Interior is at present considering the question of constructing a network of electric railways in Riga and the Town Corporation has taken the matter in hand. The ministry has expressed its willingness to support the town by allowing a loan for the purpose on profitable conditions. The general cost of constructing the electric roads in Riga has been determined at 1,600,000 rubles, or \$800,000.

It is reported that the czar has sanctioned the building of an electric railroad from Warsaw, via Lodz and Kalisz, to Skalmierzycze. From this point connections will be made with Ostrowo, Krotoschin and Lissa. From Lieradz and Storce a branch line will run to Wilhelmsbrück, Kempen and Oels. The work should be advanced sufficiently so that passenger traffic may be opened up in 1900.

Infringement of Series-parallel Controller Patent.

The preliminary injunction obtained for the General Electric company against the Nassau Electric Railroad company of Brooklyn, on September 13th, prohibiting the latter company from infringing on the patent (No. 393,323) granted to G. H. Condit for series-parallel-controller operation of electric cars, has been made permanent. The apparatus complained of as infringing the Condit patent was supplied by the Steel Motor company. Judge Lacombe granted the preliminary injunction, and the United States Circuit Court of Appeals for the Second Circuit directed that it be made permanent. The order of the court directs the Nassau Electric Railroad company to remove at least 250 of the offending car equipments by January 28th, and to continue so doing at the rate of 250 a month until August 1st, when all the infringing apparatus must have been removed.

Electric Lights in a Small Southern Village.

An occasional correspondent of the Western Electrician in Charlotte, N. C., sends the following: "We have in this state probably the smallest town in the South with electric lights, this being Elkin, N. C., with a population of 350 to 400. The system is 220-volt, two-wire, with independent residence and street circuits. Current is supplied from a 25-kilowatt, slow-speed Crocker-Wheeler dynamo, driven by an automatic engine. The fuel is cordwood, which is cheaper there than coal, and this plant has given more satisfaction than most of the other town plants in the state. The proprietors are using eight Helios arc lamps singly on the 220-volt circuit and 32 candle power incandescent lamps in Cutter street hoods for the street lighting. For residences and stores eight, 16 and 25 candle power lamps are used."

Pacific Cable Projects.

In the United States Senate, on January 7th, Mr. Lodge introduced, by request, a bill to provide for a submarine cable between the United States and Hawaii, the Philippines, Japan, China and Australia. The postmaster-general is authorized to contract with the Pacific Cable company of New York for the payment of \$125,000 a year for 20 years, for transmission of official messages from San Francisco to Honolulu, the line to be laid by December 31, 1900. Before December 31, 1902, the company shall construct a line from Honolulu to Manila, with an additional sum of \$125,000, to be paid annually by the government. Within four years the company shall lay connecting lines to Japan, for which \$25,000 a year for 20 years shall be paid. The rates fixed between San Francisco and Honolulu are 35 cents a word, and to the more distant points \$1 a word.

DEVELOPMENT OF THE TELEPHONE FIELD.

Telephone Situation in Michigan.

[From the Detroit correspondent of the Western Electrician.]

The sale of the Michigan Telephone company to the Cleveland Telephone company, which was announced last week, carries with it much more significance than appears on the surface.

Those who claim to know say the real meaning is that it is another step toward fighting all telephone companies not using Bell instruments. The fight will be made at the cost of millions of dollars, but in the end the Bell people all over the country propose, if they can do it, to be in the telephone just as the Standard Oil company is in its own particular line of commerce. All this provided opposition can be crushed to the wall.

The new president of the Michigan Telephone company—for it will continue to maintain a separate organization—is Charles J. Glidden, president of the Cleveland company. Mr. Glidden is not a Cleveland man. His home is at Lowell, Mass., and not many years ago he was a telegraph operator. Now he is a telephone magnate and promoter. It has become his business to be made president of telephone companies. Every few weeks he adds another presidency to the list, and now he is, nominally at least, the head of the Bell companies in Texas, Minnesota, Arkansas, North Dakota and several other states.

Under the old rule the Michigan Telephone company, controlling all the Bell exchanges in the state of Michigan, had to fight all opposition within the state and stand the expense involved, the patentees only agreeing to fight patent infringements. Accordingly, in the states where opposition is strongest the profits of the Bell stockholders are smallest, and where the opposition is weak the profits are not materially interfered with. Michigan is counted one of those states where opposition is uncomfortably strong and growing rapidly. This unequal battle of the states has done much to encourage rival companies, and each year has shown them stronger than before.

For the absorption of the several operating companies there will be formed a gigantic telephone syndicate, with millions at its back, prepared to make a bitter fight for the control of the telephone business of the United States. For the purpose of this consolidation Mr. Glidden is the president. He is in reality the personal representative of the millionaire syndicate. Whenever it is thought best to begin active operations against opposition lines the necessary funds are to be taken from the general pot. They will not lessen the profits of Michigan any more than those of New York or California.

"There is no question but what it will be a fight to a finish," said a man who is in close touch with some of the Bell magnates. "Either the Bell will be the only telephone in use or it will be driven out of the field. There can't be any other result."

"Will opposition companies be bought out?"

"That depends. Where it will cost less than to fight, yes; where not, then no."

"Supposing that opposition companies are driven out, does it mean that the rates will go up?"

"I can't say as to that. I can only refer you to what is being done now. You know that the fight has been reopened with much vigor in this state. In towns where exchanges are being reorganized the Bell people's contracts call for 10 years at the price stated, with a six months' notice on the part of the subscriber to cancel the contract. In any event, you know, the Standard Oil company hasn't raised the price of oil. See the comparison?"

Speaking of the fight in Michigan, the same man said that many millions of dollars were to be spent in Michigan alone in bettering the plant. For instance, all the wires in Detroit are to be put underground and all wires to other towns would be in cables, either underground or aerial.

"The system is to be perfected," he said, "before the war begins in real earnest."

Friday night a director of the Michigan Telephone company, who would not allow his name to be used, while neither admitting nor denying the story of the general combine of state companies, said this concerning Michigan:

"We intend to fight this battle to a finish. There is no doubt about this. We have millions at our disposal for bettering our plants, and we will not rest until all opposition has been swept away. This is emphatic."

This activity on the part of the Bell companies will undoubtedly bring about a combination of anti-Bell people, and the telephone organization which was formed here two years ago may prove an important factor in the impending struggle.

From Cleveland come the story of the transfer of a large part of the stock of the Michigan Telephone company, together with the actual management of the concern, to the Cleveland Telephone company. The report continues: The Michigan company operates exclusively under the American Bell Telephone company's license in Michigan, with 15,000 subscribers and 10,000 miles of long-distance wire. The assets of the company are \$2,500,000.

The new arrangement places under the Cleveland management the largest number of subscribers in the United States," and J. P. McKinstry, general

manager of the Cleveland Telephone company. "There are in all 50,000 subscribers and 30,000 miles of toll line. The added development of this combined territory cannot be less than 15,000 subscribers in 1899, comprising the states of North Dakota, South Dakota, Minnesota, Michigan, Arkansas and Texas. It would not be surprising if the copper district in Northern Michigan were talking with Boston before the close of the year. Full details cannot yet be given, but some important changes in policy of management will be made ultimately."

Mr. McKinstry also expressed the opinion that the tendency was toward the consolidation of all the operating companies under the direct management and control of the parent organization.

"As a matter of economy, if for no other reason," said Mr. McKinstry, "I think sooner or later all the companies working under Bell licenses will be combined into one great corporation, just as all of the several telegraph companies of this country were merged into the Western Union company a quarter of a century ago.

"However, I have no official knowledge this step is at present being considered, but there is a natural tendency toward such a movement, and it is, in my opinion, bound to come."

New England Telephone Notes.

[From the Boston correspondent of the Western Electrician.]

Mayor Josiah Quincy has signed the order recently passed by the Boston Board of Aldermen, authorizing the Massachusetts Telephone and Telegraph company to establish a new underground system, the company making a contract with the city by which the mayor was able to gain further advantages for the municipality not set forth in the original order. The chief additional provisions require the company to furnish without charge in the underground system a duct for carrying the city's fire-alarm wires, and to furnish within the limits of the city as many different kinds of service, and at as low rates, as the New England company now furnishes. Two years is to be the extreme limit of time allowed the company for its equipment and operation of at least one telephone exchange. It is stated that the people connected prominently with the promotion of the corporation have been largely interested in the Lamson Store Service company, Messrs. Ames, Shepard, Titcomb and Counsel Gilman being in this list, and President Z. S. Holbrook was formerly Chicago manager.

Some of the directors of the Boston and New York Telephone and Telegraph company, incorporated in New Jersey December 17th, are among the men interested in the new Massachusetts company, and it is presumed that the New Jersey corporation is to work in conjunction with the one in Massachusetts, and connect the two cities with long-distance service, although plans are not yet fully announced.

Bell Telephone Business for 1898.

In last week's issue of the Western Electrician it was stated that the American Bell Telephone company's output for the year was about 194,000 instruments. This number was secured by taking the company's reports for 11 months of the year and carrying out the proportion for December. But the official report for the last month of the year is now at hand, and it appears, from the unprecedented demand for instruments in December that the Western Electrician's estimate was too low. The net output for that month, according to the company's statement, was 27,771, while the average for the other months of the year was about 16,000. It is stated that for the month ended December 20th the company was unable to fill the orders received for instruments. These orders called for 51,477 instruments, whereas its gross output for the month amounted to 41,937 instruments.

The net output for the year was 205,725 instruments, and the total number of outstanding Bell telephones is now stated to be 1,125,246. The total number of instruments outstanding five years ago was 582,506. This number was increased to 676,536 in 1895, to 773,849 in 1896, to 922,253 in 1897, and 1,125,246 in 1898. The figures are taken from the Boston News Bureau.

Bell Interests in Michigan.

The Detroit correspondent of the Western Electrician announces that "a report has been received from Niles that the American Bell Telephone company is negotiating with newspapers in every city in Michigan which has independent telephone service, asking for advertising rates and offering to pay in advance. It is understood that the company intends to reduce rates to a point which will drive out all competition.

"The Taxing Board at Lansing has assessed the new Detroit Telephone company the sum of \$10,000. The company will try to have it reduced.

"About January 15th the Michigan Telephone will issue a new directory for Detroit. Manager Forbes says it will contain 1,500 more names than a year ago."

Telephone Service in Chicago.

Two interesting contributions, relating to the telephone service in Chicago were presented in the Chicago Record of January 2d. The first is by Angus S. Hibbard, general manager of the Chicago Telephone company, and presents the Bell company's views on the situation. The other is an incidental reference by Charles G. Armstrong, an independent engineer, in the course of a review of the year.

Mr. Hibbard makes the following statement of the present condition of development of the Bell service:

"During the past year the number of telephones operated in Chicago and vicinity by the Chicago Telephone company has increased to a greater extent than ever before in the history of the company, and the daily use made of the telephones in the Chicago exchange has so increased as to require large additions to the operating plant of the company and to the forces employed.

"Two new exchanges have been opened in the downtown district—one, known as 'Central,' being located in the Chicago Title and Trust building, 100 Washington street, and the other, known as 'Harrison,' in the Manhattan building, 315 Dearborn street. The operating appliances in these offices are of the very latest design and have given excellent satisfaction. The lines in the central office form a group of about 1,500 of the busiest telephones ever served from one office, each line being used, on the average, 80 times every day, so that, notwithstanding the rapid work performed by means of automatic signals, the force of operators required for their service has been unusual.

"The wire plant of the Chicago exchange has been increased during the year by more than 10,000 miles of wire, there now being nearly 48,000 miles of telephone wire operated in Chicago, over 40,000 of which is contained in cables. The amount of overhead wire on poles has been reduced during the year and consists now largely of short feeder lines leading from the main underground extensions to the premises of the subscribers.

"The rate of use of Chicago exchange telephones has increased during the year from 220,000 to over 270,000 calls daily, 50,000 calls more per day being handled now than at the same time last year.

"The party-line residence service has been extended largely, and more telephones are now operated in residences in Chicago than in any other city in the world.

"During the coming year extensions of equal importance are to be made in the Chicago exchange. New operating apparatus is to be placed in the main office, 203 Washington street, providing for the operation of metallic-circuit lines. A new exchange, known as "Monroe," is to be located in Sangamon street, near Madison street, in a building about to be erected by the company.

"The toll lines operated by the company and radiating in all directions from Chicago now reach 145 cities and towns, in 58 of which exchanges are operated by the Chicago Telephone company. Important extensions have been made by the long-distance company, reaching to Kansas City and all important towns in Missouri on the west, and also northwest to St. Paul and Minneapolis and throughout Minnesota and the Dakotas. The telephone business between Chicago and New York has increased steadily throughout the year, and business is now accomplished by long-distance telephone which formerly required a trip to the distant point.

"In every department of the service it has been demonstrated to a greater degree than ever before that the best kind of a telephone in the office or on the desk of a busy man, or in a private residence, is one of the most valuable facilities for the expedition of business."

Mr. Armstrong concisely presents the views of the subscribers in the following summary:

"So far as the telephone octopus is concerned very little improvement has been made in their instrument, but some slight improvement in switchboard apparatus has been brought about in this city, the Chicago Telephone company having established a new exchange, which, it is hoped, will better the service somewhat, although so long as they provide the subscriber with the oldest form of telephone known there is little to be looked for. On the other hand, the opposition companies are struggling to bring out the best and newest thing in their line, with the result that thousands of private parties are installing telephones for office, warehouse and store use, and hundreds of exchanges are being put in all through the country, and in some cases the Bell people have been compelled to cut their price to as low as \$1 a month. But until we can get good, healthy competition in the city of Chicago nothing can be hoped for in either improvement of service or reduction of price.

"During the last year the dime-in-the-slot telephones have been declared against by the City Council, and the opinion has been passed by the city attorney that they are unlawful and that the company has no right to maintain them under its charter. The telephone company meantime is still maintaining the dime-in-the-slot machines and will probably continue to do so."

Eureka Express Switchboard.

For the central-station telephone switching apparatus herewith illustrated the manufacturers make especial claim for rapidity of operation, simplicity of construction and economy of maintenance. Each drop and jack is self-contained, and can be removed and replaced in less than 30 seconds by a novice without disturbing the night-bell circuit, a single-line connection or using a tool. The clear-out drop and operator's cam are self-contained and removable.

The following description of the board drops and their method of operation will be of interest to exchange managers:

The boards are built in 100-line dust-proof frames, finished in quarter-sawed oak, and so arranged that, by removing the molding from one side of the cabinet, additional cabinets can be placed side by side, thereby increasing the capacity of an exchange 100 numbers at a time without disturbing the first section installed, or, if larger frames are desired, they can be furnished. Each 100-line metallic board is equipped with a full complement of operator's set, comprising 10 pairs of strong, heavy plugs and reinforced cords. These cords are so manufactured that they allow a set-screw clamp

them into the plug handles in such a way that there is no pull upon the tinsel of the cords, and this arrangement does its work so efficiently that it is impossible to pull a cord from a plug in service. The operators can kink the cord closely up to the plug without fear or danger of breaking its connections. Over each set of plugs is a self-contained clear-out drop and listening and ringing cam that controls the ringing on either cord and the cutting in and out of the operator's set.

With each operator set is included a hand generator warranted to ring through a resistance of from 35,000 to 40,000 ohms, and it can be adapted for ringing either series bells on short lines or also those of high resistance, where it is desired to ring a maximum number of bridge bells over a long bridge line.

The Eureka long-distance amplifying solid-back transmitter has a metal solid back, eliminates all vibratory action and is serviceable and firm. The transmitter is suspended from a neat arm and is adjustable. The equipment also includes long-distance silk-wound induction coil, with fiber-rubber heads, screw and washer terminals and soldered connections, night-alarm bell, gravity batteries for transmitter and night-bell circuits, double-pole receiver and spring head-band, organ-stop switches for changing the ringing circuit from hand to power generator and to cut on and off the night-bell circuits. The total width of the board is 19 inches.

The Eureka Electric company manufactures these boards in any size cabinet desired, 100-capacity size being standard. Metallic boards are built either

Drop.

Cam.

EUREKA EXPRESS SWITCHBOARD.

for common-return, ground or complete metallic circuits, for use with either series or bridging telephones, or a combination of both. For large exchanges a transfer system is provided.

In place of the drops falling upon the board, the Eureka express drops fall sideways, as shown in the cut. With other types of self-restoring drop boards, a jar is liable by accident to drop shutters and retard the work of the operator, as she will be unable to determine which indicate calls and which are the result of accident.

In the Eureka board the drops are held firmly in position and current must pass before the armature will release the drop. After a call has been made and the drop has fallen, the operator inserts a plug into the jack which throws the operator's set in connection with the subscriber making the call. The operator does not have to move the listening cam to complete the circuit, which is established immediately by the insertion of the plug. After learning the number desired, she takes the mate of the plug used and inserts it in the jack of the drop to which connection is desired. This movement establishes the circuit, and, by turning the operator's

cam to the right, rings the subscriber wanted without, in any way, ringing back into the first subscriber's ear. Then by a slight movement of the operator's cam to the left she throws the operator's set out of the circuit. The insertion of the plugs cuts out the main line drops and cuts in a high-wound bridged automatic restoring clear-out drop. At any time, should the operator desire to learn if the lines are busy, a slight movement on the switching circuit will throw her in circuit.

When use of the line is discontinued, the ring-off from either side will drop the clear-out drop of the circuit, and the operator may restore the cam to its normal position, which automatically restores the ring-off drop. Each ring-off is self-contained in a hard-rubber case, with its own operator's cam, and is easily accessible at any time.

This board has proven its efficiency by several years of hard service, and it is now giving entire satisfaction in exchanges where the conditions are unusually exacting. In one of these a board of 300 numbers is operated satisfactorily by one person.

In construction, it is claimed, this board embodies many advantages, the electrical and mechanical work being of an unusually high order. The quality of the material used is high-grade and the durability of each component part guarantees long life under the most severe use.

New York Telephone News.

The New York and New Jersey Telephone company has declared a quarterly dividend of 1 1/4 per cent. An extra dividend of one per cent. has also been announced. Both are payable January 14th.

Commissioner Kearny of the Department of Public Buildings, Lighting and Supplies of New York has sent to the City Council a communication announcing that he had ordered the New York and New Jersey Telephone company not to answer any calls on long-distance telephones to other cities and out-of-town places coming from telephones in public buildings. The bills for long-distance calls for the last year, the commissioner said, had been enormous, and he was satisfied that all, or nearly all, the calls had been on private business. City officials and others who wish to talk with persons outside the city will have to use other telephones in future than those in public buildings.

Through the presence of mind of one of the employes of the New York and New Jersey Telephone company, says the New York Tribune, a serious accident was averted. Though the man was terribly and painfully burned about the face and arms, he saved a comrade's life and prevented an explosion which would have caused much damage and possible loss of life. Harry C. Johnston, 25 years old, of No. 268 Bridge street, Brooklyn, and Frank Rockhold of No. 286 Barrow street, Jersey City, were working in the telephone company's manhole, in Broadway, at the head of Dey street. They were making up joints and finishing the connection of some telephone cables in the conduit. To do this it was necessary to use heated paraffin, and while Rockhold was in the hole Johnston had charge of heating the paraffin. He had just handed down a ladle full of the oil, when a drop of water from overhead fell into the ladle and the contents spluttered up and took fire. Knowing that if a fire occurred, it meant instant

death to him and a running blaze all along the line underground, causing many explosions of escaping illuminating gas, as well as sewer gas, Rockhold, quick as a flash threw the heavy ladle up to Johnston. It was impossible for the latter to catch the hot vessel, and to drop back into the manhole again meant to Rockhold the thing he had tried to avoid, so, with rare presence of mind, Johnston kicked the ladle as it emerged from the hole. As he did so the paraffin exploded, some of it spilling into the hole, on Rockhold's face and arms, while a great shower of the hot fluid was thrown into Johnston's face. Neither man knew how badly he was burned, but they went to a nearby drug store, where their wounds were temporarily dressed, and they made haste to reach the Hudson Street Hospital. There they were treated by Surgeon Richardson, who said it was remarkable that both of Johnston's eyes had not been burned out by the hot paraffin.

Work will begin immediately on the new telephone line to be built from Washington to Maybent, for which the contract has been let to Charles Belden, says the Nevada City (Cal.) Herald.

Opposition to Chicago Telephone Company.

Serious competition for the Chicago Telephone company is threatened by a syndicate which has secured control of the ordinance of the Illinois Telegraph and Telephone company, now before the Chicago City Council. Charles H. Aldrich, who represents the promoter, assured the committee to which this ordinance was referred that a company would be formed immediately, and the work of establishing an independent system begun as soon as the franchise was granted.

The ordinance for the Illinois Telegraph and Telephone company was introduced in the council on June 27th by Alderman Novak and referred to the committee. It offers a 50-year franchise to operate a telephone system in all the territory comprised within the limits of the city of Chicago, with the provision that in the district bounded by North and Ashland avenues, Thirty-ninth street and the lake the wires shall be underground. The maximum charge which can be made for the use of a telephone is \$85 a year, and the company binds itself to furnish the city telephones for the various offices in the city hall free, and charge \$5 a year each for all other telephones it may use for fire and police purposes. The committee recommended the ordinance substantially as it was introduced.

Mr. Aldrich directed attention to the fact that while the ordinance under which the Chicago Telephone company is operating specifies that the maximum rate for service in Chicago shall be \$125 per year, the company really charges \$175, as the old system for which the franchise rate is charged is so defective that it is of no commercial value whatever. His company proposes to introduce a complete metallic up-to-date system that will excel the Bell service, he claims, and charge only \$85 per year. Mr. Aldrich also said that the company would include several St. Louis capitalists who are now interested in the Kinloch company of that city and Cleveland capitalists who are engaged in establishing an independent system in that city. From this it is inferred that the company has been formed by Milo G. Kellogg and his associates, although Mr. Aldrich refused to reveal the identity of the men whom he represents. The ordinance will be considered at the council meeting next Monday evening, it is thought.

Trouble in another form is threatened by Joel M. Longenecker, James A. Quinn, E. P. Barry, Dr. J. E. McFatrieh, James D. Morrison, W. W. Watson and others, who have formed an association with the object of securing legislation to lower telephone rents to \$75 a year. It was reported last week that a bill is being prepared to be sent to Springfield.

No Combination of Telephone Interests Contemplated.

[From the New York Tribune.]

A dispatch from Boston has been printed to the effect that prominent Boston interests were forming a combination of all the telephone companies throughout the country which are opposed to the Bell Telephone company, that a majority of those companies had already agreed to sell out to the new company, and that the People's Telephone corporation of this city had been approached by the promoters of the projected combination, but had not yet decided to come in. It was added that the new combination would probably be conducted in harmony with the Bell company, the effect being the practical doing away with all competition in the telephone business.

The People's Telephone corporation mentioned in this dispatch is the company organized a few months ago through the efforts of leading representatives of the New York Board of Trade and Transportation and other mercantile bodies in this city, to furnish a telephone service here which should be more efficient and less costly to subscribers than that given by the Bell Telephone company.

Ex-Congressman Darwin R. James, president of the Board of Trade and Transportation, is also the president of the People's Telephone corporation. He said yesterday afternoon that the report that the People's Telephone corporation had been approached on the subject of entering a combination such as was described in the Boston dispatch was entirely without foundation.

Mississippi Valley Telephone Company

The Mississippi Valley Telephone company has 7,000 subscribers in Minneapolis and St. Paul, and the Bell company has only 5,000. The Mississippi Valley company expects to increase its list to 12,000. The company's headquarters are at Minneapolis. The company has six exchanges working at the present time in Keokuk, Fort Madison, Burlington, Muscatine, Minneapolis and St. Paul. In the last two towns all the lines are underground. In Fort Madison and Muscatine exchanges the American telephone is used, in Burlington the Western Telephone Construction company's instruments, and in the rest the Stromberg-Carlson apparatus. The company expects to extend the long-distance lines all over Iowa in the spring. On the whole the exchanges are increasing right along. In Keokuk, for instance, the subscribers number about 450 at present, while the Bell company has only about 175.

Single-phase, Alternating-current Motors in St. Louis.

During the last few years the introduction of multi-phase electrical systems of power distribution has made such progress that there are many central-station men who do not appreciate the extent to which the single-phase, non-synchronous, alternating motor has won its way into popular favor. In 1896 the Wagner Electrical Manufacturing company of

the result that there are at present installed several hundred of these single-phase motors in all sections of the world. It would be impossible in a single article to enumerate all the uses and special applications of this apparatus, but it will be interesting to note the adoption of the Wagner company's type by power users in St. Louis alone.

There are now in service in the city of St. Louis about 160 of the Wagner company's single-phase motors, ranging from one to 20 horse power capacity

of the current supplied is now 60 cycles per second. The power consumption is recorded upon recording wattmeters, there being quite a number of types of meters in use.

The Wagner company's motors for installation in St. Louis are so wound that they may be connected for either a pressure of 208 or 104 volts, depending on the requirements of the immediate installation. They operate with equal satisfaction and efficiency on either voltage, but it is obviously

2. Motor Driving Type-setting Machine.

3. Twenty-horse Unit Driving Section of Press Room.

SINGLE-PHASE, ALTERNATING-CURRENT MOTORS IN ST. LOUIS.

St. Louis, a pioneer in this field, began commercially to introduce its non-synchronous type of single-phase, alternating-current motor, and it has since steadily progressed in the manufacture of this type of machine, adding such improvements as experience suggested.

The first single-phase motors of this type built by the Wagner company were installed in its fac-

each. These motors are all fed from the alternating-current circuits of the St. Louis central stations. In the underground district, where there is a low-tension, three-wire network, the motors take their current, in the greater number of instances, from the 208-volt outside wires of the three-wire system, no transformer being necessary for the motor installation. Where the three-wire system is not carried

of advantage to operate these machines from 208 volts, if possible, especially where the motor is installed at considerable distance from the entrance point of the current-supply mains to effect the greatest economy in the cost of wiring. It may be said incidentally, however, that there is nothing in the construction of the motor to prevent its operation from any other pressure of current supply,

SINGLE-PHASE, ALTERNATING-CURRENT MOTORS IN ST. LOUIS.

tory at St. Louis in order that they might be subjected to a thorough and practical test before any extensive effort was made to place the motor upon the market. A number of these first motors are still running with heavy loads in the Wagner company's shops, and to succeed, but the original design proved that it has not been found necessary to make any alterations in the original motors. A little over a year ago this company began to push its alternating-current, single-phase machine throughout the United States and foreign countries, with

into the building, but a two-wire branch only, the motors are operated on 104 volts direct, without transformers. In the outlying districts, where the current distribution is at a pressure of 1,000 or 2,000 volts, depending upon the distance from the central station, the motors are supplied from the secondaries of step-down transformers. Where incandescent lights are not used, a special transformer for the motor is installed; but where lights are required, the motor is connected to the lighting mains on the secondary side of the transformer. The frequency

and it is the practice of the Wagner company to wind the motors for any voltage specified by customers up to 500.

The advent of the successful single-phase motor has been a great boon to the small power users in the city of St. Louis, as the alternating-current mains have covered the entire city practically, and the direct-current mains were only available in very limited portions of the city. Since the introduction of these motors, therefore, small factories, regardless of location, have been able to secure power

service from the central stations, and the result has been that a great many power users have been added to the list of customers of central stations, thus providing the central stations a very rapidly increasing day load, a feature of central-station business to which a great deal of attention is at this time being paid all over the country.

These motors are being used for almost every conceivable kind of service, from the operation of the entire mechanical department of a daily newspaper to the driving of general machinery, candy factories, pressure blowers, etc. To give the reader a better idea of the great variety of uses to which this type

SINGLE-PHASE, ALTERNATING-CURRENT MOTORS IN ST. LOUIS.—16,000 ALTERNATIONS.

of motor is put, a representative of the Western Electrician recently secured a series of photographs, which are presented in the accompanying composite cuts. In one of these is shown a seven horse power motor, supplying the power used in a shirt factory. As will be seen, the motor is belted direct to a system of countershafting, from which the factory machines are operated. The load is a changing one, varying from about 2½ to 7½ horse power, the motor fully taking care of all fluctuations between these limits. Another view illustrates a motor installed in a macaroni factory. This is one of the smallest motors built by the Wagner company, being rated at two horse power. It carries a load of about 2¼ horse power. Most satisfactory results are secured in what is considered a very careful process of manufacture. Probably the most exacting work which a power motor is called upon to perform is that of operating high-speed printing presses. The most complete and successful installation of Wagner company's motors for this character of work is that in the printing office of the Westliche Post, one of the daily papers of St. Louis. In this plant there are seven motors, ranging in capacity from two to 15 horse power each. Prior to the installation of the Wagner company's motors the plant was operated by steam. Through the introduction of the alter-

of the current supply, and an almost absolutely constant rate of speed has been secured. Views of motors operating portions of the Westliche Post plant are shown. Other work done by these alternating-current motors in the printing offices is the operation of linotype machines, elevator, pneumatic tube message delivery system, etc. The total installation in this office is about 60 horse power. The plant has been in successful operation for about nine months. In the view showing a motor operating a machine shop, the motor is used to drive all of the machinery and carries a heavy friction load in the shape of a large system of countershafting. The motor operates continuously for a period of 10 hours daily, with a practically constant load. In another view is shown a motor operating a portion of the Wagner company's factory. Here the friction load thrown upon the motor in starting is probably as severe as could be found in any character of service, and it was to test the motor under this condition that it was installed in this department of the factory. In addition to the friction load of the complicated shafting system, there is also a heavy fly-wheel on the main shaft, which assists in carrying over sudden fluctuations in load, which adds much to the severity of the starting conditions. The load on the motor is about 6¼ horse power continuously, the motor being rated for five horse power. The mechanical operations performed in this department are such as to throw sudden and very severe loads upon the motor. An interesting application is a 20-horse power motor, driving a 72-inch Sturtevant blower. This class of work opens a great field for this type of motor. It is also a character of work which the motor will be called upon to perform in operating pumps. The starting load comes on gradually, increasing to the full operating load as the combination approaches full speed. No trouble whatever is experienced in starting with the full blower opening.

Without going further into the details of the individual installations, it will be of interest to furnish a general description of the Wagner company's motor:

In general appearance these motors correspond very closely to many of the standard types of multipolar direct-current machines on the market. The motor is built on neat lines and with a view to mechanical as well as electrical perfection. The workmanship is of the highest grade, and durability as well as efficiency has been attained. The motors differ radically, however, from motors of the direct-current type in their internal construction. As is the case in all alternating-current motors, the fields are built up on sheet-iron plates circular in form, with slots punched on the inner periphery. These plates are carefully annealed and japanned to cut down internal losses, which would otherwise arise from the generation of eddy currents in them. The windings of the field are threaded into the slots and constitute so-called pancake-shaped coils. The num-

object of this clear. When the line is connected into the two outside binding posts, as indicated, the entire field winding of the motor is used, and the connections are such as to use the motor at its rated capacity both for starting torque and load. If for any reason an abnormally large starting torque is required, or if it is desired to operate the motor so that it will safely carry very suddenly applied excessive loads, the feed-wire connections are changed as to make use of the middle and left-hand binding posts. When so connected the motor will operate with about 25 per cent. of additional starting torque, and an additional maximum load capacity of about 25 per cent. This third terminal is so

SINGLE-PHASE, ALTERNATING-CURRENT MOTORS IN ST. LOUIS.—7,200 ALTERNATIONS.

arranged as to cut out a few turns of the field winding of each of the field coils, and is termed by the Wagner company the "loop" connection. The cast-iron portion of the frame is merely a shell into which the built-up field is slipped from the bottom, being held in position by a cast-iron follower. The armature of the motor, as in the case of the fields, is built up on sheet-iron plates mounted upon a spider, teeth being punched into the outer periphery. The form of winding upon this armature exactly corresponds to that of the ordinary direct-current motor, the coils being placed on the core progressively and connected to the commutator in exactly the same way as would be the winding of a direct-current motor armature. The commutator of these armatures is of the radial type, and is annular in form, the armature winding connections being made at the outer end of the segments. The hole in the center of the commutator is made large enough to admit of the entrance into it of a short-circuiting device, which moves parallel to the shaft and is operated by a sliding sleeve on the shaft. This device, furthermore, is so designed and constructed as to be operated by a pair of governor weights contained in the armature core, the idea being that these governor weights will, when the centrifugal force is sufficient, throw out, and

General View of Motor.

Diagram of Connections.

SINGLE-PHASE, ALTERNATING-CURRENT MOTORS IN ST. LOUIS.

nating-current motors the Westliche Post has been able to effect a saving of at least 33 1-3 per cent. in the cost of operation of its mechanical department. Further than this, the publishers have been able to make the plant a model of neatness and cleanliness by doing away with all the dirt, moisture, etc., incident to the operation of a steam plant, and it is stated that the results secured upon the printing presses are more satisfactory than they were able to derive from the steam-driven plant. It is a very essential condition in the successful operation large, automatic, high-speed presses, that there should be a flow of ink to the rollers bearing a certain ratio to the speed of operation. With alternating-current motors, the speed variation is largely dependent upon the frequency rather than the voltage

ber of poles in the motor depends upon the speed desired and the frequency of the current supply, the speed very closely approximating the number of alternations per minute divided by the number of poles. This form of winding of the field coils is such as to give a maximum strength to the middle tooth of the pole, the strength of the pole gradually diminishing in either direction from this central tooth. All of the windings of the poles are connected in series or in parallel, as conditions of terminal voltage shall demand. The Wagner company makes it a practice to bring out three ends from this field winding to a terminal board located upon the top of the motor frame. The accompanying diagram, which illustrates the method of connection of the motor into circuit, will make the

push the short-circuiting device into the central hole of the commutator. The governor weights fit close to the shaft and move radially. The force resisting the action of these weights is a spiral spring located between the commutator and the front bearings. When the centrifugal force is such as to overcome the resistance of this spring, the governor weights fall outward from the shaft and move the sleeve, which guides the short-circuiting ring forward on the shaft. The other mechanical details of the motor are much the same as in the Wagner standard direct-current motors. The bearings are long and substantial, being of phosphor-bronze and with self-oiling rings. A noticeable feature of the alternating-current motors built by the Wagner company is the uniformly heavy shaft to be found in all

sizes. As will be seen by referring to the general view of the motor, there is a set of carbon brushes running on the commutator. The holders of these brushes are so mounted as to be also controlled by the governor weights, being fixed to a frame that is so mounted upon the front pillow block as to permit of the motion parallel to the axis of the shaft, and of sufficient magnitude to bring the brushes entirely clear from the surface of the commutator when the governor weights are thrown out. In other words, at the instant when the short-circuiting ring slips into the commutator the brushes are thrown off the commutator surface. The brush holders are also so carried that they may be revolved on the commutator shaft their position upon the commutator surface being thus regulated. In the mechanical construction of the motor the clearance between the armature and field is made as small as practicable in order to hold down the reluctance of the magnetic circuit to the smallest possible amount. In its general appearance this type of motor is really a transformer, in which the field winding corresponds to the primary winding of the transformer and the armature winding to the secondary of the transformer. The alternating current, which is sent from the supply circuit into the field winding, generates by induction alternating currents in the armature windings. By means of the brushes running upon the commutator the direction of flow of these armature currents is so controlled as to create a magnetic polarity in the armature of sufficient angular displacement from the polarity of the field to produce the necessary revolving action. At the instant of starting the carbon brushes may be closed by a short-circuiting connection between them, or may be closed through an external resistance. When the current is first turned into the field winding the motor starts off with a very large starting torque and very quickly runs up to the operating speed. Just before attaining the operating speed the governor weights perform their function of pushing in the short-circuiting device and throwing off the brushes. When this action takes place, the commutator is thrown entirely out of service, save that of a mere short-circuiting medium for the armature winding. The direction of the rotation of the armature can be completely controlled by the position of the carbon brushes upon the commutator surface. The starting torque and starting current may also be controlled through wide limits by adjustment of the position of the carbon brushes. The torque characteristic of the motor is practically the same as that of a series direct-current motor, the maximum torque being at the first instant of starting and decreasing as the motor runs up to speed. On attaining the operating speed the motor runs with remarkably uniform speed, varying in extreme cases not more than eight per cent. between full load and no load. The conditions at full speed are such as to permit of a very high armature efficiency, there being no brush friction and very little armature resistance. It is found in operation that the wear upon the commutators of these motors is practically negligible, and one of the most satisfactory features in connection with the operation of the motor has been the small amount of attention which they have required.

The operating curves of these motors, shown herewith, are the results secured upon the five horse power automatic size, in one case operating on 60 cycles, and in the other operating on a 16,000 alternation circuit. It may be stated that these curves do not show the maximum load capacity of the motors, a 60-cycle motor being capable of carrying for short intervals 50 per cent. overload, and a 133-cycle motor being capable of carrying, for short intervals, about 33 1/3 per cent. overload. It is interesting to note the excellent efficiency secured, and also the remarkable power factor.

As indicating further the operating results that are being secured with these motors, the following table of sizes, approximate full-load current, full-load efficiency and transformer capacity is presented:

MOTORS FOR 60 CYCLES.							
Horse Power	Approximate Full Load Current in Amps	Full Load Efficiency	Watts Idle	Speed.	Approximate Shipping Weight.	Transformer Capacity Required.	
1	21	75	150	1,750	275	1 1/2	K.W.
2	44	77	240	1,750	490	3	K.W.
3	62	79	290	1,750	550	3	K.W.
4	77	80	350	1,750	660	4	K.W.
5	91	81	400	1,750	750	5	K.W.
6	104	82	450	1,750	850	6	K.W.
7	117	83	500	1,750	950	8	K.W.
8	130	84	550	1,750	1,050	10	K.W.
9	143	85	600	1,750	1,150	12	K.W.

MOTORS FOR 133 CYCLES.							
Horse Power	Approximate Full Load Current in Amps	Full Load Efficiency	Watts Idle	Speed.	Approximate Shipping Weight.	Transformer Capacity Required.	
1	15	76	110	1,950	275	1	K.W.
2	30	78	200	1,950	490	2	K.W.
3	45	80	290	1,950	660	3	K.W.
4	60	82	380	1,950	850	4	K.W.
5	75	84	470	1,950	1,050	6	K.W.
6	90	86	560	1,950	1,250	8	K.W.
7	105	88	650	1,950	1,450	10	K.W.
8	120	90	740	1,950	1,650	12	K.W.

The Wagner company has received a large number of complimentary letters relative to the utility of their single-phase motor. A purchaser as far away as Melbourne, Australia, sends

in as gratifying a communication relative to a 15-horse power motor as could be desired. It seems that this motor was desired to operate upon three different frequencies of current, ranging between 40 and 70 cycles. Mr. F. W. Edgar, the engineer controlling the installation, in a voluntary communication to the Wagner company, reports that there has not been the slightest hitch from the first time the current was put into the motor to the present, and that the motor starts off with full load in about 1.3-5 seconds. "In all previous motors," continues Mr. Edgar, "supplied from America, England and the continent, there has always been the difficulty of the starting current, which your engineers seem to have overcome. We are therefore able to do away with auxiliary starting gear, which makes a very great saving in the cost of installation."

Double Drum Hoist and Electric Motor.

The electric hoist illustrated shows one of the recent applications of a General Electric induction motor to a double independent-drum Lidgerwood mine hoist. It is compact in form, and the levers controlling the clutches and brakes and the handle of the rheostat are placed in the position most convenient for control by the operator standing on a platform above the floor and having a clear view over the top of the hoist. Each friction drum is driven through a single-reduction gearing by a 100-volt, 12-pole induction motor of 30 horse power capacity, running at 600 revolutions a minute. Each drum is independent and is 42 inches in diameter by 40 inches face. Together they hold about 420 feet of seven-eighths-inch rope. The maximum hoisting speed is 300 feet a minute, and the weight hoisted, i. e., load, car and cage, 2,100 pounds. The depth from which the load is to be hoisted is 400 feet from the surface.

Emerson Organ-pumping Outfit.

The Emerson Electric Manufacturing company of St. Louis has brought out the electric organ-blowing attachment illustrated by the accompanying cut. The device is designed to drive the pumping mechanism of a pipe organ and to automatically regulate the supply of air.

The system is designed primarily for operation

EMERSON ORGAN-PUMPING OUTFIT.

on alternating currents, but its simplicity and compactness and the ease with which it can be installed recommend its use with any kind of electric current.

The outfit shown consists of an Emerson single-phase alternating-current motor of one horse power, arranged with triple-worm gear to directly transform the revolutions of the motor (1,800 per minute in this case) into the reciprocal crank motion required for an organ pump (45 strokes per minute in this case).

It eliminates the necessity of all pulleys, belts, countershafts, etc., and is furnished to meet the exact requirements, as to length of stroke and strokes per minute which may be required to meet the necessities of various organs.

In this system the motor is started and left running (at a constant speed) while the organ is in use, and would be left running during an entire service or concert. The only disadvantage to this is the amount of current used while the pump is not in operation, but as this amounts to only 1.3 cents an hour on a one horse power motor with a rate of 10 cents a thousand watts, it is of no great consequence, and, in fact, is largely compensated for by the absence of extra current in starting several times. No regulating rheostats are needed, and there is no sparking of contacts on stoppage and starting.

The operation of this outfit is as follows. The motor is started by the handle marked "motor-starting handle," and as the bellows of the organ is presumably empty, the friction clutch shown at the other end of the motor shaft is in contact with worm disk, and the motor begins pumping air into the air reservoir until filled. The natural rise of the top of the air reservoir, to which the chain marked "connection to bellows" is attached through pulleys or crank-bells, will release the friction disk when filled to any desired point, and the pump mechanism will stop, leaving the motor running free and thus taking almost no current. As soon as the air reservoir begins to empty, this will allow the clutch to operate again, and supply as much or as little air as may be necessary to keep the reservoir full or well supplied with air.

The action of the friction disks is positive and noiseless. The worm is of hardened steel. The worm-wheel is run in a bath of oil, and is therefore

perfectly lubricated at all times, and the entire outfit is manufactured in a workmanlike manner to stand hard and continuous service with little or no attention. The action of the clutch may be controlled so as to pump fast or slow, and to change speed as the air reservoir fills, by merely making a spring connection between air reservoir and motor instead of solid connection, but the manufacturer advises a solid connection whenever practicable, as there is then very little or no wear on the friction clutch.

Yerkes Street Railway Properties.

The annual meetings of the North and West Chicago Street Railroad companies and the Lake Street Elevated Railroad company were held at Chicago on January 10th. Favorable reports were received from all of these properties, the old directors and officers were elected for the ensuing year, and general satisfaction was expressed with the policy adopted by the management.

The report of the North Chicago Street Railroad company contained the following information:

The receipts from all sources were.....	\$3,015,323.01
Against (for the previous year).....	2,911,552.41
Showing an increase of.....	103,770.60
The operating expenses amounted to.....	1,390,680.93
Against (for the previous year).....	1,319,926.63
Leaving a balance of.....	1,624,642.08
Against (for the previous year).....	1,591,625.78
Or an increase in earnings of.....	33,016.30
After paying fixed charges, including railway rental, taxes, insurance and interest, amounting to.....	543,665.24
There is a balance to the credit of net earnings of.....	1,080,976.84
Being an increase over last year of.....	125,813.79
Out of which there were dividends paid amounting to.....	879,957.00
Leaving a balance to credit of income account of.....	210,019.84

The total earnings on the capital stock amounted to 13.65 per cent. against 14.47 per cent. for the previous year. This difference in percentage of earnings is owing to the increase of capital stock in the early part of last year, the money realized from that increase going to pay former indebtedness. The number of passengers carried, including transfers, was 78,394,660, which shows an average of 3.7 cents a passenger received for each passenger carried.

The West Chicago Street Railroad company reported that the number of persons carried on transfers was 31,315,814, out of a total of 111,916,319 passengers carried. The company has over 200 trans-

DOUBLE DRUM HOIST AND ELECTRIC MOTOR.

fer points. A condensed report of the treasurer follows:

	1898.	1897.	Increase, 1898.
Gross receipts.....	\$4,031,903.93	\$3,899,919.19	\$131,985.74
Operating expenses (50.0 per cent).....	2,017,946.60	1,929,664.48	88,282.12
Profit from operating.....	\$2,013,957.33	\$1,970,254.71	\$43,702.62
Fixed charges, including interest, taxes and rental of leased roads.....	1,108,000.82	1,136,184.79	61,816.03
Applicable to dividends.....	815,956.51	831,058.02	*18,112.41
Dividends paid.....	791,340.00	791,340.00
To income account.....	\$ 24,616.51	\$ 42,728.92	*18,112.41
Percentage on capital stock.....	6.18	6.32	*0.14
Passengers carried in 1898, horse.....	239,249
Passengers carried, electric.....	28,748,138
Passengers carried, cable.....	51,643,118
Total.....	80,600,505
Passengers carried on transfers.....	31,315,814
Grand total.....	111,916,319
*Decrease.			

The Lake Street Elevated Railroad company's business is summarized as follows:

	1898.	1897.	Increase.
Gross business from passengers.....	\$618,326.59	\$561,370.93	\$56,955.66
Advertising, etc.....	18,589.80	*3,512.76
Totals.....	\$633,403.63	\$579,960.73	\$53,442.90
Operating expenses.....	374,947.01	329,241.21	*41,772.23
Extraordinary expense.....	31,880.17
Net earnings.....	\$258,456.62	\$218,956.32	\$39,500.30
Fixed charges, including taxes, interest on floating debt and loop rental.....	335,147.96	291,798.68	133,449.28
Deficit.....	\$ 76,691.34	\$ 72,842.36	*\$4,151.02
*Decrease.			
Average passengers per day, 1897.....	30,766
Average passengers per day, 1898.....	33,948

The operating expense per cent. of earnings was 51.27 per cent. for 1898 as against 56.75 per cent. for 1897. Having regard to which the following may be of interest:

Loop rental.....	1897.	1898.
Maintenance of track.....	\$15,707.20	\$61,953.76
Maintenance of cars and motors.....	7,104.37	9,534.76
Totals.....	26,552.14	72,511.51
Totals.....	\$19,263.71	\$99,000.05

Mr. Yerkes announced the prospective consolidation of the outlying electric roads on the North

and West sides, which are now operated as feeders in connection with the larger systems. The new corporation will be known as the Chicago Consolidated Railway company.

There are nine roads, which may be grouped as follows: The North Chicago Electric, Chicago North Shore, North Side Electric and Evanston electric lines, extending along the north shore from the North Chicago cable terminus to Evanston; the Chicago Electric Traction and Chicago and Jefferson Urban Transit lines, reaching the north-west territory of the city; the Cicero and Proviso, Suburban and Ogden street-railway lines, the former two extending west from the Lake street elevated and West Chicago termini to Austin, Oak Park and Maywood, the latter extending southwest to Clyde, Hawthorne and Lyons.

Mr. Yerkes said that the consolidation would make possible economies in management and operation, which would make the lines more profitable than they have been, and would enable passengers to go from Evanston to Oak Park and other points without passing through the center of the city. No statement was made as to the amount of capital for a central company, but the present capitalization of the nine companies is as follows:

	Stock.	Bonds.	Total.
North Chicago Electric.....	\$2,000,000	\$29,000	\$2,829,000
Chicago North Shore.....	650,000	675,000	1,325,000
North Side Electric.....	1,500,000	155,000	1,655,000
Evanston Electric.....	1,000,000	130,000	1,130,000
Chicago Electric Transit.....	1,500,000	1,097,000	2,597,000
Chicago and Jefferson Urban.....	2,000,000	200,000	2,200,000
Cicero and Proviso.....	2,500,000	1,893,000	4,393,000
Ogden Street Railway.....	1,500,000	576,000	2,076,000
Suburban Railroad.....	1,250,000	1,250,000	2,500,000
Total.....	\$13,900,000	\$6,811,000	\$20,711,000

Of these obligations the following bonds are guaranteed by the North Chicago Street Railroad company: North Chicago Electric, \$649,000; Chicago Electric Transit, \$255,000; North Side Electric, \$155,000. These roads earn the interest, so there is no charge upon the North Chicago road. The West Chicago Street Railroad company guarantees the following amounts: Cicero and Proviso, \$1,289,000; Ogden, \$570,000; Chicago and Jefferson, \$206,000; Chicago Electric Transit, \$842,000; North Chicago Electric, \$180,000. The interest on these bonds also is earned by the respective lines.

CORRESPONDENCE.

New York Notes.

New York, January 9.—The connection of the Western Union Telegraph company with counterfeit money or "green-goods" swindlers, in so far as the company forwards messages from the dupes to the sharpers, has long been a source of complaint by the police. The Hudson County (New Jersey) grand jury took action in the matter, and on Friday reported indictments against the Western Union company and John B. Bertholf, the Jersey City manager, for aiding and abetting the green-goods men. Immediately afterward a capias was issued for the arrest of Manager Bertholf. He was arrested at the company's office, and surrendered to the sheriff. Bail had been fixed at \$2,500, and the required bond being furnished, Mr. Bertholf was released, pending arraignment. The charge is that the company, knowing the messages were addressed to swindlers, forwarded them from Jersey City addresses given as a "blind," and refused to give the police the addresses to which the dispatches were forwarded, or at any rate delayed in so doing. The Western Union company was also indicted by the grand jury of Camden County (New Jersey) on January 6th for violating the 59th section of the Crimes Act, which makes it a misdemeanor in New Jersey for a telegraph, telephone or express company to transmit any communication by cipher or otherwise relating to the drawings of lotteries, policy numbers or other forms of gambling prohibited by the statutes of the state. The maximum penalty is \$2,000 fine and six years' imprisonment.

Manhattan and General Electric made surprising advances last week in the stock market. It was reported that the Metropolitan Street Railway company had made an agreement for control of the Manhattan on the basis of an exchange of stock, but this rumor was denied. Another report was that the Manhattan had awarded to the General Electric company a contract for equipping its system with electricity; and this story, of which neither trustworthy denial nor affirmation could be obtained, seems to have been the main factor in causing the stocks of both companies to go up.

A new labor union has been formed under the title of the Electric Cable Splicers' Union of New York city, and it is said to have been incorporated under the laws of this state "for mutual benefit and social purposes."

Work on the downtown section of the West Side conduit electric system of the Metropolitan Street Railway company will close for the season on January 18th. At that time the Eighth avenue cars, now running to Barclay street, will run as far as Rector street, with a side line to Broadway and Canal street. Next spring the line will be extended to Battery place. The new cars, run by compressed air, will be started on the Twenty-eighth and Twenty-ninth street crosstown lines as soon as the machinery and plant at Thirteenth avenue and Thirty-fourth street are ready. This will be about April 1st.

M. S.

PERSONAL.

James H. Glasier, chief dispatcher of the Delaware division of the Erie railroad, died at his home in Port Jervis, on January 8th, of pneumonia, resulting from grip. He was born at Oriskany Falls, N. Y., about 65 years ago, and was telegraph operator on the Erie railroad at Cochecon when the Civil War broke out. He entered the military service, and was an operator in the Army of the Potomac under General McClellan. He also had the distinction of being General Grant's operator, and was often put by him on the fring line.

L. H. Rogers has retired from the Fort Wayne Lamp Works of Cleveland, of which he was manager, to accept the treasurership of the Oklahoma Cement and Plaster company of Okarche, O. T. The company was organized for the purpose of developing a section of Oklahoma territory that contains an earth that is in reality a cement, fit for use with but little preparation. This property was discovered some years ago, and since it first became known Mr. Rogers and a party of capitalists have been quietly at work organizing to exploit this novel product. The company feels that it has secured all of the so-called cement ground that is located in that immediate vicinity. Mr. Rogers' experience as one of the oldest and best trained men in the electrical business will no doubt prove of great value in the development of this property.

W. R. Mason has been appointed manager of the St. Louis office of the Siemens & Halske Electric company of America. Mr. Mason has had valuable experience as manager and salesman, especially in the street-railway field, and his acquaintance extends to managers and operators of street-railway properties and central stations and lighting plants throughout the country. Mr. Mason represented the Walker company at St. Louis until that corporation was absorbed by the Westinghouse interests, and he succeeded in increasing the business of the Walker company in that district so as to attract the attention of the management and win special commendation. Mr. Mason's friends throughout the country will be pleased to learn of his new connection. His energy, perseverance and intelligent application, together with his wide acquaintance, should prove valuable in his new position.

The Engineer Corps of the navy, through Engineer-in-chief Melville, presented a heavy silver loving-cup to Chief Engineer Walter McFarland, who has resigned from the navy to become assistant superintendent of the Westinghouse companies. The presentation took place at the apartments of Commodore Melville. All the naval engineers now on duty at Washington, as well as a number of friends, were present. The cup was inscribed with Mr. McFarland's name and the following sentiment, proposed by Commodore Melville: "Drink deep the draught of love, the love of your fellow-men." "The retirement of Chief Engineer McFarland from the navy," says the Washington correspondent of the New York Tribune, "furnishes a striking instance of the government's parsimony in the remuneration of men who occupy places of great responsibility. Mr. McFarland, while on duty as Commodore Melville's assistant, in the Bureau of Steam Engineering, disbursed about \$20,000,000 annually. While at sea he had sole control of the engines of ships that cost \$5,000,000 each. His pay was \$2,400 a year, while the Westinghouse companies start him with a salary of \$8,000."

A cable dispatch from London, January 5th, announces the death in that city of Mrs. Clara Jessup Moore, widow of Bloomfield H. Moore of Philadelphia, aged 75 years. It is rather a singular coincidence that simultaneously with the announcement of Mrs. Moore's death the statement is published that evidence has been unearthed at Philadelphia proving conclusively the fraudulent character of the work and claims of the late "Inventor" Keely, in whom Mrs. Moore was greatly interested. It is asserted by Mrs. Moore's friends that her death was hastened by the fact that she became convinced that her confidence in Keely's representations had been misplaced. Mrs. Moore's career, apart from her social activities, was devoted largely to deeds of charity and to literature as a pastime. She wrote stories and poems under the pseudonym of Mrs. Clara Moreton. Her favorite theme was the independence of woman. Mrs. Moore became interested in the labors of Keely and became a believer in his claim to have discovered an unknown etheric force. Through her munificence Keely was supported in the progress of his alleged investigation for several years. She wrote a paper in 1885 on "Ether, the True Protoplasm." Three years ago Mrs. Moore entered into an agreement to supply Keely with more funds, on condition that Professor Lascelles-Scott of London should be permitted to examine his laboratory work and become the custodian of his secret. For a time Keely seems to have deceived Professor Scott, but after a short stay in Philadelphia he departed and Mrs. Moore publicly announced that her agreement with Keely was abrogated. Mrs. Moore was married in 1842. Her husband died in 1878, leaving an estate valued at nearly \$6,000,000, of which Mrs. Moore and her only son, Clarence B. Moore, who now resides in Philadelphia, were appointed executors. Besides her son, Mrs. Moore had two daughters, the elder of whom, Ella Carlton, married Count Carl Gustav von Rosen of Sweden, and the younger, Mary, mar-

ried the Baron Carl von Bildt, a son of a former secretary of the Swedish legation at Washington.

TRADE NEWS.

The Emerson Electric Manufacturing company of St. Louis, Mo., has recently perfected a device by means of which church organs can be operated with alternating-current motors, and requests correspondence from all persons interested in this class of apparatus. This device has been perfected in response to inquiries covering a number of years and is now placed on the market by the Emerson company, as it believes it is a thoroughly practicable and efficient device. The company will be pleased to send descriptive circular and prices to the electrical fraternity upon request. In corresponding about the organ-blowing outfit ask for circular No. 2007.

Mr. H. W. Wiswell, electrical engineer, formerly with the General Electric company, and who has been for the last year associated with the New York and Ohio company as manager of the transformer department, and who is stated to have designed the model '98 transformer of that company, makes the announcement that he has resigned his position with that company, his contract having expired, and has associated himself in a similar capacity with the Warren Electric and Specialty company, Warren, O. This company will place upon the market the new Peerless transformers, which, it is claimed, will be a distinct improvement upon anything now on the market, and expects to be able to make deliveries about April 1st.

The Electric Appliance company has prepared for distribution to the telephone trade a sample card of the celebrated Parante wires particularly adapted to telephone uses. The card shows samples of No. 19 plain and braided single-conductor Parante of a high insulation, suitable for telephone work. It also shows samples of No. 19 duplex twisted Parante wire in three styles, the first being plain with one conductor of red rubber and the other with black rubber insulation; another sample with black and red rubber insulation, but braided over with a regular saturated weatherproof braid. There is still another sample of the No. 19 two-conductor twisted having red and black rubber insulation, but having glazed braid instead of the saturated braid. These sample cards can be had for the asking.

The Warren Electric Manufacturing company of Sandusky, O., has appointed J. Holt Gates & Co. general agents for its apparatus in the territory surrounding Chicago. The company has recently placed, through this agency, a 15,000-light alternating-current plant for the new power and light plant of Armour & Co., at the Union Stockyards, Chicago. This plant will consist of one machine of 7,000 (16 candle power) lights capacity, at 1,000 volts and 7,200 alternations, and two 3,600 lighters. These alternators are of the inductor type, and will be operated by rope drive from Corliss engines of 2,000 horse power and 1,100 horse power each, to which will also be attached Walker direct-connected power generators. It is stated that the Warren alternators were selected on account of their close regulation, high efficiency, low temperature and ability to stand "grief." The Warren Electric Manufacturing company is now prepared in its new factory to build 10,000-light machines, both single and two-phase. It has over 60 machines on order at the present time.

BUSINESS.

The Ball Engine company, Erie, Pa., will furnish the engine to be used in the electric-light plant being erected by the Seckner Contracting company at Churubusco, Ind. It has also sold a 165 horse power engine to the Flint and Pere Marquette Railway company, to be used for electrical purposes.

As an indication of the appreciation with which the trade regards the Twentieth Century catalogue, issued by the Central Electric company, which is daily in receipt of testimonials, two extracts are given:

We hereby acknowledge the receipt of your grand general catalogue and discount sheet. Please accept our thanks for same, and when in need of any material will send in our order.

We beg to acknowledge receipt of the copy of your new catalogue, and wish to compliment you on this very elegant publication. It is a credit to your firm, and we hope will be the means of largely increasing your business. It certainly will prove of great value to all purchasers of electrical supplies, as it seems to be nearer perfect than anything in this line heretofore published.

Charles H. Besly & Co., 10 and 12 North Canal street, Chicago, manufacturers and dealers in machinists' hardware, report a very successful business for the year 1898. A decided improvement was noted in the demand for the specialties of their own manufacture, viz., taps of every description, Badger and Gardner die stock, Helmet sheet bronze and wire ton springs, parallel clamps, Perfection and Bonanza oil cups, Gardner grinders, Helmet solid oil and Mannocitin, a rust preventive. Among foreign orders for this material may be noted shipments to England, Russia, France and India, Brazil, Argentina, Uruguay, Chile, Peru and Bolivia. There were large shipments to the jobbers and manufacturers in this country. The firm's factory at Beloit, Wis., is being run full time, and Besly & Co. regard the outlook for the future as very bright.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued January 3, 1899.

616,879. Electromechanical Gong. Clarence E. Beach, Binghamton, N. Y. Application filed May 14, 1896.

A magnetically controlled releasing device, a revolvable part provided with projections capable of engaging with a portion of the releasing device, a gear moving with the revolvable part, a pinion engaging with the gear and with an internal gear, and a striking mechanism operated by the movement of the pinion around the axis of the gear.

616,891. Electrolytic Apparatus for Treating Metals and Ores. George D. Burton, Boston, Mass. Application filed July 19, 1897.

A tank is provided for containing an electrolytic solution, an anode and a cathode disposed therein and connected to a suitable source of electricity, a hopper disposed over the tank, a material feeder for feeding the material to be treated into the hopper, and a perforated electrolyte feeder for feeding an electrolyte into the hopper in conjunction with the material, whereby the infowing material is acted upon by the infowing electrolyte and thoroughly distributed throughout the tank, thereby preventing clogging of the material and facilitating thorough action of the electrolyte thereon.

616,906. Electric Furnace. James A. Deuther, Boston, Mass. Application filed June 2, 1897.

In an electric arc furnace there are two opposite electrodes, a feed mechanism, a regulator operating independently of the feed mechanism and located adjacent to the anode for receiving the material to be treated from the feed mechanism and for supplying the same to the arc, and means for operating the regulator.

616,953. Telephone Receiver. James J. Mulconroy, Philadelphia, Pa. Application filed May 7, 1898.

A cushion for a telephone receiver is composed of yielding material, and constructed as an annular body of approximately semi-cylindrical transverse section, the outer edge of which is adapted to grasp the rim of a receiver, the inner edge of which is adapted to rest freely or unsecured against the end face of a receiver, forming an air cushion between its inner and outer edges.

616,956. Electromagnetic Brake. Frank C. Newell, Chicago, Ill. Application filed February 5, 1898.

Two electric motors are employed for driving a car, and an electric circuit, independent of the motor circuit, connects the field of each motor in series with the armature of the other. The independent circuit is normally open and has terminals, circuit closers operative at will to engage the terminals to close the independent circuit and thereby convert the motors into generators operated by the inertia of the car in motion, and an electromagnet track-brake device in the independent circuit supported with its poles extending to engage a track rail forming its armature.

NO. 617,003.

616,978. Storage Battery. Friedrich W. Schneider, Triberg, Germany. Application filed December 3, 1896.

A supporting frame consists of a series of insulating troughs arranged one above the other and having perforated side walls; trough-shaped current conductors are inserted in the trough and have projections on their inner surface, and active material is filled in the current conductors.

616,979. Means for Cooling Dynamo-electric Machines. Georg W. von Siemens and August W. H. Roth, Berlin, Germany. Application filed October 22, 1898.

Claim is made for the combination with the casings forming approximately to the exterior surfaces of the enclosed parts but separated therefrom, whereby lateral air passages are provided in the machine, of means for effecting the rapid flow of air currents laterally through the air passages, whereby the surfaces of the machine are cooled.

617,002. Means for Producing Battery Electrodes. Theodore A. Willard, Norwalk, Ohio. Application May 4, 1896.

A cutter for producing battery electrodes from metallic plates has a cutting edge at an inclination to a vertical plane and gradually sloping from its highest to its lowest cutting point, and having a flat-bottom bearing surface inclined laterally to ride on the plate, and an inclined top surface at a different inclination from the bottom surface to turn the leaf.

617,003. Tubular Electrode for Storage Batteries. Theodore A. Willard, Cleveland, Ohio. Application filed January 26, 1897.

An electrode circular in cross-section, hollow through the center and having a series of annular ledges from top to bottom, uniform in cross-section from edge to base and having uniform spaces between them, and curved outward and upward from their base, is described.

617,004. Storage-battery Electrode. Theodore A. Willard, Cleveland, Ohio. Application filed January 26, 1897.

An electrode for batteries has a succession of shelves, one above the other upon its outside and a hollow body closed across its ends to exclude liquid, and a stiffening core of a different material in the body within the ends.

617,010. Timing Apparatus for Trolley-railway Systems. Herby Garrett, Dallas, Tex. Application filed April 19, 1898.

Timing apparatus of the class described having an insulating device with electromagnetic controlling mechanism, includes a trolley circuit closer comprising a pivotal trip arm adapted to normally rest on top of the trolley wire and provided on its inner side with a longitudinal wire groove and an arched contact plate spanning the groove and the wire therein, and having a circuit wire connection with the electromagnetic controlling mechanism.

617,024. Electrolytic Reducing and Amalgamating Sluice. Joseph H. Jory, San Francisco, Cal. Application filed May 27, 1897.

A reducing and amalgamating sluice having a series of closely adjacent plates with contracted passages there-

between, electrical connections for alternately charging the plates positively and negatively respectively, and a fibrous or similar protective covering incasing the alternate positive plates, to prevent direct metallic contact of the adjacent plates.

617,067. Helix for Electrical Apparatus. John T. Williams, New York, N. Y. Application filed April 3, 1895.

One claim is for a combined electromagnet and condenser, the condenser having for one of its plates the winding of the electromagnet, for the other a second conductor interposed between the several convolutions of the winding in inductive relation thereto.

NO. 617,010.

617,009. Electromagnetic Apparatus for Actuating Mechanism. Samuel H. Hoggson, Chicago, Ill. Application filed August 4, 1897.

In an electromagnetic apparatus for actuating mechanism the combination of a ratchet wheel, a lever fulcrumed at an intermediate point of its length and carrying a weight at one end and having a pawl engaging the ratchet wheel to rotate the same on the descent of the weighted end of the lever, an electromagnet arranged below the fulcrum of the lever, the electrical circuit thereof, an armature arranged in proximity to the electromagnet, a spring for raising the armature, a pitman connected to the armature and loosely connected to the unweighted end of the lever so as to enable the lever to move independent of the pitman and vice versa, and a circuit maker and breaker actuated by the descent of the weighted arm of the lever to close the circuit.

617,114. Electric Motor. Charles R. Meston, St. Louis, Mo. Application filed July 9, 1898.

The combination is described of a fixed shaft depending from a motor frame, an armature mounted on the fixed shaft, fan blades mounted on the armature, suitable bearings for the armature, a housing for the bearing, and a switch for the motor circuit, which switch is mounted on the housing.

617,121. Apparatus for Electric-current Supply, etc. Edwin J. Preston and Arthur B. Gill, London, England. Application filed December 29, 1897.

The arrangement comprises a dynamo, two storage batteries, a charging circuit and a service circuit, and connections between the circuits and batteries, of a contact lever which is automatically moved into contact by the starting of the dynamo and out of contact by the stoppage of the dynamo, and a switch for altering the connections between the storage batteries and the charging and service circuits, which is automatically shifted by the contact lever upon the starting and stopping of the dynamo.

617,128. Electric Elevator. Alonzo B. See, Nils O. Lindstrom and Daniel A. Mason, New York, N. Y. Application filed April 26, 1898.

An electric elevator comprising hoisting machinery, a polyphase electric motor for controlling the machinery for either direction of travel, branch circuits representing each current phase extending along the elevator shaft, switches accessible to an operator controlling the branches, and a governor operated by the movement of the apparatus for reversing the phases with respect to the motor terminals.

617,139. Electric Block System for Railways. Hamilton Baluss, Jr., Wayne, Mich. Application filed December 31, 1897.

A system comprising a railway is provided with a trolley wire for supplying current thereto, a plurality of stations at which the trolley wire is bent aside and run parallel with the main line, two insulated sections of detached trolley wire occupying the gap in the main line made by turning the main wire aside, a switch at one station operated by a moving car for disconnecting the current from a detached section in advance of a car, and a switch operated by a passing car, to disconnect the current from a detached section at a station in the rear of the car.

NO. 617,024.

617,145. Telephone-exchange Switch and Signal Apparatus. William W. Dean, Boston, Mass. Application filed March 19, 1898.

A compound telephone circuit extends from one substation to another through a central station and comprises the individual exchange circuits of the substations; switchboard connections uniting their central station ends; a bridge at the central station containing a source of current, and dividing the switchboard connection into two terminal sections; an impedance coil in one of the terminal sections; a shunt circuit round the impedance coil; a condenser in the shunt circuit; and a repeating induction coil having its windings included in the other terminal section and the shunt circuit respectively, the impedance and induction coils being organized with magnetic cores and armatures to form signal-controlling relays.

617,165. System of Electrical Distribution. Samuel Kirlin, Watertown, S. D. Application filed August 18, 1898.

A system of electric distribution consisting of a primary circuit, a secondary circuit, two or more transformers common to both circuits, a device in the primary circuit, mechanically responding to current changes therein, an electromagnetic switching device automatically controlled by the responsive device, adapted to switch the transformers in and out of the primary and secondary circuits.

617,170. Combined Lightning Arrester and Fusible Cut-out. Burton L. Lawton and Ernest C. Wilcox, Meriden, Conn. Application filed August 2, 1898.

The device comprises a block or base of insulating material, a grounding terminal and pairs of line and instrument terminals mounted thereon, fusible cut-outs, each connecting a line and an instrument terminal, a copper plate mounted on the block, pairs of laminated carbon plates, one for each line terminal arranged on the copper plate, perforated mica strips spacing the carbon plates, an elastic copper strip connecting each line terminal with its corresponding pair of carbon plates and bearing upon and securing the latter in position, and a metallic binding post mounted upon the copper plate between the pairs of carbon plates, and an electrical contact with the copper plate, the binding post constituting the grounding terminal.

617,187. Means for Generating Electricity from Machinery of Locomotives. Harry F. Roach, St. Louis, Mo. Application filed October 10, 1898.

The dynamo is mounted upon the frame of a locomotive; cranks or eccentrics are mounted on the armature shaft of the dynamo, the cranks or eccentrics being arranged on the armature shaft at an angle with relation to each other, the armature is connected to the cross head of the locomotive and the cranks or eccentrics; for converting the reciprocating motion of the cross-head into rotary motion of the armature shaft.

NO. 617,192.

617,192. Electric Propulsion of Vehicles. Friedrich W. Schneider, Triberg, Germany. Application filed December 10, 1897.

The main battery, when starting, is put in circuit parallel with a small auxiliary battery constructed for quick discharge, for the purpose of supplying the additional current required at the start, essentially from the auxiliary battery, and thus avoiding a high rate of discharge from the main battery and augmenting its efficiency.

617,193. Electric Switch. Oscar H. Schuck, Philadelphia, Pa. Application filed July 2, 1898.

An alarm comprising an electric circuit, a swinging switch arm in the circuit, a contact brush in the circuit and with which the arm normally engages, a sliding plate adapted to hold the switch arm in its open position, and arranged to be moved to release the arm by the closing of a door, and a switch in the circuit normally held open by the closed door.

617,275. Quick-break Electric Switch. William F. Bossert and George L. Holton, Utica, N. Y. Application filed June 9, 1898.

In an electric switch there is the combination with electric contacts forming terminals of the circuit in which the switch is placed of a pair of independent switch blades pivoted at one end to one of the contacts, a coupling having grooves in its inner face to receive the other or free ends of the pair of switch blades, means connecting the blades and coupling, and actuating means for operating the switch.

617,287. Circuit-closer. Judson D. Garlock, Palmyra, N. Y. Application filed April 22, 1898.

The device comprises an indicator case having an angular seat, a firing face ring mounted upon the seat to be turned in either direction, a face plate secured to the ring parallel with the glass face of the indicator, a stud held rigidly in the face plate and terminating within the case in a curved end, a wire connected with the outer end of the stud, and a second stud carried by the face plate and adjustable to and from the other stud with its inner end within the case curved toward the curved end of the other stud, and a wire connected to the outer end of the stud, and a pointer adapted to vibrate between the curved ends of the studs.

REISSUE.

11,706. Electric Buoy. Ernst W. G. C. Hoffmann, Charlottenburg, Germany. Application filed December 8, 1898. Original number, 607,745, dated July 19, 1898.

This device is adapted to be floated and submerged, and contains a pump designed to secure the entrance and exit of the water serving as variable ballast in the device, the pump having a relatively large clearance, whereby the rarefaction of air in the device is avoided, means for actuating the pump controllably from without the device.

CHICAGO, JANUARY 21, 1899.

No. 3

Mechanical and Electrical Equipment of the Union Hotel.

Among the attractions of the newly fitted Union hotel and restaurant on Randolph street, Chicago, the very complete plant for lighting, heat, power, communication and ventilation is not the least interesting. The building is an old one remodeled, but the interior arrangement and fittings are entirely new. Advantage was taken of the opportunity by Mr. Herman Weber, the proprietor, to install a power plant having the latest improvements for efficiency, convenience and economy. But the exigencies of space and location—the filling of old bot-

tion (Fig. 2, p. 36), which were built to fit into the place assigned them.

There are two externally fired tubular-type boilers, each having 90 tubes $3\frac{1}{2}$ inches in diameter. The tube-heads are 12 feet apart and there is an 18-inch smokebox extension at the rear. In the front the boiler sheets are carried 36 inches beyond the tube-head for a combustion-chamber extension. A Hawley down-draft furnace especially constructed for the plant is attached to the combustion chamber. It is equipped with water grates and a water arch above the firebox. The circulating pipe is connected to the tube-head above the tubes on the line of the vertical diameter of the boiler. The outside

used. In case the exhaust steam should be insufficient to maintain this pressure in severe weather, a reducing-valve, installed for the purpose, comes into play, utilizing live steam for heating. In connection with the exhaust-steam piping there is a sensitive back-pressure valve which will open to the atmosphere and permit free exhaust to the outside air should the pressure rise above $5\frac{1}{2}$ pounds in the exhaust header.

A steel stack extending 220 feet above the grate bars gives ample draft to the furnaces. It is connected directly to the rear of the boilers. The hot gases from the combustion chamber pass directly through the tubes to the rear smokebox extension

FIG. 1. MECHANICAL AND ELECTRICAL EQUIPMENT OF THE UNION HOTEL.—ENGINES, DYNAMOS AND SWITCHBOARD.

ties with new wine—made necessary some special features of interest.

The design of the steam and electrical generating plant was entrusted to Pierce & Richardson. A careful survey of the basement showed that the most available space for the steam-raising units had a width of 12 feet six inches with but seven feet eight inches of clear head-room. The position of the supporting columns of the building was the cause of the narrowness of the space, while it was impossible to excavate more than 10 inches before encountering the steel foundations extending out from the adjoining 18-story Ashland block. This depth of 10 inches was, in fact, utilized for the saddles supporting the new boilers and for the blow-off connections. Into the space available it was necessary to place boilers having a combined capacity of 200 horse power. The problem was essayed by Mr. S. G. Neiler, of the engineering firm mentioned, who designed the boilers now in opera-

diameter of the boiler is 72 inches and its total length is 16 feet six inches, the furnace extending six inches farther in front. So little head-room was left on top that the safety valves had to be placed on their sides.

These boilers are designed to evaporate 4,000 pounds of water each an hour from and at 212 degrees, the steam pressure to be carried at 120 pounds. They supply steam for two engines driving dynamos and also all the steam used for laundry purposes and for the heating tables, etc., in the kitchen, through a valve reducing the pressure to 30 pounds. To place them in position in the basement it was necessary to take up the flagstones of the sidewalk above and remove the curb and a portion of the retaining wall. Then an excavation was made in the street and the boilers were slid in place on skids.

For the general heating system of the building exhaust steam at about five pounds' pressure is

and thence through a short length of curved breeching to the stack.

Feed water is obtained partly from an artesian well on the premises, partly from the city mains. The boiler pump is of the Knowles type, and there are two Sellers re-starting injectors. Coal screenings are burned in the furnaces. The plant is operated 24 hours a day and now consumes five tons of screenings daily, carrying therewith an average load throughout the entire time of 400 amperes at 110 volts. The boiler guaranty is that $9\frac{1}{2}$ pounds of water shall be evaporated with one pound of Indiana coal. Tests are now making to determine whether this guaranty has been fulfilled. The boilers and furnaces were furnished by the Hawley Down-draft Furnace company of Chicago; the boilers were built by the Oil City (Pa.) Boiler Works.

One feature of this plant is the thorough and complete manner in which all details of economical operation are carried out—exceptional in so small a

plant. The piping system is complete and carefully laid out. The space is limited and the array of steam and water pipes seems complicated, but access is provided to every valve and every fitting. The high-pressure pipes are encased in the H. W. Johns felt covering and the others in asbestos sponge moulding. The row of overhead pipes shown in the picture of the boiler room (Fig. 2) is composed of hot-water return pipes leading to a header on the wall at the left, not shown in the photograph.

An interesting piece of apparatus designed to ef-

fect greater economy is a special Cochrane feed-water heater, expansion and return tank. This is placed in the engine room, but, being back of the engines, is not clearly shown in Fig. 1. It is of about 200 horse power capacity, being designed to raise 8,000 pounds of water from 60° to at least 204° in an hour. The filtering material is quartz sand together with the usual broken coke. In connection with the heater there is a special arrangement for purifying the feed water. Above the heater and connected with it is a tank holding a soda-ash solution which is fed into the heater through a sight-feed. This chemical precipitates all the sulphates in the water, while the temperature of the water in the heater—228°—due to the back pressure of five pounds, precipitates the carbonates. This, being done in the heater, prevents any scale-forming material from entering the boilers. The purity of the water is still further insured by a suitable connection in the pump discharge, whereby samples of the water going to the boilers can be drawn from time to time and tested. By this means the amount of soda ash to be admitted through the sight-feed is regulated very closely.

FIG. 2. MECHANICAL AND ELECTRICAL EQUIPMENT OF THE UNION HOTEL.—SPECIAL TUBULAR-TYPE BOILERS.

fect greater economy is a special Cochrane feed-water heater, expansion and return tank. This is placed in the engine room, but, being back of the engines, is not clearly shown in Fig. 1. It is of about 200 horse power capacity, being designed to raise 8,000 pounds of water from 60° to at least 204° in an hour. The filtering material is quartz sand together with the usual broken coke. In connection with the heater there is a special arrangement for purifying the feed water. Above the heater and connected with it is a tank holding a soda-ash solution which is fed into the heater through a sight-feed. This chemical precipitates all the sulphates in the water, while the temperature of the water in the heater—228°—due to the back pressure of five pounds, precipitates the carbonates. This, being done in the heater, prevents any scale-forming material from entering the boilers. The purity of the water is still further insured by a suitable connection in the pump discharge, whereby samples of the water going to the boilers can be drawn from time to time and tested. By this means the amount of soda ash to be admitted through the sight-feed is regulated very closely.

The plant is equipped with steam and oil separators. Each of the two engines has an individual steam separator. There is an oil separator in the main exhaust pipe in addition to one attached to the feed-water heater, thus preventing the admission of oil to the general heating system. All steam condensation from the appliances in the kitchen and laundry is brought back to a trap and returned to the heater. Drips from the steam separators are also carried to a trap, which discharges into the heater. Thus all condensation is saved.

With the exception of the deep-well pump all the machinery in the building is electrically driven. Current is supplied for light and power by the two engine-dynamo units shown in Fig. 1. The engines are of the Westinghouse compound, non-condensing, upright, inclosed type, and under test have shown a water consumption of not over 25 pounds per indicated horse power. They have a capacity of about 100 horse power each at 120 pounds steam pressure. The engines are directly coupled to Westinghouse 50-kilowatt, 110-volt, multipolar dynamos. The generating units are arranged in the shape of an L to utilize the limited space to the best advantage. The switchboard is a handsome one of white marble with Weston instruments and quick-break switches. It was installed by Rohn & Meyer of Milwaukee, who did the construction work.

Seven electric motors are operated on the 110-volt house circuits in various parts of the building. All were made by the Crocker-Wheeler company. Three of them are in the southern end of the engine room. One, the large motor shown in Fig. 3, drives a carbonic-acid ice machine by belting and a countershaft. It is a 25 horse power machine. Above this motor, in the picture, is seen a board with two ordinary motor-starting and controlling

and pumps water into the tank until automatically cut off when the water reaches the maximum height. Arrangements are also made so that the motor may be operated independent of the automatic device by a double-throw switch on the motor board. The motor shown at the right in Fig. 3 is of three horse power and is belted to a brine pump used in the refrigerating system. In the center of this picture, mounted on a masonry foundation, is the Knowles steam deep-well pump. This pump lifts the water from the artesian well, which is 446 feet deep, the water level being 110 feet below the basement.

In the kitchen a five horse power motor is in-

FIG. 3. MECHANICAL AND ELECTRICAL EQUIPMENT OF THE UNION HOTEL.—MOTORS IN THE ENGINE ROOM.

stalled to drive a dish-washing machine and the dumb-waiters through the medium of belting and a short line shaft. A picture of one end of the kitchen, showing this equipment, is given in Fig. 4. Another five horse power motor drives the laundry machinery. On the upper floors there are two motors. One, a 25 horse power machine, in the second story, drives a large exhaust fan which operates the ventilating system of the whole building, pipes for changing the air radiating to all parts of the building. The other motor operates the passenger elevator running from the hotel entrance to the top of the building. It is of 15 horse power and is located at the top of the elevator shaft.

About 800 incandescent lamps are connected to

the wiring system—600 of 16 candle power each and 200 of 25 candle power. The larger lamps are used principally in the electroliers in the restaurants on the first and second floors. These fixtures are elaborate and handsome. Lamp signals are used to summon the waiters in the restaurants. Each waiter has a number, and a lamp back of the corresponding number on a glass sign is lighted from a little switchboard in the serving room when the waiter is wanted to deliver an order received from the kitchen by the dumb-waiter. When the waiter enters the serving room he opens the switch bearing his number and cuts out his lamp. A similar system is used in the private dining rooms, and the noise of bells is avoided.

Every guest room in the hotel has a telephone communicating with the office. There are also telephones in each hall and reception room, in the restaurant office, hotel office and private office, engine room, steward's room, kitchen and laundry. In all about 45 instruments, made by Rohn & Meyer, are installed. The system is not an intercommunicating one, but by repeating messages in the offices any part of the building may be communicated with from any other part.

Other electrical features include a recording watchman's clock, a complete hotel annunciator system and an emergency fire-alarm device by which all the bells in the house may be rung at once. The telephone and call-bell circuits are operated by 12 cells of storage battery in the engine room, arranged so that six cells are supplying working current while the others are being charged. Sixteen candle power lamps are in series in the charging circuit to reduce the voltage. Automatic alarm bells are connected with the system so that they will ring and call the attention of the engineer should a fuse be blown.

Polyphase Transmission of Power¹

By F. WALLIS.

The transmission of energy by polyphase currents has made much greater progress abroad than it has in this country, and, in addition to our national conservatism in adopting new methods, there are two main reasons for our backwardness. In the first place, there are but few sources of water power in Great Britain, and, recently, steam power can be obtained comparatively cheap all over the country. In Switzerland and in America, where long-distance transmission has made such strides, water power in large quantities is constantly to be met with, and is naturally taken advantage of, while, again, in the mining districts of both America and South Africa, fuel can often only be obtained at very great cost, and consequently it is cheaper to transmit power over a great distance from one large center, where water power or fuel can be more easily obtained, than to have a number of isolated plants.

Nevertheless, there is a considerable field even in this country for the transmission of power in large quantities over long distances—say, 20 to 40, or even 50, miles, for not only might great generat-

ing stations be erected near the coal pits, where fuel can be obtained delivered to the boilers at 25. 6d. per ton, but, further, the enormous power that runs to waste in our blast furnaces might be in part utilized for the generation of electricity. It has been estimated that, for every 100 tons of metal cast, energy sufficient to generate 2,000 horse power for one week is wasted in blast-furnace gas, and that throughout the country about 2,000,000 horse power is thus wasted.

But quite apart from such problematical schemes there are many cases in which polyphase transmission might be advantageously employed. For instance, at Dublin, where the generating station

¹ From the London Electrician.

is only seven miles from the furthest sub-station and the pressure employed is only 3,000 volts, polyphase transmission has been found to give admirable results. Indeed, wherever it is desirable to work at a pressure of 2,000 or 3,000 volts or more, polyphase transmission offers many advantages. Again, in many cases where the generating station is within a few hundred yards of the area of supply, the polyphase system may be profitably adopted, owing to its suitability for motor work. This particularly applies to the case of the transmission of power in works where motors form the chief part of the load. And it must be borne in mind that even though there may not be many openings for long-distance transmission at voltages of 10,000 or so in England, many such transmissions are required in the colonies and elsewhere abroad, and it is preferable that the necessary plant should be installed by English engineers.

The question thus arises, What is the greatest distance to which electrical energy can be economically transmitted, and how do the various systems of transmission compare with one another? The largest circuit yet employed has been the experimental one between Frankfort and Lauffen, a distance of 100 miles, over which 300 horse power has been transmitted at 3,000 volts, three-phase currents being employed; 4,000 horse power has also been transmitted on the three-phase system at 10,000 volts over 24 miles at Sacramento, and 1,400 horse power at 11,000 volts over 35 miles at Fresno, Cal., not to mention the Niagara-Buffalo line and many others. There are also several two-phase lines at work. Of single-phase alternating lines, that at Rome may be mentioned, where 2,000 horse power is transmitted at 6,000 volts from the Falls of Tivoli, 18 miles distant from the city. M. Thury and others have also installed several long-distance continuous-current plants, of which that at Geneva, where 400 horse power at 6,600 volts is transmitted over 20 miles, is the longest, though the Brescia line, over which 700 horse power is transmitted 12 miles, is worked at the highest voltage, namely, 15,000. In the case of many of these transmissions, where water power is employed, it must be remembered that the power available is greatly in excess of that required, and that consequently very considerable losses in the line and plant could be permitted.

Abroad, transmission of power is almost invariably carried out by bare overhead wires. In England no such transmission on any large scale has yet been tried, and it is more than probable that the Board of Trade would insist on insulated cables being laid either underground or by the side of a railway, or in some such thoroughly safe and efficient manner, whenever a high voltage was employed. And in many ways this would be an advantage, for any long-distance transmission would necessarily be on a very large scale, and any breakdown, which might easily occur with overhead wires, would cause great loss to the community. Further, overhead wires have great inductive effects, and in a crowded country like England would cause much trouble. The underground mains would, of course, be either concentric or laid very close together.

In other countries the conditions are, as a rule, entirely different. The chief consideration is generally small first cost, and, consequently, bare overhead conductors are almost universally employed. But, even with these, there are limits to the voltage which may be employed; not, indeed, in the apparatus at the ends of the line, for transformers can be made to safely stand almost any voltage, but in the line itself. In a very dry climate 20,000 or 30,000 volts may be safely employed, but in a damp and foggy atmosphere, even 10,000 volts may be too high for satisfactory working, owing to moisture collecting on the insulators, and so causing short-circuits.

But, granted a long-distance transmission, the question still remains, How does the polyphase system compare with the direct-current and with the single-phase alternating? Now, though direct currents have been employed by M. Thury over considerable distances at very high pressure (e. g., the 15,000 volts at Brescia), there are many disadvantages connected with such a system. In the first place, as M. Thury himself states, the maximum output of a high-pressure continuous-current dynamo is about 45 amperes at 3,000, or, at most, 4,000 volts; hence, for generation at 15,000 volts, four or five machines must be coupled in series; and likewise, wherever it is desired to tap the mains, another four or five machines in series must be run as motors, each either helping to drive a common shaft, from which a large generator may be driven to supply the lower potential current required for distribution, or driving its own smaller generator direct. In other words, large units with the corresponding gain in efficiency and in first cost cannot be employed with the continuous-current system. And, further, since commutators must be employed at the full potential of line, the risk of accident to the attendants or to the machines themselves is very great. On the other hand, the employment of the direct current admits of a saving in the weight of copper in the line as compared with any of the alternating systems, the relative figures for direct-current, single-phase, two-phase, four-wire and three-phase circuits being 0.50, 1.00, 1.00, 0.75, assuming the same maximum potential

difference in each case. As a matter of fact, the gain in copper is even greater, for in almost all alternating circuits the power factor is less than unity, and consequently a greater current has to be carried than corresponds to the power transmitted. On the other hand, in the above figures it is assumed that the maximum alternating electromotive force is $\sqrt{2}$ times the effective electromotive force, and though this is approximately true, it should be remembered that the disruptive discharge due to an alternating electromotive force is sluggish; that is to say, does not at once follow the applied electromotive force, so that, to take an instance, an alternating electromotive force of more than $\frac{15,000}{\sqrt{2}}$ effective volts is

required to produce the same disruptive effect as a continuous-current electromotive force of 15,000 volts. Further, there is no electrolytic effect with an alternating current, nor does the osmotic effect, whereby moisture creeps to the negative pole of a continuous-current circuit, exist. Of course, with underground cables these effects would not, under normal circumstances, be present; yet should by any chance a minute leak develop they would at once manifest themselves.

On the whole, in the majority of cases, it will be found that though there would be a considerable saving of copper in the line, the continuous-current system is placed out of court by the fact that the generators and motors have to be split up into, comparatively speaking, small units, and that a considerable element of danger is always present owing

end of a line to the other in large quantities, for in such a case the cost of the exciter and of the battery of accumulators or the small non-synchronous motor required for starting purposes does not bear a large proportion to the total cost of the installation, nor is the extra attendance required for these a serious item. But where only small motors are concerned such complication becomes prohibitive, and though many induction and other self-starting motors have been brought forward, none have yet proved themselves sufficiently satisfactory for general adoption, or at least, as a matter of fact, have not yet been generally adopted. It should be added that synchronous motors may be started, not only by small subsidiary self-starting motors, or by driving their exciters as motors from a battery of accumulators, but also by supplying the exciters from the alternating-current mains when, provided their field-magnets are laminated, they will run as alternate-current motors. But this method involves the use of the laminated fields and other complications, and does not seem to be often employed.

With the polyphase system the difficulty of self-starting is entirely done away with. Even synchronous polyphase motors will start themselves, owing to the reaction of the eddy currents induced in the solid pole-pieces, provided the pole-pieces are solid, and not laminated at the tips, as is often the case; but as the resulting torque is not very great, the motors have to be started light and the load only thrown on when they are running in synchronism. Synchronous motors have the great advantage of a power factor of nearly unity when

FIG. 4 MECHANICAL AND ELECTRICAL EQUIPMENT OF THE UNION HOTEL.—MOTOR-DRIVEN DISH-WASHING MACHINE AND DUMB-WAITERS.

to the necessarily more or less exposed commutators being at high potentials above the earth.

The single-phase alternating system is well adapted for the transmission of power over long distances when it is simply a case of one receiving station where the one or two large motors convert all the energy at once into its mechanical equivalent. In the text-books it is shown that the system requires more copper in the line than the three-phase, the proportion being 100 to 75; but, as large single-phase motors, such as have just been referred to, are always synchronous, and there is practically no lagging current in the line, whereas with a three-phase transmission the power factor will rarely exceed 80 per cent., and the line wires have to be increased proportionately in size, it follows that there will not in practice be much difference in the weights of copper employed. The real objections to the single-phase system are two in number—first, that the motors employed have to be of the synchronous type, and, secondly, that rotary converters designed to transform single-phase alternating currents into continuous current cannot be built for an output much above, say, 50 kilowatts, on account of the excessive sparking at the commutator, this sparking being due to the great fluctuations in the alternating current in the armature. A synchronous motor might, of course, be arranged to drive an entirely separate continuous-current dynamo and the sparking difficulty so got rid of, but the cost of the two machines would considerably exceed that of a polyphase rotary converter, and the efficiency of the conversion would be lower. But the chief objection to the single-phase system is undoubtedly that first mentioned, namely, that synchronous motors have to be employed which cannot be started without external aid, and further require separate field excitation. This does not matter so much in a large transmission, where power is simply sent from one

properly excited, and hence, if three-phase synchronous motors are employed, there is a saving of 25 per cent. of the line copper over the single-phase system. But in spite of their lower power factor, induction motors are far more generally employed on polyphase circuits. With these there is no difficulty in starting, even under full load. Small motors up to 10 horse power or so are generally made with squirrel-cage rotors, and these when starting under full load take for a short time a current of two or three times the normal full-load value. Larger machines are provided with a variable resistance in the rotor circuit, and will start under full load, taking only the normal current. For cranes and hoists the rotors are wound to have a considerable resistance, and a starting torque of even five times the normal can be obtained.

Further, the polyphase system has the advantage of being peculiarly well adapted for use with rotary converters. A three-phase current can thus be transformed into a single-phase, a two-phase or a continuous current, though for conversion into single-phase or two-phase it is far simpler and more efficient to use static transformers. For conversion into continuous current, however, rotary transformers must be used, and since in polyphase systems the flow of power is constant there is no difficulty with sparking at the commutator. Indeed, the tendency to spark and the demagnetizing effect of the armature is far less than with continuous-current dynamos, since the armature reactions of the two circuits tend to neutralize one another. Thus we are told that the 600-kilowatt converters at Niagara will give 900 kilowatts without sparking.

It is rather a drawback to the use of the rotary converter that as a rule it requires a static transformer to reduce the polyphase voltage before it reaches the machine. The reason is that continuous currents are almost always required at low voltage,

and a rotary converter with only one armature winding has a fixed ratio between its polyphase and continuous-current voltages, the former being lower than the latter. But even were any voltage ratio possible it would still be undesirable to introduce high-potential currents into a revolving armature, and static transformers would have to be employed. From what has been said it must not be inferred that static transformers must necessarily be employed with motors, for such is not the case. The polyphase circuits can be, and in large sizes generally are, led into the stationary portion of the motor, where they can be as well and safely insulated as in a transformer itself. Small motors, however, cannot be wound for high pressure except at prohibitive cost, the limit for a 20 horse power

in the other two branches on the motors will rise to make good the deficit, and the voltages will once again become approximately equal. Nevertheless, many engineers prefer the two-phase system with four wires, where, as the two circuits are electrically independent of each other, they can be independently regulated. The lamps are then each on their own circuit, and only in the motors are the two phases brought into play. For this reason it has been suggested that it would be better to employ three-phase transmission in the line on account of the saving of copper (the weight for the same maximum potential difference as compared with the two-phase four-wire system being in the proportion of 75 to 100), and at the receiving points to transform by static transformers to the two-phase system.

A third method is to transform from three-phase to continuous currents by the use of rotary converters, and much can be said in its favor. In the first place rotary converters can be made to act not only as transformers, but also as boosters, for the field winding may be compound, and sufficient series turns employed to actually make the full-load voltage greater than at no load, the phase relations in the polyphase circuit being altered thereby. Again the periodicity of the polyphase circuits may be too low for the satisfactory working of lamps (neither arc nor incandescent lamps should be worked under 40 revolutions per second), and then the only thing to do is to distribute by continuous currents. Further, the regulation of a continuous-current voltage is easy, and of course, continuous-current motors work satisfactorily. Such a combined system is particularly well adapted for traction purposes, where, on account of induction troubles and of three-phase currents requiring at least two trolley wires, it is, as a rule, impossible to use anything but continuous currents for the working of the cars. On the other hand, the use of the polyphase system throughout is in many cases more satisfactory. Where motors alone are to be driven the conversion to continuous current is quite unnecessary, for, as has been said, large motors can be supplied directly from the high-pressure mains, and smaller ones only require static transformers in place of the more costly and less efficient rotary converters. Where, however, the distribution is mixed, that is to say, where motors and lights have to be run from the same circuits, the question is not so easy of solution even when the frequency is high enough for lighting purposes. Although in some cases, as has been mentioned, the regulation of voltage on polyphase circuits has been found to be a comparatively simple matter, the experience obtained has perhaps not yet been sufficient for us to say that this will always be the case, and it may be taken as a maxim that wherever regulation will be a difficult matter requiring great care and attention it will be more economical in the end to install some simpler system, even at an increased first cost. Again, though accumulators may be charged by means of rectifiers or rotary transformers from alternating circuits, their use is almost entirely confined to continuous-current distribution.

So far as the motors are concerned the polyphase system more than holds its own. Not only will induction motors start under full load, but their regulation is an easy matter. Synchronous motors will run at absolutely constant speed, no matter what the load, and well-designed induction motors of from two horse power to 100 horse power drop only from eight per cent. to four per cent. in speed at full load. They thus act like continuous-current shunt motors. Their efficiencies between these sizes vary from about 76 per cent. to 92 per cent., and could be designed to be greater still. As a rule, the regulation of speed is effected by a variable ohmic resistance in the rotor circuit, though in cases where large starting torque is not required auto-transformers, which inductively reduce the voltage of supply, are often employed. Alteration in speed may also be effected by alteration of the number of stator poles, by changing the connections from star to mesh, and by coupling two motors together, so that the rotor current of the first machine supplies the stator of the second. As a rule, however, regulation is effected by altering the resistance of the rotor circuit, though this method has the disadvantage that when carried out to any large extent the efficiency is considerably reduced. The polyphase motor has, further, the great advantage over the continuous-current motor of requiring no commutator. It is also of very strong mechanical construction, and requires little or no attention. Likewise, for equal power, its weight is less than that of the direct-current machine, while, at the same time, it can stand very considerable overloading for a short time. There is very little difference in efficiency, power factor, starting torque and exciting current between the three-phase and the two-phase motor, what slight difference there is being in favor of the three-phase.

A great deal has been said concerning the low-power factor of polyphase systems. For transmissions in which the load consists chiefly of induction motors, the factor varies from about 0.65 to 0.85. As a rule it will be about 0.75 or 0.8. The motors and transformers, and not the line, are the chief sources of the lag of current behind the electromotive force, though the result of a low-power factor is increased size of plant all round. The coil can, however, be compensated for to a considerable

extent by the employment of a few large synchronous motors, which not only have no lag when properly excited, but when over-excited will still run as motors, with the current leading the electromotive force. They then, in fact, act as condensers. One American firm actually sends out condensers with its motors, but, generally speaking, the condenser cannot yet be regarded as a commercial article. In the matter of power factor the advantage of the three-phase over the two-phase motor is so small as to be practically negligible. It must be remembered that as the load decreases the power factor also decreases, so that when the motor is running light, and absorbing but little energy, the current it takes is still 20 to 30 per cent. of the full-load current.

With the introduction of polyphase motors frequencies have fallen considerably from those of 100 cycles per second and more employed some years ago for electric lighting. The higher the frequency the cheaper are the transformers, but, on the other hand, if a motor is to run on a high-frequency circuit at a given speed, it must have an increased number of poles, and this, in small sizes, at least, means increased size and cost. Further, the higher the frequency the greater the magnetic leakage and the magnetizing current required. Also, the higher the frequency the greater is the skin effect in conductors, and consequently the more finely must they be subdivided. At Niagara a periodicity of 25 has been adopted, and this is but little lower than that of the majority of polyphase transmissions in America. In Europe a rather higher figure, of somewhere over 40, is more general, in order that the circuits may be employed for lighting as well as for motive purposes.

Repairing Electrical Machinery.

By B. F. FELS.

A collar on a shaft of an adjusting spindle is frequently broken, as in the case illustrated in Fig. 1, at *A*, owing to the expansion of the collar when un-

REPAIRING ELECTRICAL MACHINERY

motor being about 1,000 volts, and with these static transformers must be employed.

Thus in a large transmission system large motors will take current direct from the high-pressure mains, while for smaller motors one or more distributing centers with large static transformers will be established. Lamps may also be run from the low-pressure polyphase circuits, being connected either between the three mains in a three-phase system, or, preferably, between each of the mains and a fourth balance wire running to the junction of the three circuits on the low-pressure side of the static transformer, in which case the latter must be star wound. In a balanced three-phase system the sum of the three currents is always zero, and so a fourth return wire is unnecessary, but where the load may be unevenly distributed, as is the case when lights are run from the mains, a fourth wire will take the unbalanced current and the voltage regulation is more satisfactory than if no return wire were used. As against the extra weight of the return wire this system has the advantage that the voltage between the mains is raised to $\sqrt{3}$ times that required by the lamps, and consequently the mains conductors take less copper. On the other hand, in many cases in practice there is no difficulty in obtaining a good balance even without the supply of a fourth wire. The motors on the circuits act as automatic regulators, for should the voltage between any pair of mains fall, owing to extra lamps being switched on to that circuit, the current in the corresponding branch of the motor windings will fall. The back electromotive force in these branches will rise and the current will further fall, while at the same time the currents

REPAIRING ELECTRICAL MACHINERY.

der strain, or when the set-screw is forced too tightly into the seat. When a fracture of this description occurs, it is not necessary to discard the collar, as it may be repaired by riveting on a piece of thin soft steel, as represented by the dotted portions. These pieces should be provided for each side of the collar, and, if an extra good job is wanted, the pieces may be sunk into the sides by filing off some of the metal. After shaping the pieces to conform to the collar, drill four rivet holes in each, and mark the places for boring the collar to correspond. The rivet may then be inserted, countersunk, headed and filed off smooth, making a neat and substantial piece of work. If the patched parts are held against an emery wheel or

grinder for a short time, the resulting polish will cover up the joints and rivet heads.

TROUBLESOME KEY.

Electrical machinery, when operated at extra high speed, is sometimes productive of loose nuts, bolts, set keys, etc. In a recent case which came to notice, the high speed of a motor caused one of the driving pulleys to give trouble by loosening on the shaft. Pieces of tin, etc., were driven in with the key, but the latter persisted in working loose every few days, and had to be tightened over again. Fig. 2 is a section of the parts, showing the key C in its seat between the wheel hub and the shaft. This trouble was permanently overcome by boring two set-screw holes in the hub and inserting the set-screws D D into these, as shown. These set-screws were brought to bear firmly upon the key, thus taking up the surplus space. They served to retain the screw securely in its seat.

PATCHING A BROKEN PULLEY.

A piece was broken from the rim of a pulley attached to the driving shaft of a dynamo, and the sharp edges cut into the leather driving belt so badly that the floor was strewn with fine particles of leather ground from the belt. In time the belt would have been completely destroyed. This fracture was repaired, as shown in Fig. 3. The piece which had broken out was replaced and a sheet-iron patch riveted to the inner side of the rim, as represented by the dotted portions at E. The rivets were countersunk, as at F, Fig. 4, and the heads finished off by grinding and rubbing off with oil and emery, thus eliminating roughness of any sort. After this the belt was not cut in any way, and the pulley was practically as serviceable as a new one.

HARDENING.

The reason why hardened parts of electrical devices often fail to give satisfaction is that the process of hardening was not properly performed. In some shops the pieces are treated in bone-meal, but no provisions taken to test the operation in its different stages and govern the time of exposure accordingly. Fig. 5 is a suggestion for a cast-iron heating box, easily made and simply operated. The feature of the box is the tell-tale or testing arrangement. This consists of two or more sample pieces made from the same material as the pieces to be hardened. These are marked A and B in the drawing, and are introduced to the contents of the box through apertures cut in the top.

As the meal is laid in layers under and over the piece to be hardened, the sample pieces are pushed in, and when the box is filled, the lid secured and the whole affair in the furnace in process of heating, the tell-tales can be withdrawn at intervals and the hardness of the metal tested. After the proper temperature is obtained, the box is removed, the lid taken off, the pieces shaken from the carbonized bone and dipped into water, or oil, as the case may be.

REPAIRING A FAN BLADE.

If the blade of a fan breaks off, after the manner indicated at C, Fig. 6, it may be repaired by first turning a drill into the stub of the blade shaft which remains in the shoulder of the hub flange,

Fig. 5. Dynamo Curves with Thin Brush; Full Line Curve, 7 Amperes; Dotted Line Curve, 35 Amperes.

EFFECT OF COMMUTATION ON THE FIELD OF DYNAMOS AND MOTORS.

as presented in Fig. 7, in which D marks the drill. After a hole is sunk deep enough to receive a beveled, pointed steel tool, the remains of the stub can be turned from its thread. This leaves the hole free for a new end. Fig. 8 illustrates a method frequently used by the writer for substituting a new end for the foot of the blade. First, all of the old end is cut off close to the foot. Then a piece of steel rod is turned down with the proper size thread, a nut is put on one end, while the other end is split and the sides are flattened out to fit over the foot of the blade, as at E. Then two or three rivet holes are drilled through both sides and the blade, and when the rivets are put in and headed up, the repaired part is secure, and experience shows that it will last as long as the blade itself or any other part of the fan.

Effect of Commutation on the Field of Dynamos and Motors.

The London Electrician recently described a series of experiments upon this subject which were conducted by W. H. Everett and A. H. Peake, supplementing an investigation of the character of the change of current in an armature coil of a dynamo and motor respectively, while that coil is passing under either brush. The experiments were made with a two-pole, five-kilowatt Crompton machine. An exploring coil of 10 turns of fine wire was wound on one of the armature coils, one end being connected to a slip-ring and the other to a revolving adjustable contact-maker. In this way the electromotive force generated in the coil at any instant

Fig. 1. Motor Curves with Thin Brush: Full Line Curve, 2 Amperes; Dotted Line Curve, 8 Amperes; Chain-dotted Line Curve, 27 Amperes.

EFFECT OF COMMUTATION ON THE FIELD OF DYNAMOS AND MOTORS.

could be found by charging a condenser with this electromotive force and then discharging it at will through a ballistic galvanometer. Each armature coil consisted of two layers of three turns each, and the exploring coil was wound between the middle and rear conductors of the upper layer.

In the accompanying illustrations, abscissæ show the relative positions of the center of the armature coil on which the exploring coil was wound, the pole-tips N, S and the brush B, the intercept between successive ordinates representing the width of one coil; and ordinates represent the electromotive force induced in the exploring coil. A change in the speed of the machine merely produced a proportionate change in the deflections of the galvanometer, so that for the sake of comparison the vertical scale is made inversely proportional to the speed in each case.

Three different brushes were successively used. The first was divided into two parts connected by a low resistance, and giving electromotive-force curves under the same conditions as for the current curves previously obtained. The second was an ordinary brush, but of the same thickness only as the first. The third was an ordinary brush of sufficient thickness to cover about one segment and a third.

Broadly speaking, the curves show that the elec-

tricity of the effect is clearly shown in the curves causing successive ripples, of which the one under the brush is, we should expect, the most marked. A decrease in the positive, or an increase in the negative current in a coil causes a positive induced electromotive force in that coil, and vice versa; therefore, comparing these ripples with the curve of current change shown in the former article, a descent in the current curve should correspond to a positive distortion or excessive rise in the electromotive force curve, and an ascent in the current curve to a depression in the electromotive force curve. In some of the curves it will be seen that there is an indication of this correspondence.

When the brush was not in the correct position to avoid sparking, sudden sharp deflections were

Fig. 2. Motor Curves with Ordinary Brush: Full Line Curve, 3 Amperes; Dotted Line Curve, 16 Amperes.

found to occur in the curves at points where the segments of the commutator leave the toe of the brush. These deflections are downward when the brush is too far backward, and upward when it is too far forward, as would be expected from the change (due to contact resistance) of the current in the coil leaving the brush.

When the thin brush is used (Figs. 1 and 3), the ripples, in both dynamo and motor curves, are much more pronounced with heavy than with light loads, since the current change is greater. Again, the difference between the dynamo curves, at various loads, is not nearly so great as between the motor curves; moreover, in the case of the dynamo the curves are smoother than in the case of the motor. These results are probably both due to the same cause, namely, that the current and electromotive force in the coils under the brush are changing in the same direction in a dynamo, but in opposite directions in a motor. In comparing curves for different loads it should be borne in mind that the brush does not remain in the same position, being always adjusted to avoid sparking; this accounts for the crossing and recrossing of some of the curves.

Experiment shows that there is no appreciable difference produced in the character of the curves by exchanging the split brush for an ordinary one of the same thickness; accordingly, none of the solid thin-brush curves have been included in the figures. With the thicker brush the curves are comparatively smooth in all cases; this, of course, is chiefly noticeable in the heavy load curves, since they were originally the most rippled. The reason for this smoothing effect is, presumably, that whenever one coil has just come under the brush, or is just leaving it, there is an adjacent coil also short-circuited, which acts like the closed secondary of a transformer, and thus partly counteracts the self-induction of the first coil. Hence, any sudden change of current in one of the shorted coils has a less effect on the main field, since its influence is counteracted by a corresponding change in the adjacent coil. The field, therefore, is steadier and the electromotive-force curve smoother with the thicker brush.

Government Controls Cable at Manila.

General Otis has informed the War Department that he has established a censorship over telegrams from and to Manila. This action was taken by General Otis on his own authority, but it has the hearty approval of the government. General A. W. Greely, chief of the signal service, who has charge of military telegraphs, said that in his opinion the censorship should have been established several weeks ago. The publication in the Manila papers of dispatches from the United States concerning the views of the administration on the attitude of the insurgents and the method in which they should be treated is regarded as the reason for the action of General Otis. It is probable that had not General Otis placed a censor in charge of the Manila telegraph office the War Department would have directed him to do so.

The North and West Chicago Street Railroad companies, which are known as Yerkes' properties, has made application to the City Council for permission to extend the overhead trolley system so as to cover all their lines. The corporations agree to increase the number of cars operated and grant other concessions if the city will grant the application.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the entire contents of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, \$3.00 for a full year of 52 numbers; 10 clubs of four or more, \$2.50, with free extra copy for eight subscriptions; foreign countries, \$5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—the only general electrical paper published in the West—thoroughly covers a territory exclusively its own. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers desiring western trade will appreciate the UNEQUALLED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

HIGH WATER MARK CIRCULATION, 20,000.

CONTENTS OF THIS NUMBER.

Table listing contents of the issue with page numbers. Includes: Mechanical and Electrical Equipment of the Union Hotel, Polyphase Transmission of Power, Repairing Electrical Machinery, Effect of Commutation on the Field of Dynamos and Motors, Government Controls Cable at Manila, Editorial, Northwestern Electrical Association, Patent Court Proposed, Telegraphing Irish, Death of M. C. Bullock, New York Electrical Society, Chicago City Railway Company, American Street Railway Association, Development of the Telephone Field, Telephone News from the Northwest, Russia's New Telephone Line, Cost of Telephone Service, Telephone War in Detroit, Michigan Telephone Stock at 50, Patent Office Decision, Southern Telephone News, New England Telephone Notes, Extensions and Improvements, Opposition to Bell Service, Chief Operator's Equipment, Underground Electric Road Proposed for Chicago, Insulated Wire Weatherproof Machine, Electrical Ventilating Plant, Chicago Street-railway Affairs, Industrial Combinations, Necessity of Using Reasonable Care in Crossing Railway Tracks, National Electric Light Association, Thawing Frozen Ground by Electricity.

DEPARTMENTS.

New York still entertains hopes of securing rapid transit through the efforts of the commission appointed for the purpose of preparing a satisfactory plan for such service. The commission has been in existence since 1891, it has cost the taxpayers \$426,470.14, and thus far its efforts have proved futile. Mayor Van Wyck, in his annual message, says: "It is to be hoped that the present Board of Rapid Transit Commissioners will, during the current year, furnish a plan not only feasible as to construction, but also entirely relieved from many features which might provoke either determined opposition or cause any considerable delay." It seems to be about time for the commission to go out of business if it cannot accomplish anything. Whatever merit or defect may have been contained in the plans already submitted they have not received

public approval, and no matter what the cause may be, the commission ought not to be continued at public expense unless it can command public confidence and support. New York may be in need of rapid transit, but if the people do not approve the plans of the commission, some other means should be relied upon for relief.

The Austrian government is endeavoring to encourage industrial enterprises and develop inventive genius. Patent laws have been enacted providing for examination as to originality of invention and granting three years in which the invention may be worked, "unless the interests of the state demands its working before the expiration of that period."

Another innovation is the concession recently granted for the establishment of an inventors' bank. The institution will be aided by the government and will be under its special supervision. It is proposed to aid inventors, advance money for the development of patents and the establishment of enterprises found upon patented inventions, and engage in commercial enterprises of this character.

The question of establishing a Pacific cable is now fairly before Congress and early action may be anticipated, as the administration appreciates the urgency of the demand for facilities for telegraphic communication with Hawaii, the Philippines and Hongkong. Senator Lodge recently introduced a bill providing for subsidizing a private company to undertake the work, and another bill has since been introduced by Senator Butler authorizing the construction and operation by the government of a telegraphic cable from San Francisco to Honolulu, thence to Manila by way of Ualan and Guam, and thence to Hongkong. The bill carries an appropriation of \$8,000,000.

It has been assumed that the expense of establishing cable communication with Honolulu, Manila and Hongkong would be less than some earlier cable enterprises because of the improved methods employed in making the cable itself and the experience gained in this class of work. It is pointed out, however, that all estimates as to the actual cost are merely guess work. The question arises where will the gutta-percha be obtained for this great cable. The present price is exceedingly high and the tendency to raise it is so great that everything pointing to the determination of the American government to engage in the enterprise advances the market a notch or two. The visible supply of gutta-percha is reported as being inadequate to the demands for it, and the necessity for securing a reliable, efficient and economical substitute grows more pressing every day.

Objections have been raised by foreign manufacturers who propose to exhibit at the Paris Exposition of 1900 that the management is making everything subservient to French interests. Mr. James Dredge, speaking for the English exhibitors, protests vigorously against the plan of "transferring the overflow from the exposition to Vincennes, which is practically six miles away from the main show, and entailing a journey of an hour and a half to reach it." Mr. Dredge contends that "here will be buried in obscurity at least one section as important to America as to England. That is the transportation section, including locomotives, motors, motorcycles and bicycles." The London correspondent of the Chicago Record cables the following expression of opinion on this subject by Mr. Dredge:

So strongly do the English manufacturers feel on this point, now that they realize what it means, that they are considering withdrawing altogether. Among most of the large exhibitors there is a general feeling of exasperation against the French for the way they have grabbed all the advantages themselves, including an absurdly large portion of the limited space at their disposal. Their greed contrasts most unfavorably with the temper displayed at Chicago, where all that was possible was done to place the visitors on more than equality with the native exhibitors.

In details of organization, too, the French have already fallen short, to the surprise of everyone, and general interest here in the exposition is being crushed out of existence. I am glad to hear that Commissioner-General Peck succeeded in increasing the American allotment, but I trust sincerely that the extra space is not at Vincennes, as in that case it is practically useless.

The American representatives reported on their return from Paris that they had been treated with

great courtesy and that the exposition management had gone to great pains to satisfy every wish that the Americans expressed. Consequently, the very best of feeling prevails.

At the meeting of the Northwestern Electrical association this week it is believed that the question of discontinuing the summer meetings of that organization will be considered. Some of the more conservative members express the belief that one meeting a year is enough, that the summer gathering is merely a pleasure party and that there is danger of these "excursions" becoming so expensive that members may find it burdensome to participate and may withdraw entirely from the organization. It would seem, however, as if the fears of this element were groundless. The organization has the remedy at hand whenever a plan is proposed that will severely tax the resources of the least prosperous member. It can always control the expenses, as it selects the place of meeting, and its members are familiar with the hotel rates and railway fares that they will have to pay. It has never been the aim of the association to encourage expensive meetings. The summer conventions have afforded an opportunity to spend a pleasant holiday in congenial company without entailing heavy expense, and there is no doubt whatever that they form a very popular feature. The fraternal spirit that is encouraged at these meetings is a valuable factor in promoting the work of the organization, and it is feared that the association would suffer greatly if the summer meetings should be discontinued. Aside from the social and commercial side of the question, there is also the consideration of the technical work done at these meetings. Some of the best papers that have been read at the Northwestern meetings were presented at summer gatherings, and there is no reason why important contributions should not continue to be made on these occasions. In presuming that these events are to be devoted entirely to social affairs, a grave mistake is made. The association can make them whatever it pleases, and whatever plan it may adopt it is bound to prove successful.

Trusts and combinations, consolidations and absorptions are the rule in trade to-day. The electrical industry is just now interested in the operations of a powerful syndicate that appears to be engaged in securing control of all the profitable street railway and lighting properties in the country. Many combinations and consolidations have been effected already, and as concessions in the form of transfers are generally given in the case of street-railway properties, and improved service or reduced cost in lighting systems, there has been no public protest. As a matter of fact, the equanimity of the people may best be explained by the fact that general trade conditions have been materially improved and that there is plenty of work to be had at fair wages. The average American workman is not disposed to quarrel with his neighbor or his employer for making a satisfactory trade or a profitable investment, but rather rejoices in the good fortune of others as long as he is permitted to earn a fair living. To-day the conditions are ripe for the execution of large financial undertakings, and the electrical industry presents an inviting field for operations of this kind.

These combinations are not confined to the operating companies, however. Manufacturing interests are consolidating or working under agreements that virtually control special lines. At the present time wire trusts, carbon trusts, copper trusts and similar combinations are engaging public attention. Some of these may succeed, but as there has been a liberal allowance of water in one case at least, it is not expected that it will prove as good an investment as the public might believe. Then, too, where these conditions obtain there is always the danger of promoters starting companies merely for the sake of selling out. When combinations are effected on conservative lines, the great saving in cost of production may warrant a slight inflation of the value of securities and permit a reduction in selling price at the same time to prevent successful competition. But another policy has been adopted in one of the most prominent combinations recently announced, and the outcome will be awaited with considerable interest by those familiar with the conditions.

Northwestern Electrical Association.

A large party of electrical men assembled at the Northwestern railroad depot in Chicago on Wednesday morning, January 18th, and under the guidance of Messrs. Wolff, Low and Whyte started for Milwaukee to attend the convention of the Northwestern Electrical Association in that city, January 18th, 19th and 20th.

The headquarters of the association during the convention were established at the Hotel Pfister, and the meetings were held in one of the parlors. Other parlors and considerable space in the rotunda and halls were occupied by exhibits.

"Trend of Central Station Design," by B. J. Arnold of Chicago.

"Meter-rate Systems," by E. L. Debell of Sheboygan, Wis.

"Design of Secondary Circuits in Alternating Plants," by George L. Thayer of Belle Plaine, Ia.

"Electricity Direct from Coal," by Professor A. J. Rogers of Milwaukee.

"Inductive Loads on Alternating-current Transformers," by Professor D. C. Jackson of Wisconsin University, Madison.

"Electric Vehicles and Their Relation to Central Stations," by H. M. Maxim of Hartford, Conn.

"Association Management," by H. L. Doherty of Madison, Wis.

As usual, the entertainment committee prepared several attractive features for the visitors, including a theater party, sleigh-ride and lecture, in addition to the annual banquet.

Patent Court Proposed.

[Special correspondence of the Western Electrician.]

Washington, D. C., January 16.—During the last session of Congress, Representative Hicks, chairman of the committee on patents, introduced a bill providing for the establishment of a court to be known as the Patent Court of the United States, to consist of a chief justice and two associate justices.

The bill provides that whenever an application for a patent is filed in the Patent Office which, in the opinion of the commissioner of patents, interferes with any pending application or with any unexpired patent, he shall give notice thereof to the applicants or applicant and patentee, as the case may be, and shall direct the examiner of interferences to proceed to declare the interference and to settle and determine all interlocutory matters and motions.

The court shall, on receiving from the commissioner of patents a certificate of any interference case, set a time to take testimony. On the evidence produced the court shall hear and determine the question of priority or originality of invention between the parties on the issue certified to the court by the commissioner of patents, and then return to the commissioner a certificate of its proceedings and findings, which shall be recorded in the Patent Office, and if such adjudication be in favor of the right of an applicant, shall authorize the commissioner to issue a patent on the application, provided such applicant complies with the requirements of law.

Telegraphing Irish.

The Westminster Gazette says the Irish postoffice officials have accomplished a feat which deserves more than passing recognition. There has just been concluded at Letterkenny, County Donegal, an Irish festival, which lasted for a week. It was decided by the promoters that the occasion should be taken advantage of for encouraging the revival of the Irish language.

kenny staff, when dealing with the first section of the work in Irish, not knowing of the special arrangements at the general postoffice, made inquiry, if the words were accurately received, and were rather surprised to receive a satisfactory answer in Gaelic along the wire. The work was sent rapidly and accurately, and the Irish telegraphists engaged in it are to be complimented on the capacity they displayed to meet the emergency.

Death of M. C. Bullock.

The death of Mr. Milan C. Bullock, the president of the M. C. Bullock Manufacturing company, at his home in Chicago on January 12th, removed a man who was not only widely known as a manufacturer of engines and mining machinery, but who was a pioneer in the electric-lighting business of the West as well.

M. C. BULLOCK.

after that, directly engaged in the electrical business.

Mr. Bullock was a native of New York state, and in his first year. He learned the machinist's trade and displayed great aptitude in it. From 1863 until 1870 he worked in a number of shops, gaining a constantly increasing experience. In 1870 Mr. Bullock became connected with the diamond-drill business. In this he distinguished himself by making notable improvements, and he was connected in important capacities with several companies until 1875, when he went to Chicago and engaged in business for himself on a small scale.

Mr. Bullock was a cheerful, energetic, resourceful man and stood high in the opinion of his associates. He was a member of the Union League Club. A widow and two daughters survive him.

New York Electrical Society.

Standing room only could be had by the latecomers at the meeting of the New York Electrical society, at the College of the City of New York, on

January 12th. The subject of the evening, which was "Latest Progress in Storage-battery Installation," was ably handled by Mr. Joseph Appleton, engineer of the construction department of the Electric Storage Battery company. The meeting was a significant illustration of the number now interested in storage-battery application, and the audience listened with close attention to Mr. Appleton's record of the triumphant way in which the storage battery has vindicated the faith of its friends through years of doubt and opposition.

After the discussion in which Mr. R. P. Bolton, Mr. Frank J. Sprague and Mr. C. O. Mailloux took part, the gentlemen present visited the storage-battery power sub-station of the Metropolitan Street railway company, at the foot of West Twenty-third street, where was seen in operation the large railroad battery of the company, equipped with all the modern appurtenances.

The following-named members were elected: Arthur D. Dunn, Harvey E. Mole, James A. Stiles, Henry I. Lurye, Walter S. Wilson, A. Haaber, Eugene F. Roeber, Herbert Jenkins, George V. Flynn, Arthur Diamant.

Chicago City Railway Company.

The annual meeting of the Chicago City Railway company was held on Monday, June 16th. The election of officers resulted in the selection of M. K. Bowen as president, Joseph Leiter first vice-president and D. G. Hamilton second vice-president, T. C. Pennington treasurer, F. R. Greene secretary, and G. O. Nagle superintendent. William B. Walker resigned the first vice-presidency of the company and Joseph Leiter, second vice-president, was promoted to fill his place.

President Bowen submitted a report containing the following summary of the affairs of the company:

Table with financial data including revenue, expenses, net gain, and total earnings for the Chicago City Railway Company. It lists various metrics like passengers carried, revenue from different lines, net gain, and total earnings with their respective values.

American Street Railway Association.

Representatives of Chicago street-railway interests have at last taken steps toward preparing for the meeting of the American Street Railway Association in this city in the Fall. An informal meeting of representatives of all the street-railway companies of the city was held on Tuesday and a committee was appointed to select a place for the meeting and make provision for holding a large exhibition.

DEVELOPMENT OF THE TELEPHONE FIELD.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The Mesaba Telephone company has completed connection between Eveleth, Virginia and Sparta, Minn.

The Litchfield Telephone company has completed toll lines from Litchfield to Manannah and Grove City, Minn.

The Fergus Telephone company of Fergus Falls, Minn., has equipped its exchange with a motor for ringing bells, instead of making the operator do it, and a call is made by touching a button.

The telephone company at New Richland, Minn., is erecting a building for a central office.

F. F. Murray and Charles Avery of North Branch, Minn., contemplate a telephone line to Wolf Creek. They are securing subscribers for a local exchange.

The Northwestern Telephone Exchange company will extend its wires north from Jamestown, N. D., to Leeds, south to Oakes and west to Mandan, N. D. A line will also be constructed from Cooperstown to Sanborn.

The Hutchinson (Minn.) Telephone Exchange company has been incorporated, with \$2,000 capital stock, to put in an exchange.

The Winona Telephone company of Winona, Minn., will put in a new switchboard in the spring.

A resolution has been introduced in the council of Duluth, Minn., asking the senators and representatives in Congress from Minnesota to use their efforts to secure legislation which shall prevent telephone companies from taking a right-of-way on post roads in cities until they shall have obtained a franchise from the city. It is reported that the Duluth Telephone company proposes to continue in business after the expiration of its franchise, if it is unsuccessful in bidding for a new one, under the act of Congress of 1866. The company denies it.

The Cedar Valley Telephone company is equipping its exchange at Cedar Falls, Ia., with a power generator to do the ringing.

Ackley, Ia., will vote February 7th on granting a franchise for a telephone exchange to the Iowa Telephone company.

A telephone line is projected from Marengo, Ia., to Genoa Bluffs and the prospects are favorable for its construction.

The Early Telephone company has been formed at Early, Ia., and 14 instruments are in use. In the spring a toll line will be run south of the town.

The Spencer Telephone company has been refused a franchise at Spencer, Ia., by the electors of that town.

Telephone connection is now complete between Helena, Mont., and Portland, Ore.

The Citizens' Telephone company of Mankato, Minn., will be defendant in a suit for \$15,000 damages, received by Walter Voebeck, by having his hands caught in a pulley on a pole of the company. The boy's mother will also sue for \$2,000 for injuries received at the same time. A lineman fell from a pole of the company recently and broke two ribs.

The Home Telephone company, which operates a telephone line between Montgomery, Minn., and Le Sueur Center, has declared a 40 per cent. dividend.

Aris & Co. have completed a telephone line between Kettle Falls, Wash., and Meyers Falls.

A telephone exchange is being formed at Hoquiam, Wash.

Boone, Ia., is said to have more telephones in proportion to its population than any city in Iowa.

The Fort Dodge Telephone company has completed its exchange at Fort Dodge, Ia., and has it in operation. There are 250 instruments in use.

The Clearfield and Mount Ayr Telephone company reduced rates for business and residence telephone service \$3 per year, making them \$15 and \$12 respectively.

San Diego, Cal., and Livingston, Mont., are the extremes of telephonic connection, being 2,161 miles apart.

The Iowa Telephone company will establish an exchange at Montezuma, Ia., at once.

Merchants of Duluth are quite anxious that the Central Wisconsin Telephone company shall extend its wires to that city, as the trade in northwestern Wisconsin is being cultivated.

The new telephone company of Oskaloosa, Ia., will soon be connected with Des Moines and intervening points.

The Ottumwa (Ia.) Long-distance Telephone company is extending its lines to Bloomfield, Ia., by way of Keosauqua and Centerville.

There is talk at New Richland, Minn., of putting a new telephone line through that section next season.

The Audubon and Kimballton Telephone company has been incorporated at Audubon, Ia.

Mitchell, S. D., now has long-distance connection over the lines of the Western Electric Telephone company.

The Northwestern Telephone Exchange company made a proposition to the County Board at Winona, Minn., to furnish telephone service at the rate of 50 cents per month for each instrument in the court house. The company claims a list of 300 subscribers and offers a three-year contract at that rate. About 50 miles of new telephone wires have been

put up in Waukesha County, Wis., during the last year.

St. Paul is complaining about the telephone service rendered by the Northwestern Telephone Exchange company, and anxious inquiries are made for the Mississippi Valley Telephone company's promised exchange. The officers of the latter company say that they have been delayed in getting materials, but will have an exchange in operation by July 1st.

The county commissioners at Winona, Minn., rejected a proposition of the Northwestern Telephone Exchange company to place an instrument in the courthouse free of charge.

Chess contests by telephone are being planned at several points in Iowa.

The new telephone exchange at Fort Dodge, Ia., has begun operations with 250 instruments in use.

Experiments have been made on the wires of the Great Northern railroad at Crookston, Minn., with a view to using the same wires for telephone and telegraph. The experiments have been successful, and Larimore, N. D., and Crookston have talked together. Heavy induction coils and condensers were attached.

The Rocky Mountain Bell Telephone company has completed connection from Missoula, Mont., through Wallace, Idaho, to Portland, Ore.

The new telephone exchange at Manson, Ia., has been put in operation.

The Little Wolf Telephone company has applied to the council of Appleton, Wis., for a local franchise and proposes to put in an exchange with 200 subscribers.

Telephone connection has been completed between Armour and Edgerton, S. D.

The threatened litigation in the matters of the Perry Telephone company of Perry, Ia., has been withdrawn and the differences settled out of court. George Bandy is now sole owner.

The Crookston Telephone company contemplates a toll line from Crookston to St. Vincent, Minn., and another to Red Lake Falls and St. Hilaire, Minn., next season.

Mount Ayr, Ia., will vote March 29th on granting a franchise to the Iowa Telephone company.

A telephone exchange is being installed at Dyersville, Ia.

The Fairmont Telephone company of Fairmont, Minn., has declared a dividend of 17 per cent. on the year's business. The company has 148 instruments in use in Fairmont, 48 at Welcome, 21 at Sherburn, and has orders for 30 each at Lakefield and Heron Lake, Minn.

There is a rate war on at Chippewa Falls, Wis., between the Chippewa Falls Telephone company and the Wisconsin Telephone company.

The Interstate Telegraph and Telephone company has been incorporated at Lakeland, Minn., to connect Hudson and New Richmond, Wis., with the Twin Cities. Contracts are let for the work, and it will be rushed to completion.

The Chequamegon Bay Telephone company is arranging to lay a submarine cable from Bayfield, Wis., to La Pointe, on the bottom of the bay, and also a line to Madeline Island.

The Standard Telephone company of Waukon, Ia., declared a dividend on the last year's business of 20 per cent. The capital stock was raised from \$25,000 to \$50,000.

The Hanamo Telephone company, the Conway Telephone company and the Savannah Telephone company have been consolidated into what is known as the "Hanamo system," with headquarters at Marysville, Mo.

The Iowa County Mutual Telephone company has been organized to build a telephone line from Marengo, Ia., to Genoa Bluffs.

The council of Fremont, Ia., has passed an ordinance providing for the construction of a telephone line by a company of citizens.

The Mutual Telephone company of Des Moines earned \$28,860 during the last year and had expenses of \$12,065. The company will refund \$20,000 worth of eight per cent. bonds and float a six per cent. issue.

The council of North Mankato, Minn., has awarded franchises to both the Citizens' Telephone company and the Northwestern Telephone Exchange company. The former thought it should be given an exclusive right, as it is a home company and has forced a reduction in tolls, but the council did not see it that way.

Russia's New Telephone Line.

The official inauguration of the new telephone line between Moscow and St. Petersburg took place January 12th. The line alone cost 60,000 rubles (\$20,400). In the exchanges at all stations American telephone apparatus is used exclusively.

The telephone is gaining popularity in South Africa. The Cape Times says: "It is understood that the postal authorities have under consideration a proposal to connect the leading towns in the Eastern Province by telephone. The connection will be applied to Port Elizabeth, Graham's Town, King William's Town, East London and Queen's Town."

Cost of Telephone Service.

A commission composed of John W. Hulse, J. M. Wilson, A. S. Worthington and A. A. Birney of Washington, J. W. Farnham of Boston and C. D. Haskins of Chicago is engaged in taking testimony upon the cost of building, equipping, maintaining and operating a telephone exchange under conditions similar to those existing in Washington. The commission visited Detroit on Monday, came to Chicago the following day and will next appear at St. Louis and Pittsburg. Several witnesses were summoned to appear at the offices of the Western Telephone Construction company, Chicago, where the meetings were held, and they were examined under oath.

The appointment of this commission was the outcome of the controversy in Washington and the litigation growing out of the attempt to enforce the provisions of the law placing the maximum rate for service in the District of Columbia at \$50. The company contended that it could not comply with the terms of the law, and insisted on running the business in its own way. When it attempted to remove instruments where subscribers had refused to pay more than \$50, injunctions were taken out and criminal proceedings were instituted against President Bryan.

The Bell people say that an expenditure of \$100,000 will be required to install the necessary equipment to take care of the large number of subscribers that a cut in rates would bring them, and therefore they refuse to make the reduction.

The independent manufacturers contend that the requirements of Washington service can easily be met on a \$50 yearly rental basis, and in evidence of good faith they stand ready to take the franchise off the Bell company's hands any time the latter fears it is going to lose money at the prices mentioned.

Telephone War in Detroit.

[Special correspondence of the Western Electrician.]

Detroit, January 16.—The fight between the Bell and the independent telephone companies of the state has already opened, and the old concern has made the first move. Saturday the Bell company started advertising a rate of \$1 per month for house and \$1.50 per month for business one-way telephones. This means that the subscriber can call up any number in the directory, but cannot himself be called. Several telephones are placed on each line.

The Michigan Telephone company, which operates the Bell exchange, has a very nice contract to go with this offer. It provides for the use of the telephone at this rate for three years, with the direct understanding that if a regular telephone service is desired, the customer must use a Bell instrument. It is said the company secured several hundred orders within a few days.

As it is now, the Bell company's rates are \$1 below those of the Detroit Telephone company (independent) on house telephones and \$4 on office telephones, being \$24 and \$36 respectively. The officers of the Detroit company claim that the new move will not injure the independent company, as it has enough contracts on hand to keep running for several years yet, even though no new orders are taken. As a matter of fact, the Detroit company has more subscribers on its books, by one-third, than the old company.

Michigan Telephone Stock at 50.

It will be interesting to independent telephone men to learn that in spite of the pretensions of the Bell interests the value of Michigan Telephone company securities have greatly depreciated, and that the recent transfers were made on the basis of 50 per cent. of face value. It is understood in financial circles that the Erie Telegraph and Telephone company, which controls the Cleveland company and several other operating companies, purchased a large number of shares of the Michigan stock at the price mentioned from a Chicago capitalist. The gentleman in question has large investments in Chicago Telephone securities and other electrical enterprises and has held the Michigan stock for a long time, but finally came to the conclusion that it would be useless to wait longer for a return to its old value. Other Chicagoans, believing that this was a good bargain, accepted similar terms, and it is believed that more of the stock can be secured at the same figure if the eastern capitalists desire to purchase it.

Patent Office Decision.

A recent Patent Office decision on heavy current protectors will prove interesting to managers of independent exchanges. The suit at issue, which has been pending about two years, is an interference brought by Frank B. Cook, vice-president of the Sterling Electric company, and involves the broad patent No. 544,368, owned by the Western Electric company, to which it was assigned by F. R. Mc-Berty. The decision rendered is in the plaintiff's favor on every point. The protector in dispute is the one so largely used by Bell telephone companies, and more recently furnished independent companies by the Sterling Electric company of Chicago.

Southern Telephone News.

[From special correspondents of the Western Electrician.]

The Cumberland Telephone and Telegraph company of Nashville, Tenn., on reaching Port Gibson, Miss., with its long-distance lines, bought out the Claiborne Telephone company of that place. The Claiborne company was a small concern, having about 30 local subscribers and eight or 10 in the adjacent territory. It was preparing to extend its service to more local subscribers and to other points. For the latter reason, the Cumberland, apparently, bought it out.

The citizens of Greenville, Miss., are agitating the question of an opposition exchange. Nothing definite has, as yet, been done.

The Cumberland Telephone and Telegraph company, which is a Bell concern, continues its residence rate at 50 cents per month at Vicksburg, Miss., and has a considerable number of subscribers on these terms, thus enabling it to hold the business people at \$3 per month. The Citizens' Telephone company, however, is constantly gathering in new subscribers at standard rates, having about the same number of subscribers as the Cumberland, notwithstanding the cut rate of 50 cents for residences, which also applies, when necessary, to business.

The Brookhaven, Miss., company, an independent company, has just sold its local exchange to the Cumberland company, which had nearly reached that point with its long lines. The Brookhaven company had only a small exchange and was not especially successful, but as it occupied a good point (a county seat) for long-distance business it was desired by the Bell people. This deal will have practically no effect on the independent companies north and south of Brookhaven.

The Citizens' Telephone company of Crystal Springs, Miss., has recently added considerably to its out-of-town lines and to its local subscribers. It has one of the best constructed exchanges in the state.

The fight between the Cumberland (Bell) company and the People's (independent) company still continues with unabated interest at Jackson, Miss. The old concern offers the 50-cents-per-month rate to all classes, while the latter continues slowly to increase its already large list of subscribers at its original rates. On the Cumberland's recent attempt to resume collecting for business telephones at \$3 per month, all the wholesale grocers, save one, and all the retail grocers, save three, discontinued the service. The leading railroad and some other important connections also discontinued the Cumberland service.

The Canton, Miss., Warehouse and Telephone company is threatened with an opposition exchange by the Cumberland (Bell) company, the latter having lately completed its through lines beyond that point. At latest accounts the Bell exchange had not materialized, though some lines have been strung through the town.

The opposition exchange at Meridian, Miss., continues to sustain itself in open and active competition with the Cumberland company. It has been recently incorporated.

The T. J. Long telephone exchange of Athens, Tenn., will in the future be known as the Athens Telephone company. It will make extensions and improvements in the equipment and service.

Extensions and Improvements.

The Hughes Telephone company is building a telephone line from Hillsboro, Ore., to Astoria. It will be completed in a few weeks.

George Bush, assistant superintendent of the Oregon Telephone and Telegraph company, is completing arrangements for connecting by telephone all the inland towns of eastern Oregon.

Dr. Wood, the telephone man of Moscow, has numerous telephone lines projected, one of which will extend from Florence, Idaho, to Buffalo Hump, which will be constructed early in the spring.

Among the Illinois incorporations formed last week was the McLeansboro Telephone company, with capital of \$10,000, to equip and operate a telephone exchange. The incorporators were F. H. Stamper, R. A. Youngblood, C. C. Cantrell.

The Metropolis, Ill., Telephone company desires to be numbered among the faithful. It is pushing the independent telephone system at Metropolis, and its list of subscribers is constantly growing. The same company operates the exchange at Robinson, Ill.

A very neat directory of subscribers has been issued by the Mutual Telephone company of Shelbyville, Ind. It is arranged in convenient form and contains a very creditable list of patrons. Toll-line connections are furnished with other towns in the vicinity.

A contract has been made between A. W. Barrett and B. C. Haldeman of the Missouri and Kansas Telephone company and A. R. Urrea of the city of Mexico and W. W. Nelson of Kansas City, which is expected to result in the establishment in the city of Mexico of a police-telephone system.

The Rocky Mountain Bell Telephone company will connect Hailey, Idaho, with the long-distance telephone system. The line is proposed from the Utah and Northern Pacific railroad to Hailey. A line will be constructed from Boise to Canby Prairie, thence to Hailey, via the Gold Belt, then to the railroad at Blackfoot or Idaho Falls. Hailey will be the headquarters of the 300-mile line between the Utah and Northern and Boise. Construction work will commence shortly.

The Miami Telephone company, of which James T. Sanders is president and J. R. Dewy secretary, has just been organized in Miami, Fla., and will begin the work of installing a plant at once. The poles, wires, telephones and station equipments will be on the ground in a few days, and it is expected that the system will be in working order within the city limits by February 1st. The line will be extended to the suburban towns of Lemon City and Coconut Grove as soon as the money can be raised for the purpose.

The news that the Erie Telephone people will string a No. 8 circuit to the copper district, connecting Houghton with Chicago, Detroit, New York and Boston, is received with pleasure in the copper country. The Houghton office of the Western Union Telegraph company now does the third largest business in the state of Michigan, and the pressure is steadily increasing. Orders going from Houghton for purchases and sales of copper shares on the Boston Exchange range from 5,000 to 25,000 shares daily, and the daily average volume of transactions on the Boston Board for Houghton customers has probably averaged very nearly \$500,000 for the last two months.

The New Ulm Telephone company of New Ulm, Minn., has increased its capital stock from \$10,000 to \$20,000, and will commence building toll lines in the spring. To the present 50 miles will be added about 100 miles more, which will give the company connection with Tracy, Redwood Falls, Mankato, St. Peter, St. Paul and Minneapolis and all points on the Minneapolis and St. Louis railroad in Minnesota, connecting with most of the important toll lines in the state. The company is using copper wire only on toll lines, and it has put up only substantial lines. It now has 135 paying subscribers in New Ulm and small exchanges in Sleepy Eye and Springfield.

At the annual meeting of the stockholders of the Wood County Telephone company at Grand Rapids, Wis., A. L. Fontaine was elected president of the board of directors, T. A. Lipke secretary and F. E. Kellner treasurer. This is an independent company, working in opposition to the Wisconsin Bell Telephone company. It has been in operation for a little over 2½ years, with 200 instruments and 100 miles of line outside of the city, taking in all the surrounding villages. It contemplates building a line to Marshfield in the spring, which, with the connections that city will soon receive, will give the Grand Rapids (Wis.) concern connections with the whole Wisconsin valley. The Wood County Telephone company is said to be one of the strongest organizations of its kind in the state.

A visitor to the factory of the Victor Telephone Manufacturing company of Chicago would notice that during the last year remarkable progress has been made in increasing the output of the factory and improving the company's apparatus. The Victor company recently issued an artistic circular describing in detail the Victor switchboard apparatus

and its subscribers' outfits. One of the most recent improvements relate to the construction of the Victor drop coil. These drop coils are fastened with small lugs to the binding-post by crew, which extend into borings in the binding-post. The connections of the five jack and drop sections to the line circuits are made in exactly the same manner, thus doing away with all soldering inside the switchboard cabinet and enabling a drop coil to be removed and another inserted in 30 seconds, and a five-jack and drop section in one minute. The Victor company recently closed contracts for four boards with the Slate Belt Telephone company of Nazareth, Pa., a 200-drop board and all equipment for Mitchell, S. D.; a 200-drop board in Paxton, Ill., another in Bunceston, Mo., and a 400-drop exchange in Ashland, Wis. Manager Blaine State that the company's sales recently ran up to 1,200 drops and 900 telephones. As a consequence the company has just contracted for an additional floor space of over 10,000 square feet, which will give the Victor Telephone company one of the largest factories in the United States.

Opposition to Bell Service.

The prospects of competition in telephone service in Chicago have awakened considerable interest in the subject, and the Tribune has secured reports from other cities in which independent companies have been established. Following is a brief summary of the conditions, as reported:

In Detroit the Bell company charged a minimum of \$48 for residences and \$75 for business telephones two years ago. The average rate now is \$24 for residences and \$36 for business places. The new company, the Detroit Telephone company, began business two years ago and cut the rates to \$25 and \$40 respectively. The new company is giving fair service, which is expected to be improved. The company has 5,000 telephones in Detroit, while the old company has 4,000.

Indianapolis is the center of the opposition companies of the state. The new company first secured 3,000 subscribers, who signed contracts for three to five years' service, which is a larger number than the Bell company is now serving. The average rates of the Bell company are \$48 a year for residences and \$60 a year for business houses. The new company cut these rates. The opposition now extends to perhaps 30 cities in Indiana, all of which are being rapidly connected with the new central office in Indianapolis.

Fort Wayne has reaped considerable benefit from the war between the Central Union Telephone company and the Home company. In 1879 a telephone company acquired a perpetual franchise for certain streets, and it is under this franchise that the Central Union to-day works. Until 1896 this company had a monopoly. The rates charged were \$36 per annum for residences, \$48 for business houses. In 1896 the Home Telephone and Telegraph company, an independent concern composed of local business men, secured a 50-year franchise for the city streets. It agreed to place wires underground in certain districts, to give concessions to the city in the way of free telephones, to pay to the city two per cent of the gross receipts after January, 1900, to furnish telephones at a rate not greater than \$36 per annum for business houses and \$24 for residences, or at both place of business and residence, \$48 for both. This gave the residence telephones at virtually \$1 a month. The company began to operate in 1897, and the Central Union at once put instruments in business houses at \$24 per annum and residences at \$10. The Home company made no cut, but the people gave their support to it, and it was but a short time till it led in the number of subscribers. The Central Union finally put telephones in many residences and business places, charging nominally a rental, but collecting nothing, and thus the case stands. The Home company has more than double the subscribers of its competitor.

New Orleans' telephone service until recently was supplied by the Great Southern Telephone and Telegraph company, but that concern has been merged into the Cumberland Telephone company. Until five years ago the rates for business telephones were \$120 per annum. The residence rate was \$30 less. The business men threatened to organize an opposition company. This resulted in a reduction of rates for business telephones to \$96. About six months ago Detroit capital organized the People's Telephone company, which announced that it would give business telephones for \$60 and residence telephones for \$30. The Cumberland people met this cut, and the new concern announced a further reduction, which has also been met, and now both are offering business telephones to the community for \$3 a month and residence telephones for \$2.50 a month.

Rates in Cleveland have been governed largely by the introduction of what is known as the Cory line, which serves a number of subscribers, and can be secured in a residence at a minimum rate of \$1.50 a month. Every message, however, which is sent over a Cory line can be heard in every residence in which there are branches. The best telephones are not much cheaper than three years ago. Telephones for residences are little used. It is probable that the competition which the Home Telephone company, now the Cuyahoga Telephone company, promises when it becomes established will insure cheaper service.

New England Telephone Notes.

[From the Boston correspondent of the Western Electrician.]

The American Bell Telephone company has sold since January 1st, to Boston bankers, \$3,000,000 four per cent, 10-year debenture bonds, being part of an issue of \$10,000,000, of which one-half was disposed of, bearing date of July 1, 1898. This leaves \$2,000,000 to be issued.

Steps have been taken to establish a rival telephone company in Connecticut, to form the connecting link between Boston and New York, it is reported, some of the same people who are back of the new local enterprise being named in connection with a New Haven project. The same incorporators are interested in the Boston and New York Telephone and Telegraph company, which was incorporated in New Jersey about three weeks ago. The capital in the latter instance was given as \$1,000,000. The application of the Massachusetts Telephone and Telegraph company for permission to issue its first \$10,000 of stock has been filed with the commissioner of corporations.

It is announced that the American Bell Telephone company is considering the advisability of establishing its headquarters outside of Massachusetts. The laws of Massachusetts provide that no corporation shall contract an indebtedness beyond 50 per cent, of the par value of its stock. With a capital of about \$25,000,000, as at present, or even \$30,000,000, as it would have to be to meet the proposed extensions this year, the company is permitted to issue only \$12,000,000 or \$15,000,000 in bonds, although Bell stock is selling at nearly \$75,000,000. In moving to another state the share capital will, of course, be so arranged as to reduce the market price, dividends, etc. It is also said to be probable that stockholders will have a right to put money into their enterprise and take stock therefor.

There is a movement on foot to build a telephone line to connect with the Susanville line at Adin, Cal.

Chief Operator's Equipment.

The accompanying cut, Fig. 1, illustrates a very neat chief operator's desk that is being manufactured by the Sterling Electric company of Chicago. The chief operator's desk or toll board shown in the illustration is equipped for 20 metallic circuits. At the sides will be noticed a number of very convenient pigeon holes and other spaces fitted for the necessities of a busy operator. The switchboard proper is the usual Sterling board and is, as is now very generally known, made similar to the Bell apparatus.

Fig. 2 illustrates a very handsome 200-drop metal-

FIG. 2. CHIEF OPERATOR'S EQUIPMENT.—200-DROP METALLIC BOARD AT PONTIAC, ILL.

lic board that the Sterling company has installed at Pontiac, Ill. This board is fitted up with the Sterling company's improved type of Bell switchboard apparatus, and is the same as the standard Bell switchboard. The Sterling company says that it is exactly the same as a Bell board, as far as the ringing and listening key, the plugs, the cords and the pulley weights, which slide on guide wires; the

FIG. 1. CHIEF OPERATOR'S EQUIPMENT.—20-DROP METALLIC CIRCUIT, TOLL AND CHIEF OPERATOR'S DESK AT LAFAYETTE, IND.

drop-ringing arrangement and the transmitter support are like the Bell, and also the arrangement for wiring in the cabinet work. The chair and cabinet work for this switchboard are of a pattern that was especially designed by Chief Engineer Cook, of the Sterling company, when he held the same position with the Bell company as he does with the Sterling.

Underground Electric Road Proposed for Chicago.

To secure factory terminal facilities in Chicago the Wisconsin and Inland Lakes Railroad company, which was organized to build an electric railroad from Chicago to the lake region of Southern Wisconsin, to carry both passenger and freight, proposes to lay its tracks in underground tunnels

in the city. The ordinance giving the necessary franchise is pending in the City Council. The route proposed is from a terminal station at State and Fourteenth streets underground to another station at North State and Kinzie streets, thence by a curvilinear route to Huron and Wells streets, thence, diverging to a point at about Franklin street, to Clybourn avenue, and thence to Center street, where the tracks cross to the West Side. It is proposed

at any height, without removing the wire from the poles, and does not interfere with the operation of the wire.

Electrical Ventilating Plant.

In the accompanying cut is illustrated an interesting installation of a single-phase alternating-current motor in a ventilating plant in St. Louis. The mo-

ELECTRICAL VENTILATING PLANT.

to run a branch from the Bloomingdale road out Western avenue to the northern limits of the city. President Case has promised aldermen who have discussed the matter with him that the tracks shall be underground in all parts of the city east of Pa-

tor was manufactured by the Wagner Electrical Manufacturing company, and is a standard type of this class of machines. In this special application a 20 horse power motor is belted to a 72-inch Sturtevant blower. This class of work opens a great field for this type of motor. It is also a character of work which the motor will be called upon to perform in operating pumps. The starting load comes on gradually, increasing to the full operating load as the combination approaches full speed. No trouble whatever is experienced in starting with the full blower opening.

Chicago Street-railway Affairs.

At last week's meeting of the Chicago City Council Alderman Kimbell made a new attempt to give the local street-railway companies the long-

INSULATED WIRE WEATHERPROOFING MACHINE.

desired extension of franchise under the much-discussed Allen law. The proposed ordinance would extend all the franchises until December 31, 1906. By a vote of 33 to 27 it was buried by reference to the city hall committee. One alderman remarked that while the members of the Legislature were tumbling over one another to repeal the Allen law, under which the ordinance proposed would be operative, the time was most inopportune for any legislation by the council.

A novel petition was received by the aldermen from H. W. Duncanson of 1076 Fillmore street, a real estate dealer, and Lamson Bros. & Co., a Board of Trade firm. The petitioners claim to represent \$35,000,000 of capital in Chicago and New York, and offered on behalf of the syndicate to buy the street-railway properties and franchises of Chicago lines as quickly as the latter expire, and name the terms on which they will agree to operate all street cars as one system for twenty-five years. Universal transfers are to be given throughout the city from one division to another. The regular fare is to be five cents for a single trip in one continuous direction, but 10 tickets can be bought of conductors for 30 cents, good between 5 and 7 o'clock at night and 6 and 8 o'clock in the morning for all persons. The syndicate will agree to pave and keep in repair 16 feet in the center of

cific Junction. A good rate of speed in the tunnels is promised.

Insulated Wire Weatherproofing Machine.

Lewis & Buehl of Sycamore, Ill., are putting upon the market the entirely new machine illustrated. Every person interested in insulated wire is asked to take time to thoroughly investigate its merits. It is a well-known fact that the life of insulated wire depends upon the compound used to preserve the cotton from atmospheric changes. This machine allows the use of slow-drying soft insulating compound, and it gives the wire a thorough coating. The machine is simple in construction and does its work quickly, easily and at a moderate cost. It applies the compound to any sized wire or cable

the street where there is a double track and eight feet where there is a single track. The city is given the right of purchase at the end of the twenty-five-year franchise, the price to be fixed by five appraisers. This petition was also referred to the city hall committee.

Alderman Alling secured the reference to the finance committee of an ordinance creating the position of street-railway expert, to be appointed by the mayor, at a salary of \$200 a month, to collect statistics and other information, the expert to hold the office during 1899.

INDUSTRIAL COMBINATIONS.

The General Electric company of Minneapolis has been incorporated under the laws of New Jersey, with a capital of \$2,100,000. It succeeds a company of the same name, and the articles provide for doing business in every line of electric utility and in all parts of the world. It has been rumored that it is to be the "starter" for an electric combination which should include a large number of electric-light and street-railway companies. The officers of the company say that it simply means that some of the local stockholders have sold their holdings and new capital has come in.

The North Hudson County Railway company, which, starting from the Hoboken ferries, controlled the surface roads tapping all the northern part of Hudson County, N. J., has passed under control of the North Jersey Street Railway company, and the chain of electric railroads through the northern part of New Jersey is now practically complete. The North Jersey company has now swallowed up almost every one of the important existing lines in Hudson, Essex, Passaic and Union counties. It is said that the North Jersey company paid the three controlling owners something in excess of 160 on stock purchased at about par.

The Boston Light, Heat and Power company, which recently secured the Clinton, Mass., Electric Light company by purchase, is looking over the plant of the Spencer, Mass., company, and is also said to be negotiating for the Portsmouth, N. H., company's plant. The absorbing corporation, which had secured a number of other plants prior to getting possession of the Clinton establishment, is capitalized at \$2,000,000, and George F. Blake, president of the Blake Pump Manufacturing company, is at the head of it. Among its acquisitions are the Milford and Lowell plants in Massachusetts and the electric-light plant in Easton, Pa.

Very interesting reading is furnished by the "Trust Extra" of the India Rubber World of New York. The story of the relations of the proprietors of that journal to the promoters of the proposed rubber trust and also to each other forms an interesting and instructive episode in American business life. The narrative is too long to be given here, but as the India Rubber World—of which, by the way, Mr. John R. Dunlap of the Engineering Magazine is chief owner—has adopted an attitude of "outspoken opposition to the formation of the trust proposed," it is to be presumed that the "Trust Extra" will be sent to any applicant.

A Chicago daily newspaper prints a special dispatch from New York in which these statements are made: "A trust craze seems to have developed. In dozens of important industries men are traveling and telegraphing and telephoning to bring about consolidations of competing concerns. A table compiled by a local paper gives 92 trusts formed during 1898, and embracing every department of industry. Their aggregate capitalization is shown to be \$1,292,749,200, of which \$957,957,300 is common stock and \$334,791,900 preferred. Their bonded indebtedness will increase the total to over \$1,500,000,000. The total value of the United States wheat crop of 1896 is placed at \$310,602,530—less than one-third of the capital of the 1898 trusts."

The new National Carbon company has now, it is said, bought out the Globe Carbon company of Ravenna, O., and the Solar Carbon company of Pittsburg, the last two carbon manufacturers in the country not previously included in the combination. It is stated that of the \$4,500,000 preferred stock \$2,500,000 will be allotted to Chicago interests, including the electrical industry as well as financial circles. Cleveland and St. Louis take the balance. The entire amount was oversubscribed about \$2,000,000. The Chicago Tribune says: "The new company is unique in that it is an organization which controls not only all the producers of carbon in the United States, but it also embraces the big buyers of carbon. Nearly all the big electric companies, both power and light, of the United States are directly interested in the new company through their officers. It has the friendly co-operation and support of the capital interested in the electrical industries of the country." The new company is now incorporated. In addition to the gentlemen named as directors in the Western Electrician of last week are the following named: Hugh H. Hamill, Trenton, N. J.; A. M. Young, Brooklyn; John S. Bartlett, Boston, and A. J. Eddy, Chicago. The officers are: President, W. H. Lawrence; first vice-president, James Parmelee; second vice-president, E. D. Dickey; secretary, H. E. Hackenberg; treasurer, James Parmelee.

Necessity of Using Reasonable Care in Crossing Railway Tracks.

Mrs. Johanna Hickman recently obtained a verdict of \$7,500 for personal injuries against the Nassau Electric Railroad company of Brooklyn. She alleged that she was crossing Fifth avenue and Ninety-first street in the afternoon and looked each way and saw no car. She said, according to the New York Sun, that she wore an old-fashioned sun-bonnet that projected from her face, and that after she started to cross the street she made no effort to look either way. Other witnesses testified that the car was in sight. The decision was appealed, and the Appellate Division of the Supreme Court in Brooklyn reversed the verdict and ordered a new trial. Justice Woodward, who wrote the opinion, says:

"That the plaintiff has failed to meet the requirements of the law in establishing a lack of contributory negligence seems to us too plain to be disputed. To hold that a woman, 56 years old, in good health and the possession of her faculties, with an unobstructed view of a street-railroad track for a distance of several blocks, has met the obligation resting upon her of exercising reasonable care when she has glanced up and down the street from the sidewalk and then, with no further exercise of her faculties, walks slowly and deliberately upon the track, with an approaching car fully in view, with its bell ringing, is absurd. * * * The plaintiff had no right to assume that the car would be in such control that the motorman would be able to protect her against her own negligence. Nor was the motorman bound to assume that the plaintiff, in broad daylight, would continue to advance until she should be in a position of danger. * * * It is not enough that the plaintiff should merely look in both directions; she must look for the purpose of seeing if there is danger; and if her rate of progress in passing over the danger point is so slow that a car in traveling at a reasonable rate of speed may be reasonably expected to have come within view, and in such a position as to cause danger, she is not excused from the duty of using her eyes because she may, at some previous time, have discharged this duty. Plaintiffs have some duties to perform, and it is not proper that a jury should be allowed to speculate on the question of damages where the plaintiff has failed to show a compliance with the reasonable requirements of the law and that she has been free from negligence contributing to the accident."

National Electric Light Association.

The 22d meeting of this association will be held in New York, May 23d, 24th and 25th. Headquarters will be established at the Murray Hill Hotel, Fortieth street and Park avenue, where accommodations can be had on the American plan at \$3.50 and upward per day; on the European plan, \$1.50 and upward per day, according to room.

The Electrical Exhibition company will hold an exhibition at Madison Square Garden during the month of May, under the auspices of the association and in connection with the meeting.

Thawing Frozen Ground by Electricity.

Mr. Nelson Graburn, electrical engineer of the Montreal Street Railway company, has obtained a patent for a process of thawing frozen earth by the passage of a current of electricity. A syndicate with a capital of \$125,000 has been formed in London to exploit the process in the mining regions of the Klondike. The plan is to use the heat of a resisted electric current, instead of bonfires or heated boulders, in the shaft to thaw the ground. By this electric system it is claimed that almost all the heat energy can be applied just where it is required, without the great loss consequent upon other methods by radiation.

CORRESPONDENCE.

New York Notes.

New York, January 16.—Your Joseph Leiter seems to be largely interested in the International Air Power company and the New York Auto-Truck company, which were incorporated in New Jersey on Saturday. These two companies are authorized to manufacture, buy, sell and deal in compressed air, electrical machinery and apparatus, locomotives, engines, trucks and cars, and to manufacture all machinery for the supplying of electric, compressed air and other motive powers. It is said that the International company will manufacture the apparatus and that the Auto-truck company will use it in New York and elsewhere. The idea is to operate vans for heavy cartage traffic by compressed-air motors. Mr. Joseph H. Hoadley, an incorporator in both companies, is credited with this statement: "The auto-trucks are simply a localization of the railroad in force and hauling power. Take your average trucking wagon, which is six feet in length. Add another six feet for the team, and you have a hauling capacity of two tons to 12 feet. The auto-trucks are six feet in length, with a hauling capacity of eight tons. It's an easy proposition for a trucking man. The speed of the auto-trucks would be governed simply by the conditions. In round numbers there are 150,000 horses used in the

trucking business in the borough and Brooklyn. There were 10,000 horses used in this city on the street-car lines. Those horses were supplied by motive power and the system capitalized at \$200,000,000. At the same proportion a system which supplanted the use of 150,000 horses ought to be capitalized at 15 times as much. No explanation is made of the reference to electricity in the incorporation papers.

Joel C. Clark, secretary of the New York and New Jersey Telephone company, died at his home in Brooklyn on Wednesday morning last. Mr. Clark was born in Hallowell, Me., in 1842, but moved to Massachusetts early in life. He came to New York some years ago and became interested in the telephone business. He was one of the incorporators and a director of the New York and New Jersey Telephone company and of the New York and Pennsylvania Telephone and Telegraph company. At the time of his death he was secretary of the former organization and treasurer of the latter. Mr. Clark was a man of much culture, and had been a contributor to several magazines. A widow, five daughters and two sons survive him.

One of the papers prints a story about the transportation of freight over the trolley lines in Brooklyn. With the consolidation of the surface railroads it is thought to be practicable to operate electric freight cars at night for the benefit of manufacturers in the transport of goods, for the contractors who remove household ashes and refuse and for other purposes.

On the organization of the Legislature the speaker of the Assembly announced the following-named committee on electricity, gas and water supply: Messrs. Witter of Tioga, Fordyce of Cayuga, Hatch of Steuben, Brennan of Kings, Evarts of Orleans, Sloane of Schuyler, Appar of Westchester, Beebe of Essex, Sprague of Sullivan, McKeown of Kings, Kelly of Albany, Fitzgerald of New York and Gale of Queens.

An important decision was handed down at Albany January 10th by the Court of Appeals in the case of Oliver Ingersoll against the Nassau Electric Railroad company, in which the plaintiff sought to restrain the company from using the tracks of the Atlantic Avenue Railroad company on Bergen street, on the ground that a constitutional amendment of 1874 made the consent of the abutting property-owners a prerequisite to the operation of a surface railroad on the streets of a city, even though the cars were run upon the tracks of another line. The court refutes this contention, and holds that the act of 1839, which authorizes one railroad corporation to contract with another for the use of its road, is in full force and effect to-day. The opinion of Chief Judge Parker is concurred in by all the judges except Judge Vann, who dissents. Judge Parker says, in part:

"The constitutional amendment of 1874 was an attempt to place restrictions on the legislative power, but so far as the act of 1839 is concerned this constitutional provision had reference only to the building of new roads and the acquisition of new franchises. It aimed not at the destruction of vested rights such as the Atlantic Avenue railroad had acquired, either directly by overthrowing the statute or indirectly by compelling the assignee under the contract to obtain the consent of the abutting owners. Such consent was in fact given when the abutting owners first consented to the building of the railroad, for the consent was naturally given in the presence of a statute declaring that the franchisees would permit the corporation to contract with another corporation for the use of its road.

"If, then, it be true, as we shall attempt to show later that it is not, that the Legislature has since the constitutional amendment of 1874 attempted to deprive the Atlantic Avenue Railroad company and other surface railroad corporations similarly situated of a valuable part of their franchises, such legislation is unconstitutional and void. Salability is an essential element of property, and the destruction or diminution thereof is a taking of property that cannot be done except through the exercise of the right of eminent domain or of the police power. The salability of the property right in question is affected and its value diminished, if not destroyed, if the assignee thereof cannot make use of it without the consent of the abutting owners. It seems very clear to us that there is no statute that has for its purpose the cutting down of railroad franchises so as to eliminate therefrom the statute of 1839, which allows the contracting of one railroad company with another for the use of its road without acquiring anew the consent of the abutting property-owners thereto."

The court explains that the question here presented did not appear in the Kingston Colonial City Traction case, and that this is the first time it has been passed upon by the Court of Appeals of New York.

A man giving the name of Samuel Johnson was arrested in Newark last week for tampering with electric meters. He wired a shunt around the meter so that only a portion of the current consumed was measured. The arrest revives the question, Is electricity something that may be stolen? Philip N. Jackson of the Electric Light company said that it was proposed to make an example of Johnson, if possible, but that there was no special statute applying to tampering with electric-light wires and that they would have to prosecute him under the common law.

Northwestern Notations.

Minneapolis, January 16.—The electric-light company of Iowa City, Ia., has finally agreed to accept \$72.50 per light per year for a term of five years. The City Council contemplates submitting to popular vote the matter of a municipal electric plant.

Cedar Falls, Ia., voted an amendment to the franchise of the Cedar Falls and Normal Railway company by extending it five years, making it 25 years.

The big electric plant, operated by water power from Canyon Ferry, near Helena, Mont., has been put in operation. It is the hope of the company to extend wires to Butte, 40 miles, where the immense smelters can use all the power available. This will be done if the loss of power will not be too great for profit. It is estimated the cost of treating ore by this power will be reduced from \$2 to 75 cents.

The Citizens' Traction company of Oshkosh, Wis., may have trouble in getting into Neenah. The officials of that place demand that a car line be built to Riverside Park, and decline an entrance except on that basis.

The state Supreme Court has granted a rehearing in the matter of J. C. Flynn against the Electric and Water company of Little Falls, Minn. The question at issue is the reasonableness of a 30-year contract, which the council entered into.

The Gas and Electric Light company of Council Bluffs, Ia., has been sold under foreclosure proceedings. It was bought by a reorganization committee.

The Tri-city Railway company of Davenport, Ia., has made improvements to its schedule recently.

It is currently reported that Toledo, Ia., capital has purchased a controlling interest in the stock of the Toledo and Tama (Ia.) street-car system.

The electric-light system of Springville, Ia., has been completed and put in running order.

Fonda, Ia., contemplates a municipal electric plant.

The Centerville, S. D., electric-light plant is rolling up a monthly deficit of \$150, and the taxpayers are complaining.

The council of Albert Lea, Minn., has appointed a committee to report on the cost of a municipal electric-light plant.

The street-railway company of Dubuque, Ia., recently yielded to the demand of the city for a payment of its share of the paving tax for all streets north of Tenth, amounting to \$3,500.

The Water company of Davenport, Ia., has just installed a very complete electric-light plant for lighting its station.

The Waterloo and Cedar Falls Rapid Transit company, operating between those cities in Iowa, has leased all its property to the Cedar Falls and Normal Railway company. As the ownership of both companies is the same, the change is but nominal.

The electric-light plant at Warrens, Wis., has been completed and put in operation.

Fonda, Ia., will vote on January 23d on granting a franchise to a local company for electric lighting.

It is reported that the electric car line between Mason City, Ia., and Clear Lake will be extended to Fertile, and make a loop back over the present steam-car tracks to Mason City.

An electric-light plant will soon be installed on Government Island, at Rock Island, Ill.

The council of Albert Lea, Minn., has appointed a committee to ascertain the cost of a municipal electric-light plant.

A number of capitalists of St. Croix Falls, Wis., contemplate building an electric line to Balsam Lake, Wis., the new county seat.

The Mitchell Electrical company of Mitchell, S. D., has been incorporated, with \$75,000 capital stock.

Malcolm McDougall has been granted a franchise for a standard or street-car line, between Seattle, Wash., and Tacoma. Whether he proposes to use steam or electric power is unknown.

The electric-light plant at Red Lake Falls, Minn., is completed and in operation.

The change in the car line from Sioux City, Ia., to the suburb, Leeds, is giving the best of satisfaction. The line is shorter and has less curves.

The perennial rumor of an electric line from Minneapolis to Lake Minnetonka is again in evidence. The Twin City Rapid Transit company now has a line as far as Hopkins. The Great Northern railway has a line from Hopkins to Excelsior, on the lake, which it is about to abandon, owing to a change of route. The plan, as now announced, is for the street-railway company to equip the railway track from Hopkins to Excelsior for electric traction, and the deed is done.

L. A. Nixon was arrested at Blue Earth City, Minn., charged with tampering with the electric-light wires belonging to the city. He was bound over to the grand jury.

A bill has been introduced in the Minnesota Legislature providing for the execution of murderers by electricity.

An electric air compressor has been put in operation at Rockland, B. C., at the Mascot mine. It is said to be the first electric motor ever used for operating an air compressor to work satisfactorily.

Mayor Patzer of Bismarck, N. D., and others are interested in a project to construct an electric car line in Bismarck, to run between the Sheridan House and the capitol building.

A capitalist has been looking over the falls at Red Lake Falls, Minn., with a view to developing the power and transmitting it electrically to Grand

Forks, N. D. The cost of the plant would be about \$70,000.

Canton, S. D., has just had an electric-light plant put in operation.

J. E. Clarey, formerly editor of the Saturday Review in Des Moines, Ia., has been successful in a case involving the payment of \$1,000 to secure the silence of his paper for one issue. The manager of a local electric-light plant is said to have paid that sum for the silence of the paper on the gas question. The paper complied, but the editor appeared before the council and stated the money had been paid him for his silence. The court holds that he is entitled to keep the money.

The Great Northern Railway company is considering the feasibility of operating its trains through the Cascade tunnel in Washington by electricity. If it is concluded to use this power, the distance from Leavenworth, Wash., to Skykomish, Wash., 65 miles, will be so operated. Power would be obtained from the falls in Tumwater Canyon.

Perham, Minn., has just installed an electric-light plant, and finds that there are practically no wires strung for furnishing private houses with light. Additional wires will be stretched, covering the residence portion.

The city of Eau Claire, Wis., awarded the electric street lighting to the Eau Claire Light and Power company.

Another election will be held at Humboldt, Ia., to vote on a franchise for the Electric Lighting and Power company.

The Eighth street motor line in Dubuque, Ia., has been ordered sold in March by the United States court. The property involved exceeds \$100,000 in value. It is understood to be the intention of the present company to buy it in, as the remainder of the system would be useless without it.

The council of Missoula, Mont., has decided that the purchase of the electric-light and water plant by the city is too expensive, and the present company is furnishing service at reasonable figures.

The District Courts in Duluth and Superior have issued an order to permit street cars to be run over the Duluth-Superior bridge between the two cities. They have been doing so for some time, but this is an order to the assignee of the bridge company to continue the arrangement. M. S. P.

New England News.

Boston, January 16.—The Lynn and Boston Railroad company, which operates a surface line by electricity between Boston and Lynn, via Chelsea, asks for authority to increase its capital stock to the extent of 9,603 shares, and a hearing will be given by the railroad commissioners on the petition.

The Boston Elevated Railway company is fighting competition on the part of the West Roxbury and Newton road, which may eventually be extended toward the city proper and parallel the big concern's routes to Boston from that section.

The Tremont street tracks, which were removed when the subway was finished, have been greatly missed, and there are many petitions for their reinstatement. The matter will come before the Legislature, inasmuch as an order for their removal was attached to the original subway act, and it will require legislative sanction for their restoration. It is believed that Boston transportation facilities require the addition of the removed tracks already, so rapid is the growth of the business, to say nothing of the demands of the public for convenient car service.

The severed ends of the Anglo-American cable, which was broken off Cape Cod during the great gale last month, have been picked up by the cable steamer and reunited.

The first cars over the Norton and Mansfield electric road were run last month. This is interesting because the new line completes, with only one exception, the Bristol County system of electric lines centering in Norton, Mass. The Taunton, Mansfield and Attleboro lines are now in active operation, and the Mansfield and Easton line will be operated by spring.

A verdict of \$3,000 has been awarded against the Boston Gas Light company by Wolf Koplan, plaintiff, for injuries sustained by an explosion in the subway on March 4, 1897. This is the first of a long series of cases arising from the explosion, a test case, on which suits for \$1,000,000 have been entered. The gas company will take the case to the Supreme Court on exceptions.

The fortieth annual report of the railroad commissioners of the state of Maine shows that there has been an increase during the last year in the street-railway mileage of the state amounting to 2,572 miles. The number of passengers carried on the entire street-railway service was 14,651,161. Gross earnings for the year were \$862,885.64, and operating expenses \$613,396.42, making the net earnings nearly \$250,000. The most important extension of the year was between Lewiston and Bath, a distance of about 26 miles. J. S. B.

PERSONAL.

E. S. Lea, general manager of the Lea Manufacturing company, Elwood, Ind., was in Chicago this week.

E. Kuhlman, manager of the Kuhlman Electric

company, Elkhart, Ind., was a welcome visitor in Chicago electrical circles last week.

Mr. H. C. Eddy, well known to the electrical trade, is looking after the interests of the Buckeye and Jandus Electric companies in the territory under the jurisdiction of the Chicago office of these companies.

S. B. Way has resigned his position as construction engineer for the Electric Storage Battery company of Philadelphia to accept the position of chief electrician for the Imperial Heat and Light company of St. Louis, Mo.

Stanley A. Jones of Jones & Winter, St. Paul, was in Chicago early in the week. Mr. Jones is particularly interested in telephone construction work, and he says that independent companies are making great gains throughout the Northwest.

NEW INCORPORATIONS.

The Sangamon Electric company has been formed at Springfield, Ill., with capital stock of \$10,000, to manufacture electrical appliances and machinery, by Thomas F. Sheridan, Thomas B. McGregor and Frank G. Howser.

The South American General Electric Supply company of Schenectady, N. Y., has been formed for the purpose of buying in the United States and selling in South America electrical apparatus. The capital is fixed at \$50,000, and the directors are S. D. Greene, H. W. Darling, D. Mazenet, J. R. Lovejoy and M. F. Westover.

The Havana Electric Railway company, with \$7,000,000 capital, was incorporated at Trenton, N. J., January 7th. Its objects are to manufacture and sell electric power and sell gas in the West India islands, and to operate railways, cables, telephone and telegraph lines, light cities, towns and buildings, deal in real estate, engage in mining, smelting and refining, operate steamships and build and operate reservoirs and sewers. The principal offices of the company will be at Asbury Park, N. J., with Albert C. Twing as agent. The incorporators are W. P. S. Melvin of East Orange, G. K. B. Wade and Herbert A. Howell of New York. It is understood that the company is formed for the specific purpose of acquiring the street railways of the city of Havana.

ELECTRIC LIGHTING.

The need of an improved system of electric lights is being urged for Milton, Ore.

The village of Charlevoix, Mich., has purchased the Charlevoix electric-light plant, and will run it in connection with the water-works.

The Redwood City, Cal., Council has voted in favor of the proposition of submitting to the people the matter of raising funds for an incandescent-light plant. It was decided to raise \$8,000.

In Portland, Ore., the water committee of the City Council has resolved that the recommendation of the construction committee be adopted for the city of Portland owning and operating its own plant for the purpose of lighting the city. The construction committee was authorized to lay before the committee a form of contract for purchasing and installing a plant to light the city.

ELECTRIC RAILWAYS.

It is rumored that an electric line will be built from Grand Rapids to Kalamazoo, via Gull Lake, next spring.

An attempt is being made by an English company to secure a concession to build an electric wire-rope railway from Aosta, in Italy, over the Great St. Bernard to Martigny, in the Rhone Valley. The cost is estimated at \$2,895,000.

The Citizens' Street Railroad company of Indianapolis has filed with the Supreme Court a motion for a rehearing in the case in which it was recently decided that the company's charter would expire in January, 1901, and that the charter granted to the City Railway company would become operative on that date.

Work has begun on the inclined extension of the Lake Street elevated railroad of Chicago. The tracks will descend to the street level on an incline about half a mile long. Trains will be run out to Harlem and compete with the suburban service of the Chicago and Northwestern Railway company for the business of Oak Park and Austin.

The Westchester (N. Y.) Electric Railroad company has certified to the following proposed extension of its lines: In the village of Pelham Manor, on Pelhamdale avenue and Boston turnpike, from the old Boston post road to the New Rochelle boundary line; also along Pelhamdale avenue and the Shore road to the New Rochelle boundary line, and also along the Boston turnpike from Pelhamdale avenue to the New Rochelle boundary line.

A petition has been filed in court on behalf of the bondholders for the appointment of a receiver for the City Electric Railway company of Decatur, Ill. The receiver will probably be W. L. Shellbar-

ger, secretary and treasurer of the company. The holder of the trust deed is the National Trust and Savings Bank of Chicago. The capital stock of the company is \$300,000; bonded indebtedness, \$175,000; interest due since March 1st last, \$6,750. Falling off in earnings and assessments for street-paving improvements are among the causes assigned for the interest default.

A newspaper dispatch from Tacoma, Wash., states that John D. Rockefeller's agents at Everett, in that state, are preparing to build one of the largest electric plants on the Pacific coast. Its purpose will be to furnish power to operate the Everett and Monte Cristo railroad, 65 miles long, standard gauge, owned by Mr. Rockefeller, and chiefly carrying freight, together with the Everett street railway and half a dozen large Everett industries which Mr. Rockefeller controls. These include nail works, the largest paper mill on the coast, a smelter and the city lighting plant, besides a big concentrator at Mr. Rockefeller's Monte Cristo mines. It is estimated that the saving in the cost of power will pay for the electric plant in three years.

TELEGRAPH.

The Western Union Telegraph company is stringing a wire eastward from Los Angeles on the Southern Pacific. The workmen have reached Maricopa Junction, and will run a loop over the Maricopa and Phoenix railroad to Phoenix, Ariz., after which they will continue their way eastward.

The International Cable Directory company announces that the second edition of the "Western Union Telegraphic Code" will be issued on or about March 1st. This code differs from all others that have preceded it in the fact that it is on file in leading Western Union Telegraph offices and in hotels and other public places on both sides of the Atlantic, thus making it to all intents and purposes a universal code, while preserving all the conditions of secrecy required by users of codes. The book has been adopted by the United States War Department and by the commissioners to the Paris Exposition of 1900.

POWER TRANSMISSION.

The Portland Oregonian says that so great is the demand for cheaper power at Murray that a project has been considered of generating electricity at Thompson's Falls, Mont., and bringing it by wire as far as the big concentrators on the South Fork and Canyon Creek.

A report from Los Angeles explains that "although the drought of the last year has been disastrous to mining interests and will reduce the state's output of gold by many hundreds of thousands of dollars, a few of the big properties have been able to keep their production up to their usual amount. It has caused the increased development of water in many districts and has induced many mine owners to supplement water power with electricity, so that it has been of some benefit in leading to an increase in the means of production."

PUBLICATIONS.

A small pamphlet, issued by the Western Electric company, gives directions for the trimming and general care of that company's enclosed arc lamps. The booklet is of convenient size for the pocket.

The Western Electric company of Chicago and New York has recently issued bulletin No. 12, T. B. L., descriptive of a tile bolt and lock and also a screw bracket. The two devices are much in demand. A copy of this bulletin will be mailed to anyone upon application.

All the literary productions of the Joseph Dixon Crucible company of Jersey City, N. J., are well written and well printed; they have also an air of sincerity and the art of being interesting. One of the latest is a little four-page paper, Graphite, of which two numbers have appeared. It is frankly devoted to the interest of the Dixon company; there is no dissimulation about it, and it is worth reading. A recent pamphlet from the same source is entitled "Pencilings." It is well illustrated and describes the different kinds of Dixon lead-pencils.

A very handsome brochure, fully sustaining the reputation of the General Electric press, is that on "Thomson Recording Wattmeters," issued by the General Electric company of Schenectady, N. Y. Aside from a general introduction and an index, the pamphlet is divided into three parts—"Illustrations and Descriptions of Meters," "Complete List of Standard Meters," and "General Information Regarding Meters." The work shows evidence of careful compilation and should be valuable to engineers and managers. It will be sent on application to the company publishing it.

The twentieth annual number of The Tradesman of Chattanooga, Tenn., dated January 1st, is an especially valuable issue of this excellent periodical. The Tradesman devotes itself particularly to the development of the industries of the South, and the bulky annual is packed full of articles written by practical men and showing the industrial prog-

ress of that section of the country. Mr. A. S. Heywood of Atlanta contributes one on "The Progress of Electrical Development," indicating the electrical plants of the South installed or extended during the year 1898. In every way the Tradesman annual is creditable to its publishers.

A very convenient vest-pocket memorandum book, bound in celluloid, is issued by Baker & Co., the platinum refiners of Newark, N. J. The cover is adorned with a handsome representation, in colors, of a draped American flag. Under this design is the firm's card and a few words relating to the pamphlet, "Data Concerning Platinum." Otherwise, there is no advertising matter in the book.

The National Association of Manufacturers of Philadelphia has issued an American Trade Index, a descriptive and classified directory of manufacturers engaged in export trade, which has been published for foreign circulation. This directory comprises one feature of the practical work that is being done by the National Association of Manufacturers in the extension of foreign trade of the country. It contains an alphabetical list of members and a classified list, the registered cable addresses of members and particulars of cipher telegraphic codes. The association contains about 1,000 members, comprising the leading manufacturers of the country.

A graduates' magazine, The Technology Review, has just been issued by the recently organized association of class secretaries of the graduates of the Massachusetts Institute of Technology. It is an octavo volume of 140 pages, attractive in appearance and of the best workmanship. The cover, designed by Hapgood and printed on army brown paper, is handsome. The first number contains the announcement, a portrait and biographical sketch of President Crafts, articles on "The Function of the Laboratory," by Professor Silas W. Holman, and on the "Pierce Building," by Professor Eleazer R. Homer, the architect, reprints in fac-simile of early Institute documents and letters—all in the first and more general half. The latter half, seventy pages, is given to news of the Institute, of the undergraduates and graduate classes. Plans are shown of the several floors of the new Pierce building, of the first floor of the Rogers building as now altered, and of the dynamo house. There are two half-tone inserts and two line-drawings, one by Gelett Burgess. An excellent review of Professor Holman's recent book on "Matter, Energy, Force and Work" is given by Dr. Goodwin.

ELECTRICAL SECURITIES.

The Brooklyn City Railroad company has declared a quarterly dividend of 2½ per cent. and an extra dividend of one per cent.

The annual statement of the Chicago General Railway company shows receipts from passengers of \$17,294, and from miscellaneous sources of \$2,444.95, making a total of \$19,738.95. The expenditures were for maintenance \$11,732.73, transportation \$39,763.33, general expenses \$8,076.67, fixed charges \$55,202.01, total \$114,774.74; leaving a net gain of \$4,964.21.

The North Shore Traction company reports gross earnings for November of \$103,488, a decrease of \$1,994 as compared with the same month of the previous year, and net \$30,658, a decrease of \$6,231. For the two months ended November 30th the gross earnings were \$227,534, a decrease of \$232 as compared with the corresponding period of the previous year, and net \$84,654, a decrease of \$2,630.

The directors of the General Electric company have declared the first dividend of \$3.20 on the preferred stock of the company as reduced. They have also declared a dividend of \$11.66 2-3, applicable to the unpaid accumulated dividends on the preferred stock. The unpaid balance of \$19.05 2-3 will probably be paid, it is said, within a short time, and then consideration will be given to the payment of dividends on the reduced common stock.

Plans of reorganization of the New Orleans Traction company are under advisement now by a committee representing the interests involved. Holders of Crescent City Railroad company's five per cent. construction bonds, Crescent City Railroad company's stock, New Orleans City and Lake Railroad company's stock, New Orleans Traction company six per cent. construction trust notes, preferred stock and common stock have been invited to deposit their holdings with the Continental Trust company of the city of New York, Fidelity Trust and Safety Vault company, Louisville, Ky., or United States Trust and Savings Bank, New Orleans, La. Thirty-three and one-third per cent. of the amount payable on New Orleans Traction company's preferred and common stock, namely, \$2 per share on the preferred stock and \$1 per share on the common, is payable at the time of the deposit of securities.

MISCELLANEOUS.

Mr. McGann, commissioner of public works in the city of Chicago, has started on a campaign of

progress, he says, in the way of preparing the streets of Chicago for automobile vehicles, which will carry 10 or 12 tons of freight, and which, he believes, will be used by most firms doing a large hauling business as soon as the streets are strong enough for the traffic.

Sofia and Constantinople, in part, have been supplied with electric lighting by German firms, who have also installed the electric light for the municipality of Kalamata in Greece, where Heidenmann & Co. of Cologne have constructed an electric railway to the harbor of Kallivra. In Roumania there has been established a branch of a large German firm. The electric lighting of the palace of the sultan at Yildiz has just been carried out by a Berlin firm, who gave Magdeburg and Buckau firm the contract for the necessary machinery.

TRADE NEWS.

A serviceable monthly calendar for 1899 is issued by the Phillips Insulated Wire company of Pawtucket, R. I. A feature is a sheet at the back containing complete calendars for 1899 and 1900.

In officially announcing the death of Mr. R. T. McDonald, the Fort Wayne Electric corporation says: "While his death will be keenly felt by all his business friends and associates, it will not materially affect the business affairs of this corporation, except that it will necessitate the election of a new president. This election will occur in due course of time, and when made will be announced to all persons interested."

Mr. Stuart W. Wise, who was formerly treasurer of the Manhattan General Construction company, has opened an office in the John Hancock building, 178 Devonshire street, Boston, Mass., the former New England address of the Manhattan company. Mr. Wise will push the sale of the Manhattan enclosed arc lamps. The company manufactures lamps for direct-current circuits to operate singly on 110 to 220 volts, two or more in series on 220 to 550 volts, and to operate singly or in series on alternating-current circuits.

General Manager Corrigan of the American Electric Vehicle company, Chicago, receives from time to time gratifying testimonials of the efficiency of his vehicles and of the pleasure they give the users. One purchaser, E. W. Young of Oconomowoc, Wis., in a letter full of enthusiasm on the merits of the American vehicle, says: "For comfort and ease of riding nothing could be nearer perfection. In speed it exceeds your claim for it. A child can guide it, as mine has done. It is clean, odorless, absolutely harmless, and will not shy at a stump or bicycle, gets no bad tempers, requires no coachman. Suffice it to say that I have found the ideal sport, and that your carriage is the ideal way to secure the most pleasure from this sport, and I wish you every success."

Mr. George B. Foster has been appointed sales agent in charge of the branch office of the Wagner Electrical Manufacturing company in Chicago. The Wagner company recently located in handsome offices in the Marquette building, Chicago, and Mr. Foster will look after the company's interests in Northern Illinois and Northern Indiana, Michigan, Wisconsin, Minnesota and in Iowa. Mr. Foster is a thoroughly reliable, experienced and capable electrical man. In 1887 he was salesman for the Western Edison company; he was afterward with Humbird & Gorton and then with Leonard & Izard and the Thomson-Houston company. During the World's Fair he was engineer in charge of arc lighting at the fair grounds. Of late he has been identified with the Chicago office of the Walker company. With a man as well known and as experienced as Mr. Foster in charge of this important branch, it is safe to say that the Wagner company will find its interests well taken care of.

BUSINESS.

The Globe Carbon company of Ravenna, O., issues a hanger with an amusing picture of "The Real Carbon Battery" as a centerpiece. The Globe company's battery is said to be "first in quality, first in efficiency, first in the hearts of our countrymen."

The Buckeye Electric company finds its factory severely tested in keeping even with the orders received for the Buckeye special coiled-filament lamp. This company ships only selected and thoroughly tested lamps, guaranteed uniform in wattage, voltage and candle power. The special filament used in lamps for alternating systems is highly commended by central-station managers.

The Chase Electric Sign company of Chicago has opened an office at 26 South Eleventh street, St. Louis. This company is meeting the success which it merits, doing an honorable and straightforward business in a business-like way. It has recently placed in position an exceptionally large electric sign (11 by 33 feet) with three lines of lettering over the entrance of the St. Louis Exposition building.

The Jandus Electric company reports an excellent demand for the Jandus enclosed arc lamps for all

systems. The continuous-globe lamp, 25 inches in length, meets the demand for a short lamp, and has, it is claimed, the advantage of perfect ventilation, thus preventing overheating and depreciation of efficiency. Catalogues and information may be had by addressing the Chicago office, 753 Monadnock building.

The G. F. Harvey company of Saratoga Springs, N. Y., issues a booklet giving the favorable opinions of a large number of physicians who use Vitogen in practice. Vitogen is an antiseptic powder recommended to electrical men in the treatment of burns. The Harvey company exhibits a letter from Harry E. Rood of the Gas Light and Coke company of New Albany, Ind., who says that Vitogen saved his life. Mr. Rood was severely burned in the back by contact with an arc-light switchboard.

The Central Electric company, Chicago, is sending out a neat piece of advertising matter in the shape of a circular card about a foot in diameter, one-half section of which is devoted to an embossed Okonite trademark and the other half to artistically arranged samples of Okonite wire. The Central Electric company has adorned its various advertisements with a new and tasteful trademark, embodying the names of the Central Electric company encircling the well-known Okonite design.

These two names have been so long associated together that it seems eminently fitting that their combination should be made emblematic.

A very simple device is often of more value to the users and the originator than a more complicated piece of apparatus. The Ritter soldering-iron attachment is an example of the value of a simple device. As the name partly indicates, this is a small soldering-iron tip designed to be attached to the burner of an ordinary gasoline blow-torch. The tip may be attached or removed instantly with an ordinary screwdriver, and is capable of doing all the work of an ordinary soldering iron. It has the advantage of being light and convenient to carry around and of being always hot and ready for use as long as the torch is burning. The Electric Appliance company is introducing this specialty, and states that it has no difficulty in selling one or more to every construction man to whom it is shown.

The Western Electrical Supply company of St. Louis, Mo., is exploiting its Perfection annunciator, which has met with much favor from the electrical trade in general. The mechanism of the Perfection annunciator is of such a character that it will, it is said, stand any jar without dropping the needle, and at the same time it is very sensitive to the battery current and requires a very small amount

of battery to successfully operate it. In appearance it is of neat and artistic design, with a finish that is a credit to the maker. The Western Electrical Supply company is making popular prices on these annunciators, with the desire to furnish the trade with a strictly high-grade instrument at a reasonable price. These annunciators are fully illustrated in the company's new No. 18 catalogue, which will be mailed to anyone in the trade upon request.

J. Holt Gates & Co., Marquette building, Chicago, report the following recent sales: Armour Glue Works, Chicago, one 225-kilowatt, 500-volt generator, two 150-kilowatt, 500-volt generators, seven 50 horse power motors, two 100 horse power motors, two 150 horse power motors, one 30 horse power motor, all made by the Card Electric company, Mansfield, O.; Deering Harvester company, Chicago, seven 500-light transformers, five 400-light transformers, three 200-light transformers; Elkhart Lake Electric Light company, Elkhart Lake, Wis., two 10 horse power single-phase motors and transformers, and direct-current dynamos attached to large storage batteries for electric launches; Armour Glue Works, Chicago, one \$3,000 switchboard; Pierce & Robinson, Chicago, one \$700 switchboard; residence of P. D. Armour, Jr., Chicago, one 300-light electric-light plant, with Nash gas engine direct-connected.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued January 10, 1899.

617,314. Telephone. Will E. Byrns, Adams, Ind. Application filed May 27, 1897.

This is a magneto-telephone and comprises a hollow core, a metallic diaphragm secured opposite one of the heads thereof, a metallic bar constituting a conductor secured at one end to the diaphragm and adjustably secured at its other end to a stationary part, whereby the tension of the diaphragm may be positively controlled, a helix upon the core in electrical connection with the battery or generator and the diaphragm, and connections between the conductor and the line wire.

617,325. Railway Signal System. Frederick C. Esmond, New York, N. Y. Application filed March 17, 1896.

A signal apparatus is adapted to be set and locked by a passing train to signal an approaching train, a register for the approaching train and operating apparatus for the register being placed at a point succeeding that at which the signal is received and adapted in like manner to be set by a passing train simultaneously with the signal apparatus.

NO. 617,314.

617,375. Electrical Resistance. Julius F. H. Voigt and Jacob A. Haefner, Bockenheim, Germany. Application filed December 26, 1895.

An electrical resistance consisting of a suitable base piece, an enamel layer secured thereto and a conducting layer of fired liquid metal.

617,381. Electric Transformer. David H. Wilson, Chicago, Ill. Application filed July 30, 1897.

The coiled conductor having a metallic core is provided with opposed pole pieces; a second coiled conductor is provided with a metallic core, the second conductor and core permanently mounted between the pole pieces of the core of the first conductor so as to at all times form part of the magnetic circuit of the first-mentioned conductor, one of the conductors acting as a primary coil, the other acting as a secondary coil.

617,382. Telephone System. David H. Wilson, Chicago, Ill. Application filed July 30, 1897.

The induction coil is provided with a movable core, a circuit breaker associated therewith and operated by the movement of the core, a receiver, a transmitter, a signaling device, a system of circuits so arranged that the circuit breaker is in circuit with the primary coil when the signaling device is operated and is cut out of circuit when the transmitter is being used.

617,418. Electrical Measuring Instrument. George T. Hanchett and Frederick B. Sage, Hackensack, N. J. Application filed May 2, 1898.

In a Wheatstone bridge, the combination of the circuits thereof, a circuit closer for the battery and a circuit closer for the bridge, both attached to a single movable handle.

617,422. Telephone. Theodore Berdell, Summit, N. J. Application filed March 28, 1896.

An outer diaphragm is held at its center by a conducting support, an inner diaphragm or plate is mounted upon an insulating bridge, through which the conducting support passes, and an amount of granular material is held between the diaphragms.

617,503. Circuit Breaker. Paul P. Goldey, Philadelphia, Pa. Application filed March 2, 1898.

In a circuit breaker the combination with the line terminals of a pivoted switch arm carrying terminals, and a magnet arranged to the arm and mounted in the connection between the terminals, a catch to hold the switch in its open position to engage the terminals and a spring to throw the same down on release of the catch, and an armature arranged in connection with the magnet and catch as described and so as to release the catch on the occurrence of an abnormal current in the line.

617,526. Apparatus for Electrodeposition of Metals. Elisha Emerson, Buffalo, N. Y. Application filed December 16, 1896.

In an apparatus for the electrodeposition of copper there is the combination with a cylindrical cathode of a series of horizontal anode bars in proximity thereto, and curved supports therefor composed of lead with lugs or ribs forming receptacles for the anode bars, whereby the latter are maintained out of contact with each other and in the same relative positions as they are dissolved.

617,540. Electric Signal. Charles A. Parrish, Jackson, Mich. Application filed August 4, 1897.

In electrical signal apparatus there is the combination with the track instruments, a relay, a circuit therefor, and a circuit through the track instruments and the relay magnet, which circuit has therein a pair of insulated terminals adapted to be closed by the relay, of a signal circuit including the signal and a source of electric energy and having for its terminals the relay circuit-closing lever and one of the insulated terminals, whereby the closing of the open terminals by the circuit-closing lever simultaneously completes the two separate circuits.

617,543. Electrotherapeutic and Massage Apparatus. Oscar Schneider, New York, N. Y. Application filed August 17, 1898.

A roller electrode is provided with an interior compartment and is composed of wooden sections, intermediate metallic strips and metallic heads with which the strips are alternately connected, and a spring-actuated nipple guided in a suitable socket in the roller electrode and adapted to eject liquid charged in the same, is also provided.

617,546. Controlling Electric Motors and Trains. Elihu Thomson, Swampscott, Mass. Application filed February 28, 1898.

Provision is made for separately actuated contacts for varying the motor speed, electromagnets for controlling the contacts and means for controlling the magnets from a distance.

617,508. Automatic Regulator. George S. Neeley, Pacific, Mo. Application filed July 28, 1897.

Claim is made for the combination with an induction motor included in the primary circuit of a dynamo, and an auxiliary exciting generator for the dynamo, of a column or post upon which the induction motor is mounted, a carrier rigidly connected to the rotary member of the induction motor, a governor sleeve slidably fitted on the column or post, governor arm pivoted to the carrier and linked to the sleeve, and a crank linked to the governor sleeve and to the brush carrier of the auxiliary exciting generator.

NO. 617,381.

617,601. System of Control for Electric Motors and Railway Trains. William B. Potter, Schenectady, N. Y. Application filed March 17, 1898.

A system of train control for an electric railway is described comprising a number of motor cars, each of which is provided with a controller for its motor, the controllers being in parallel between the source of supply and ground, step-by-step actuating devices for each controller, a circuit or circuits including the step-by-step actuators, and a regulator in the circuit or circuits governing the actuators.

617,608. Electrical Cut-out. Albert P. Seymour, Syracuse, N. Y. Application filed November 1, 1897.

A fuse box is provided with a chamber having interior longitudinal radially projecting faces, a rotatable live-current plug, provided with exterior longitudinal radially pro-

jecting faces, adapted to contact with the radially projecting faces of the chamber, whereby the chamber is divided into two separate chambers, metallic terminals on the fuse box, and contact plates on the plug for engaging the terminals.

617,621. Electric Headlight Lamp. Harlan P. Wellman, Ashland, Ky. Application filed September 15, 1898.

An electric headlight lamp having positive and negative carbons, an inclosure for the carbons, means to which the inclosure is secured for adjusting the carbons, and means for axially rotating the inclosure, whereby the carbons may be relatively adjusted.

NO. 617,543.

617,664. Automatic Alarm Mechanism for Electric Motors. Robert W. Traylor, Richmond, Va. Application filed June 22, 1898.

An automatic alarm mechanism for electric motors and other apparatus comprises a normally open electric circuit, which includes one or more signaling or alarm devices, a rotating cylindrical body, a friction gear arranged in suitable relation to the cylindrical body so as to be operated by frictional contact with the latter, due to downward displacement of the body, and a circuit-closing device having an operating connection with the friction gear to close the normally open circuit and operate the signal or signals.

617,691. Telephone Switchboard. James M. Overshiner, Elwood, Ind. Application filed August 4, 1896.

A telephone switchboard is described comprising a series of combined drop devices and jacks, each comprising in a single structure a magnet, a drop, a latch device for the drop, a rocking jack having a socket in its end for the reception of a plug and contact pins co-operating with the jack.

617,692. Telephone Switchboard. James M. Overshiner, Elwood, Ind. Application filed April 10, 1897.

A cam or enlargement on the drop is adapted to overhang the socket of the jack when the drop falls, and a plug having an independently movable handle is adapted to engage the cam or enlargement on the drop and restore the latter to the latch device.

617,702. Annunciator-drop Device. William O. Meissner, Chicago, Ill. Application filed July 1, 1896.

An annunciator drop is described comprising an electromagnet, a case therefor stamped from a continuous piece of metal, and comprising a body portion provided with wings and adapted when bent into shape to surround the sides and bottom of the magnet, a lug projecting from each side of the body portion near its end and integral therewith, a projecting part at the other end of the body portion integral therewith and adapted when bent into shape to be connected with the core of the magnet and cover the end of the magnet, an armature pivoted to the lugs on the body portion, a drop located at one end of the magnet, and a hook connected with the armature extending past the magnet so as to engage the drop.

Western Electrician.

EVERY SATURDAY.

Vol. XXIV.

CHICAGO, JANUARY 28, 1899.

No. 4

Henry L. Doherty.

At Milwaukee last week the Northwestern Electrical association, now having the largest membership of any electrical association in the country, elected a man not 29 years old to be its president. Mr. Henry L. Doherty of Madison, Wis., who was thus honored, is the youngest man ever elected to the office he now holds, and it may be doubted whether so young a man holds the presidency of any similar organization in the country. However, although young in years, Mr. Doherty has had a wide experience in the lighting business. His has been no accidental advancement. He has worked for it and earned it. Mr. Doherty is a man of much energy, good capacity and quick resource, of whole-souled devotion to the interests in his charge and of entire loyalty to his associates. While no doubt ambitious for himself, he is also cordially interested in the success of others. He is a good man to arouse the esprit de corps of any body of men associated by mutual interest. He has the enthusiasm of youth, and he is self-confident and persevering. Fortunately, too, he is gifted with pleasing and persuasive manners. It is this combination of character-traits that made Mr. Doherty's rise in the Northwestern Electrical association so rapid.

Henry L. Doherty was born on May 15, 1870, and was reared in Columbus, O. He had his own way to make in the world, and at the early age of 10 he became partially self-supporting, earning money to buy his clothes by carrying papers. When Henry was 12 years old he entered the service of the Columbus Gas company. Mr. Emerson McMillin was then superintendent of the works, afterward becoming general manager and then president. Since that time Mr. Doherty has been (with one or two short exceptions) continuously associated with Mr. McMillin in various capacities, from office boy to manager in various gas and electric plants controlled by Mr. McMillin.

In the spring of 1896 Mr. Doherty moved to Madison on account of his health and became general manager of the Madison Gas and Electric company. The plant was threatened with municipal opposition, which he successfully averted. His determined opposition to municipal ownership, at all times and places, has brought him into prominence and has shown him to be an active and effective worker.

Mr. Doherty is a prominent member of all of the large gas associations, and has been a frequent contributor to gas literature and an inventor of many gas appliances. He gave the first public lecture and exhibition ever given in the United States of calcium carbide and acetylene gas, and the five or six years that have intervened have failed to disprove the statements and predictions he then made.

The new president of the Northwestern association has educated himself in chemistry and gas, steam and electrical engineering. He indulges sparingly in light reading, but confines his studies entirely to scientific matters relating to gas and electrical engineering. He is a member of eight engineering and scientific societies. Though still the manager of the Madison Gas and Electric company, he has given this property but a portion of his thought for the last two years, and at present is acting as Mr. McMillin's assistant in his position as president of various large gas and electric companies. He spends the greater portion of his time in New York, but still claims Madison, Wis., as his home.

Mr. Doherty's wide acquaintance with electric, gas and other engineers, coupled with his energy and ability, of which he has given ample proof, should prove advantageous to the association. He hopes to interest capital, to a greater extent than has been done, in central-station work generally throughout the country, and thus assist in the extension and development of the electric-lighting industry.

Mr. Doherty is unmarried.

Agents are engaged in making surveys and securing the right-of-way for a projected trolley line across New Jersey from Trenton to Point Pleasant. They say they have perfected arrangements between Point Pleasant and Hamilton Square, the latter a village four miles east of Trenton. New York capitalists are said to be behind this project.

Overhead Trolley to Be Substituted for Cable in Chicago.

The Chicago street-railway companies have been anxious for several years to substitute the overhead trolley for the cable wherever the latter is used, but thus far they have been unable to obtain ordinances granting permission to make the change. The City Council is now considering a proposition of this character, and it is believed in street-railway circles that permission will be granted.

Charles T. Yerkes argued for the universal overhead trolley at a special meeting of the joint street committee of the council on Monday afternoon, and it is admitted that there was evidence at the meeting and afterward that some aldermen who upheld Mayor Harrison in his fight against the franchise-extension ordinances were inclined to favor the overhead trolley in the heart of the city. Aldermen Badenoch and Gunther talked openly in favor of the Chicago City Railway company's ordinance for a trolley loop in Michigan and Wabash avenues and State street. These aldermen and others say they

put on more cars that can safely be accommodated and that breakdowns may be expected at any time as a result. The tunnels are necessary for the operation of cable lines, and their capacity is limited, but trolley cars could be carried over the bridges on trolley lines as well as through the tunnels, and this, of course, would relieve the present congestion of traffic. If Clark street and Lincoln avenue cars could be carried over the Clark street bridge, the service could be greatly improved, as it would admit putting on 50 per cent. more cars.

On the South Side the same complaint has been made, and the management has contended that it was helpless as long as the council refused to permit it to use electricity on its State street and Wabash avenue lines. While the track elevation work was in progress and the Indiana avenue cars were operated electrically over Wabash avenue north of Eighteenth street, instead of being carried down as trailers on the cable line, the service was so much improved that the patrons of that line have ever since been clamoring for extension of the trolley system so as to do away with the cable. Aldermen Gunther and Badenoch voiced this sentiment in demanding the change.

An officer of the Chicago City Railway company pointed out that the conditions in New York were entirely different from those that obtain in this city. New York has good drainage, well-paved streets and the roadways are kept cleaned. An entirely different state of affairs exists in Chicago. The drainage is very poor—the worst in the country, it is claimed—and, taken in connection with poorly paved and exceedingly dirty streets, would make the operations of a conduit trolley line impracticable. State street, for instance, during the spring is frequently submerged at several points, and the cable slot admits the water and mud to the conduit. With these conditions it is not strange that the management refuses to consider the substitution of electric conduit for cable service.

"If the city provided properly drained streets and kept them paved and cleaned we might find means of complying with this demand," said an officer of the South Side company, "but to-day it is simply out of the question."

Death of a Telegraph Pioneer.

[From the Boston correspondent of the WESTERN ELECTRICIAN.]

Captain Charles Spear of Hingham, Mass., died January 21st at his home in that town, aged 81 years. He was one of the leading business men of Boston a quarter of a century ago. He went to California in 1850 and built up a steamboat business there which profited by the mining boom. On his return to Boston he built and was the sole owner of the telegraph line from Boston to Albany. He also built the Cape Cod telegraph line to Boston.

in connection with which he established the Cape weather report, which has since come to be looked upon at the port of Boston as one of the public necessities. These reports were telegraphed from Highland Light to Boston, and were displayed in the Merchants' Exchange news room on State street of which concern Captain Spear was then the proprietor. He had also been interested in many large transportation enterprises. He was a prominent Mason and Odd Fellow.

American Engineering Exhibits at Paris.

At the annual meeting of the American Society of Civil Engineers in New York last week Mr. William E. Smith of Chicago, who has been appointed commissioner to supervise the engineering exhibit from this country at the Paris Exposition, urged the society to help make this country's showing a creditable one. Already 13,000 square feet have been allotted for the exhibition, and more will be available in the United States government building. Mr. Smith urged the engineers to provide models of American cities, showing their situation, railroads, highways and waterways. The transportation charges will be paid by the United States commission. Mr. Smith asked the society to do its utmost to bring the engineering feats of Americans to the attention of the people of Europe, and said that President McKinley was especially anxious that the United States should be well represented at the exposition.

HENRY L. DOHERTY.

will vote for the Yerkes universal trolley ordinance if a clause is inserted fixing a time when some other system will be substituted.

Mr. Yerkes had said that if any reputable firm in the United States would contract with his companies to put in an underground electric conduit and operate the system successfully for one year the companies would take the plant off the hands of the firm, pay the cost of installation and 10 per cent. profit on the investment. He also promised to "take down the trolley and throw it away" whenever any practical substitute was on the market. Arguments were made by Aldermen Math and Herrmann against extending the overhead trolley when the underground trolley was in successful operation in New York, Washington and Budapest. Mr. Yerkes told the aldermen about the Love traction experiment with the electric conduit on his North Side tracks. It was all right in dry weather, he said, but the bad weather came and knocked out the insulation. Since then he had lost faith in the underground trolley and had never changed his mind. "It is all in the lay of the land," he said, referring to the obstacles in Chicago.

At present there is a general demand for increased surface-railway facilities on all sides of the city, particularly in the West and North Divisions. Mr. Yerkes has pointed out that the present cable plant is taxed to its full capacity and that the lines thus operated are constantly overcrowded. He claims that at certain hours the company is now forced to

MILWAUKEE CONVENTION.

Annual Meeting of the Northwestern Electrical Association Last Week.

The seventh annual convention of the Northwestern Electrical Association was held in the Hotel Pfister, Milwaukee, on Wednesday, Thursday and Friday of last week. President F. A. Copeland of La Crosse, Wis., presided. There was a large attendance and much interest. Considerable important business was transacted, one item being the abolition of the summer meeting for 1899.

OPENING BUSINESS.

After the routine opening business Secretary T. R. Mercein presented his report as secretary and treasurer, which was adopted, Mr. Norcross referring to Mr. Mercein's reports as always "good, specific, full and satisfactory." The secretary announced that the association had now the largest membership of any electrical association in the country, and the statement was received with applause. He also called attention to the various features of the programme.

At the afternoon session the members listened to the reading of the

PRESIDENT'S ADDRESS.

Six years ago a few Wisconsin electrical men met together and organized the "Northwestern Electrical Association," calling their meeting its first annual convention and themselves its charter members.

There was no flourish of trumpets; little or no public notice was taken of the matter and no general interest was manifested in it.

To-day, at its seventh annual convention, the "Northwestern" is the largest electrical association in the country, and its members gather together from Ohio on the east to Colorado on the west, and from Arkansas on the south to Manitoba on the north. The press heralds its conventions months before their dates; full copies of all its convention proceedings, papers and discussions are subscribed for in advance by the leading electrical journals, whose representatives—frequently the editors themselves—are always in attendance at its meetings. Its convention reports have been sent, on request, to public and private technical libraries in this country, and to foreign lands. These and other gratifying facts should be, as doubtless they are, a source of pride to every member, and should stimulate each of us to do his share in promoting the welfare and extending and strengthening the influence and power of this sturdy and vigorous young association, which in the limited field of its own choosing has, in six short years, moved from the foot to the head of its class. The inquiring mind naturally seeks the causes that have operated to this success. I think it is due to the following, among others:

First—The fact that the association has been, and is, conducted on broad lines, aiming for the greatest good of the greatest number; to benefit the men at the coal pile, the boiler, the engine, the dynamo, the switchboard and the lamp, as well as the owner and the manager; that it aims to come, and does come, in close touch with the practical men and the practical questions in the everyday operations of all parts of a working plant.

Second—The fact that the large majority of our members are men of the Northwest, a virile, active, self-reliant, assertive manhood, eager and willing to learn and no less eager and willing to teach. No better life-blood can be asked for in any active organization than to have its membership largely of men of the great Northwest.

Third—The fact of its economy, it costing but \$5 to join, and \$5 a year to retain full membership—the lowest cost of any association in the country.

Fourth—The happy combination of business and pleasure that marks our official programmes, attracting men to the meetings and membership because they know, either from the programmes sent them or from their previous experiences with us, or from those of others, that they are coming to meet old friends and make new ones; that they will learn something themselves, or teach something to others, all in an atmosphere of welcome, goodwill and good-fellowship that brings out the best side of their natures and remains a pleasant memory when they return to their homes and their daily routine.

These facts, with others, gentlemen, have made our association what it is to-day.

There are several matters of more or less importance to which I call your attention. One of them is the question of summer meetings. As you know, our articles of incorporation provide for two meetings a year, on the third Wednesday of January and July respectively.

It has been suggested that the interests of the association would be best subserved by having but one meeting a year, the main reason advanced therefor being that the summer meetings are but sparsely attended by central-station members; they are therefore of little value. If the matter comes up I trust it will be fully discussed and acted upon with due deliberation. In this connection I will call your attention to the fact that while associate members have, under our present rules, no vote on this or other questions, they are a large, liberal and important element in our membership, and their wishes and interests should have due weight in the consideration of any radical change of association plans.

Another question is whether we should not adopt some systematic plan of compiling and issuing to members published articles of interest to our members, such as articles on municipal ownership, be they in favor of corporations or municipalities, the reports of cities operating their own plants, or any other matter that would be of benefit to members of this association.

I would suggest that a committee, consisting of the secretary and two members, be appointed to collect data, etc., that in its judgment would be of value to the members, have it compiled in suitable shape for filing, and copies sent to each member.

To assist this committee, I would suggest that each member, on seeing an article on any subject he thinks of interest, cut it out and mail it to the secretary. We could in time form a valuable pamphlet for ready reference.

Another suggestion is that we have a representative at each state capital in our territory, either a member of the association or someone in our employment, to examine all bills introduced in the legislatures, and report promptly on those that in any way affect electrical interests. His report could be made directly to the chairman of the legislative committee, and could then decide the action necessary.

Our association has grown to be quite a factor in the electrical world, and in order to command the respect that is due us it has become necessary to increase the work in the secretary's office. There are few of you who realize the amount of time and labor required to run this office. Similar institutions pay their secretaries a salary. It is not nec-

and Lord. Later Mr. Schuette's resolution, amending the by-laws to provide for an assessment on all central-station members in Wisconsin, was referred to the same committee.

This resolution of Mr. Schuette was an important one and was the cause of much discussion. It read as follows:

Resolved, That Article II. of the by-laws of this association be amended by adding a new section, as follows:

Section 3. Whenever the officers of this association may deem it necessary to raise funds, for the purpose of protecting the material interest of our central-station owners, they are hereby authorized and directed to levy an assessment on all central-station members in Wisconsin, in an amount not to exceed ten cents for each kilowatt of dynamo capacity of their plants in any one year.

Mr. Schuette also suggested that all central stations not members (perhaps one-third of the whole number in the state) should be requested to contribute to this fund, the same as the members, as they would derive the same benefit. He explained that it was proposed to pass a law in Wisconsin that even if any city had reached the debt limit of five per cent. valuation, if it wishes to engage in electric lighting, it need not consider that as indebtedness at all; so that, if the law is passed, any city may go into the business at once. "Supposing this bill is passed," said Mr. Schuette, "the cities which would have built before, perhaps, except on account of the limitation, can build at once, and some electric-light man will go to a city and say, 'Look here; you build a plant (I can build a plant for you for one-half what the existing plant will cost), and I will take bonds on the plant for half the pay.' We should make an assessment, and it is very important that it should be done. There must be some

VICTOR TELEPHONE EXHIBIT AT MILWAUKEE.

essary to state the exorbitant salary ours receives. I would suggest you take this matter up and adjust the salary to something compensate for the labor involved.

I would also suggest that the dues of members be raised to \$10 a year, as the present dues are not adequate for running the association on the lines on which it should be run. The dues of the National Electric Light association are \$25; those of the Edison association \$106.50; and I am sure our association is of as much value to its members.

I commend these questions to your consideration. Association matters have gone so smoothly since we last met that there seems nothing to criticize, unless it would be the steamer convention of last June, which should be judged more as an excursion than as a convention. Those who were able to go enjoyed a delightful trip, admirably arranged and carried out.

I would suggest that officers be elected at the end of the convention.

In closing, I call your attention to the programme for this meeting. It is an interesting and attractive one, and we should all get pleasure and profit from it. It is from discussions, however, that most benefit results, much being brought out in them that the mere reading of a paper does not give. We are here to learn from each other, and no discussion confined to the points of a paper will be abridged unless absolutely necessary.

I wish you all a happy and prosperous new year.

GENERAL BUSINESS.

On motion of Mr. Doherty the suggestions in the president's address were referred to a special committee. On Mr. Debell's suggestion this committee was also instructed to nominate candidates for the various offices. The members of the committee were Messrs. Norcross, Debell, Livermore, Kountz

one at Madison continually during the session. I have no doubt there will be a dozen different bills introduced this year."

The question of the interests of other states than Wisconsin in the territory covered by the association came up in the discussion of this resolution. Mr. Livermore said that the Minnesota Electric Lighting and Gas association was formed last summer for the protection of its own members. He thought that purely state matters should be left to state associations. Others thought that members in the different states should co-operate. Mr. Schuette wanted some one employed to represent the Northwestern association at Madison during the session of the Wisconsin Legislature in any event. Finally, the whole subject was referred to the committee already appointed.

On Thursday morning the report of this committee was received. It contained several important recommendations. For

NEW OFFICERS

these gentlemen were named:

President—Henry L. Doherty, Madison, Wis.

First vice-president—John H. Harding, La Porte, Ind.

Second vice-president—S. B. Livermore, Winona, Minn.

Secretary and treasurer—Thomas R. Mercein, Milwaukee, Wis.

Directors—W. W. Bean, St. Joseph, Mich.; J. H. Culver, Decatur, Ill.; George Innes, Eagle Grove, Iowa.

These officers were duly elected:

SOME IMPORTANT CHANGES.

On the recommendation of the committee the salary of the secretary and treasurer was raised from

\$150 to \$300 per annum, beginning with this fiscal year.

It was decided to hold no summer meeting in 1899.

In accordance with President Copeland's suggestion, there was created an information committee, composed of the secretary and two other members—P. H. Korst of Racine, Wis., and E. L. Debell of Sheboygan, Wis.

Later in the day Mr. Lord explained that the new information committee was instituted for the purpose of taking charge of matters of general information for the association. "When any member," said Mr. Lord, "finds anything pertaining to electric lighting or municipal ownership, for instance, or anything of that nature, he is respectfully invited to forward it to the secretary of the association, and then the secretary, in connection with the other members of the committee, will prepare the matter and publish such parts of it as are necessary and desirable, and, as I understand it, send these printed slips out to the different members of the association for their future benefit and use."

Mr. Norcross thought that the plan was one of the simplest, cheapest and best ways that could be had of each man in the association getting the benefit of the news and suggestions of every other man. Whenever anyone finds a useful article in a magazine, or gets hold of any important information let him forward it to the secretary. As an example of the kind of information that was wanted, Mr. Norcross said that he had been inquiring into the question of the kind of coal that it was best to use. Suggestions from experience would be valuable to him and doubtless to others.

The matter of representation at state capitals within the jurisdiction of the association during the sessions of the respective legislatures was left

certain qualifications for membership in the association, and at the time that the member is elected those qualifications may be all right, but they may not be maintained. Those qualifications might be changed, and if it is worth while to provide qualifications in advance, it would seem to me wise that we should maintain some way of keeping up our classification. Another point is the fact that we have an honorary membership list which is rather large for an association of our years. It does contain many excellent names, such, for instance, as that of Professor D. C. Jackson, a man whom this association cannot honor too much, but it seems to me that we ought to have some way of cutting down that membership, and I see no other way except to reclassify all of those members in the associate and active membership. This is a matter that I hope will be taken up. A number of those on our list of members do not take interest enough in the association to attend its meetings, and I think the whole membership ought to be reclassified, and then we might elect those we saw fit to that membership.

"Another change I suggest in our by-laws is that honorary members be nominated at least six months prior to the election. At one or two of our summer conventions there have been honorary members elected when there was only a very small attendance of the active members of the association, and I do not think any harm could arise from a nomination at least six months prior to election, and I therefore suggest that change.

"Another change is that the election of officers be made the closing order of business.

"There are one or two other suggestions that I would like to offer. One thing is in regard to our badge. The present badge is seldom seen except at a convention, and I suppose in this room there are a great many of the National Electric Light

Another Niagara Power Project.

By ORRIN E. DUNLAP.

There is a prospective new power development scheme at Niagara, and if the project is carried to completion it will result in a development of power close to the Whirlpool Rapids by means of the diversion of a portion of the water that flows through the gorge at that point. The plans were prepared by John Berkenbine, president of the Franklin Institute of Philadelphia.

For some time the development of power in the lower gorge at the Falls has been considered; motors have been suggested, made and tried and plans prepared, but as yet there is no important development of power on the lower river. On the Canadian side the commissioners of Queen Victoria Niagara Falls Free Park have had surveys made under the direction of Superintendent James Wilson. The results of these surveys, and the situation as portrayed to the commissioners in a report of Superintendent Wilson, have been presented in the WESTERN ELECTRICIAN, together with a map showing the possible points of development. It has been suggested that a tunnel be constructed on the New York side of the gorge from a point near the bridges to the whirlpool, but the latest idea and the one that appears to have general approval, is to construct a canal at the point referred to.

This canal will have a length of about 5,300 feet and a width of about 100 feet. It will start at a point about 300 feet below the new steel arch bridge of the Grand Trunk railway and extend to the whirlpool. Its course will be alongside or underneath the tracks of the Niagara Falls and Lewiston railway, better known as the Gorge road. The head which it is estimated will be obtained is 45 feet, and it is expected to develop 35,000 horse power, at an estimated cost of \$2,000,000. It has been figured that the amount of water passing through the Whirlpool Rapids is from 100,000 to 275,000 cubic feet per second, the speed of the water's flow being about 21.75 miles an hour. It is estimated that a canal of the dimensions given will divert about five per cent. of the river's flow for power purposes, say 10,500 cubic feet per second. The entrance to the canal will be a monolith of concrete or masonry, having openings through which the water will be admitted. This construction of the entrance is expected to keep out all floating ice and debris. The water that is diverted for power purposes will be returned to the main stream at or near the whirlpool, and is not expected to mar the beauty of the rapids. The power house will be located over the tracks of the Gorge road, in order that there may be a free vent for the water. It is the conception of the promoters that the construction of the canal will be the main expense to be met, as the standard patterns of water-wheels may be used, the plan doing away with expensive wheel-pits and shafts, as well as unusual machinery. The scenic features of the road would not be lessened. The level of the canal will be so arranged as to provide for a maximum fall or raise of 15 feet in the river's level resultant from winds on Lake Erie.

The illustration presented herewith shows the entire route of the proposed canal and the site of the prospective development. It is very evident that engineering difficulties of great magnitude would be met, and the development, when it is perfected, will be notable. It is understood that the promoters of the power company and the officials of the Niagara Falls and Lewiston railway have a perfect understanding about the right-of-way and other privileges, this being that the railway company will grant the power company the right-of-way, with the understanding that it is to receive a royalty on every horse power developed. The road would probably become a customer of the power company. All the necessary changes in the roadbed of the Gorge road would be made by the power company, without cost to the railway company.

The construction of the canal will require the blasting away of the Niagara cliffs and the removal of thousands of tons of rock. All of this excavated material not wanted for the canal walls could be dropped into the river, with full assurance that the current would rapidly sweep it away. The same method employed in hydraulic mining would be used in removing the debris of the slopes where necessary.

Victor Telephone Exhibit at Milwaukee.

The illustration on page 50 shows the artistically arranged exhibit of the Victor Telephone Manufacturing company of Chicago presented at Milwaukee during the Northwestern Electrical association's convention last week. The enterprise of the Victor company in appearing at the convention of the Northwestern Electrical association, which is devoted mainly to electric-light and power interests, is to be commended. But Manager W. T. Blaine does nothing by halves, and the picture illustrates his appreciation of the fact that the artistic in a display of such character is as valuable as an exhibition of meritorious points in apparatus. The room was tastefully arranged with roses and mirrors, and the combination of the color of the American Beauties with the highly polished and finished instruments made the display that excited so much admiration.

ANOTHER NIAGARA POWER PROJECT.

entirely with the president and secretary and protective committee.

Mr. Schuette's resolution was referred to the president, secretary and protective committee, with full authority to incur such expense as was necessary and to raise the requisite funds in such manner as they may deem just and equitable.

No change was made in the amount of the annual dues.

PRESIDENT DOHERTY'S SUGGESTIONS.

The new president, Mr. H. L. Doherty, was presented on Thursday morning, but did not take the chair, as he thought the retiring president should serve until the close of the convention. This innovation was put to a vote and adopted. The thanks of the association were extended to Mr. Copeland, the retiring president, and Mr. Mercein, the re-elected secretary.

During the afternoon session, however, President Doherty did take the chair for a time. He made a few remarks in relation to changes in the by-laws he had proposed the day before, and which he proceeded to explain. He said:

"I see no objection to holding meetings in Milwaukee each year, but perhaps at some future year circumstances might arise when it would be deemed advisable to hold our annual meeting at some other city. I have therefore suggested an amendment to the by-laws in that respect, to read that the annual meeting of the association be held on the third Wednesday and Thursday of January each year, in Milwaukee, or at such other time and place as the directors may elect.

"Another change is to the effect that our by-laws be modified so that the directors of the association can classify the members at their discretion. We have

association's badges being worn simply because they are convenient, and I would suggest that this association adopt a button."

The president made some informal suggestions about the design of a button, and there was also some discussion of the amendment to the by-laws making it possible to hold the annual meetings elsewhere than in Milwaukee. It was proposed to leave the matter to a committee, with power to act, but there was some objection to this. "I do not want to leave it in the power of a committee to fix Chicago as the place of meeting," said Mr. Norcross; "I stick by Milwaukee." Mr. Livermore and Mr. Debell also favored Milwaukee. At length it was decided that the new president's suggestions covering by-laws and badges be submitted to a committee of three, to be appointed by the president, to report as the first order of business at the next annual session. This committee was announced Friday morning. It consists of D. C. Jackson, L. E. Kerns and L. W. Burch.

Mr. Doherty made some further remarks relating to the necessity of every member taking an active interest in the affairs of the association. He said that the association had the largest list of members, but it should also have the largest attendance at its meetings and the largest following of exhibitors.

Mr. Innes of Eagle Grove, Ia., remarked that this was his first Northwestern convention. He thought that especial attention should be paid to the needs and experiences of central-station men in the small towns operating plants of 500 horse power or less. "I think it would be well," said he, "to devote a little more time to the question box and less to

[Continued on page 55.]

Enclosed Electric Furnace.

An interesting experiment was conducted at Armour Institute of Technology, Chicago, last week, to determine the practicability of a new form of electric furnace for producing calcium carbide, with a hollow upper electrode through which the material is to be fed to the arc. A temporary furnace was constructed in the forge-room of the Institute under the direction of I. S. Preñner, engineer for the American Carbide company of Holstein, Ia., for whom the test was made. C. E. Freeman, associate professor of the department of electrical engineering, and J. E. Snow, instructor of practical electricity in the institution, conducted the test and made a report upon the results obtained.

From the accompanying cuts some idea of the appearance of the temporary furnace and the electrodes can be gained. Fig. 1 shows the furnace, with an opening disclosing the position of the electrodes. Another view of the electrodes is given in Fig. 2, and Fig. 3 shows the condition of the furnace immediately after the current had been turned off.

It is proposed to employ an enclosed furnace in order to take advantage of the increased temperature thus obtained and permit of continuous operation as long as the electrodes last, which, it is estimated, will be about one week. Owing to certain limitations in regard to time, the arrangements for the test were by no means as complete as they might have been, and this fact is considered in the report.

The form of furnace tested, as already mentioned, was one having a hollow upper electrode, through which a powdered mixture of 60 per cent. lime and 40 per cent. coke was fed. The lower electrode was solid, having a superficial area of about one square foot; the upper one consisted of four four-inch by

During this time a little over five pounds one ounce of carbide, or eight pounds per hour, was produced. Considering the time lost in feeding, this would approximate 16 pounds per hour, or 384 pounds per day."

Commenting upon the crude apparatus employed in the tests and other drawbacks, Professors Freeman and Snow said:

"In view of the fact that in order to observe the operation of the furnace the front was left open—the sides and back being but partially closed—a strong draught was created, which seriously impaired the efficiency of the arrangement. This was clearly shown in the accumulation of the product at the rear of the arc.

"During the run an average of about 35 horse power was delivered in the arc.

"Considering the various losses attending this test, it is safe to predict that its present efficiency can be increased 100 per cent. by the application of suitable arrangements for feeding, prevention of draught and removal of product."

The American Carbide company will erect a plant at Maquoketa, Ia., where good limestone is abundant and water power available. The initial plant will have a capacity of 1,000 horse power. The furnace will be designed to take 8,000 to 10,000 amperes at 100 volts.

Aluminum as an Economic Factor.

By FRANKLIN H. WENTWORTH.

Kind mother Nature looks ever compassionately upon her children, and when certain of her bounties necessary to their well-being are lost to them, either through physical weakness or lack of wit,

seems discouragingly slow. In the '50's the French were making aluminum at about \$3 a pound. They proposed then to use it for helmets and cuirasses. To-day, by the most improved processes, it costs at least 20 cents, notwithstanding the fact at least one-twelfth of the solid crust of the globe is composed of it. It is perhaps the most abundant element upon the earth surface, next to oxygen and silicon. But the extracting cost must be halved, and halved again, before it will cut more than a passive figure in the economics of electrical progress. Its specific gravity is much less, and therefore, from certain viewpoints of engineering, it is more desirable for use than copper. Its lesser conductivity will, however, all things considered, prevent its taking the place of the heavier metal except where price alone is the determining factor.

The copper trust can flood the market with copper at six cents a pound and make a fair profit. The present prices are, of course, non-competitive, and therefore naturally excessive. Man seeks his own good at the whole world's cost. So long as the laws permit monopoly those persons enjoying it will make what they can. There is no reason why they should not. The wrong is not individual; it is institutional, and therefore cannot be remedied by attacking individuals. The wide difference at present between the cost prices of the two metals, copper and aluminum, makes the outlook none too bright for those manufacturing interests which are now at the mercy of the copper monopolists—dependent on their pleasure—as, for example, the manufacturers of insulated wire. The price of copper, if further arbitrarily raised, must eventually force all similar manufacturing interests into consolidation. By consolidation a great saving is effected in the cost of the conduct of business. While there is free competition between similar interests, business success makes the employment of able men imperative. But department managers and expert salesmen who demand salaries of from \$3,000 to \$5,000 per annum under a competitive system are a needless expense as soon as competing establishments consolidate. The product then being monopolized and the competitive factor eliminated, order clerks alone are necessary, and high-priced men may be dismissed.

However unpleasant the prospect, it will in no way profit the electrical fraternity to close its eyes to these obvious facts. True conservatism consists in understanding the situation, facing it bravely, and making the best of it; not in shirking the issue until all is hopelessly involved.

It must be daylight plain to anyone who thinks, that if aluminum or something else does not speedily come to the rescue and loosen the grip of the copper monopoly, many able electricians will be forced into other lines of effort; and as the same concentration is taking place in other fields, from similar causes and working similar results, they are much more likely to be forced into idleness. This will clearly work injury to all companion industries, from the maker of a porcelain insulator to the publisher of an electrical journal. Men are quick to resent individual oppression; but when they suffer as a class they seem singularly slow of apprehension. The manufacturer should be able to comprehend that he is in the same boat with his workman. This will be readily apprehended when, the consolidation once effected, he finds that the benefits of the saving made by discharging his valuable men does not accrue either to him or to the other manufacturers in the pool. For, being still subject to the exactions of the basic monopoly, these savings in management can be squeezed out of their pockets by the same process that forced their consolidation. Thus, eventually, unless something intervenes, each entire business must be forced into the hands of those who control the natural resources from which the raw material that enters into the several products is drawn.

The vague and unsatisfactory attempts of the national and local governments to regulate trusts and monopolies have always proved, and always must prove, abortive. Not only is the best legal talent of the country employed by these large combinations, but all such attacks as have been so far made are wrong in principle. They are aimed at the manifestations of monopoly, instead of at monopoly itself. It is not the government's business to say how much money a man or a corporation shall have; but it may be its business to say how the money shall not be gotten, should the manner of getting it violate the natural right of others. All attempts to regulate trusts have so far begun at the wrong end. The trust, in so far as it is purely an economizer in production, is legitimate. Monopoly of natural resources is another matter. Monopolies of this sort are built up by unjust systems of taxation, and they can be easily destroyed by just systems of taxation.

That this truth is coming to be clearly and definitely recognized is evidenced by the opposition shown to the present governor of Michigan in his attempt to assess the property of monopolies in that state on the same basis as other property.

If the holdings of the copper trust were assessed at their true value by the states in which they lie, it would not be necessary for the electrical industries to turn to aluminum for relief. We would have plenty of copper at a reasonable price.

FIG. 1. ENCLOSED ELECTRIC FURNACE.

four-inch carbons bound together, and having a hole $1\frac{1}{4}$ inches square through the central portion. In the illustrations the upper electrode is seen through the aperture in the front of the furnace, protruding downward. The lower electrode has the appearance of three fire-bricks side by side, and extending upward at the right and left are two slabs which form a sort of enclosure about the upper electrode and restrict the space into which the carbide is admitted. This arrangement also served to confine the heat generated.

After running until necessary adjustments had been made, a quantity of the powder mixture that had been prepared was introduced enclosed in a paper cartridge. It was found that this method of feeding was not desirable, as the powder was not sufficiently compressed to retain its form after the paper burned away. The result was a choking of the furnace and considerable time was consumed in clearing away the refuse.

Another method of feeding was adopted by introducing the powder in a loose form. An objectionable feature of this method was unavoidable irregularity, owing to imperfect arrangements. The result was that the furnace was not working continuously as regards the powder. Accordingly, it was found desirable to employ the method of feeding the material in compressed form, and experiments will be continued with the view of determining the size of cartridges best suited for commercial work. Other modifications may be introduced, such, for instance, as feeding from more than one point. The object is to determine the exact capacity of the arc employed for collecting and the most favorable conditions under which the enclosed furnace may be operated. In the experiments last week Professor Freeman reported that the feeding began at 3:38 and was discontinued at 4:10, making a run of about 40 minutes.

she does what she can to compensate them, as a kind mother should. She offers few things to the satisfaction of man's wants for which, on occasion, she has not a substitute; not so perfect, mayhap, not quite so desirable for a special purpose, but an alternative nevertheless. She has given to those who would seek out the secrets of her lightnings a fitting vehicle for their transmission—copper, copper in quantities so vast as to oppress the imagination. But here she sees an astonishing proceeding. She sees these human atoms, for whom she has provided so bountifully, at the strange task of parceling out to a few those resources which she gave freely to all. Once in possession, these few become the dispensers of her bounty, laying all others under tribute. But nature hates a monopoly. There is something of justice in her fiber. Pityingly she takes her weakling by the hand, saying, "Thou hast not wit enough to keep that I give thee, but thou art still my child. Behold!" Seizing a bit of common clay, she holds it for an instant in her alambic—and gives to him aluminum.

The recent advances in the price of copper, due to rumors more or less authentic that a combination of the copper interests of the world is under way, has given a renewed impulse to experiments in aluminum production. The electrical world is unmistakably waking up to the fact that unless it can find a competing factor, it will soon be helpless in the hands of those who control the natural resources upon which depend its life and growth. It sees a ray of hope in aluminum. By its discovery every clay bank is converted into a mine of precious metal. But the secret of its simple extraction is not yet discovered, although recently fair strides have been taken in that direction. Contemplating long periods progress seems rapid; but in the face of threatened immediate copper monopoly, it

Telegraph Construction in Cuba.

Mr. E. J. Nally, assistant general superintendent of the Postal Telegraph-cable company at Chicago, has received an interesting letter from John A. Miner, who is now engaged in building telegraph lines for the United States Signal Corps in Cuba. The letter was written on Christmas, at the Signal Corps camp, 36 miles south of Puerto Principe in Cuba. Mr. Miner was a Postal operator at Davenport, Ia., and is well known to the telegraph fraternity of this section of the country. His letter furnishes a fair idea of the difficulties encountered in establishing telegraph service in the new possessions of the United States:

I have finally brought up in this country by the necessity of a line from Principe to Santa Cruz, where there is cable connection with the outside world. We are building a temporary line at present on lance poles, and making all the ties to trees and old Spanish poles wherever possible. The distance is 66 miles, and it is 66 miles of the wildest and most desolate country at present one ever saw. There is evidence everywhere that this country was once in a very advanced state of civilization, but four years of war have devastated it of everything like civilization. We are

line had been strung but a week ago with the heaviest copper wire known to the trade. Every combination known to the operator's art failed to bring a response from the circuit. Finally, by the use of other circuits, it was discovered that a break existed somewhere between Omaha and Blair, Neb., 40 miles distant.

"A line gang started out early this morning. Scarcely had the suburbs been reached when a novel discovery was made. No wire was to be found on the poles along which the copper was strung at such great expense but a week ago.

"The poles were there and the glass insulators, and in some places a few shining threads of copper indicated where the wire had been 40 feet in the air, but the wire was gone.

"The gang kept on up the line for several miles before the end of the wire was found. The whole line for this distance had been removed as cleanly as if veteran linemen had done the work.

"Now the Western Union has agents running around town examining junk piles for several hundred pounds of copper wire.

"The supposition is that thieves went to work early and continued throughout the night to steal the copper for its bulk market value. The thieves probably made \$100 by the night's work. During that time they must have climbed many telegraph poles and taken as many chances of dropping to the earth below and being killed, but apparently the theft was committed without an accident."

Mechanical Surface-contact Railway System.

American engineers will be interested in the latest development of surface-contact systems claiming attention abroad. The plans provide for a system relying on mechanical apparatus. It was invented by Herbert Allen and Oliver Peard, and primarily depends upon the wheel of a tram-car depressing the end of a pivoted lever, which raises, through the medium of a rod, a surface contact placed in a box which is bolted to the side of the rail. The contact is then gripped and supported by a special form of collecting device carried under the car. Immediately the vehicle has passed, the contact drops back into its seat, which is flush with the roadway. The contact, on engaging with the collecting device, is still further raised by means of the collector, and it is only when the contact is so raised that it becomes alive. This is claimed to be an important safety factor. In Fig. 1 *c* is the end of the pivoted lever placed in the groove of the rail. Upon being depressed it operates the lever arm *c'*, which pushes upward the spindle *d*, on the summit of this being contact plate *e*. But the depression of *c* accomplishes more than merely pushing up the contact above the street level. It will be seen that the spindle *d* carries a projecting arm, indicated by *h*, and upon the subsequent raising of the contact by the collector, this comes into contact with copper brushes *j*, which are in permanent connection with the feeders. It should be mentioned that the operation of *d* is against the tension of a spring, *k*, so that when the contact, *e*, has been released by the car, it is pulled sharply back into its seating.

Fig. 2 illustrates how the contact is held by the car-collectors during the passage over the stud; *c* simply rests upon plates *o*, thus giving effective connection between the car and the mains.

The inventors claim that it would be impossible to operate the lever by any other means than the car-wheel, as no other vehicle could run in the groove of the rail, and it would need a considerable weight to actuate the mechanism. Should anything go wrong with the mechanism of the box, the inside is so arranged and attached to the lid as to permit of its being removed and replaced in a few minutes. This system permits of the car running in either direction, as one box is not dependent on another for its actuation. The inventors claim, too, that the system could be established at a less cost than that of a first-class trolley line. The cuts are reproduced from the London *Electrical Review*.

Situation in the Copper Market.

Copper continues to "boom." At the close of last week the quotations in New York reached 15 1/2 and 15 1/4 cents a pound. Buyers are very active, and as the quantity of the metal available for early delivery seems to be limited the price has continued to rise. Some of the dealers go so far as to predict 20-cent copper inside of six months. Others are more conservative. A representative of one of the largest metal houses in New York is quoted as follows: "The recent advance in copper is certainly bona fide, and, I might say, has taken place in the absence of almost any speculation whatever. We have at this date not a single speculative contract on our books. Consumption, both here and abroad, is enormous and far exceeds the production, and as far as we are able to judge the situation will continue for some considerable time to come. All the producing companies, none excepted, are sold ahead entirely for the next two months, and large contracts have also been booked for later deliveries. Copper will go to 16 cents in the near future. Copper is king; everybody wants it, in fact, is crazy for it. Fifteen and one-fourth cents is freely bid this [Saturday] afternoon, but no sellers at this price."

Naturally, new copper-mining companies are springing up like mushrooms. In Boston, according to the *News Bureau*, the brokers are having lots

of fun with the new copper companies. They are not called "cats" or "dogs," but "rabbits," some of them "jack rabbits" and some of them just "rabbits," because they multiply so rapidly. Some of the more recent ones are classed under the heading of white mice. "The active head of one of the big copper companies smiles sarcastically," says the Boston authority, "and denominates the new copper promotions as jackpots, because, he says, it takes two knives to open one. But it is just these rabbits, white mice and jackpots that are liable to make the price of copper in the future, not this year or next; but some of them have chances of becoming great mine" with good management. For 20 years the bane of the copper market has been the small copper producer who offered his 100,000 pounds of copper all over the world with such importance as to break the copper market without effecting a sale.

With it all, the talk of syndicates to control the copper output of the country continues. The *Chicago Tribune* asserts that there are two—one chiefly an English syndicate, in which the Rothschilds are interested, seeking to gain full possession of the Montana mines; the other, made up of American

FIG. 1. MECHANICAL SURFACE-CONTACT RAILWAY SYSTEM.

capitalists, seeking to purchase developed and undeveloped copper lands in the Lake Superior region. The *New York Times* of January 21st said that the rumor of a copper syndicate had been revived, but that J. D. Rockefeller authorized the statement that he was not interested in any such transaction.

INDUSTRIAL COMBINATIONS.

Articles were filed with the secretary of state of New Jersey on January 14th, consolidating the Bergen County Gas Light company and the Englewood Electric Light company into the Englewood Gas and Electric company, with an authorized capital of \$400,000.

From New York it is reported that the American Steel and Wire company believes it has succeeded in obtaining control of practically all the steel and wire plants in the United States, which are mostly free of debt, except an obligation of about \$2,000,000 on the Washburn & Moen plant. The company has, it is said, net current assets of about \$15,000,000.

The United States Carbon company of Cleveland desires it to be known that "it is in no manner connected or associated with the new carbon trust." It asserts that it is thoroughly equipped with the largest and most improved carbon machinery in the world, and is prepared to manufacture and supply all varieties of electric-light carbons. It does not wish the electrical trade to be misled into the idea that all the

FIG. 2. MECHANICAL SURFACE-CONTACT RAILWAY SYSTEM.

carbon companies are included in the new consolidation.

According to an Associated Press dispatch from New York, dated January 22d, arrangements have been completed for the consolidation of the illuminating and natural-gas and electric-lighting properties, plants and franchises in central and southern Indiana and Ohio. E. C. Benedict, who has large investments in gas property throughout Indiana, is the principal factor in the combination.

It is now stated that the negotiations begun a month ago for the consolidation of all the city and suburban electric and traction railways of Baltimore have been completed. Alexander Brown, representing the Elkins-Widener syndicate, which first bought the Baltimore City Passenger Railway lines, has accepted the proposition of the Consolidated company to sell its stock at \$37.50 a share. With the acquisition of the City Passenger Railway company's stock at \$80 a share, calling for \$12,000,000, and the consolidated calling for \$13,758,000, the deal involves \$26,000,000. Three months ago Consolidated Railway stock had not reached its par value of \$25. Under the deal just effected the \$9,000,000 stock distributed at the formation of the company will return over \$13,000,000.

FIG. 3. ENCLOSED ELECTRIC FURNACE.

following an old Spanish telegraph line which was completely destroyed by the Cubans three years ago. There is quite a lot of Spanish poles standing, but there is not a piece of wire to feet long left. The poles have been standing for about 20 years, but they are what is called ironwood and hard as a rock. It is impossible to sink a spur in them and all our ties have to be reached by ladder. They used the queerest insulators and the brackets are of iron. It is impossible to drive a nail in the wood. But the Spaniards fastened their brackets by drilling a hole through the pole and bolting the brackets clear through.

We build at the rate of about five miles a day across the prairies, but we have been over two days at times getting a half mile of wire strung through some of the forests where we have to cut our way through. We have a force of 30 Cubans cutting poles along the line, and as soon as we get communication through to the cable connection we start back and transfer the wire to heavier poles. We have already left two test stations 12 miles apart, and will provide for another here when we leave. We now have a courier line from the last station to the sea. We leave an operator and lineman at each station, so that they will not be tedious. I am to stay at Santa Cruz until the line is finished and then will probably go back to work at Principe. Our chief signal officer for this division is Lieut. Shepherd, an old operator and at the outbreak of the war a signal sergeant in the regular army.

It was he who volunteered to go out in an open boat from the cruiser *New York* to cut the cable at Santiago. He was successful, as everybody knows, and for that act was made a first lieutenant. Before we started we put in a telephone system connecting all the different camps with the headquarters in town. I have several of the insulators the Spaniards used, and am going to take them home as souvenirs of my part in the construction of a military telegraph line through the wilds of Cuba. They will make excellent paper weights. They used porcelain exclusively and very heavy wire.

The country where we are working now is full of guerillas and last night we went over and witnessed a Spanish fandango. It was the most weird spectacle I ever saw. It beats a cake walk or a ghost dance. Now that the war is over, people are moving out on their farms again and things will boom. They all seem to

FIG. 2. ENCLOSED ELECTRIC FURNACE.

think that this island will be a veritable paradise when it gets "Americanized," as they say.

We expect to stay here until about May 1st, and then go back to the States. The people in town are inhaling American customs already. They have ordered two patrol wagons of the Studebaker Wagon company. We use the lines of the Cuba Submarine Telegraph company out of Santa Cruz. I don't know what line they connect with in the States, but hope the Postal.

Daring Theft of Copper Wire at Omaha.

Copper is getting so expensive that it seems to be dangerous to leave it outdoors over night. At any rate that seems to be the inference from the story telegraphed to the *Chicago Tribune* from Omaha on January 20th:

"This morning when the Western Union operators cut in their crack through circuit from Omaha to Minneapolis and the British Northwest the instruments failed to work.

"This was the source of much surprise, as the weather conditions were first-class. Then, too, the

The Chicago Telephone company has managed to survive the period of depression, and, according to the annual report presented on another page of this issue, it is in a fairly healthy condition.

Chicago needs improved street railway service and it is admitted that the only way to secure it is by abolishing the cable and substituting electricity on all surface as well as elevated lines.

dermen have signified their willingness to take the matter up, and there is a chance that an agreement may be reached. Mayor Harrison wants a conduit electric system, but the street-railway men say this is simply out of the question.

When the bill to grant the Pacific Cable company a subsidy of \$100,000 a year for 20 years for the construction and operation of a cable across the Pacific was called up in the House of Representatives on January 18th a very spirited debate followed.

In a measure, at least, the experiments in "drawing sparks from the clouds" by means of kites which are being conducted at Bayonne, N. J., by William A. Eddy have proved successful, although it is said that the length of the sparks is much less than was expected.

One result of the agitation of street-railway matters in Chicago has been the development of a strong feeling favorable to the proposition looking to the acquirement of street-railway properties by municipalities.

A petition to the Legislature was adopted which will be circulated throughout the city and state for signers, requesting that "hereafter all laws or ordinances affecting street railroads, gas or electric lighting, telephones, water supply or other public utilities, shall contain provisions requiring ratification by a majority of the legal voters residing in the municipality affected by such laws or ordinances."

The alarmist has reappeared to proclaim another danger attending the use of the telephone. "More cases of grip have been coughed and sneezed into the telephone to be contracted by the next user of the instrument, than have proceeded from all other sources combined."

is contracted from telephone receivers, and the receivers should be kept clean."

On general principles the advice of the New York physician should be followed in the matter of securing cleanliness, but there is reason to believe that the danger which he points out has been greatly exaggerated.

Heretofore telegraphic communication between the old and new worlds has been maintained over submarine cables controlled by American, English, French and Spanish interests, but now there is promise of a distinctively German enterprise, backed by governmental influence and supported by public funds.

A decision of importance to companies that must put wires underground, but which is not to be officially reported, was rendered recently by the Court of Appeals of Kentucky, in the case of "Cain's administrator against the Ohio Valley Telephone company."

After the plaintiff's evidence had been introduced on the trial, a verdict for the company was directed, and the Court of Appeals now affirms the judgment in its favor. It points out that the decedent was shown to have been an experienced driver in the city, and that he knew that he could reach his destination by taking another route, and that it was perfectly clear that he took the course he did voluntarily and with a full knowledge of the surroundings, as it was daylight and there was nothing to obstruct his vision, and there was no testimony that he was either induced or directed by the servants and agents of the company to take this route.

This decision will go far toward establishing the rights of electrical companies engaged in construction work and fix the limit of their responsibility for accidents growing out of the condition of a roadway that has been disturbed by them.

MILWAUKEE CONVENTION.

[Continued from page 51]

abstruse affairs." He added: "It may be true, as was said here yesterday, that belt transmission is a thing of the past—that is true, speaking technically—but practically, for us in small stations, the truth is not applicable, and we are not going to throw away our belts. In fact, there are cases where it is impossible for us to use large units in our plants without the flexibility that belts give us."

MISCELLANEOUS AND CONCLUDING BUSINESS.

On motion of Mr. Korst the president was authorized to appoint a delegate to attend the annual meeting of the National Electric Light association in New York in May. Secretary Mercein was appointed by President Doherty as the delegate.

J. M. Hill, who had charge of last summer's excursion-convention, sent a telegram from Hartford, Conn., reading as follows: "The association has my heartfelt wishes for a pleasant meeting and profitable convention."

On Friday morning the convention was adjourned.

READING OF PAPERS.

On Wednesday afternoon Mr. B. J. Arnold of Chicago made an address on "Trend of Central-station Design," which was listened to with interest and discussed. The next paper was on "Systems of Meter Rates," and was read by Mr. E. L. Debell of Sheboygan, Wis. This was a live subject and was discussed at length. Professor A. J. Rogers of Milwaukee read a short but interesting paper on "Electricity Direct from Coal," and this concluded the day's programme of papers.

Professor D. C. Jackson of Wisconsin University, Madison, Wis., read his paper on "Inductive Loads (Arc Lamps and Motors) on Alternating-current Transformers" on Thursday morning. A discussion followed, and then Mr. George L. Thayer of Belle Plaine, Ia., read a paper entitled "Design of Secondary Circuits in Alternating Plants." The discussion of this paper took the members until the hour of adjournment.

"Electric Vehicles and their Relations to Central Stations" was the subject of H. M. Maxim of Hartford, Conn. Mr. Lord read the paper on Thursday afternoon. There was no discussion. Mr. J. H. Harding of La Porte, Ind., then read the last paper of the meeting. His subject was "Utilization of Exhaust Steam." This interested the members in a practical way, and many inquiries were made.

QUESTION BOX.

Three questions were submitted for discussion on Wednesday morning:

1. What is the best way to enlarge the arc, incandescent and motor capacity of a plant that is now "filled up" in all departments?

2. For a plant in a small city, no day circuit, services to midnight only, what method of charging for lights would give best satisfaction to company and consumer?

3. Which of following methods would give best satisfaction in supplying lamps: (a) Plant to furnish lamps free and change them when burned dim. (b) Plant to charge for first lamp; renewals free; customer to pay breakage. (c) Plant to sell lamps at cost; no free renewals. (d) Customer to buy lamps in open market, plant having no restriction as to make.

Mr. Doherty: It looks as if the only answer to the first question was to build a new plant. But a great many interesting points might be brought out in that question. For instance, if the station was filled up in every department yet the managers might not have the money or feel that it was advisable to put in a complete new plant, new arc machines, new alternators, and might want to make an increase in one line this year and in another line the next. There are a dozen different ways of doing that—putting arc lamps on the transformers around the station, cutting them in and out with knife-blade switches, etc. I do not think that there is an automatic switch now on the market for alternating currents, but one is expected soon. There is a switch for the direct current working by clockwork, throwing lights on and off, on circuits like the Edison, and where they do not use series lamps. I would hardly undertake to answer the question, but I may suggest that an alternator with reserve capacity for future needs, that would enable them to lighten up the load on the arc machines and take on more lamps, might be put in. Then they could transfer service back and forth between one department and another, and in that way save considerable on the enlargement of the plant.

Mr. Schott: There is only one way to answer this first question, outside of the arc end of it. On the incandescent and power side, the true way to take care of it is to put it on the meter basis. On the arc end, if the station be equipped with straight series arc apparatus, while it can be metered, it is not exactly what you might term practical. I know of one town that within the last two or three years was placed in this position: they had overhead circuits, and they were forced within a given district to go under ground. In that underground district they had in the neighborhood of about 25 miles of arc circuit, while the question of ducts, cables, etc., necessary to place series arc commercial work underground meant quite a large sum of money. On

the other hand, changing from the series arc at a flat rate over to the incandescent circuits and on a meter basis meant quite a loss in the income, but after considering this matter very thoroughly, they finally concluded to adopt the enclosed style of lamp on a meter basis. The result was that the increase in cables, etc., was very slight over what they had been obliged to use before in operating their incandescent end of it, and the first year the loss in income was \$21,000, but the third year has proven that the average rate received for arc lamps connected is higher than when it was on a flat-rate basis. They avoided the increasing of the capacity of the station: they avoided the additional investment in conduits and cables. As a rule, when customers change from the series arc to the enclosed arc, they are not as well satisfied as they were before, for the reason that the series arc light will throw more light on the ceiling, but after the service has once been put in effect, the customer grows used to it, and knows that he can turn the arc on any hour of the day or night, and sees the advantage of it. In two years you can convert any man, no matter how far he has been on the other side of the fence. I think the only way to take care of the business and provide for additional capacity without increasing your station is as stated.

Mr. Livemore: If an incandescent plant is wired up altogether to four-watt and 3.6-watt lamps, if the regulation of that plant is good enough, they can use a three-watt lamp and increase their capacity very largely in that way on the incandescent lamp and on the alternating business. Where they are using the new three-wire transformers, which are made now of very high efficiency, a very material saving can be made in the dead load carried by every alternator, and in every plant using the old type of transformers made previous to four or five years ago. I know that in my case I have made a plan which I am going to carry into effect at once, by which I replace 49 old-type, two-wire transformers with 11 three-wire secondaries. This change alone in the dead load carried by my alternating machine will make a difference of eight amperes, at 1,100 volts, and in that way you can make a very material saving.

Mr. Debell: That question (referring to question No. 1) was suggested by myself, and I will state that the largest part of the business of our plant is done on a meter basis, and that as high efficiency of lamp is used as we think the station will stand in an alternating system. We have concluded that the only way to increase our capacity in the direction needed is by putting in additional machinery, and what we principally wish to know is what kind of machinery would be best put in—the simplest arrangement that would allow us to take on more business. The machinery in use now is an alternating system for incandescent lights, straight series arcs, for doing street and commercial lighting and 500-volt power service.

Mr. Frund: In reference to this first question I may say that we had three years ago two 60-kilowatt alternators, very well loaded on nearly four-watt lamps, and the question arose as to the advisability of putting in more machinery. On a 100-volt secondary it was a pretty hard matter for us, under test submitted, to get anywhere a three-watt lamp, but we finally had a manufacturer that furnished us a 3½-watt lamp; and in that way we avoided putting in new machinery for the time being, but in a very short time that extra installation was taken up. We were then running on a flat rate, very satisfactory to us, but it meant another expenditure of something like \$8,000 on the incandescent plant for new business. The question resolved itself into this, whether it would pay us to put in meters and run the risk of reducing our income. Having seen some of the results in other plants, where the meter rate reduced the income considerably, we were in doubt, but we finally resolved to put in meters, and the consequence of this was that a 60-kilowatt machine did the work, where we required two machines of 60 kilowatts each before. It took us nearly two years to get on our feet, but now we have a very satisfactory service, and while it was a severe blow at the beginning, and though we had a great many people who thought we were making money head over heels, as it were, and thought we should give them more light than we were under the meter rate, yet they found afterward that the rates were fair, and we have no trouble at all now on meters or with meter rates.

Mr. Thayer: In Cedar Rapids, near where I live, there is a typical plant of the old style, that is, with alternating currents, small transformers, 500-volt power circuit and series arcs. They have reached the limit of their station, and last year they began putting in two-phase alternators and throwing out a good many of their old transformers, and they are gradually changing their power business, wherever practicable, into two-phase motors, with the intention of ultimately throwing out all of the 500-volt system and running just their alternators for the day load. The series arcs they would keep—the street circuit on series—but they are installing a good many more—all their extra arcs are going on the alternators. They are using a few big alternators rather than a number of the small types of the smaller machines. That is the way one large plant solves the question.

Mr. Grover: I would like to add a question to that list in relation to power. We have recently

installed a power plant. It appears that nearly every station that I can find in the state that furnishes power furnishes it on a different basis. There does not appear to be any established rate for power. I think that there should be some committee appointed on that line, the same as we had on incandescent rates previously, to get the uniform rates of power, so that we can find out how cheap it can be done. Since starting the power circuit I have had one man come in and say, I can go over to Sheboygan and get it for so much, and to Madison for another rate, and go down here to Kenosha and strike something else. Well, the amount of it is, you get the rates all around and nobody knows what the rates are. What I would like to know is, how cheap I can do it and still make a dollar out of it.

In reference to the changing of a plant to a meter rate from a flat rate, the gentleman that has spoken speaking of the decrease in revenue in changing from contract to meter, has had a different experience from mine. I have found it to be just in the reverse. In two plants which I have changed over from contract to meter, I found that the revenue went down the first year about 20 per cent., and operating expenses decreased about 33 per cent., and the second year the income increased 50 per cent. and the operating expenses still remained about 30 per cent.

Mr. Thayer: Where a man has a certain number of lights and he burns them regularly every night, and certain hours, we do not say much to him, but if a customer wants light which he expects to burn at unusual or intermittent times, we either name him a high contract rate or a meter rate such as would be to his advantage to go on. But we make the distinction also that a good many plants do not, in giving him a discount for long-hour service, and not on the amount of light used. It may be that he is a customer who closes early, and uses an immense number of lights, up to our capacity, and then he shuts his lights off. Our first efforts were to charge him a rate of 33 cents a month per lamp and five cents a 1,000 watts by meter. That was made to fit into the rate that the customer had been receiving. We have followed practically the rates of the Chicago Edison company, charging 20 cents a 1,000 watt-hours on a 3.1-watt-lamp basis for the customer's average the year round, and half a cent for all succeeding hours. That rate gives us an equivalent rate of about 13½ cents a thousand watt-hours in a store, as the lights are usually burned, and it has the additional advantage that if a man wants to take extra long hours, instead of paying in the neighborhood of 14 or 15 cents, he is only charged 10 cents for that extra burning. For the first hour during the six lighter months, and the first hour and a half during the six winter months, we make a modification, and that is to forestall the time when we will put in meters, and if a man loads up his store for the holiday season he has got to pay for it, but at present it has the advantage of equalizing bills, cutting down the heavy winter bills and making the summer bills a little larger. I think you will find in changing over to a meter basis you have trouble with heavy winter bills, and if you get a system of discount by which you can cut down your heavy winter bills, you may get more for your customer by the year than you can get by letting his bills run way down in summer time and way up in winter time. We go on the basis that a short-hour customer has got to pay a large price and a long-hour customer will get a very substantial reduction on the rates, and so far we are gradually working over onto a meter basis, and we have got, I think, 40 or 42 per cent. now on meters; and that has all been done within three years, and so far we have kept right at it, and whenever we can nail a customer to get him on meter we do it, and in time we will have pretty nearly everybody on meters.

SOCIAL FEATURES.

The social features consisted of a lecture and electrical entertainment in Plymouth Church on Wednesday evening and the banquet of Thursday evening.

The lecture was given under the auspices of the association by Mr. Frank L. Perry of Chicago, whose subject was "Curious Things Electrical." It was the desire of Secretary Mercein that such an entertainment be given with the idea of "popularizing the subject," and the lecture was given with that object in view rather than for the benefit of men already surfeited with knowledge of "Curious Things Electrical." It was estimated that an audience of 600 heard the lecture and witnessed the experiments. Among the "curious things" dwelt on by the lecturer were the alternating current, as shown by specially constructed motion slides, wireless telegraphy, Edison and Tesla's views on the most "curious things electrical," electrical execution chair of Sing Sing prison and Tesla's rotary field. A description was also given of Mr. Perry's trip some years ago under water on an electrically driven submarine boat. The experiments presented were novel. A telegraph instrument was made by combining a large electromagnet, two chairs, a piece of sheet-iron and a rubber band; lengths of wire were electrically treated red hot to illustrate various applications, and an iron box was burned into by aid of a carbon rod connected with the Edison street circuit, introduced to the stage for this occasion. According to the complimentary notice in the Milwaukee *Sentinel*, pub-

lished the following morning, the explanation of wireless telegraphy proved "intensely interesting," and the lecturer, in his practical demonstration of how burglars employ electricity to open safes, "dazzled the eyes of his audience by the brilliancy of his operations in burning holes through iron plates with carbon sticks charged with electricity." Mr. George W. Patterson of Chicago followed with a pretty exhibition of Indian club swinging with electrical effects.

The banquet on Thursday evening proved a most enjoyable affair, and was, as usual, well attended. Secretary Thomas R. Mercein presided as toastmaster and performed the duties of his position with ease and grace. Toasts were responded to by the mayor of Milwaukee, ex-Governor Peck and Mr. Weld, also of Milwaukee, B. E. Sunny, Pliny Norcross, H. L. Doherty, E. H. Abadie of St. Louis, William S. Hine, James Wolff, A. C. Shaw of the Electrical Engineer, Willard Low, Professor Jackson, F. L. Perry and a number of others. After the banquet those in attendance were most hospitably entertained in the parlors below by the Wagner Electric Manufacturing company and the Electric Appliance company of Chicago.

MEMBERS AND VISITORS.

Among those present were the following-named gentlemen:

Table listing names and locations of members and visitors, including Abadie, Eugene H. (St. Louis), Adams, H. E. (Chicago), Austin, M. L. (Chicago), Barr, Edward L. (Chicago), Bean, W. Worth, Jr. (St. Joseph, Mich.), Boyer, F. N. (Chicago), Bragg, Wm. P. (Monroe, Wis.), Brown, W. A. (Chicago), Burch, L. W. (Madison, Wis.), Chacker, E. W. (Chicago), Chanood, H. O. (Quincy, Ill.), Colbert, F. E. (Chicago), Collins, W. Forman (Chicago), Condit, Sears B., Jr. (Boston), Copeland, F. A. (La Crosse, Wis.), Culver, J. H. (Decatur, Ill.), Cutter, George (Sheboygan, Wis.), Debell, E. L. (Chicago), De Sternecke, Paul M. (Chicago), Doherty, H. L. (Madison, Wis.), Downs, B. B. (Chicago), Foote, Allen R. (Washington, D. C.), Ford, F. H. (Madison, Wis.), Foster, W. H. (Geneseo, Ill.), Friend, H. W. (Vincennes, Ind.), Galt, C. T. (Chicago), Grover, T. F. (Fond du Lac, Wis.), Hamacek, A. (Chicago), Harding, J. H. (La Porte, Ind.), Hay, Chas. E. (Springfield, Ill.), Hine, Wm. S. (Chicago), Innes, Geo. (Eagle Grove, Iowa), Kaimeyer, C. E. (Chicago), Keller, Leo (Chicago), Kerns, L. E. (Madison, Wis.), Kittman, L. W. (Chicago), Korst, P. H. (Racine, Wis.), Koutz, R. F. (Neilsville, Wis.), Little, A. McNab (Chicago), Livermore, S. B. (Chicago), Lord, Irving P. (Waupaca, Wis.), Low, Willard W. (Chicago), Markley, Jos. C. (Beloit, Wis.), Messer, Charles (Chicago), McConnell, W. J. (Chicago), McCulloch, W. E. (Beardstown, Ill.), Mercein, Thos. R. (Milwaukee), O'Brien, James B. (Chicago), Overbagh, Frank (Chicago), Paige, C. C. (Oshkosh, Wis.), Patterson, Geo. W. (Chicago), Pearce, C. H. (Ishpeming, Mich.), Perry, F. L. (Chicago), Pletzcker, E. J. (Chicago), Plockard, W. R. (Chicago), Pomeroy, J. G. (Chicago), Raymond, Francis (Chicago), Rex, Geo. P. (Chicago), Rousseau, A. J. (Chicago), Schockley, B. J. (Decatur, Ill.), Schott, W. H. (Chicago), Scribner, Jesse (Chicago), Snow, A. C. (New York), Smith, Wm. M. (Milwaukee), Smith, A. (Milwaukee), Smith, C. R. (St. Paul), Stagg, F. L. (Madison, Wis.), Stahl, A. J. (La Porte, Ind.), Starks, C. G. (Berlin, Wis.), Stedman, Hiram (Berlin, Wis.), Strong, B. H. (Baraboo, Wis.), Swift, R. A. (Chicago), Thayer, Geo. L. (Belle Plaine, Iowa), Thorp, W. H. (Beaver Dam, Wis.), Trege, Chas. H. (Hoopesston, Ill.), Turner, H. L. (St. Joseph, Mich.), Wakeman, C. J. (Chicago), Whyte, Geo. S. (Chicago)

APPLICATIONS FOR MEMBERSHIP.

Applications for membership were received from A. A. Schlew, Lancaster, Wis.; A. J. Stahl, La Porte, Ind.; W. H. Schott, Chicago, Ill.; George J. Wesborn, Cadillac, Mich.; Hiram Stedman, Berlin, Wis.; Joseph C. Marsden, Beloit, Wis.; Julian Roe, Chicago; Samuel Wilkinson, Northville, Mich.; Charles H. Trege, Hoopesston, Ill.; Siemens & Halske Electric company, Chicago; Tutonia Incandescent Lamp company, Tutonia, O.; Beardtown Electric Light and Plant company, Beardtown, Ill.; W. H. Foster, Geneseo, Ill.; Stillwater Gas and Electric Light company, Stillwater, Minn.; A. C. Gates, Newton, Ia.; Douglas Hoopesston, Ottawa, Ill.; J. C. Wormly, Chicago; H. M. Wilkinson, Atlanta, Ga.; Howard C. Slater, Milwaukee, Wis.; Okonite company, New York, N. Y.; Andrew J. Paul, Boston; Henry W. Friend, Vincennes, Ind.; J. H. Mabbs, Chicago; G. E. Hall, Oshkosh, Wis.; Eagle Grove Electric company, Eagle Grove, Ia.; W. E. Doerley, Big Rapids, Mich.; Pose Manufacturing company, Hartford, Conn.; J. G. Shawn, Viroqua, Wis.; Dearborn Drug and Chemical Works, Chicago.

Convention Notes.

The Sawyer-Man Electric company was represented by Clarence A. Ross of the Chicago office.

Russell A. Willson of Marquette, Mich., was said to have been the only "municipal" man at the convention.

Mr. Pomeroy of McGill & Pomeroy, electric-railway supplies, was there. What was the matter with McGill?

Channing T. Gage, the man so well known throughout Minneapolis and St. Paul, and, in fact, the entire Northwest, was on hand, as usual.

Treasurer and General Manager A. Louis Kuemsted, accompanied by "Lieutenant" Raymond, did the honors for "the electrical bargain house."

"Healy" of the Julius Andrae Sons company was "everywhere." Healy is a good fellow, a hard worker, and he energetically did the honors for Milwaukee and his popular house.

Mr. B. J. Arnold, who addressed the convention on the "Trend of Central-station Design," was compelled, by pressure of business, to return to Chicago before the close of the convention.

Julian Roe represented the Crocker-Wheeler Electric company last year, and this year he followed his usual custom and appeared at the convention. Manager Wilmerding was not in attendance.

Of course the genial representative of the Perkins Electric Switch Manufacturing company of Hartford, Conn., Edward K. Patton, ran up from his Chicago office, and "mixed" with his host of friends.

The John A. Roebing's Sons company, as is customary, appeared in the person of A. B. Conover, Jr. Mr. Conover's convenient combination pocket-book and memorandum-book was much sought after.

The Cass & Aaron company, Chicago, dealer in second-hand electric machinery and repairs, would have found the Northwestern convention a splendid opportunity in which to add to its already long list of friends.

S. M. Hamill of the Brush Electric company of New York often suddenly appears at conventions, as was the case at last year's Northwestern convention, but this time he was absent, leaving Mr. Sunny to do the honors in his stead.

E. Kuhlman of the Kuhlman Electric company of Elkhart, Ind., manufacturer of transformers, was heartily welcomed by his many friends. Mr. Kuhlman is one of the most experienced manufacturers of transformers in the West.

F. Overbagh, manager of the Chicago General Fixture company, did the honors for his institution, and was assisted in his "pink tea" by L. W. Kittman, so well liked as the company's traveling representative throughout the Northwest.

The Dearborn Electric company, Chicago, appeared in the person of Charles Messer. Mr. Messer has not heretofore been a regular attendant at the Northwestern conventions, but it is hoped, now that the start is made, it will not be his last.

It was a matter of great regret to the many friends of the Wagner Electric Manufacturing company that Assistant General Manager W. A. Layman could not have appeared in company with Manager of Sales Abadie and Chicago Manager Foster.

Last year Western Manager Frank H. Clark of the Chicago office of the Electric Storage Battery company of Philadelphia made his debut at a Northwestern convention, and the promptness with which he turned up this time indicates that he knows a good thing when he sees it.

L. W. Burch of the Electrical Supply company of Madison, Wis., was, of course, on hand. Mr. Burch was feeling jubilant over the fact that he had recently secured a very large order for wire and had also recently been able to double the capital stock of his company and have it all paid in.

It has often been said that no electrical convention would be complete without "Senator" George S. Searing, who, it may be stated incidentally, sells Hart switches as a matter of recreation. Mr. Searing's distinguished presence added greatly to the pleasure of the banquet.

Owing to pressure of business at the city hall of Edgewater and also at the western office of the American Electrical Works, Mayor Donohoe was compelled to delegate the pleasant task of attending the Northwestern convention to his energetic representative, Edgar H. Hammond.

Francis Raymond took care of the interests of the Charles E. Gregory company. Someone started the report that Mr. Raymond is shortly to become a benedict. In the event of Mr. Raymond being successful in such an important undertaking, his friends are prepared to show him all the honors.

No man was more warmly welcomed than W. H. Grissom of Monadnock block, Chicago, representing the Eureka Tempered Copper Works of Northeast, Pa. Mr. Grissom is a man who makes a friend at every turn through his unflinching courtesy and consideration of others, and, once made, he never loses him.

M. B. Austin & Co., occupied a parlor near the convention hall and were represented by Messrs. Austin and Browne. This concern's exhibit consisted of Mr. Austin's patent switch that has met with such great success during last year, circuit

breakers and L. A. Chase & Co.'s conduit system. Speaking of conduits of this latter company, calls to mind that Sears B. Condit, Jr., of L. A. Chase & Co., joined forces with Mr. Austin in helping entertain.

Count William Goltz, ex-secretary of the association and well known for so many years in Milwaukee in electrical circles, and within the last year or so secretary of Meysenburg & Badt, came up from Chicago and mingled once more with his Northwestern convention friends and acquaintances in Milwaukee.

Electrical Specialist George Cutter, full of his old tricks, was on hand, and, as usual, warmly welcomed. Mr. Cutter made no exhibit. This is the only thing that can be said to his discredit, as he has of late brought out several most valuable novelties in the line of arc-lighting specialties, and this occasion was the chance of the year.

A. J. Stahl earned the name at this convention of the "hot-water heat" expert. Mr. Stahl knew his business, and gave the practical men of the convention many practical points on economics in the matter of the distribution of heat from the modern electric-lighting central station. Mr. Stahl's headquarters are at La Porte, Ind.

General Manager Fox of the Northern Electrical Manufacturing company sent from Madison a most genial representative in the person of F. L. Stagg. Mr. Stagg is Mr. Fox's right-hand man, and having been in the electrical business for many years and thoroughly acquainted, it is safe to say that Mr. Fox's interests were well looked after.

The Fort Wayne Electric corporation strolled into the convention halls with that usual winning smile for which it is noted in the person of its ubiquitous representative, E. L. Draffen, of the Chicago office. Mr. Draffen brought his smile back to Chicago in an enlarged condition, and it is said there is good reason for his happy mood.

George Patterson of the Chicago office of the Circular Loom company won tremendous applause by the climax of his performance in electric club swinging at the lecture on Wednesday evening. Mr. Patterson produces an electrical performance that has been presented on the stage in both New York and Chicago, winning him an enviable reputation.

Electrical Engineer Knox of No. 700 Fisher building, Chicago, should not have lost the opportunity again to shake the hands of his many friends made at the preceding Northwestern convention. Mr. Knox has recently severed his connection, however, with the Varley Duplex Magnet company, and, with other connections pending, he was unable to spare the time for a gathering that would have given him the greatest pleasure.

When a man comes clear from the hub of the universe to a point on the circumference, like Milwaukee, it is certainly a compliment, and for this reason the sudden appearance of that cultured Bostonian, Sears B. Condit, Jr., manager for L. A. Chase & Co., created something of a sensation among his many warm western friends. Mr. Sears made many new friends at the last National convention in Chicago, and this time he is doubly welcome.

The Library Bureau of No. 215 Madison street, Chicago, through its painstaking representative, Rodger A. Simonson, made a novel exhibit of its card system of records, suitable particularly to the needs of central-station men. Managers who have had trouble devising a system of records for station service found Mr. Simonson's exhibit one of great value, as he literally fills "a long-felt want." Specimen forms of systems in use in New York, Boston and Chicago were exhibited.

It isn't often that so busy a man as Western Manager B. E. Sunny of the General Electric company can spare time to join the detachment he usually dispatches to every convention, but this time he was on hand early and stayed late. Mr. Sunny responded to a toast at the banquet, and made some most pertinent remarks, that may be considered almost in the light of a prophecy relative to the trend of the central-station business the coming year. Mr. Sunny's words made a decided impression.

Jacob Cloos of the Cloos Engineering company had charge of the wiring for the exhibits, and was unflinching in his courtesy and efforts to aid the boys in the hard work necessitated by such hasty preparations. Mr. Cloos has made a reputation for himself with his non-arcing oil-break switch. It has been pronounced one of the innovations of the year and is an invaluable adjunct in any situation where high-tension currents liable to arc and do damage are employed. This device is worthy of the most careful investigation.

Although General Manager Hammer of the Chicago Rheostat company could not find time to be present, as was also the case with Mr. Harding of the same concern, he nevertheless is entitled to the thanks of the association for his courtesy in the loan of a large rheostat as an adjunct in the production of the electrical effects in the lecture at Plymouth Church on Wednesday evening. Mr. Hammer's rheostat, although put together with almost no other data than guesswork, operated with the greatest perfection.

With a rush of wind, the door of the Pfister opened on Thursday evening, and in blew "Clark," that ubiquitous pole dealer whose name constitutes

one of the ornaments in the title of the Valentine-Clark company of Chicago. "Clark" is losing his well-established reputation for absolute veracity through his yearly repetition of his indifference to electrical conventions, that in every instance is disproved by his sudden appearance at every convention at the most opportune moment. Valentine stayed at home to work.

No Northwestern convention is looked upon as complete unless Secretary and Treasurer William M. Smith of the Chicago Insulated Wire company is present. Mr. Smith came up with the Chicago party and remained with the boys through to the end. He made no exhibit, but the product of the Chicago Insulated Wire company is well known to the members of the Northwestern Electrical association, and Mr. Smith merely used this opportunity for renewing old acquaintances and adding new ones to his already long list.

Messrs. William S. Hine and A. McNab Little represented the Western Electric company. Messrs. Hine and Little made no exhibit, but presented interesting printed matter relative to the great variety of Western Electric apparatus. They had bulletins representing alternating lamps and other supplies, to say nothing of the Stanley apparatus, which is Mr. Hine's particular care. In the hands of experienced convention goers entertainment is usually a prominent feature of every exhibit, and Messrs. Hine and Little did their part gracefully.

Messrs. Selumacher and Zamel of the Zamel Arc Light Meter company, Chicago, are two of the most enthusiastic attendants of the Northwestern convention, and turned up as usual. It will be remembered that the Zamel company exhibited on previous occasions a novel arc-light meter, through which the time of burning of arc lamps might be registered, and thus charged to the benefit of the consumer—a device that has proved in practice its efficiency as an aid to the salesman in introducing the arc light into stores where arc lamps are only desired during a portion of the evening.

Manager of Sales E. H. Abadie of the Wagner Electric Manufacturing company of St. Louis received from a competitor during the Northwestern convention a compliment seldom paid, and more valuable from the fact that it did come from a strong competitor. In the presence of several gentlemen, the manager of a branch office of one of the largest electric companies of the United States stated that a contract he had recently seen, and which was drawn up by Mr. Abadie, was such a model in its way that he considered it an advance in the art of contract making.

W. Worth Bean, Jr., in company with H. L. Turner, electrician of the St. Joseph and Benton Harbor Electric Railway and Lighting company of St. Joseph, Mich., came to represent him, who to-day is "the maddest man in Michigan," "Governor Bean." The latter gentleman, as is his usual good fortune, one might almost say, custom, is at present engaged in a slight case of wrestle with someone in his municipality, who is trying to make inroads on his business. It was too bad he couldn't have been in attendance, but he need have no anxiety; the "chip of the old block" knew his business.

The inimitable and ever graceful Western Manager James Wolff, of the New York Insulated Wire company and incidentally chairman of the Northwestern Commission of Transportation, although almost overcome with an attack of the grip, left his bed in order not to miss one of his most pleasant and profitable trips of the year. Messrs. Wolff, Whyte and Low certainly deserve credit for the fine showing of members produced on the special train from Chicago. Incidentally, it may be said that Chairman Wolff made a most graceful response to Secretary Mercein's call for a toast at the banquet.

That man of many friends, Joseph H. Cooke, came to the convention, as usual, to represent his two pets, the Buckeye Electric company and the Jandus Electric company of Cleveland. As is well known, the Jandus company has recently brought out several new types of enclosed arc lamps, and its work in the production of such lamps for alternating and continuous service has been brought to a remarkable state of perfection. Those interested in knowing something of the advances in the art of arc-lamp manufacture will find it profitable to visit Mr. Cooke's Chicago office, No. 753 Monadnock block.

So many bouquets have been deservedly cast at the feet of the silver-tongued secretary, Thomas R. Mercein, that it seems almost superfluous to add to his already luxuriant flower garden. It is gratifying to note that this year the association, without a dissenting voice, doubled the secretary's salary. It seems incongruous almost to speak of salary in connection with a man who has shown himself a genius as an executive in association matters, but this spontaneous action on the part of the association should be taken by Mr. Mercein, as it was meant, as a well-deserved recognition of faithful service.

The remark was made with reference to the Illinois Electric company, "These boys have certainly come to the front." Applying, as it did, however, to this concern's rapid growth into prosperity, it was none the less pertinent relative to the manner in which its hustling representatives "did up" the '99 Northwestern convention. Secretary L. K.

Cushing, Treasurer Carl Keith, backed by those skillful salesmen, H. E. Adams and Dewey Newman, needed no exhibit to demonstrate that the Illinois Electric company was one of the "warm things" of the present day, especially in the western supply business.

President Edgar of the Dearborn Drug and Chemical Works was one of those missed this year at the Northwestern convention. Last year Mr. Edgar read one of the most interesting papers presented at the convention on the treatment of boilers for the prevention of scale. However, Willis D. Jameson, in company with J. M. Frye, nobly did the honors, making an interesting exhibit of specimens of boiler scale, etc., to say nothing of Dearborn perfumes and oils. Vice-president Eddy and "Entertainer" Carr of the Dearborn company made the mistake of the year in failing to slip in, if only for an hour or two.

It is safe to say it was the unanimous opinion of the guests at the Pfister that Manager A. L. Severance of this popular hostelry outdid himself on this occasion in the matter of attending to the comforts of his convention guests and seeing that every courtesy was shown them. Mr. Severance was on hand constantly, in person, always courteous, and doing everything in his power to extend that hospitality for which the Pfister is now noted. It is a very easy matter to prophesy that the next Northwestern convention, a year from date, will be held in no other hotel than the Pfister, which has been repeatedly pronounced an ideal hotel for the convention.

Of course President Willard W. Low of the Electric Appliance company was on hand, and this time his lieutenant was B. B. Downs. Mr. Low was almost ubiquitous, and where he was not traces could still be found in the shape of Appliance buttons, carrying the story of Packard lamps. This little button or charm, as it was called by the company, was said to prevent, if carried in the pocket, bald heads, hard work, love, warts on the nose, bicycle face, dark brown taste, war craze, swelled head, delirium tremens, unhappy marriages, insanity, punctured tires and the purchase of any other apparatus than that sold by the Electric Appliance company. But where was Stacey?

W. R. Pinckard, in company with C. W. Rugg, came up from Chicago to look after the interests of the Westinghouse Electric and Manufacturing company of Pittsburg, Pa. It was unfortunate, however, that these gentlemen could not have been joined by Manager Warren of the company's advertising department. Mr. Warren was one of the most welcome guests at the last midsummer convention on the steamer, and he would have found many old friends had he been able to again appear at Milwaukee. When Mr. Warren himself cannot appear, it has been suggested that he delegate his energetic assistant, "Probasco." The Westinghouse company made no exhibit this time.

Of course the Sprague Electric company was there in full force, and Western Manager E. B. Kittle, in company with Charles G. Burton, who has recently allied himself with this institution, showed the Northwestern people that the Sprague company always means to keep away up in the front ranks. Messrs. Kittle and Burton were on hand every hour in the day, and someone whispered every hour in the night as well. However that may have been, most energetic work was performed, and the artistic stories of these gentlemen relative to the merits of Lundell fans and motors, Sprague elevators and interior conduit will be remembered as gems of electrical salesmanship.

The General Electric company held forth in a room on the parlor floor, as usual, and was represented by F. N. Boyer, J. Scribner, "Tom" Ferris of Milwaukee, R. A. Swain and F. W. Wilcox. The General Electric company did not make any display other than an introduction of a new line of small single-phase induction motors and the two-rate wattmeter. The latter instrument places the central-station manager in possession of the amount of current consumed by his customer at any period of the run, and enables him to do justice to his customers on charges between the peak and valley of his load. The usual line of printed matter was on tap, with some excellent new publications on arc lamps, meters, transformers and supplies.

When a supply house as far south as the Commercial Electrical Supply company of St. Louis sends a man to Milwaukee, no better illustration than such a proceeding can be found of the far-reaching nature of the company's business. James B. O'Brien did the honors for the Commercial company, and did them in his usual inimitable manner. The Commercial Electrical Supply company is now often referred to as the emporium of electrical supplies, and, owing to the comprehensive nature of the company's business, the question is often asked why President Joseph Franklin, Jr., and Manager of Sales Paul D. Cable haven't sometimes taken this opportunity to steal northward on a little "business trip" that would not be unflavored with pleasure.

Electrical Engineer Adolph Hamaeck of the Sturgeon Bay, Wis., electric-light plant, surprised the convention with a new arc lamp of most novel and simple construction. The lamp was of the enclosed-arc type for alternating current, and one of its features was its shortness, being only 18 inches long. It has a direct carbon feed; that is, it is without

a carbon rod, and it also has no side rod extending down outside of the globe enclosing the arc. Mr. Hamaeck states that his lamp burns from 75 to 125 hours on one trimming, consuming a 12-inch upper and a five-inch lower half-inch carbon. Mr. Hamaeck expects to organize a company to exploit this new lamp, as he has had already a most surprising demand for it to an extent which necessitates a greatly increased capital.

"Colonel" George Rex did the honors for the Columbia Incandescent Lamp company of St. Louis. As is well known, Mr. Rex is the manager of this company's Chicago office. Mr. Rex made one great mistake in his otherwise successful effort to make the most attractive possible display for his company. The one stone he left unturned, so to speak, was his failure to induce Secretary Arthur Garrison of the Columbia company to follow his time-honored custom of appearing at the Northwestern conventions. Mr. Garrison has recently become a benedict, but, of course, his excuse for this unpardonable failure would be "too busy at the factory," and undoubtedly the statement is correct, for it is said that the Columbia company is having a phenomenal rush of business. The trademark "unequaled in quality," backed by the company's honest endeavor, seems to be paying.

A most interesting novelty and one that attracted no little attention on the part of economically inclined central-station men was the wire re-insulating machine of Lewis & Buchl of Sycamore, Ill., exhibited by Everett L. Palmer. This was Mr. Palmer's initial appearance at the electrical conventions, but it did not take him long to prominently locate his machine in one of the parlors. In practical operation the machine illustrated the manner in which old and poorly insulated lighting or other electrical conductors can be re-insulated, and thus saved from being stripped from the pole. Mr. Palmer distributed a neat little circular, which told the reader "how to save your insulated wire." Practical men at the convention told Mr. Palmer that he had a winner and a seller and a device that would likely be in the hands of every electric-light man with an appreciation of high insulation.

Martin J. Insull, manufacturers' agent, Chicago, made his initial bow in this capacity at a Northwestern convention, and his debut won him favor, for his exhibit of the Wright demand meter created more or less of a sensation among the central-station managers. It was a curiosity, in a way, except that many had already been posted relative to its advantages, but, nevertheless, the practical exhibition of its merits, through the agency of a sample exhibited, proved it beyond doubt to be a most meritorious invention, and demonstrated that Mr. Insull knows his business as a manufacturers' agent. Mr. Insull was assisted in his work of entertainment and exhibition by Thomas James and Charles D. Heile, the latter gentleman attending particularly to the business of the Wright Discount Meter company. One specialty in the Insull exhibit that met with particular attention was the type "K" transformer of the Pittsburg Transformer company, the agency for which Mr. Insull has recently accepted.

As has been its custom at every convention, whether National, street-railway, telephone or Northwestern, the Central Electric company sent a noble phalanx of representatives to remind people of the "old and reliable house" that has recently issued the "greatest encyclopaedia of electrical supplies of the nineteenth century." President George A. McKinlock, as was the case last year, was prevented from attending by pressure of business, but Secretary Charles E. Brown ran up for a day to catch a glimpse of the boys. Mr. Brown left the company's display in the hands of his two popular representatives, F. M. Pierce and C. W. Cobb. The Zeco arc lamp was the one specialty paid particular attention; this lamp is meeting with great success, owing to its many valuable qualities, chief among which is its extreme simplicity and very simple but very novel clutch. According to President McKinlock, the demand for this lamp has been so great that the company has recently had to secure a very large stock, so that orders could be promptly filled.

E. L. Barr represented the Wallace Electric company of Chicago, and in company with Leo Keller of Shoeman & Keller, talked "Chicago" arc lamps. Shoeman & Keller are general distributing agents for the Chicago incandescent arc lamp, and the Wallace Electric company is acting as sales agent likewise for this lamp. One of the features of the Chicago lamp is its simplicity; no springs, no gears, no ratchets, no chain feed; in fact, nothing to adjust or get out of order. The claim is made that this lamp is the best enclosed arc lamp on the market for direct current, and many good reasons are given for this assertion. The present occasion was Mr. Keller's first appearance, and he proved himself a "good fellow" in every sense of the word and made many friends. He will meet with the warmest welcome at the next convention, especially from the fact that it is rumored that he is a talented entertainer and his stories are inimitable. Mr. Barr, in addition to his other duties, did most energetic work for that old standby of the Wallace Electric company, the Eddy Electric Manufacturing company.

The Victor Telephone company of Chicago distinguished itself for enterprise in being the only telephone company this year to present its apparatus at this notable northwestern electrical gathering.

one of the ornaments in the title of the Valentine-General Manager William T. Blaine, accompanied by A. J. Rousseau, engaged one of the best located parlors in "exhibition row," and there presented for the inspection of the electrical experts as fine specimens of telephonic instrument work as, it is safe to say, are on the market. A 200-drop capacity metallic switchboard was shown, also a full line of desk 'phones, wall sets and general switchboard apparatus. Mr. Blaine is an old newspaper man, and showed his talents as an entertainer by the rapid manner in which he made friends with those at the convention. The Victor Telephone company, although starting hardly a year ago, has made such rapid progress and met with such phenomenal success, that the already large factory on Clinton street, Chicago, has had to be extended. An inspection of a section of the Victor switchboard shows instantly the reason for the company's rapid stride forward. Anyone versed in machinery will instantly see that Mr. Blaine's motto has been to present the very highest grade of workmanship.

Secretary George S. Whyte of the Leschen-Macomber-Whyte company was one of the trio, the other two members of which were James Wolff and Willard Low, that constituted and carried to such a successful termination the Chicago transportation arrangements. Mr. Whyte, as was naturally expected, owing to his energetic nature and host of friends, did noble work in the matter of bringing together delegates for the special train from Chicago. A man is never a prophet in his own country, though, and in spite of his influence among the boys, he failed most signally in his own bailiwick, for many were the inquiries for Macomber, who, it will be remembered, made his initiatory bow at electrical conventions with much grace at the street-railway gathering in Boston last fall. The Leschen-Macomber-Whyte company makes quite a specialty of furnishing guy ropes and other wire goods, to say nothing of iron, steel and copper wire, bare and insulated, suitable for electric-light service and especially to the needs of telephone work. The last-named branch of the company's business has greatly increased of late, due, no doubt, to the popularity of this company's goods and its representatives among the independent telephone exchanges.

New "Interrupted-current" Dynamo.

A new and interesting type of dynamo, claimed to be of remarkable efficiency, has been brought out

connected through a special commutator to separate distributing circuits with a common return, as shown in the accompanying diagram (Fig. 1). The initial voltage generated in each circuit is 220 volts. This current is generated in each circuit for only one-third of the time, or, in other words, each coil on the armature is active for only one-third of a revolution, being entirely cut out of circuit for the remaining two-thirds. Actual test has demonstrated that when a rate of 5,400 impulses a minute has been reached the light is absolutely steady.

A recent test of a 300-light machine of this type was made in the following manner: Two new 16 candle power, 110-volt, 55-watt lamps were selected at random from a barrel of Buckeye lamps. These were placed at each end of a Bunson photometer. One was connected to the mains of a direct-current machine and held at 115 volts; the other was connected with the dynamo being tested. The Bunson disk was placed in the center of the scale and the current from the dynamo under test was regu-

As will be noticed from Fig. 2, the machine is simple and compact. The results obtained, while remarkable, can be, it is said, demonstrated to be correct theoretically, and the record of the machine itself furnishes the corroboration of the theory.

The Triumph company thinks that this machine opens a new era in incandescent lighting and that, on the present close margin of profits, no consumer can afford to overlook this opportunity of cutting down his fuel account. The manufacturer states that it is ready to furnish a limited number of sizes at present and to put them in on trial, permitting the machine to make its own record.

Fish Brothers' Switchboard.

The cut presented herewith illustrates an artistic switchboard that has just been built for the Fish Brothers Wagon company of Racine, Wis., by Julius Andrae & Sons company.

The Fish Brothers Wagon company is one of

FISH BROTHERS' SWITCHBOARD.

lated with a field rheostat until the lamp on that circuit was brought to the same candle power as that on the direct current. All readings were taken with Weston portable voltmeters. When the candle power of the lamp on what may be called the 'interrupted-current' generator was exactly the same as that on the direct current the apparent voltage of the interrupted current was observed and the test began, the results being given below. The dy-

of the largest concerns of its kind in the United States, and recently it decided to make the addition to its factory of an electric power station, including a new engine room and new engine; in fact, the company has put in an entirely new electric equipment and is installing motors up to 50 horse power to drive the machinery of the factory. There will be in the entire installation about 20 Northern Electrical Manufacturing company's motors. In the power house there will be three generators, one Rockford dynamo for lighting service alone, and two Northern company's power generators of 125 kilowatts each.

The plant was sold by J. S. Healey of the Julius Andrae & Sons company of Milwaukee and the switchboard was put up by the Andraes especially for this plant. This board is equipped with three Weston illuminated instruments—two voltmeters and one ammeter. There are also six "I-T-E" circuit breakers made by the Cutter Electrical Manufacturing company of Philadelphia, also six Crouse-Hinds tubular switches, quick-break. In addition, at the base of the board are two Cutler-Hammer rheostats and two Garton-Daniels lightning arresters. The metallic portions of the board, switches, instruments, etc., showing on its face, are all finished in red burnished copper, and as the board proper is of Italian marble, this combination of marble and copper gives it a most artistic finish. The board is surmounted by a red copper fish, the eyes of which, when the board is in operation, will be illuminated by two tiny incandescent lamp bulbs. The entire board is raised 18 inches from the floor on two highly ornamented red-copper pedestals.

FIG. 2.

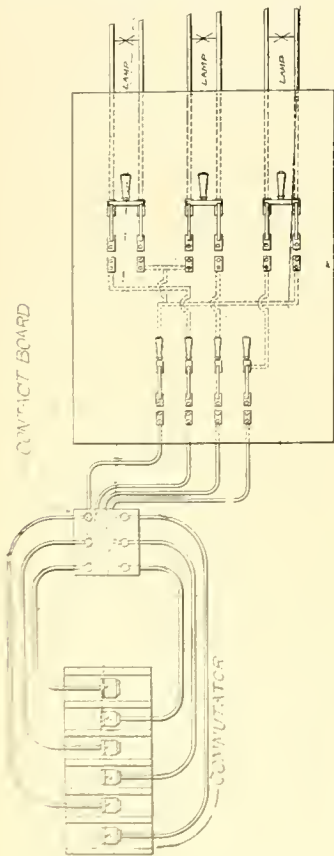

FIG. 1.

NEW "INTERRUPTED-CURRENT" DYNAMO.

The Triumph Electric company of Cincinnati, O. This dynamo, the maker claims, will develop current 50 per cent. more light than the most modern efficient machine of the usual design for the same rated capacity, or, vice versa, will develop more for the same number of lights with the expenditure of only 25 per cent. of the energy required by other machines.

As compared with the dynamo to that of Corli in the same field the result being obtained by using the direct-current dynamo, 50 to 100 per cent. more light per ampere, the armature windings being divided into distinct and separate cir-

cular dynamo was belted to a countershaft driven by a 12 by 14 automatic engine.

Average of three cards, 33.35 horse power; number of 16 candle power lamps, 394.

Average of three cards, 21.43 horse power; number of 16 candle power lamps, 152.

Average of three cards, 13.82 horse power; fields open.

Number of 16 candle power lamps per horse power delivered at full load, 15.66.

Number of 16 candle power lamps per horse power delivered at half load, 11.32.

It will be observed that these results are fully 50 per cent. better than can be expected from any standard machine of the same capacity; also that there is a surprisingly small drop in efficiency at half load.

Writing from Santiago de Cuba, a correspondent of the Chicago Record says: "Santiago has no means of street traffic save by ancient carriages or hacks, and a street railway undoubtedly would be a paying institution. The climatic influences are such as to make the inhabitants lazy, no matter whether they have lived here long or not, and they all detest walking. It costs \$1 to ride in a carriage to any part of the city, no matter if the distance is one block or 20 blocks. On account of the hills and the hot climate a street railway would necessarily have to be operated by electricity or other mechanical power, as it would be impossible for mules or horses to pull the cars up the grades."

Reliable Telephone Apparatus.

The accompanying illustrations show the apparatus and mechanical details of the Reliable Electric Manufacturing company of Worcester, Mass. Fig. 1 shows the transmitter which has been perfected in this company's shops. Its construction will be readily seen by a careful study of the picture. It is composed of two carbon plates, one being adjustably mounted in the transmitter casing and the carbon-contact plate being fastened on a thin metal plate and riveted on the diaphragm, leaving a clearance of one-sixteenth of an inch between the carbon plate and the diaphragm, in order to make the whole surface of the diaphragm sensitive to vibrations. The casing is preferably mounted in a suitable socket, so that it can be turned round from time to time, in order to prevent the carbon grains from packing together. An annular felt washer is mounted upon the carbon plate so as to confine a body of powdered or granulated carbon between the carbon plates.

Fig. 1. Transmitter.

Fig. 2. Mechanical Construction of Exchange Telephone.

RELIABLE TELEPHONE APPARATUS.

At the outer end, the annular felt washer engages a chamfered or inclined edge on the carbon plate, this construction being especially adapted to give a half-sliding, half-compressing motion of the felt washer in order to reduce the friction to the minimum. By providing the carbon-contact plates with a serrated or roughened face, an increased area of contact is secured between the carbon grains and the contact plates, so that the vibration of one of the plates will cause a considerable variation in the resistance to the electric current; also, on account of this construction, there will be less liability of the powdered carbon caking or hardening.

In the other telephones the same form of transmitter is adopted. Fig. 2 shows the mechanical construction of the instrument designed by this company for exchange and long-distance service. It will be observed that it is rather unlike many of the standard market telephones for exchange instruments. The aim of the designer in perfecting this character of telephone apparatus has been to reach a higher degree of perfection in mechanical construction than has heretofore been obtained.

Fig. 3 shows the combination transmitter and receiver which is being made for use, either with the apparatus manufactured by this company, or to be applied to instruments of other make.

Fig. 4 shows the desk or movable instrument. This is a well-finished piece of apparatus, made in

polished nickel and carefully constructed as to mechanical and electrical features.

CORRESPONDENCE.

New York Notes.

New York, January 23.—The Manhattan Railway company and its property occupied a large share of public attention last week. On Tuesday Mr. W. J. Fransioli resigned his position as general manager, after 18 years' service with the company, to go with Richard Croker's auto-truck company. Alfred Skitt, the lately appointed vice-president of the Manhattan company, will assume the duties of general manager. Later came vague rumors of a possible consolidation of the Manhattan, Metropolitan and Third Avenue railway interests, but these startling reports could be traced to no authoritative source. Then came renewed talk of the electrical equipment

Fig. 3. Combination Transmitter and Receiver.

Fig. 4. Desk Telephone Set.

of the Manhattan elevated system. All the time the stock was going up on Wall street by leaps and bounds. But this was not as remarkable as it would have been at another time, as the week was one of extraordinary "boom" on the stock exchange, and almost every well-recognized trading stock advanced. One report was that the Vanderbilts had purchased large holdings of the stock, but this was promptly denied by Senator Depew. Then it was rumored that the Westinghouse company had secured the contract to equip the road for electrical operation, but Mr. Russell Sage denies this, and asserts that while the company is considering the possibility of electrical operation, it is proceeding very cautiously and nothing has been done. Mr. Sage is quoted by the *Sun* of yesterday as talking freely about the situation, and I will quote here a portion of the interesting interview. You will see that the venerable capitalist is uncertain about electricity, but has a good word to say for compressed air.

We had a meeting of the board, at which Mr. Westinghouse made an estimate of the cost of equipping the road with electricity. We all agreed that the estimated cost was too high, and Mr. Gould asked if he could get an expert of his from the Union Pacific to study the question. We said he could—it was unanimous. The expert is still at work, and we have a committee of the board looking into the matter. We have had several meetings of the board to talk the thing over and we're still at work on it.

You see, we don't want to expend eight to fifteen million dollars on this thing unless we know just what we're going to get. Now, Westinghouse is an expert and a friend of mine, and he ought to

know something about it, but he isn't very sure about the thing. Four years ago he came to me and said we could save \$600,000 a year by using electricity—and \$600,000 a year is tempting. I asked him to look into it. He kept me waiting a couple of years and then he was so sure about it.

"Hold on to your steam for a while," he said. So, you see, there's nothing sure about this. I don't know anything about electricity, and they all seem a little in the dark about it. You see a man climb a pole, and the next thing he comes down flop—dead. We run trains under two minutes' headway in the rush hours on Third Avenue and under two minutes' headway on Sixth Avenue, and we carry 500,000 people a day. We can't have any delays or accidents. I am proud of the fact that we have never killed a passenger, and with some new arrangements, if two trains should run into each other fifty people might be killed and that might bankrupt the road.

Out in Chicago, Mr. Gould tells me—I've never seen it—they are running trains on the elevated by electricity, but they don't run such heavy cars or such long trains as we do. Of course, they don't carry so many passengers.

[Mr. Sage was asked by the reporter if the company was still looking into air power.]

Oh, of course, we're looking at the thing from all sides. Now, up at 125th street, they've been running an air-power car and an electric car for quite a while. I haven't been up there, but they say they run all right. The air-power car makes more noise, though. This air power is coming up again, and out West, they tell me, they think air power's the only thing.

Lieutenant S. Dana Greene of the General Electric company is scheduled to present a paper on "Electricity on Board Ship" before the American Institute of Electrical Engineers on Wednesday evening. This is a popular subject nowadays and should draw a good attendance.

Mr. Croker's auto-truck company has been organized. The stock of the company was increased to \$10,000,000. The following-named officers were elected: Joseph H. Hoadley, president; Louis Nixon, vice-president; Nathan Straus, treasurer; C. C. Hardy, secretary; Augustus Van Wyck, general counsel; and, as directors, J. H. Hoadley, Arthur P. Gorman, Nathan Straus, Louis Nixon, Richard Croker and Robert J. McKinstry of Philadelphia. The project of the company is to do a general trucking and freight-transportation business in the city of New York and throughout New Jersey. The general counsel for the company is the late Democratic candidate for governor of the state. An obstacle in the path of the company has arisen in the person of Mr. W. E. Prall, who says that he is the inventor of the devices for using compressed air which the new company proposes to use. Mr. Croker says that the company will go ahead with its plans, regardless of Mr. Prall.

The New York Gas and Electric Light, Heat and Power company, "the \$25,000,000 company," is absorbing the Edison Electric Illuminating company with the aid of several prominent financial concerns. Mr. George Foster Peabody, representing the principal stockholders of the Edison company, has entered into an agreement with the State Trust company for the sale of the Edison stock represented by him, to become binding only in case the holders of at least 55 per cent. of the stock shall have agreed to the sale by February 15th, with an allowance of 10 days additional to stockholders living abroad. Up to these dates all stockholders will be privileged to join in the sale on the same terms. These terms fix a valuation of 220 on the Edison stock, payable in four per cent. purchase-money gold bonds, due February 1, 1949, of the New York Gas and Electric Light, Heat and Power company at par; that company to have the right to pay off the bonds at par and accrued interest at any time within three years from February 1, 1899. The bonds may be exchanged for cash at a valuation of 85 and accrued interest at any time before March 25th by Edison stockholders who do not desire to hold them. The bond issue is limited to \$21,000,000. There seems to be no doubt that the sale will be made. The *Sun* is authority for the statement that R. R. Bowker, first vice-president of the Edison company, was opposed to the negotiations for the transfer and has sent in his resignation. Mr. Bowker will also resign, it is added, as president of the Manhattan Electric Light company, which is controlled by the Edison Electric Illuminating company. The outstanding capital stock of the Edison Electric Illuminating company is \$9,200,000. There are also outstanding \$4,312,000 in first-mortgage bonds and \$2,188,000 in first consolidated mortgage bonds. According to the plans of the new company, it is proposed that it shall use the "surplus" electricity from the new power plant of the Metropolitan Street Railway company.

It is rumored that the Brooklyn Rapid Transit company, having now secured control of the Nassau Electric company, will soon succeed in acquiring the Coney Island and Brooklyn company, the only remaining surface trolley system, and follow up this deal by either leasing or purchasing the two elevated roads. The Flower syndicate, it is said, eventually aims to accomplish the consolidation of all the Brooklyn transportation companies and to operate them as one system. The plan contemplates the formation of a new company to purchase all these properties and pay for them partly in bonds and partly in the stock of the new corporation. M. S.

PERSONAL.

John Kean, the senator-elect from New Jersey, holds the principal interest in the Elizabeth Street Railway company.

Richard Croker, Jr., and Frank H. Croker, sons of the Tammany chieftain, are at work now in the Westinghouse Electric shops near Pittsburg. They are taking a course in practical electrical engineering. After they have finished they will enter on the study of law. They are yet a little undecided as to

what profession to follow, but say that both electricity and law are good things to understand.

Mr. C. C. Warren of Sandusky, O., was in Chicago last week. Mr. Warren anticipates a boom in the electrical business, and he believes the next year will show a revival that will recall the early days of electric lighting.

Henry C. Payne of Milwaukee, who returned from a trip to Washington on January 20th, fell in an epileptic fit at the Milwaukee Club and was removed to his home. Mr. Payne has suffered from similar attacks several times within the last year or two, and he has been warned by his physicians to avoid excitement and overwork.

A current newspaper paragraph describes Rossington Elms of St. Louis, 77 years old, as the first messenger boy in St. Louis. He is said to be the oldest telegrapher in America. He is oldest in service of all the employes of the Western Union Telegraph company in the United States. He has served in every position in the telegraph office, beginning as a messenger and advancing to the offices of manager and superintendent. He has been an employe of the Western Union and its predecessors just 50 years.

ELECTRIC LIGHTING.

Santiago, Cuba, boasts an electric-light plant, but the streets are nevertheless very poorly lighted by kerosene lamps.

At Sherman, Chautauqua County, N. Y., the Sherman Electric Light company has been organized. The company has a capital stock of \$5,000. One of the directors is Charles E. Cobb.

The Astoria (N. Y.) Light, Heat and Power company, with its principal office in New York city, has been incorporated with a capital of \$500,000. The company will supply both gas and electricity, and will operate in the several counties comprised in New York city. The directors are Horace W. Fuller, Augustus R. Moen, Arthur C. Hume and F. R. Foraker of Manhattan and T. Wilbur Spear of Brooklyn. It is believed that John D. Crimmins is interested in this company.

The St. Joseph and Benton Harbor (Mich.) Railway and Light company has secured the contract to light and heat the court-house and jail at St. Joseph for three years for \$3,000. The county paid over \$6,000 for the years 1896, 1897 and 1898. This is a blow to municipal ownership. The building committee refused to give W. Worth Bean, president of the company named, the contract in former years. Mr. Bean followed the Board of Supervisors up every year and got the contract by comparing actual results. The figures were taken from the supervisors' reports. The citizens are pleased by the saving to the county.

ELECTRIC RAILWAYS.

It is said that a party of surveyors has been at work for some time in surveying a proposed electric-railroad route from Phoenix, Ariz., to the Arizona Falls and other points of interest on the Arizona Canal. The scheme is projected by the Arizona Water company. The electricity to operate the new line will be generated at the falls.

It is reported that New York financiers have secured options on all street-car systems of St. Louis except the Suburban. Brown Brothers, bankers, are said to have organized the deal. The Central Traction company's franchise, under which street cars can be operated over all existing lines, has been obtained, it is said, by those interested in the syndicate.

The Westinghouse Electric and Manufacturing company has the news that its newly organized French Westinghouse company has the contract for the equipment of the Paris Metropolitan railway with the underground-conductor system. Two or three German companies and various American electrical companies were competitors for the contract. The apparatus will be made at the company's works at Havre.

The street-car company owning the lines in Rockford, Ill., has projected a new line to Belvidere, by the way of Blackhawk Springs. The latter is a summer resort. It is claimed that the Rockford company has the plans perfected to build the road in the spring. At present the Chicago and Northwestern is the only road between Rockford and Belvidere. One of the arguments in favor of the building of the road is that a large number of the hands employed in Belvidere factories reside in Rockford and travel back and forth to and from their work.

The Trenton and Princeton Traction company has been incorporated with a capitalization of \$200,000 to build an electric railroad between Trenton and Princeton, N. J., nine miles distant. The incorporators are ex-Senator George O. Vanderbilt of Princeton, Charles W. Shipper of Boston, and Julius Garst, Elmer E. Carpenter and Henry Lincoln, all of Worcester, Mass. The sum of \$5,000 has been paid in, and Mr. Vanderbilt says the right-of-way has been procured over private lands. The Trenton Traction company and the New York and Philadelphia Traction company have contemplated

building a road to Princeton, but had been deterred by the opposition that came from the university authorities, who do not care to make it any easier for students to get to and from Trenton.

PUBLICATIONS.

The illustrated catalogue and price-list of the Ohio Electric Works of Cleveland, O., for 1899, is just out. This company is well known for its business in electrical novelties for popular use, in the way of bicycle, carriage and necktie lights, batteries and induction coils for medical use, small motors, etc. Doubtless there will be a wide demand for the new catalogue.

A handsome catalogue, with a warm red cover, has just been issued by the Columbia Incandescent Lamp company of St. Louis. It is mainly devoted to well-executed, full-sized half-tone illustrations of the several types of lamps made by the company and will be of value to consumers. The Columbia lamps have a fine reputation, and the company says that its prices are now as low as any it has ever had in effect.

The Simplex Electrical company of Boston has an electric heating department, being the sole manufacturer under the patents of the American Electric Heating corporation. It has issued a neatly printed and well illustrated pamphlet giving particulars of the large number of electric heating and cooking appliances it manufactures, as well as interesting general information on the subject. This is the latest publication on this very attractive branch of the electrical business, and it will doubtless be in demand from engineers, station managers and that portion of the public which desires to surround itself with end-of-the-century conveniences.

Rand, McNally & Co. of Chicago announce the early issue of the 1899 edition of their "Business Atlas and Shippers' Guide" (29th volume), a work that should be of great assistance to all houses with traveling salesmen or shipping departments. This book will contain large scale maps of every state and territory, each Canadian province, Mexico, Central America, special maps of Cuba, Porto Rico, Hawaii, Philippine Islands, and a general map of each continent. The indexed matter covers about all the information necessary for systematic routing and shipping. An alphabetical index shows towns, populations, express offices, money-order offices, etc. A remarkable instance of how a new railroad might affect the expenses of a business house is shown by the completion of the Pecos Valley and Northwestern railway from Pecos, Texas, to Amarillo, Texas, via Roswell, N. M. This new line of 365 miles is a direct connection between points on the Texas and Pacific and Fort Worth and Denver City railways. The failure of an old book to show it might cause an unnecessary trip of over 800 miles, as that would be the distance traveled according to old maps. The new territory opened by this line must also be of interest to commercial houses. The publishers announce that there are annually many thousand changes in the indexed matter and maps, and it would therefore seem that their advice to business men to purchase a new book annually is founded on reasons other than the mere profit on the increased sales of the book. The binding is in substantial canvas, with an index printed in red figures on the front cover.

ELECTRICAL SECURITIES.

The New York and Queens County Railroad company reports for the quarter ended December 31st: Gross earnings, \$86,919; operating expenses, \$58,403; fixed charges, \$65,813, leaving a deficit of \$39,294.

The Albany Railway company reports for the quarter ended December 31st: Gross earnings, \$167,177; operating expenses, \$105,271; fixed charges, \$26,246; balance, \$36,048; an increase of \$4,940. The general balance sheet as of December 31, 1898, shows cash on hand \$56,562 and a profit-and-loss surplus of \$74,470.

It is "authoritatively" stated in Boston that the General Electric company is receiving more than sufficient interest on the securities in its treasury to pay its debenture bond interest and preferred stock dividends. This leaves the entire manufacturing profit for the common stock. It is added that the company is now earning at the rate of 15 per cent. on its common stock.

The Dry Dock, East Broadway and Battery Railroad company of New York reports for the quarter ended December 31, 1898, gross earnings, \$159,713; operating expenses, \$114,857; fixed charges, \$32,686; net income, \$12,607; a decrease of \$13,546, as compared with the same period the year before. The general balance sheet as of December 31, 1898, shows cash on hand \$4,436 and a profit-and-loss surplus of \$18,793.

The board of directors of the Brooklyn Rapid Transit company has called a special meeting of the stockholders for February 11th to vote on the proposition to increase the capital stock of the company from \$20,000,000 to \$45,000,000. It is understood that \$8,000,000 to \$10,000,000 of the new stock will be utilized in completing the Nassau purchase, while the remainder will be held in the treasury of the Rapid Transit company for contingencies, including the ultimate absorption of the elevated roads of Brooklyn.

MISCELLANEOUS.

It is reported that Joseph Leiter will organize a compressed-air auto-truck company in Chicago. It is said that Mr. Leiter has already secured options on land in one of the large manufacturing suburbs, with ample switching facilities on the Belt Line, and will at once begin the erection of an extensive plant for the manufacture of the new motors, the patent rights of which he controls.

The Allan Line steamer Sardinian arrived in Portland, Me., on January 18th, from Liverpool, after a 17-day passage, during which she encountered tempestuous weather. During an electric storm on Tuesday, January 10th, about 5:30 a. m., the crew was awakened by a terrific explosion, which shook the steamer from stem to stern and threw some of the men from their bunks. A huge ball of fire had burst only a few feet above the steamer, and had distributed innumerable smaller ones along the rails and masts. The officer on the bridge was blinded and half-stunned by the explosion and flash, and was thrown violently off his feet.

TRADE NEWS.

A telephone a little better than anything else on the market is a pretty hard thing to build, but the Electric Appliance company claims that it has succeeded in doing this in its No. 11 instrument. It is backing its claims with a liberal offer, which telephone companies are asked to investigate.

The Emerson Electric Manufacturing company of St. Louis received, a few days ago, an order from China for a number of desk and ceiling fans, amounting to about \$1,300, and the next day an order for a quantity of alternating-current ceiling fans, which were to be shipped to South America, amounting to about \$675. In addition to these orders the demand is unusually active from the larger cities in the United States.

The annual election of officers for the Columbia Incandescent Lamp company of St. Louis resulted as follows: President, W. O. Garrison; vice-president and treasurer, A. C. Garrison; acting secretary, George P. Rex. Mr. Rex returns to St. Louis to assist in the routine work of the office. Mr. W. O. Garrison will continue to serve in an advisory, rather than in an active capacity, while the actual management of the company will continue in the able hands of Mr. A. C. Garrison.

Among the latest calendars received is that of the Laclede Battery company of Kokomo, Ind. It is artistic in design and execution, and contains no advertising matter whatever—unless, indeed, the inscription, "Compliments of the Laclede Battery company, Kokomo, Ind.," in the upper left-hand corner may come under that name. An etching by Peter Moran, entitled "Stacking Time," occupies the central position. Underneath is fastened the bunch of 12 small tickets, each representing a month. The calendar is bound to occupy a conspicuous place wherever beauty and utility are appreciated.

To form the connecting link between engineers and technical men generally and the good positions that they should fill is the object of the new Technical Agency, 1365 Monadnock block, Chicago. The agency undertakes, upon the shortest possible notice, to furnish manufacturers, consulting engineers or others with civil, mechanical, electrical, chemical or mining engineers, draughtsmen, electricians and, in fact, competent assistants for any line of engineering work. The names of these men, with complete records, copies of recommendations, etc., are filed under separate headings, and the employer can be supplied with complete statements of the ability and experience of any number of men who are qualified to undertake a particular branch of engineering work. The revenues of the company are derived from a small fee charged to the applicant, to cover cost of filing papers and conducting necessary correspondence, etc., and a commission on his salary when the position is secured. To the employer there is absolutely no charge. Without trouble and without expense he is supplied with a list of carefully selected experts in any particular line—a list which would cost him a large amount of time, effort and expense to duplicate by any other method. It is said that the manufacturers who have availed themselves of the Technical Agency's facilities express themselves well satisfied with the company's methods.

BUSINESS.

William Roche's electric horseshoe pin is having a large sale. It is claimed to be the first of its kind to be operated with a dry cell, thus avoiding the danger of the old acid wet cell. Mr. Roche says that the cell (No. 4 vest-pocket) is capable of giving at least 1,500 flashes before being run down, and is then a good cell for bell-testing, etc.

The United States polishes manufactured by G. W. Hoffman of Indianapolis seem to be filling a place in the electrical trade, several of the larger concerns using these goods exclusively. A special powdered polish is made by this concern for use on arc-lamp parts, where absolute cleanliness and brightness are required. It is said to be indispensable about the dynamo and engine room, where pride

is taken in the metal finishing. A trial sample of the polish will be sent to anyone enclosing a two-cent stamp and stating the class of work to be polished.

Varney & McQuat of Indianapolis, manufacturers and dealers in electrical supplies, have just moved into a new store, and are now located at 125 Meridian street, in much larger and more desirable quarters. They are now located in the heart of the wholesale district. This is the second move of this firm in the last two years, and it is made to enable it to take proper care of its rapidly increasing business. It has more than trebled its supply space and has put in a complete repair department, and is now prepared to accept and turn out all manner of electrical repair work, the refilling of commutators, rewinding of armatures, etc.

As is now quite generally known throughout the Northwest the Julius Andrae & Sons company handles the Ericsson telephone apparatus that is sold under the trademark "Standard of the World."

Since the Andrae company secured this agency these telephones have been introduced throughout its territory. The Julius Andrae & Sons company was established as far back as 1866 and incorporated in 1895, and the name has been synonymous throughout the Northwest for years with the highest class of electrical work. Julius Andrae & Sons company is agent for various types of dynamos and motors, and, in fact, for all sorts of electrical goods.

Reduced rates to Hot Springs, Ark., are offered by the Wabash Line, which has on sale 90-day round-trip excursion tickets to the famous Hot Springs of Arkansas at very low rates; through sleeping cars to Hot Springs with but one change of cars—in St. Louis Union Station. Hot Springs is the only health resort endorsed and conducted by the United States government. The climate is like that of Italy. This is the season to go. Over 300 hotels, and boarding rates to suit all visitors. Illustrated pamphlets and

full information furnished by C. S. Crane, general passenger and ticket agent, St. Louis, or F. A. Palmer, assistant general passenger agent, Wabash ticket office, 97 Adams street, Chicago.

Builders of electrical power stations will be interested in the following statement relating to the desirability of galvanized corrugated iron for roofing, made by the Cincinnati Corrugating company of Piqua, O.: "Galvanized corrugated iron is to-day being sold at lower prices than painted iron sold for five or six years ago, which makes it a very popular roofing. Slate, being readily affected by heat and cold, cracks and falls off a roof. A fire close to a slate roof quickly cracks and breaks the slates, which then slide off the roof, and falling below, are liable to cause loss of life, while the roof framework is left exposed and readily catches fire. Our company is making a specialty of galvanized corrugated roofing, and will take pleasure in quoting prices, etc., upon application."

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued January 17, 1899.

617,708. Conduit Electric Railway. Richard W. Barkley, New York, N. Y. Application filed June 13, 1892.

Claim is made for the method of preventing leakage in conveying an electric current from a conductor protected by air chambers from water, while the street or road is submerged, to a motor on a car, which consists in making contact between the trolley and conductor in the air chambers, and in causing the trolley to dive under the walls or partitions between the air chambers, losing and taking up contact with the conductor.

617,714. Electric Condenser. Charles S. Bradley, Avon, N. Y. Application filed December 16, 1897.

A condenser is composed of two conducting surfaces separated from one another by a spacer or thread of insulating material wound or peripherally arranged to leave spaces between the several turns of the thread.

NO. 617,714.

617,715. Enclosed Electric Switch. William M. Brown, Johnstown, Pa. Application filed September 11, 1897.

The closed insulating vessel and metal casing have tapered passages in the opposite walls of the vessel and casing, a post passing through the vessel and fitting in the bearings, and a switch member carried by the central portion of the post.

617,726. Counting Mechanism of Electric-supply Motor Meters. Sydney Evershed, London, England. Application filed June 7, 1898.

In a motor meter there is the combination with an armature axle of an electromagnet thereon, excited intermittently by a current derived from the armature, a balanced lever pivoted to lie in mid stroke at right angles to the axle, having a magnetic head surrounding the axle, adapted to reciprocate in the direction of the axis of rotation without retardation to the axle synchronously with the pulsations of the current, and means on the balanced rocking lever to actuate a counting train.

617,783. Electromagnetic Hone. Theodore R. Smith, Los Angeles, Cal. Application filed December 9, 1897.

The combination of a hone and an electromagnet is arranged with such relation to the hone that the lines of effective magnetic force through the hone are toward one pole of the magnet only.

617,793. Regulator for Constant-current Dynamos. James J. Wood, Fort Wayne, Ind. Application filed July 8, 1898.

Movable commutator brushes and a shifting mechanism are employed, together with a friction clutch, the driven member of which drives the shifting mechanism, means for rotating the driving members thereof continuously in opposite directions, an electromotive device controlling the clutch, and a casing enclosing the clutch formed with bearings for the working parts and excluding dust and moisture from the working surfaces.

617,866. Electric Igniter for Explosive Engines. Ferdinand E. Canda, New York, N. Y. Application filed August 25, 1897.

A speed-regulating mechanism for gas and oil engines is employed comprising a plurality of separate electrical igniting devices, adapted to ignite the charges at different periods in the stroke, and means for throwing the several igniting devices into and out of action at will.

617,837. Electric Railway System. Emil B. W. Reichel, Berlin, Germany. Application filed October 3, 1898.

Several motor cars are included in a single train with a motor controller upon each car, a graduated indicator is located near one motor controller to be within the presence of the motorman operating the latter controller, and graduated means for operating the graduated indicator, the means being governed by another of the motor controllers.

617,838. Electromagnet. Max Schiemann, Dresden, Germany. Application filed December 31, 1897.

A multipolar electromagnet comprising a conductive core, conductive spools carrying the wire coils, threaded on the core, the coils wound and interconnected to form a multipolar electromagnet with alternating positive and negative poles, the flanges of the spools constructed with a wide base at right angles to the longitudinal axis of the electromagnet.

617,839. Connection Counting Mechanism for Telephone Lines. Charles E. Scribner, Chicago, Ill. Application filed March 15, 1897.

The combination with a telephone line and a connection counter associated therewith, of a line jack and an answering jack connected with the line, a connecting plug for use with the spring jacks, and circuit connections of the connection counter with the answering jack only adapted to co-operate with circuits terminating in the plug to render the connection counter operative.

617,840. Lock-out Mechanism for Party Telephone Lines. Charles E. Scribner, Chicago, Ill. Application filed June 21, 1897.

Means are provided for producing current in the line during the use of the line; there is a telephone switch at a sub-station, a magnet coil in the circuit of the telephone, and switch contacts of the telephone switch are adapted to complete the connection of the magnet with the line in the movement of the switch; mechanical means controlled by the switch are adapted to bring the armature of the magnet into contact with its poles when the switch is in its normal position.

617,842. Method of and Means for Deriving Poly-phase Currents. Herbert A. Wagner, St. Louis, Mo. Application filed November 13, 1896.

The method of obtaining difference in phase between two or more alternating-current branch circuits consists in connecting the branch circuits to different points in a single-phase supply circuit and to each other, and shifting the phase of one of the branch circuits, whereby a slight phase difference induced in the branch circuit will cause currents to flow through the other of the branch circuits differing in phase from one another and from the supply circuit.

617,853. Electric Signaling. John P. Coleman, Edgewood Park, Pa. Application filed December 2, 1897.

One claim is given: In a relay the combination of a magnet, an armature lever, a contact plate pivotally supported by the lever, means for preventing a movement of the plate independent of the lever during the normal operation of the relay, and front and rear contact points.

NO. 617,840.

617,854. Relay. John P. Coleman, Edgewood Park, Pa. Application filed January 20, 1898.

Pivotal supports for the armature are so arranged as to permit of movements of the armature in places at an angle to each other, and contact plates are pivotally mounted on the armature.

617,858. Magneto Circuit Closer. John E. Fuller, New York, N. Y. Application filed November 10, 1898.

The combination is claimed with the field magnet, the armature and its coil, of a switch having magnetic material that is acted upon by the change of magnetic strength and circuit-closing stops at opposite sides of the switch with which the switch is brought into contact in one direction by the action of a spring and in the other direction by the action of the magnetism.

617,886. Electrolytic Refining of Copper. Elias A. Smith, Anaconda, Mont. Application filed May 19, 1898.

The electrolytic method of refining copper consists in depositing the copper from anodes thereof, immersed in an acid bath, concentrating the resultant impure electrolyte to recover, by crystallization the bulk of the copper salts (blue vitriol), further treating the "mother liquor" by progressive shallow evaporation at high temperature, under air exposure, to throw down the iron salts and to gradually concentrate the free acid, and upon subsequent cooling then adding suitable hypophosphite to remove the antimony and arsenic while retaining liberated sulphurous acid in solution, and thereupon diluting to complete the precipitation of antimony and arsenic prior to the return of the free acid to the refinery bath.

617,890. Telautograph. George S. Tiffany, Highland Park, Ill. Application filed May 29, 1896. Renewed February 11, 1898.

The method of transmitting telautographic messages consists in transmitting the movements of the transmitting pen into impulses of successively like polarity, transmitting these impulses by induction into pulsations of successively opposite polarity, and causing the receiving pen to move a step under the influence of each of the latter pulsations.

617,891. Telautograph. George S. Tiffany, Highland Park, Ill. Application filed February 8, 1897. Renewed July 29, 1898.

Claim is made for the combination of a receiving pen, an escapement for directly propelling the same, a magnet for controlling the escapement, a vibrating armature for the magnet provided with circuit makers and breakers, whereby the movement of the armature is continued automatically, and means connected with the receiving pen for opening the circuits of the escapement magnet when the receiving pen comes to a position of union.

NO. 617,842.

617,892. Telautograph. George S. Tiffany, Highland Park, Ill. Application filed August 21, 1897. Renewed July 29, 1898.

Provision is made for sending impulses of like polarity to line dependent to number upon the movement in extent of the transmitting pen, means for producing a series of induced pulsations of successively opposite polarity, and means for moving the receiving pen step-by-step operated by the to-and-fro induced pulsations.

617,908. Galvanic Battery. Charles T. Richmond, Cleveland, Ohio. Application filed July 18, 1898.

A carbon plate is adapted to serve as a cover for a counting jar and have two threaded bosses on its under side and a hole between the bosses, with two carbon porous cups which screw onto the bosses, the zinc element consisting of two curved plates which lie between the cups with their concave sides facing the cups, and a stem to which the plates are secured which passes out through the hole in the carbon plate and is insulated therefrom.

617,938. Electrical Alarm Mating. Arthur De Forest Risley, Richfield Springs, N. Y. Application filed January 27, 1898.

The elastic non-conductor is provided with orifices; the conducting strips are arranged respectively above and below the orifices, forming the insulated terminals of an electrical alarm circuit, and the loose conductor is caged within the orifices.

617,958. Electrical Apparatus for Freezing, Lighting or Extinguishing Gas Burners at a Distance. Paul L. Guycnot, Aix les Bains, France. Application filed July 30, 1898.

In an electrically operated apparatus for freezing, lighting and extinguishing gas burners by means of a ball valve, there is the combination of a ball valve having a plurality of valve seats, with an electromagnet adapted to operate the valve, a permanent magnet for determining which valve seat is to remain open and a reversing commutator.

618,042. Galvanic Battery. James D. Darling, Philadelphia, Pa. Application filed October 16, 1897.

An inclosing vessel contains an element in the form of a horizontal conducting plate having a surface of peroxide of lead applied thereto and an element of amalgamated zinc disposed in the form of a horizontal plate of comparatively small vertical height and fitting closely against the inner sides of the inclosing vessel, the elements being arranged with their proximate surfaces at a substantially uniform distance throughout.

618,043. Zinc Electrode. James D. Darling, Philadelphia, Pa. Application filed August 17, 1898.

Claim is made for the combination of a conducting rod, a zinc cup supported thereby and a mass of solid zinc amalgam contained within the cup.

CHICAGO, FEBRUARY 4, 1899.

No. 5

New Plant for Heat, Light and Power in the Hotel Metropole.

Some remarkable economies have been achieved by remodeling and extending the power plant at the Hotel Metropole, so that one compact installation of modern machinery furnishes light, heat and power for all departments of the large hotel. The Hotel Metropole, owned by Mr. Francis J. Kennett and under the direction of Mr. William C. Bailey, is at Michigan avenue and Twenty-third street and is a quiet, family hotel of considerable size. For a number of years current for the electric lighting was taken from a central-station company, the cost of illumination averaging \$800 a month. At the same time the hotel people were operating a steam plant to heat the building and operate the elevators,

by the use of exhaust steam, the Paul vacuum system was installed, whereby a back pressure of less than one-half pound could be maintained at all times.

The method of operating the hydraulic passenger elevator was by the ordinary plan of duplex direct-acting pumps. To economize on the operation of this work, Gould triplex electric pumps were installed, operating by a motor connected by spur-gear rawhide pinions, which reduced the average consumption of power from 150 pounds of steam to 34 pounds of steam per horse power. As a further method of economy in connection with this pump, a Cutler-Hammer automatic starting-box was connected in such a manner that when a certain degree of compression in the compression tank was reached the motor would be stopped and entirely cease to consume power. When, by reason of the operation

etc., varying from two to 7½ horse power, the latter being used on an Andrew & Johnson fan to ventilate the hoods in the kitchen.

The question of the water supply was solved in a very satisfactory manner by drilling an artesian well, 280 feet deep. A Poble air lift was installed by the Sargent Rock Drill company, by means of which 50 gallons of water per minute are delivered into the house tank. This method of pumping artesian water has its advantages, both from an economical point of view and from the fact that the air passing through the artesian water almost entirely rids it of the sulphureted hydrogen gas entrained therein, making the water much more potable than where pumped by the ordinary process.

As a measure of further economy a contract was made with Westinghouse, Church, Kerr & Co. for

NEW PLANT FOR LIGHT, HEAT AND POWER IN THE HOTEL METROPOLE — ENGINE-DYNAMOS AND SWITCHBOARD.

spending, on an average, \$750 a month for coal. They also consumed ice costing, on an average, \$200 a month. The management decided to enlarge the building, and this was done by adding a wing, increasing the capacity of the hotel one-fourth and the electric-light consumption one-third by reason of the new banquet rooms in the annexed portion.

After a careful investigation it was decided that it would be more economical to install an electric-lighting plant, and as the former steam-heating plant had become very defective, partly from use and partly from the fact that it was one of the hurriedly installed World's Fair plants, to also rebuild, in a measure, the entire plant. The proprietor accordingly installed two generators of the Westinghouse type, direct-connected to two Fischer four-valve engines, one unit of 60 and one of 60 kilowatts capacity, and one Westinghouse compound engine direct-connected to a Westinghouse 75-kilowatt generator. The three engine-dynamos, with the switchboard at the left, are shown in Fig. 1. In order to reduce the back pressure which would be occasioned

of the elevator, the pressure fell slightly in the compression tank, the automatic starting-box would start the motor, again pumping it up to the desired pressure, thus cutting off the loss occasioned by condensation wherever slow-moving, direct-acting pumps are used. This electro-hydraulic pump outfit is shown in Fig. 2 (page 64). A smaller triplex pump of the same pattern to pump water for the house supply was also installed.

A third important improvement was the installation of two water-tube boilers of 225 horse power each. In order to get the head-room it was necessary to excavate to a point on a level with the base of foundations of the building, and set the boilers in a steel pan. Hawley down-draft furnaces were installed, and all pipes in the basement were covered with two thicknesses of magnesia pipe covering.

The laundry was operated by a slide-valve engine, consuming over 200 pounds of water per horse power. This engine was displaced by a 10 horse power motor. Several other motors were installed to operate ventilating fans, ice-chopping machinery,

the installment of a 15-ton ice machine, direct-connected and on the brine system. This machine furnishes the ice and refrigeration for the whole establishment.

Owing to the fact that the bell wiring of the institution had been put in in rather an unsatisfactory manner during the hurried construction of the building, great trouble had been experienced in keeping up the batteries and from the grounding of lines, short-circuiting, etc., necessitating daily attention in the way of repairs and renewals for the large number of batteries scattered throughout the building. A small motor-generator, supplied by the Crocker-Wheeler company, was installed and connected by means of main wires so as to displace all batteries, the result being that this generator is operating all the bells and call systems in the building continuously without trouble or inconvenience and so far without expense for repairs and without being stopped for more than two hours during the two years it has been in operation.

The benefits accruing to the owner by reason of the new equipment are noteworthy. For one thing,

the manager is able to operate every radiator in the building without the disagreeable hammering and pounding which is too often found in steam-heating installations, and without the disagreeable odor coming from the air valve and the annoyance of having the water running on the carpets, all of which are obviated by the use of the Paul vacuum system. As to the new electric plant, the management is to-day running three times the lights that it formerly did, has always a reserve unit as a provision against an emergency of any kind, has a pure and wholesome water supply, irrespective of the condition of the city water, and an abundant supply of ice. Its coal bills average \$550 a month through the year, or less than they were with the old steam plant alone by \$200 a month. This saving is partly due to the fact that the Hawley furnaces can be operated with nut coal at a less price than lump coal, partly to the economies obtained from the use of the Paul system, by utilizing the exhaust steam, and partly by the use of electric pumps and motors. The owner has no electric-light bills to pay, no ice bill and only a very small water bill (some city water being used in the boilers and for the purpose of washing the silverware).

The net economy is stated as follows: Saving on electric-light bill, \$800 per month; saving on ice, \$200 per month; saving on water, \$100 per month; saving on coal, \$200 per month; total saving per month, \$1,300; from which should be deducted the wages of one electrician at \$60 per month, which was the only additional help required, and cost of lamp renewals at \$50 per month, making a total

plants under his charge, showing the great flexibility of electrical apparatus. In two cases the power plant is reinforced by 600-volt, direct-current motors, driven by generators at other waterfalls, not far distant. In one case the distant wheel and generator is controlled from the principal station. A novel arrangement of secondaries was described, showing how a monocyclic generator may be used in emergency to supply three-phase circuits from the regular transformers.

The electrical engineering museum has recently been enriched by a number of pieces of station auxiliary apparatus secured from the Minneapolis General Electric company, showing various steps in the development of lightning arresters and switchboard apparatus.

A Heisler two-phase alternator, recently secured from the Mankato Electric Light and Gas company, is being modified for experimental use, a system of switches being arranged to permit the easy and rapid changing from 1,000 volts to 100 volts at will, also enabling the use of both pressures at the same time.

Curious Electrical Phenomenon.

In a letter to the New York *Tribune* Mr. Charles E. Phelps of New Brunswick, N. J., describes an interesting natural fire-ball display which he witnessed in his youth. His narrative is as follows:

"In the year 1834 I was living with my father in Oswego, N. Y., I being then 11 years of age. The time was the latter part of October or first of November—I cannot give the exact date. I was walk-

Blunard, in the port of Croisie, but must, it would seem, have been of electrical origin."

Success of the Electric System on the Alley "L."

From the annual report of President Carter of the South Side Elevated Railroad company of Chicago it is evident that the lately adopted electric system of car propulsion is very successful from the financial point of view. This is especially interesting, as the South Side road is the first in the country to use the Sprague multiple-unit system, by which each car is completely equipped with motors, controllers and contacts so connected and operated that they may be used as a distinct and independent car equipment or as part of the electrical propelling outfit of a whole train controlled by one man on any car in the train. It is also the first elevated railway having storage-battery station auxiliaries.

The net earnings of the company for 1898 amounted to \$295,944, as compared with \$121,943 in 11 months of 1897. After paying \$22,500 of bond interest there remained a surplus of \$273,444, equal to 2 3/5 per cent. on the capital stock. The full significance of the return is apparent, however, only when motive power is considered. The electrical equipment was in complete operation only for the last six months of the year, when net earnings were \$196,933. Deducting six months' bond interest there remains \$180,958, equal to dividends at the rate of 3 1/2 per cent. a year. While no dividends have been declared, earnings being expended largely in bettering the property, it is predicted that distributions may begin in April if conditions continue favorable, and that the stock may be put on a three per cent. basis.

In regard to a combination President Carter's report says: "The possibility of combination with another company has been under discussion from time to time since August, but thus far legal objections have prevented the formulation of any proposition for your property which your directors could recommend."

Of the electric system the president says: "We began using electric cars in April, had 67 in operation in May, and gradually increased the number until July, when they finally superseded the steam trains. We had minor difficulties to contend with, which were met and solved. None of them resulted in injury to any passenger, and none of them involving the control of the train, which has always been complete. We believe that the Sprague multiple-unit system has fulfilled expectations. A schedule speed of 15 miles per hour is easily maintained and time lost is easily made up. If needed in order to meet competition, your company has the ability to increase the speed to 20 miles an hour."

Mr. Carter's reference to the storage batteries is interesting: "While the amount of current used per car-mile is low, and has produced gratifying results in all tests and comparisons made, the fluctuations of power above the average requirements are large, and the sudden demands on the power house compelled us to prepare promptly for the heavier business of the winter, which, with increased number of cars in service, heat and light loads, would have been beyond the capacity of the power house. Additional engine capacity could not be obtained in the time at our disposal, would have cost more money, and have been expensive to operate. We accordingly installed two batteries of 750 kilowatts each, equidistant from the power house, at Twelfth and Sixty-first streets, respectively. These batteries have very greatly reduced the fluctuations and the maximum load at the power house. While the output at the power house is the same, the batteries charge at times of light traffic and discharge at times of heavy traffic, thus equalizing the work at the power house, and relieving the engines and generators. This is certainly an economy, and it is further claimed, with what correctness I am not yet convinced, that they cheapen the cost of production. But I do know that they keep up the voltage at the ends of the line, enable your road to operate more cars, furnish increased facilities to patrons, and prevent damage to power house machinery in case of sudden demand for increased power."

The great advantages of electrical operation are shown in striking manner by the table printed below, which shows that the percentage of expense to earnings fell from 84 per cent. in January to 55 per cent. in December. The average, inclusive of loop charges, was 60.8 per cent., and exclusive 60 per cent. Exclusive of loop charges in December the extremely low rate of 45 per cent. for operation was reached. This seems to be the best possible demonstration of the wisdom of the management in making the change in motive power. Following is the table, which includes other interesting statistics:

	Daily av. traffic.	Pct. inc. over 1897.	Earnings.	Expenses.	Pct. exp. to earnings.
January	52,117	47	\$ 82,927.22	\$70,242.55	84.7
February	52,691	47	76,119.32	63,597.85	83.6
March	54,828	54	87,631.33	71,101.20	81.1
April	54,149	56	84,391.38	68,170.47	80.8
May	49,459	51	79,925.78	59,101.25	70.2
June	45,477	53	70,633.88	53,442.91	75.7
July	44,118	64	70,662.98	49,762.77	70.4
August	41,770	54	67,733.75	43,175.99	63.7
September	46,576	55	72,336.36	45,681.43	63.2
October	58,198	48	92,618.58	52,602.76	56.8
November	59,257	*69	92,372.14	52,023.58	57.3
December	62,735	*10	100,938.78	55,583.40	55.0
Totals	51,777	42	\$978,291.50	\$682,385.56	69.8

*Loop in use in November and December, 1897.

NEW PLANT FOR LIGHT, HEAT AND POWER IN THE HOTEL METROPOLE.—AUTOMATIC MOTOR AND PUMP COMBINATION FOR ELEVATOR OPERATION.

saving of \$1,190 per month, or \$14,280 a year, making over 30 per cent. on the investment, notwithstanding the increased work for the plant by reason of the annex referred to.

This installation was designed and supervised throughout by Mr. Charles G. Armstrong, consulting engineer, Chicago.

University of Minnesota.

Among the recent non-resident lecturers before the College of Engineering of the University of Minnesota were two well-known electrical engineers.

On January 24th Mr. J. J. Carty, chief engineer of the New York Telephone company, gave a lecture on "Telephone Disturbances." The sources of the disturbance upon telephone lines were discussed in an able and interesting manner and were illustrated by numerous diagrams. Special attention was given to the problems presented by the increasing use of high-tension alternating currents for power transmission and their effects upon telephone circuits. Experiences of the telephone lines at Minneapolis and St. Paul with the 3,750-volt and the 12,000-volt, three-phase circuits of the Twin City Rapid Transit company and those of the Minneapolis General Electric company were related and explained.

On January 26th Mr. Truman Hibbard, general manager of the Willow River Electric Light and Power company of Hudson, Wis., lectured upon "Hydroelectric Power Plants," discussing certain features of three phase and monocyclic systems for transmission and distribution purposes. Mr. Hibbard gave an interesting account of the power

ing up from my father's store, in First street, with our hired boy. It was about eight o'clock in the evening. The night was quite dark. We saw as we walked the street what we supposed to be a man with a lantern about half a block before us, going in the same direction, but gradually increasing the distance between us, until by the time we had arrived at our corner he was apparently a whole block ahead, at our upper corner. We turned to enter our gate, in Fifth street, which was but a short distance away, but before we got to it the man (as we supposed it to be) had rushed back the whole distance of 230 feet or thereabouts, the light appearing at the corner we had just left.

"I thought it was very strange, and, considering the matter, I turned back after entering the house for a moment to examine matters. It was clearly impossible for a man at his utmost speed to have run 230 feet while we were walking 20 or 25. I saw no more just then of the light in the street, but in a moment or two a brilliant flash flew from the corner of the house opposite ours. The house was just then vacant. After a minute or two there was another flash, succeeded by others.

"The lights were not very brilliant—not enough so nor frequent enough to arouse the neighborhood. Sometimes the lights seemed to come out of the chimney of the house, sometimes they descended to the ground and rolled slowly along, as we had seen them at first, going southward occasionally a quarter of a mile or so, and then returning or disappearing, as the case might be. After a couple of hours or so the lights became less frequent and finally disappeared.

"This phenomenon clearly could not have been of a vaporous origin, like those described by Dr.

A condensed statement of earnings and expenses, with the balance sheet, is as follows:

EARNINGS.	
Passenger.....	\$914,926.50
Other earnings.....	29,695.79
Miscellaneous receipts.....	4,297.73
Total.....	\$948,919.02
EXPENSES.	
Maintenance of way and structure.....	8,315.77
Maintenance of equipment.....	51,153.62
Conducting transportation.....	373,850.87
General expense.....	63,311.68
Loop rental and expenses.....	133,319.29
Taxes.....	26,108.33
Total.....	\$662,385.56
Total operating earnings and receipts.....	976,533.02
Less operating expenses.....	682,385.56
Net earnings.....	\$295,047.46
Deduct interest on bonds (May 1 to Dec. 31, 1898).....	22,500.00

Poor Electrical Construction.

The quarterly report issued by the Electrical Bureau of the National Board of Fire Underwriters contains interesting data upon the damages caused by poor electrical construction. The holiday season, which was included in the period covered by the report, was prolific of fires due to defective wiring of a temporary character, principally in show windows, where, on account of the material used for decorations, great care should have been exercised. Details of a few of the cases reported are herewith presented:

An open cutout was placed in a show window, and when a fuse was blown the molten metal was scattered over the decorations, which became ignited, completely burning out the show window and entailing a loss of \$200.

Fire started in a show window decorated for the holidays with cotton batting. The wiring was of a temporary nature and fuse blocks for the window circuit were located inside the window. It is impossible to state the exact nature of the trouble which caused the fire. While engaged in decorating the window the trimmer heard behind him a report like the blowing of a fuse or the breaking of a lamp. The cotton batting ignited instantly and the window trimmer was seriously burned before he could get out of the window. The fire spread with great rapidity, igniting the inflammable material in the store, in which handkerchiefs and other light fabrics were festooned from one end to the other. Heroic efforts were made by the firemen to confine the fire on the premises, but without avail. Several business blocks were destroyed. Two persons were lost in the fire and fourteen injured. The loss on buildings and contents was \$600,000.

Short-circuit of electric wires in a show window filled with inflammable material resulted in a fire which lasted for a period not exceeding twenty minutes, but burned fiercely for that time, filling the large store with smoke and breaking large plate-glass

tion is presented in Fig. 3, which shows the action of a ground of series arc wire on the limb of a tree, which burned through five inches of the limb and let it fall in the street. The case was reported by W. T. Benallack, electrical inspector, Michigan Inspection Bureau.

Practical Application of the Electric Motor to Printing-press Machinery.

By W. H. TAPLEY.

During the last five years the electric transmission of power has made most rapid strides. Aside from long-distance transmission and railroad work, we can safely say that the individual motor application to machinery stands in the first ranks.

There are no statistics giving the aggregate horse

a dangerous rival of direct motors. All individual motors should be so attached to frame of press as to be practically part of it; separate motor foundations are a failure. Geared motors should be supplied with rawhide pinion having brass bevel and sides, always using angle reduction. Ratios of 10 to 1 are permissible where press speed is not over 120 revolutions per minute; 5 to 1 and 3 to 1 where the speed is 175 revolutions per minute and upward. Direct motor should be used where none is an objection, as well as on all large presses, especially for newspaper work.

Each equipment should be provided with an automatic circuit-breaker, one that will protect press while looking after the motor. This is an absolute necessity, if we would obtain all the advantages of the individual drive.

FIG. 1. POOR ELECTRICAL CONSTRUCTION.

power now used for this purpose, yet it is safe to assert that no one branch of machinery can show the results in power saved, improved product and increased output from the application of the electric motor that printing machinery can show.

The printer demands that all the good features of the belt drive as to power and convenience of handling be retained when the individual electric motor is substituted for belt power.

That nothing be sacrificed in economy of operation and completeness of outfit it is necessary that care be exercised in the selection of the type of motor, method of control and attachment.

If this is to be done, the first step consists in becoming familiar with printing-press work, studying

The cost of direct versus geared press equipment for new presses is 25 to 33 1/3 per cent. more for the former. Where old belted presses are to be changed, with conditions equal, the cost is about the same, the gearing with fixtures amounting to the difference in cost between motors. This applies to five horse power motors and larger; smaller sizes may cost very much more, sometimes double.

General advantages secured by substituting individual-electric drive for belting are economy of power, positive speed applied direct to main driving shaft of press, ability to locate press without reference to main line of shafting, freedom from dust and dirt, a higher grade of work and increased output, which should amount to 15 per cent., without

FIGS. 2 AND 3. POOR ELECTRICAL CONSTRUCTION.

windows. The amount of insurance involved was \$320,000 on stock and \$15,000 on furniture and fixtures, and the amount of loss adjusted and paid on stock was \$13,525.33, on fixtures \$752, and on building \$1,516.

Flexible cord, used in show windows in violation of rules, short-circuited. The fuse block was outside of the window and fused at 2 amperes. (Rule 21, d. National Electrical Code, requires 6 amperes protection.) When short-circuit occurred fuse did not operate until cord had become heated, igniting inflammable material in the window. Loss, \$3,500.

Christmas decorations were installed on the ceiling of a store and attached to the circuit at fixture outlet. Wires, which were covered with evergreen, were short-circuited, and the arc set fire to decorations.

Fire in a show window caused by holiday wiring with unpaired, undersized connection. A loose joint started a fire which ignited inflammable material.

These are not the only incidents related, however. The accompanying cuts show other defects. Fig. 1 shows temporary border lights for a mimic theater at Boston, where poor contact ignited the insulation of the wire. Fig. 2 is an example of the effect of electrolysis on underwriters' wire installed in violation of rules in molding exposed to moisture. The specimen is furnished by F. D. Varnum, electrical inspector at St. Paul. Another interesting illustra-

tion of the mechanical features of the press to be equipped. Then, and not until then, are we ready to take up the electrical end.

Of the series, shunt and compound motors, the latter gives the most satisfactory results.

Belted, geared and direct-connected motors can be used, although only geared and direct are distinctly advantageous over belting from main-line shafting. The selection as to which is better must be decided in each individual case. Control of press must be positive as to handling, under all conditions, and providing a suitable range of speed. Where possible, arrange presses to operate at a uniform rate of speed, doing away with the demand for wide extremes, which are rarely used.

Of the various methods of control for direct motors, a combination of armature and field control is best. Armature control, with carefully proportioned gearing, in sizes up to five horse power, is

extra wear on machinery. This will easily pay for the electric equipment within three to five years.

As a reliable method of power application, the electric motor is without an equal, for, when properly designed for its work, supplemented with substantial attachment, the repairs are practically nil.

With flat-bed presses, printing 32 pages, 16mo., per impression, an average product can be secured, including all allowances for "making ready" and handling paper, of 21,000 pages per kilowatt-hour. With a price of five cents per kilowatt-hour, 4,200 pages can be printed for one cent.

Web presses, doing the same class, size and grade of book work, will print, cut and fold 91,000 pages per kilowatt-hour. Taking the same price, 18,000 pages are printed for one cent. A comparison shows a balance of 4 1/2 times in favor of the web presses.

When a large number of presses is in use, a safe ratio of 5 1/2 to 1 can be taken as the horse power in motors to the horse power in generators installed.

1. Abstract of paper read before the electrical section of the Franklin Institute, Philadelphia, January 21, 1899. Mr. Tapley is connected with the Government Printing Office at Washington.

Steel Arch Bridge at Niagara Threatened by Ice Bridge.

By ORRIN E. DUNLAP.

The Niagara ice bridge of 1899 will long be remembered as being one of the greatest formations of the kind ever seen in the gorge below the falls. Niagara has always been noted for its wonderful ice scenery and ice bridges, but the conditions of this year have been ideal for bridge making. The first ice bridge of the season formed early in January, a few days before the expected period, but it soon gave way to a stronger and a better bridge, which stood fast in the gorge until Sunday, January 22d, when a heavy wind blowing across Lake Erie drove the water and ice into the entrance to the Niagara River at Buffalo in such quantities that the water in the gorge increased in height 30 feet above the normal mark. This had the effect of loosening the ice bridge, and on that afternoon, when people were crossing it, it broke loose and started down stream. On the banks were thousands of Sunday visitors who had come to the falls to see the sights, but such an occurrence was unhopd for and unexpected. It looked very much as though a terrible catastrophe was about to take place. People who were on the bridge when it first started to tremble and move hurried toward shore. All but three persons succeeded in getting to shore quite readily. The trio left on the moving mass of ice was a young man near the New York shore and a lady and gentleman a little farther out toward the center. The young man first referred to displayed considerable coolness. Looking down-

ice had become stationary, it was recognized that such an ice jam was an element of great danger to the bridge, and men were set to work blasting the ice from about the abutments, over which it had piled fully 50 feet deep. They worked night and day, and managed to break quite an opening in the mass in front of the abutments and the tunnel portal, as shown in Fig 1.

On Thursday, January 26th, there was another period of high water and the ice again crowded about the abutments, and again men were set to work blasting it away. Between the bridge abutments and the falls there is an immense quantity of ice which high water may carry down on the bridge. By the first crush of ice some of the lower girders of the arch were bent slightly. The abutments of the steel arch are located very close, dangerously so, to the water's edge, but they were thought to be high enough and out of reach of the ice until this year's jam proved that an ice bridge will always have danger in it for the arch, the greatest in the world. To get a full conception of the danger an ice bridge has for the steel structure one has only to reflect upon the immense quantity of ice in one of these jams, and then to realize that it is pushed onward by the full force of the 15,000,000 cubic feet of water that comes over the Falls of Niagara every minute. With its force pent up for a few minutes, nothing that man could construct could withstand such a mighty force as that of the falls. The steamer docks on both sides of the river were torn away by the action of the ice, and both incline railways were in considerable danger.

In addition to the ice bridge, Niagara this year

FIG. 1. STEEL ARCH BRIDGE AT NIAGARA THREATENED BY ICE BRIDGE.

stream, he observed that the ice was piling up very high about the abutments of the new steel arch bridge. So high did this mountain about the abutments become that the icy mass rested far out on the main span of the arch. Standing quite still, the young man fixed his eyes on the mountain of ice about the bridge. The people on shore quickly saw what he was about to do. It was evident that he intended to leap from the ice to the arch as he was swept up to it. Closer and closer the jam moved to the bridge and higher and higher the ice piled out on the main span. He was fairly lifted from the ice bridge to the arch by the crowding of the cakes, and then he was safe. Just beyond the arch the stream of water from the portal of the Niagara Falls Power company's tunnel strikes the river, and had he been carried to that point he might have been lost. The lady and gentleman had turned their faces toward Canada and were fairly flying across the runaway bridge. Time and again the woman fell, but each time she was encouraged on by her companion. Finally they reached shore. The woman was Miss Besie Hall of Johnsonburg, Pa., and the man Mr. C. Misner of Buffalo.

These are the incidents that led up to the formation of the greatest ice bridge Niagara has ever known. The mass of ice that came down over the falls that Sunday afternoon became jammed in the gorge back of the old ice bridge, which did not go out, but being fast and piled up to an unusual thickness. From the Horseshoe Fall down the gorge for a mile the bridge stretched, the ice being from 20 to 50 feet thick. At one point it is piled up in a mountain like, while in other places there are deep crevasses which clearly indicate the depth of the mass.

It is over the steel arch thus threatened by the ice jam that the Niagara Falls Park and River Railway company operates its trolley line. After the

has an ice palace to interest visitors, and all this has served to keep the electric roads very busy. The ice palace is located opposite Prospect Park on the riverway, near the end of the upper steel arch bridge, across which the electric cars are operated. A view of the river, filled with ice at this point, is presented in Fig. 2. On the Canadian side a toboggan slide has been built, and the sport has been of an international character. From the steel arch a powerful searchlight has been operated, and its beams on the ice in the gorge below revealed a weird and attractive scene.

Early Electric Lighting in Chicago.

In relation to the connection of the late Milan C. Bullock with pioneer electric-light installations in Chicago, the M. C. Bullock Manufacturing company writes as follows: "In 1880 Mr. Bullock installed a Brush dynamo with storage battery and Swan lamps at 86 Market street, and in the late summer or fall of that year a light was swung from that building out over a platform on Market street for the purpose of furnishing light to a political gathering. Mr. Bullock at that time was the northwestern general agent for the Brush Electric company, and from 1880 till 1884 (when Mr. Alexander Kempt was appointed agent) Mr. Bullock installed a great many plants in Chicago and in different parts of the Northwest district. The fact that no record of the installations made prior to 1884 appears in the city electrician's office is probably explainable by the circumstance that our 'city fathers' did not sufficiently realize the importance of the electric-light industry and the figure it was to cut until 1884, when a system of inspection was adopted."

The Southern Iowa Electrical company is an applicant for a franchise at Moulton, Ia.

Latest Progress in the Application of Storage Batteries.¹

By JOSEPH APPLETON.

PART I.

The history of the storage battery in this country is curious, and probably comprises more troubles and trials than any other branch of the electrical industry.

Until 1894 the use of storage batteries in this country proved most disastrous to all concerned. The reasons were many, but may be summed up briefly as follows:

1. The batteries were poorly designed.
2. No attention was paid to the mechanical features, the chief idea being to get the greatest capacity for the lightest weight.
3. The batteries were much overrated, their full capacity being given as their normal working capacity.

In addition to this, the storage-battery business, generally, was in an unsatisfactory and weakly condition. Litigation was the principal cause. The fear of protracted and costly law-suits prevented capital being invested in the business and frightened prospective users from purchasing storage batteries.

Now the conditions are very different. You are all familiar with the changes which have been made during the last five years in the commercial end of the business. All the disturbing elements have been removed, and the business has been put on a proper and substantial basis. The figures for 1898 have not been tabulated, but they will show that the use of storage batteries is progressing more rapidly than ever:

	Weight of plates alone.
1894	349,000 pounds
1895	1,112,800 pounds
1896	2,315,300 pounds
1897	3,607,300 pounds

(or 10 times the business of 1894).

The storage battery is entirely different from any other piece of apparatus which is used for supplying electrical energy, being constructed and operated on the principle of chemical action instead of mechanical motion. There must naturally be a vast difference between these two principles.

In the mechanically operated apparatus, or generator, the output of electrical energy is the result of the conversion of the mechanical energy applied to it while in action, and the regularity of the output is dependent on the steadiness of the mechanical energy applied and the satisfactory running of the generator and motive power. The operation is purely mechanical, and is subject to the interruptions to which all moving machinery is liable. Again, such apparatus, if overloaded to an excessive degree, will give visible signs of distress, and if the overloading is very great, or is continued, will probably give way in some mechanical feature.

In a storage battery hundreds of horse power can be silently stored, and thousands of horse power delivered for a short period, with no apparent action or change in the battery. The action is purely chemical, and as long as the respective elements are there to be acted upon it will surely continue.

It is this fact which makes the storage battery so reliable. Such a thing as instantaneous failure or interruption of the delivery of energy is impossible, except, of course, in the case of mechanical injury to the battery from an external cause.

Any mechanically operated apparatus is liable to interruption through breakage or injury to one of its parts, but in a storage battery the chemical action will continue, and consequently the output of energy, until all the material on the plates has been converted.

An overload has not the same effect on a storage battery as on a mechanically operated generator. For a short period an overload, even of great extent, does not injure a storage battery. It causes the chemical action to take place more rapidly, or, to be more exact, causes more material to be subjected to the chemical action, and this, if not continued too long, or repeated too often, does not affect a good storage battery. Moreover, if the overload is continued too long, it does not mean the sudden failure and collapse of the battery and complete interruption of the output, but is shown by the premature depreciation of the plates in the battery. It may not be noticed for months or even years. One of the most valuable features of a storage battery is that it will safely take care of any sudden and momentary overload in the system, such as grounds or short-circuits, and if operating in parallel with generators or rotary converters, will relieve them of such overloads and consequent strain. I have frequently seen batteries burn out grounds on an underground system, discharging for a short time at an enormous rate. And in the case of batteries operating on railway loads, it is a common thing to see an occasional momentary discharge at a rate equal to twice the hour-rate of the battery. The modern storage battery is designed to stand such occasional extreme discharges, and do so without injury.

It may be well to consider before going further into our subject the question of the rates of charge and discharge of storage batteries, and their capacity at different rates. Of course, this will vary some-

1. Abstract of paper read before the New York Electrical society, January 12, 1899.

what with different types of battery, but not to a great extent. The more rapidly you discharge a battery the smaller is its available capacity. For example, the following curve illustrates the available capacity of a storage battery when discharging at any rate between the 10-hour and one-hour rate. That is to say, when the battery is completely discharged in 10 hours and in one hour. It is only within the last few years that a one-hour discharge rate has been possible with a storage battery, and it is very largely due to the fact that storage batteries can be discharged at such rapid rates that their use has been growing so rapidly.

In large engineering problems the storage battery is used chiefly to supply large amounts of electrical energy for short periods, and by increasing the allowable rate of discharge the size of the battery required is consequently reduced. In connection with this question of the reduced capacity of storage batteries at rapid rates of discharge, there is frequently a mistaken idea that if the capacity of a battery is thus reduced, the efficiency is correspondingly impaired. This is not so at all. It is only the available capacity of the battery which is reduced by polarization, or, in other words, the chemical action when taking place at such rapid rates can only reach the active material, which is

the highest possible economy in operation, and the utilization of motive power and generating machinery to the fullest extent, so that the investment may produce the greatest return. These conditions make the storage battery indispensable, for without its aid it is impossible to maintain a constant load on the power house.

Every application of electricity has its time of maximum output or "peak," and no matter how many different applications are supplied from the same system their peaks will not fit in so as to even matters up, but, on the contrary, it is found that in many cases the peaks occur at about the same time. This is particularly noticeable with a railroad and lighting load. Again, concentration of generating machinery means a larger area for distribution and the necessity of sub-stations in order to keep down the investment in conductors, and experience shows that in the majority of cases storage batteries are cheaper than the copper alone, which would otherwise be necessary, leaving out the advantages at the power house. This means that the storage battery will now play a most important part in all electrical problems, and be of sufficient importance and value to warrant the conditions being made suitable for its use, instead of, as in early days, being dumped in at any time to

are 50,000 square feet of floor space available and that 90 per cent. is unobstructed by posts or partitions. Permanent office and committee rooms for such necessary facilities for headquarters, and at slight expense a meeting room can be partitioned off at one end of the hall and arranged for the session of the convention. The building is well adapted for exhibitions of machinery, and admits of a blouse and a half from railway tracks, excellent sleeping facilities are assured. The means for reaching the city are exceptionally good, and power is available for the operation of apparatus on exhibition. The members of the committee will visit the building on Monday and decide upon the question of holding the meetings there. In the event of favorable action the local street-railway men will immediately organize local committees, and the actual work of preparation will begin.

The subjects to be discussed at the fall meeting will be selected at the meeting of the executive committee on Monday, and assignments will be made at the same time, but the names of the gentlemen preparing the papers will not be published until their acceptances are received by the secretary.

Experiments with Liquid Hydrogen.

[London Correspondence of the New York Sun.]

It is now eight months since that final triumph of the laboratory, the liquefying of hydrogen, was accomplished, and Professor Dewar at the Royal Institution on January 20th described that most volatile of gases when reduced to the coldest substance ever known.

When pure it is a colorless, transparent liquid, with considerable refractive power. It had a well-defined meniscus, but no appearance of being a metal, as Faraday thought it might prove to be. It is not a conductor of electricity. Its density is very deceptive. At first he thought it might be about half that of water, but by measuring a given volume and ascertaining how much gas it produced, he found its density to be only one-fourteenth of that of water, or six times less than that of the lightest liquid hitherto known. One liter weighed only 70 grammes. It instantly froze and solidified air and oxygen, and hence enabled the density of those two solids to be ascertained.

A little ball cooled in it and exposed to the air was first covered with a coating of solid air and then be-

Weight of Plates for 1895-6 and -7.

Money Paid for Plates in 1895-6 and -7.

LATEST PROGRESS IN THE APPLICATION OF THE STORAGE BATTERY.

on the surface of the plates and immediately exposed to the electrolyte. Hence, in reality, the actual capacity of the battery is not reduced, only the available capacity, and when the battery is recharged, only the active material that is acted upon has to be converted and not the entire amount of active material. There is a slightly greater loss in efficiency when discharging at a rapid rate due to the internal resistance of the battery, this being the C.R. loss.

Storage batteries are not free from trouble, any more than other apparatus, but, under favorable conditions, the comparison is much in favor of the storage battery. No piece of apparatus yet made is perfect, and its usefulness and consequent general adoption may be said to be proportional to the predominance of its useful features over its weaknesses or troubles. The rapid growth in the use of the storage battery during the last few years is the best proof possible that its troubles are very small, compared to its advantages.

As is the case with all machinery and apparatus which have to be operated continually for any length of time, the results obtained depend not entirely on the design and construction, but on the care and judgment with which it is operated. This fact is particularly noticeable to anyone who is constantly brought into contact with different plants and installations, as I am, and under different management, or sometimes mismanagement, in all parts of the country, and this subject alone would afford a very interesting and profitable topic for discussion and consideration.

In the early days the storage-battery manufacturers, in order to maintain a bare existence, had to jump at every opening for the use of a storage battery, whether the conditions warranted it or not, and in order to do business accepted contracts drawn entirely from the purchaser's point of view, without regard to the capabilities of the storage battery, and guaranteed results which, to say the very least, were extremely difficult to realize. What the results of all this were you know very well.

Now things are entirely different. The business is on a commercial basis, and it is not a question of getting an order at any price, but securing business which will prove satisfactory and permanent. Now storage-battery manufacturers will insist on proper conditions for the operation of their batteries, or refuse to put them in. This is as it should be, and I think I am perfectly safe in saying that during the last four or five years there has not been a storage battery installed in this country except under conditions which justified its use. Of course, some experimental applications have been made, which may or may not prove satisfactory, but this does not come under the head of the general application of the storage battery.

It should be distinctly understood that all conditions of electrical distribution are not suitable for the use of storage batteries, and that it is more to the interest of the manufacturer than the purchaser to confine himself only to those situations which are suitable, for every failure which is recorded is heard of one hundred times to every success.

Now that, by this method of doing business, confidence in storage batteries is being regained, and proper relations have been established between manufacturers and users, the growth of the use of storage batteries will be still more rapid, for it is now realized that when storage batteries are installed and operated under proper conditions that the result will invariably be satisfactory.

The trend of electrical engineering is to-day toward the concentration of generating machinery,

fill up a gap and smooth over any difficulties which cropped up.

American Street Railway Association.

By direction of the president, a meeting of the executive committee of the American Street Railway association will be held at the Auditorium Annex, Chicago, on Monday, February 6th, at 10 a. m. The members of the executive committee include Charles S. Sergeant of Boston, Henry C. Moore of Trenton, Ernest Woodruff of Atlanta, Walton H. Holmes of Kansas City, Albion E. Lang of Toledo, George A. Yuille of Chicago, Frank G.

FIG. 2. STEEL ARCH BRIDGE AT NIAGARA THREATENED BY ICE BRIDGE.

Jones of Memphis, John I. Beggs of Milwaukee and Ira A. McCormack of New York.

As the object of the meeting is to consider the arrangements for the next annual meeting of the association, representatives of the Chicago surface roads will be present. Secretary Penington, who made the arrangements for the meeting of the executive committee on his return from Boston after an interview with President Sergeant, expressed the opinion that the organization would follow the programme adopted at Boston and hold the meeting this fall in this city.

The only serious drawback to this arrangement has been the lack of satisfactory quarters for holding the meeting and the exhibition, and it is now believed that this objection has been met by securing Tattersall's building. Mr. Yuille, who was appointed a special committee by the local street-railway men to investigate this matter, has reported favorably upon this location. He says that there

can to drip liquid air. A piece of cotton wool stuck in it appeared to be magnetic, but the liquid itself, Professor Dewar is satisfied, is not magnetic. This phenomenon must therefore be due to the cotton wool being immediately filled with solid oxygen, which is highly magnetic.

Professor Dewar explained how vacuums of high tenacity were easily obtained by immersing a closed tube in liquid hydrogen. The air in the tube was immediately solidified, and if the tube was so arranged that the portion containing the accumulation of solid air could be sealed up, the other part had, according to Sir William Crookes' calculation, a pressure amounting to only one ten-millionth of atmosphere. With vacuum vessels for use with hydrogen, it was therefore not necessary to pump out air; it was only needful to put liquid hydrogen in a double-walled vessel and it made its own vacuum by solidifying the air between the two walls.

Well-informed public men in Washington entertain the belief that the project for building a government cable from San Francisco to Manila is assured of adoption by Congress and approval by the president.

She will take deep-sea soundings from Hawaii to Guam, and from Guam to Manila. The cable route from San Francisco to Honolulu has already been surveyed by the Albatross and Thetis, and carefully prepared reports of the soundings and maps of the ocean bed are in possession of the government at Washington.

Among the measures now demanding attention at the hands of the Chicago City Council is an ordinance requiring elevated-railway companies to equip their systems with automatic block signals, so as to prevent more than one elevated train in a block at a time.

A proposition to introduce mechanically propelled buses in Chicago calls attention to the condition of the city's pavements, which has heretofore prohibited the general use of electric vehicles in this city.

It is practically settled that the next meeting of the American Street Railway association will be held at Tattersall's building in Chicago, although the approval of the executive committee of the organization, which will meet in Chicago on Monday, will be necessary before the question is finally determined.

In the discussion of the proposed franchise of the Illinois Telegraph and Telephone company granted by the Chicago City Council on January 23d and vetoed by Mayor Harrison on January 30th, the question of the prevailing rentals for the service of the Chicago Telephone company has been brought prominently forward.

The grounded trolley wires and the introduction of high-voltage alternating currents render grounded telephone lines almost inoperative, and this ordinance, if drawn for the purpose of securing for telephone patrons a satisfactory service, should require all lines to be complete metallic circuits, and a further provision that no additional charge shall be made for any improvement or device for the benefit of the service.

It would appear from this that Mayor Harrison was under the delusion that there was some justification for the added charge of \$50 for metallic circuits. If such is the case he should consult the

ordinance granting the franchise. There is no mention of grounded circuits as the basis of the rates established at that time, but there is an explicit statement that the Chicago Telephone company, "during the term for which this ordinance is granted, shall not increase to its present or future subscribers the rates for telephone service now established."

An urgent appeal has been made to the Navy Department to secure favorable consideration of a proposition to extend the use of electricity upon the three new battleships, Alabama, Wisconsin and Illinois, to the same degree that it is employed in the Kearsarge and Kentucky. The main difference in the present plans in the omission of electric power for the boat hoists and the big winches.

An attack will be made upon the electrical corporations of Illinois, with special reference to the electric-lighting industry of Chicago, by the Legislature now in session, according to present indications. A bill for this purpose has been introduced in the lower house, the object, as stated, being to enable "cities to construct, maintain and operate all public utilities."

It is proposed by the instigator of the movement to keep the subject prominently before the Legislature until some action is taken. He explains that "this legislation has been proposed not only to meet the demand of public opinion with regard to municipal ownership, but for the purpose of enabling the city of Chicago to sell electric light."

The measure contains the referendum clause providing that "the people of the city may have an opportunity to vote on the proposition before it carries."

It is objected that the measure is too radical to command general support. It has been pointed out that the bill contained so much that it would not meet with success in the Legislature, and that if the author had confined the subject matter to the question of selling electric light it would have stood a better chance.

DEVELOPMENT OF THE TELEPHONE FIELD.

Recent Progress in Exchange Working.¹

By HERBERT LAWS WEBB.

The obvious direction for improvement in telephone operating to take is that of automatic working. Absolutely automatic working in large systems is practically unattainable, for no machine could possibly be made that would have selective powers sufficient to deal, in any ordinary period of time, with the multitude of different numbers and points among which selections have to be made by the operator in a large telephone system. There are several automatic telephone-exchange instruments that are marvels of mechanical ingenuity and skill, rivaling in delicacy and complication many of the wonderful machines used in manufacturing small articles and in such work as typesetting. These instruments have been brought to such a point that they are capable of dealing with the work of a small self-contained exchange. Much beyond that they will never go, for reasons that will be obvious to anyone who has ever looked into the working of a large telephone system. Briefly, it may be said that the selective powers of any machine that can be made commercially operative soon reach a limit, while the selections to be made in a large telephone system are practically unlimited, and the patience of the average telephone user is very limited indeed.

While we can never hope to eliminate human labor entirely from telephone operating, there is ample opportunity to reduce the amount of human labor required to handle each connection, and so render the operation more automatic, and consequently quicker. In every telephone connection the necessary operations for its making and unmaking have to be performed partly by the users of the service and partly by the trained operators at the exchange. Tracing the steps of an ordinary connection on the magneto system, we find them to be as follows:

1. The calling subscriber rings his bell, or more accurately, turns his magneto generator, thereby throwing the drop at the exchange.
2. The calling subscriber takes the receiver off the automatic switch-hook.
3. The operator plugs into the answering jack, and
4. Replaces the line drop shutter.
5. The operator, having got the number wanted, plugs into the multiple jack, and
6. Rings the called subscriber.
7. Conversation finished, both subscribers replace their receivers on the automatic switch-hooks and
8. Turn their magneto generators, thereby throwing the clearing-out drop.
9. The operator listens in to make sure that disconnection is required, and, such being the case,
10. Pulls out the two plugs, and, finally,
11. Replaces the clearing-out drop shutter.

In different companies and administrations different methods of operating obtain, and there are minor variations from the above series of operations, dependent largely on the efficiency of the users of the service as operators of their end of the system. But the essential steps in the operation of a connection with the series-multiple board described in the body of this book are those set forth above, with the possible exception of No. 9, which is not everywhere regarded as essential, though for good service it should be.

An examination of these steps will show which are absolutely requisite and which may be done by automatic means as a secondary result of a requisite step.

Step No. 2 has for its object switching the line from the subscriber's bell, its normal connection, to the talking circuit of his instrument, and, incidentally, closing the battery circuit of the transmitter. This is a requisite step in order to change the telephone station from its normal position of readiness to receive a signal from the exchange to the condition of readiness for talking over the line.

Step No. 1 has for its object to signal the exchange for attention. It is quite obvious that step No. 2 may, by the movement of the automatic switch, be made to effect the purpose of step No. 1, at the same time that it switches the line from the bell to the talking circuit. Similarly, step No. 7, which is the converse of step No. 2, may be made to effect the object of step No. 8, the sending of a signal for disconnection to the exchange. Here is gained two operations out of four performed by the subscriber. The British Post-office has for many years had a system in operation embodying these features. The indicator at the central office is a galvanometer, whose needle is normally inclined at one side. Lifting the telephone from the hook at the subscriber's station sends the needle over, indicating a call. When the connection is made the needle falls to zero, affording a visual busy test, and when the two subscribers hang up the needle is inclined in an opposite direction to the normal position, thereby affording a disconnection signal. Consequently there is no radical change in combining steps 1 and 2 into one operation, and step 7 and 8 into one operation.

¹ Abstract from new edition of "Telephone Handbook" Electrician Publishing Company (Chicago), now in press.

Turning to the exchange end we find that the essential operation of plugging into the answering jack (step 3) is capable of accomplishing the work of step 4, and that either step 9, which is not essential, or step 10, which is, may similarly be made to do the work of step 11. It must be observed here that a system in which the removing of the telephone from the hook sends a signal to the exchange, and the replacing of the telephone sends another signal, necessarily involves the use of signaling devices at the exchange which are entirely automatic (as far as any separate movements on the part of the operator to restore them are concerned), and such a system therefore abolishes steps 4 and 11.

The automatic features bring the essential operations in a telephone connection from 11 down to six, as follows:

1. The calling subscriber takes the receiver off the hook, thereby signaling the exchange and switching his line from the bell to the talking circuit as usual.
2. The operator plugs into the answering jack, thereby resetting the line signal and getting into communication with the calling subscriber as usual.
3. The operator plugs into the multiple jack.
4. The operator rings the called subscriber.
5. Conversation ended, the two subscribers hang up their receivers, thereby displaying a disconnection signal at the exchange.
6. The operator pulls out the two plugs, thereby resetting the disconnection signal.

The operations are cut down from a total of 11 to a total of six, or a little more than half. The operations required of the subscribers are cut down from four to two, and those of the operator from seven to four. Step 9 in the first series becomes no longer necessary when the disconnection signal indubitably means that the two subscribers connected have hung their telephones on their respective hooks and left them there. Such a disconnection signal is unmistakable and requires no supervision by listening-in; where the disconnection signal is by a drop actuated by a magneto generator, its falling may not always mean a signal for disconnection, and listening-in to make sure of the subscriber's intentions is a part of good service.

New England Telephone Notes.

[From the Boston correspondent of the WESTERN ELECTRICIAN.]

The New England Telephone and Telegraph company has adopted a revised schedule of charges for the use of the telephone at pay stations within what is termed the Boston and suburban district. The rate heretofore has been 15 cents for five minutes' use of the telephone. The new rate will be 10 cents for three minutes, and five cents extra for every additional three minutes of conversation.

The telephone privilege for the new Southern Union Station in Boston has been leased to the New England company, and it has been arranged to have eight booths in a special room adjacent to the ticket offices.

A feature of the banquet of the Pine Tree State club at the Hotel Brunswick in Boston on the evening of January 24th was the introduction of the telephone-connection idea in receiving messages from members and distinguished Maine citizens at several points. To Speaker Thomas B. Reed, Secretary John D. Long, Senator Frye, Governor Powers of Maine, Congressman Boutelle and other men of note messages were sent over the wire from the banquet hall, and their replies were heard by the participants at the tables, although circumstances were such that only in the case of the message from Professor Albion W. Small of the University of Chicago was the conversation personally given. The telephone attendants, however, at Washington and other places made the connecting link satisfactorily and demonstrated the practicability and novelty of the event. Upward of 75 transmitters were used. The music for the evening was furnished by the orchestra in the Schlitz Hotel, at Milwaukee, Wis., transmitted over the wires of the long-distance company to Boston.

EXTENSIONS AND IMPROVEMENTS.

The manager of the Blue Mountain telephone line says that an exchange will be put in at Long Creek, Ore., soon.

The Victoria (B. C.) and Esquimalt Telephone company is about to make improvements. A metallic circuit will be installed.

The Snowshoe company will begin immediately to construct a telephone line to connect its mine near Anaconda, Mont., with Libby, a distance of 15 miles.

C. W. Winter and J. B. Slater have been granted a franchise to construct and maintain lines of telephone and telegraph on public ways of Stevens County, Wash.

Among the recently licensed Illinois corporations was the Ohio Telephone company, whose capital is placed at \$500, and whose object is to operate telephone exchanges in counties of Lee and Bureau. The incorporators are R. F. Spencer, M. E. Cadwallader and J. P. Barnham.

Telephone Ordinance Vetoed.

Mayor Harrison on Monday night vetoed the ordinance of the Chicago City Council granting the Illinois Telephone and Telegraph company a franchise to build and operate a telephone exchange system in this city, and the action of the mayor was sustained by the council.

Mayor Harrison's objections were based upon the loose manner in which the ordinance was drawn, some of the provisions contained in it, and the hasty manner in which the aldermen put the measure through the council. He took occasion, however, to express his sympathy with the object of the movement which culminated in this ordinance, and volunteered his assistance and support in the enactment of a properly prepared measure to accomplish a reduction of telephone charges.

"There is no question of the public desiring relief from the present monopoly, with its exorbitant charges and absolute disregard of the rights of those who make its franchise valuable," said the mayor in discussing this point, and he added: "Personally I am willing to render any proper assistance in drawing up an ordinance that will give proper protection to the people. I regret that the present ordinance is so drawn as to force me to withhold my approval from it."

The reasons assigned by the mayor for vetoing the measure may be summarized as follows:

It fails to specify the time in which the plant is to be completed and in operation, or to provide for a bond conditioned on such completion.

It grants the right to open all streets to lay conduits, while, in the opinion of the mayor, some restriction should be made in order to protect improved streets from being unnecessarily torn up.

The section allowing the company to bring its wires to the surface at every block, joined to the other one, allowing it to string for four blocks overhead, gives an opportunity to evade the section providing for the burying of the wires in a large portion of the city.

It does not provide for complete metallic circuits, which the mayor considers necessary for good telephone service.

It does not give the city the right to use the poles and conduits of the company for its own wires.

Fifty years is altogether too long for the franchise to live, in the opinion of the mayor, and a clause should be inserted providing for the purchase of the plant by the city at a valuation of its tangible property after the franchise has expired.

There should be some provision for compensation to the city after ten years have expired.

The mayor is particularly severe upon the aldermen who rushed the measure through the council without giving opportunity for proper consideration and discussion. The language of the message is very explicit upon this point, as will be seen from the following extract: "In this connection I would call the attention of your honorable body to the objectionable consequences of passing an ordinance of such great importance in a single meeting. I feel certain, from conversations I have had with some of the gentlemen connected with the present ordinance, many of the objections I have mentioned could have been avoided had the ordinance and the amendments offered been laid over for a week, that thorough consideration could have been given the subject. With the suggestions I have mentioned the present would be a good ordinance and acceptable, in my opinion, to the citizens."

It is understood that another ordinance will be prepared and introduced embodying the features covered in the mayor's message. Commenting upon the possibility of relief under this proceeding, the Chicago Tribune says editorially:

The suggestions made by the mayor are not objectionable, as far as is known, to the persons who wish to go into the telephone business. If that is the case doubtless they can get their ordinance without difficulty and try their hand at fighting the old company. They ought to have patronage enough if they combine low rates and good service.

Proposed Extension of Chicago Telephone Company's Franchise.

It is announced that the Chicago Telephone company will ask the City Council for an extension of the franchise privileges for a term of 50 years. The company's present ordinance was passed on January 4, 1889, and was for a term of 20 years. It has therefore 10 years to run, but, owing to the threatened competition, the company has determined to bring the matter up at once in the hope of getting the subject settled before its present franchise expires. In view of the attitude of Mayor Harrison toward the Illinois Telephone and Telegraph company, it is hardly to be expected that the old company's petition will be favorably acted upon.

The trustees of Albuquerque, N. M., received sealed propositions from Peter Wehner of El Paso, Texas, and J. J. Cooper of Trinidad, Colo., for putting in an electric-light plant. Neither was accepted, but Mr. Cooper's was regarded as the better of the two. An ordinance was formed fixing maximum rates and other details governing the establishment of a plant and mailed to Mr. Cooper. If he accepts the terms an ordinance will be passed.

Michigan Telephone War.

[From the Detroit correspondent of the WESTERN ELECTRICIAN.]

Charles J. Glidden, the new president of the Michigan Telephone company, and a number of the members of the board of directors have been making an extensive tour of the state, with a view of thoroughly reorganizing the forces of the company and improving the service. Mr. Glidden has already made a number of changes in the officers of the company. Frederick A. Forbes is the general manager of the new company; James F. Land, formerly general superintendent, becomes assistant general manager; Charles H. Seitz, manager, becomes general superintendent of the central division, and the remaining three of the four districts into which Michigan has been divided will be supervised as follows: Southern district, C. E. Wilde, Kalamazoo, general superintendent; western district, W. J. Barry, Grand Rapids, general superintendent; northern district, George D. Sheiman, Marquette, general superintendent.

President Glidden expresses satisfaction with the condition of affairs. While in Detroit the party took carriages and looked over the sites for five new branch exchanges to be erected in Detroit. Specifications and contracts for the buildings will be drawn up at once.

One of the steps of the company in its preparations for the telephone war will be to build and equip its lines in the most approved manner. It has been practically decided to build another story to the present telephone building to permit the installation of a common-battery system. A wire north to Menominee is also to be started. Part of the line-construction crew is already in Detroit, and the work will be commenced as soon as the rest arrives.

The telephone war in Michigan is on in earnest. "I expect," said an officer of the Bell company, "that in six months we shall be in a position to handle 150,000 calls in Detroit per day. Experience has taught telephone men that with every improvement there has been a big jump in the number of calls. In other words, the number of calls is regulated by the capacity of the exchange to give good service, and if the service is first-class a subscriber will go over the ground by sitting still and using the telephone, putting in call after call as fast as one can count. In Cleveland, where they have the latest appliances in switching apparatus, the last count, taken a couple of weeks ago, showed 110,000 calls in one day. In the spring, when navigation opens, this will doubtless jump up to 135,000 daily, while the exchange could take care of 150,000 without trouble. Detroit, with the improvements decided upon, will be able to handle even more calls than Cleveland."

The Michigan Telephone company has made arrangements to install in the main and branch exchanges in Detroit the latest pattern of "relay" boards, such as are in use in Cleveland. President Glidden and his associates have decided to spend between \$300,000 and \$400,000 on the Detroit plant. Of this amount \$200,000 will go into new switchboards.

The new switchboard will employ luminous signals at the exchange and afford what is known as "express" service. Under this system, when the subscriber takes the receiver off the hook a tiny incandescent lamp lights up in front of the operator and continues to burn until the operator answers. When connection is made another lamp, corresponding to the line called for, flashes up and continues to burn until the subscriber answers. When the conversation is finished a pair of lights flash up and burn until the operator disconnects the lines. The signaling is all automatic. There is no ringing to get the exchange and no ringing off.

One unique feature of this system is that lines out of order will show it by the burning of these tiny lamps, so that when a line is "out" there is a steady reminder in front of the operator and the inspectors. The result of this system is not only improved service, but disconnections are made so promptly that the capacity of each line is increased.

The Michigan company's Detroit exchange was completed less than four years ago, and when it was transferred to the new telephone building on Clifford street telephone experts pronounced the equipment the finest in the country. President Glidden has decided to have this changed. The Detroit plant will use about 9,000 miniature incandescent lamps.

Consolidation of Bell Interests.

The report that the American Bell Telephone company contemplates a union of all the Bell properties of the country finds many believers. One of the largest holders of Bell securities is quoted by the Boston News Bureau as saying: "I know that it was contemplated at one time to consolidate all the companies so that the Bell people could make an unlimited service at, say, \$600 or \$800 a year to cover the whole country. The ideal situation that Bell people were striving for was to have a telephone on the desk of every business man, by which he could talk with anybody in the United States at no charge beyond an annual rental, and at one time it was thought that \$600 per annum would be sufficient to cover such a service."

The following statement, which appeared in the same journal, is probably given out with the view of

ascertaining the reception such a plan would receive:

Soon after the formation of the American Telephone and Telegraph company (the long-distance company) it was generally known and believed that the object of the company was not only to build long-distance lines, but to take in all of the sub-companies. That plan is now rapidly maturing, and in all probability the American Bell company will be merged into the American Telephone and Telegraph company of New York. Bell stockholders will be asked to accept shares of that company in exchange for their shares on a satisfactory basis as regards the earning power of the two companies. After this is adjusted all the sub-companies' stockholders, especially where the American Bell company now owns a controlling interest, will be offered the stock of the American Telephone company upon an earning basis in exchange for their stock in the sub-companies. In companies where the American Bell company does not own a majority interest it will purchase the control, so as to bring about a grand consolidation of all interests. When this plan, which is quite feasible, is consummated the American Telephone and Telegraph company will be the largest corporation in the world. There appears to those best informed to be no opposition to the plan as outlined. The Cleveland Telephone company, it will be remembered, recently purchased the Michigan Telephone company. Both these companies are controlled by the American Bell Telephone company, as are the Chicago Telephone and Central Union Telephone companies. Therefore, a consolidation of the American Bell Telephone company with another concern would mean the virtual absorption of the smaller concerns mentioned by a great corporation.

The Erie telephone management was formally elected by the board of directors of the Michigan Telephone company as managers of the property on January 18th. Ashley Pond of Detroit resigned as director and Charles J. Glidden was elected to fill the vacancy. The board as reorganized is as follows: President, Charles J. Glidden of Lowell, Mass.; vice-president, James P. McKinstry of Cleveland, O.; secretary, George B. Perham of Lowell, Mass.; treasurer, Charles A. Grant of Lowell, Mass.; general manager, Frederick A. Forbes of Detroit; local treasurer, Hugh McMillan of Detroit. The advisory committee consists of the board of managers of the Erie company residents of New England and New York.

The following-named directors of the Michigan Telephone company will remain on the board of directors: Robert T. Lincoln, president Pullman's Palace Car company; Colonel Robert C. Clowry, vice-president Western Union Telegraph company; W. A. Jackson, president Central Union Telephone company, and Norman Williams of Chicago, Frederick A. Forbes and Hugh McMillan of Detroit.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the WESTERN ELECTRICIAN.]

Senator E. E. Smith's bill in the Minnesota Legislature for allowing telephone companies to acquire a right-of-way along railroad rights-of-way has been recommended for passage. A bill has been introduced to make telephone companies common carriers and requiring them to transmit, without discrimination, messages from other companies at the rate charged individuals. The companies are placed under the Railroad and Warehouse Commission.

Work has been started on a local telephone system at North Branch, Minn.

The Northwestern Telephone Exchange company has reduced rates at St. Cloud, Minn.

The council of Duluth, Minn., has appointed a committee to ascertain the cost of a municipal telephone system.

Mekinock, N. D., has petitioned the Northwestern Telephone Exchange company to give it toll connection with Grand Forks, N. D.

The Lake Park and Ulen Telephone company has been formed at Lake Park, Minn., to build a line to Ulen.

Local stockholders of the Minnesota Mutual Telephone company at Wyoming, Minn., have decided to employ an attorney to investigate the business of the company.

The Ranch Telephone company has been formed at Chadron, Neb., to build a toll system in that vicinity. It will tap all the towns from Chadron to Gordon and Ellsworth, and will construct 300 miles of line.

The Cedar Valley Telephone company is an applicant for a franchise at Ackley, Ia.

A telephone line has been completed between Confidence and Plano, Ia.

The Perry Telephone company is putting in an exchange at Stuart, Ia.

The new exchange at Manson, Ia., has been completed and put in operation.

Oto, Ia., has voted a franchise to the Iowa Telephone company.

There is talk of a telephone line from Exira, Ia., to Audubon, to connect with the system in the latter place.

The telephone system at Lewistown, Mont., has ordered an additional switchboard with 50 drops.

Citizens of St. Paul are intensely disgusted at the way their city is mentioned in the long-distance telephone directory. The council there has refused a franchise to the long-distance company and so the city is noted as being "near Minneapolis."

The Northwestern Telephone Exchange company will rebuild the exchange at Grand Forks, N. D., at a cost of \$12,000.

The Central Telephone company is an applicant for a franchise at Monroe, Ia. The citizens will vote on the matter March 20th.

Sullivan & Still contemplate putting in an exchange at Garden Grove, Ia.

The town of Mount Ayr, Ia., will vote March 20th on the applications of three telephone companies for franchises, viz.: the Iowa Telephone company,

the Clearfield and Mount Ayr Telephone company, and the Mount Ayr Mutual Telephone company.

P. J. Menard proposes to establish a telephone exchange at Mantowoc, Wis., if he can get a franchise.

A new telephone exchange is being installed at Wheaton, Minn.

The Iowa Telephone company has made out rates for telephone service at Fort Dodge, Ia.

The Standard Telephone company has been annoyed by some unprincipled rascal cutting out the current by running a fine copper wire down the pole and into the ground. This has been done in the country and required the examination of each pole to discover the trouble. The work was done near Elkader, Ia.

G. E. Bickley and J. W. Knepper of Waterloo, Ia., have secured control of the telephone exchange at Oelwein, Ia., and will entirely rebuild the system.

The Independent Telephone association of Iowa held a meeting in Des Moines recently and discussed plans to prevent other independent companies from selling out to the Bell interests, as two in the northeastern part of the state recently did.

The La Crosse (Wis.) Telephone company has added 118 subscribers to its system in the last year. The company is preparing for numerous improvements the coming season.

The Assembly in St. Paul has passed a resolution calling on the Mississippi Valley Telephone company for a statement of the work it has done in the city and the sums expended for labor and materials.

The Elgin (Minn.) Telephone company is planning a number of extensions to its system for the coming season.

J. E. Gipson is canvassing Mandan, N. D., with a view to putting in a local telephone exchange.

The Elgin Telephone company of Elgin, Minn., has had a successful year and is planning a number of extensions for the coming year.

The McCormack Telephone company is an applicant at Ely, Minn., for a local telephone franchise.

Over \$500 of the required \$700 has been raised at Lake Park, Minn., for the construction of the proposed telephone line to Ulen, Minn.

The council of Duluth, Minn., has received two bids for a telephone franchise in that city from R. H. Evans, a promoter of Detroit, Mich. The Duluth Telephone company presented a communication relating that it has been in operation for 20 years satisfactorily, and that it can undoubtedly maintain its right to continue. It points out the injury of having two exchanges in operation and expresses a hope for an amicable agreement with the city.

Auditor Dunn of Minnesota recommends a return to the system of taxing telephone companies on their plant valuations instead of on gross earnings as at present. He says they do not bear their share of taxation.

McIntire, Ia., says it has good service over the wires of the Northwestern Telephone Exchange company, but complains that connection with Osage, Ia., is slow, roundabout and uncertain.

The Oliver Iron Mine company will soon construct a telephone line between its three properties on the Vermillion iron range in Minnesota, the Zenith, Pioneer and Savoy.

The Mesaba Telephone company has completed an exchange at Sparta, Minn. It includes Eveleth and Virginia, Minn., in its connections.

The Pierce County Telephone company has made many improvements to its system in Ellsworth and River Falls, Wis., and will make connection with St. Paul and Minneapolis in the spring.

The Northeastern Telephone company held its annual meeting at Rush City, Minn., recently. The company has 50 miles of wire in operation.

A right-of-way has been secured for a telephone line from Fergus Falls, Minn., to Wadena, Minn.

Slayton, Minn., is to have telephone connection by spring.

The Union Telephone company of Plainfield, Wis., has arranged to extend a line to Stevens Point, Wis., 23 miles.

The Iowa Telephone company plans to make many changes and improvements to its system in Iowa in 1899. The copper metallic return circuit will be extended freely, and new toll lines across the state from Council Bluffs to Sioux City, and thence to Dubuque, will probably be built.

Harlan, Ia., is to have connection with Exira in the spring.

Judge S. M. Elwood is an applicant for a telephone franchise at Sac City, Ia. The matter will be voted on at the spring election.

The Knoxville Electric company of Knoxville, Ia., has completed connection with Des Moines, and is preparing to reach Okaloosa, Ia., in the spring.

The Standard Telephone company of Waukon, Ia., has increased its capital stock from \$25,000 to \$50,000. A 20 per cent. dividend was declared.

Larkin & Coffey have sold the telephone system at Madison, S. D., to Aeksett & Gray of Harmony, Minn., who will improve and extend the service.

The annual meeting of the Wood County Telephone company at Grand Rapids, Wis., shows the company to be out of debt and earning dividends.

Sleet and ice on the wires at Morris, Minn., did about \$500 worth of damage to the telephone system recently.

The Central Telephone company is willing to put in an exchange at Pella, Ia., if the business will warrant.

A bill has been introduced in the Minnesota Sen-

ate providing for the taxation of telephone, telegraph, express and other companies under the Ohio plan, which is to assess them at the proportion of their capital stock, as their total property value is to their total actual property value.

Merchants of Cedar and Wright, Ia., are arranging to construct a telephone line to Oskaloosa.

The Chippewa Falls Telephone company of Chippewa Falls, Wis., held its annual meeting recently. The company is in good condition and has over 200 instruments in use.

P. B. Hirsch, superintendent of the Wausau (Wis.) Telephone company, was married recently to Miss Belle Holderman.

The Wisconsin Telephone company has met the rate made by the People's company at Waupun, Wis., of \$1 per month.

A bill will be introduced in the Legislature to permit Duluth, Minn., to construct a municipal telephone system.

The Wisconsin Valley Telephone company held its annual meeting at Eau Claire, Wis., recently. The company has 900 miles of line in operation. The company voted to issue no more passes.

The Merrill (Wis.) Telephone company has increased its list of subscribers 66 in the last year. It is proposed to extend toll lines to a number of towns in the vicinity this spring.

Charles McFatrige has sold his telephone line between Moravia, Ia., and Blakesburg to the Ottumwa Telephone company.

The Mutual Telephone company of Des Moines, Ia., has ordered a 200-drop switchboard.

J. M. Baker, general manager of the Iowa Telephone company, died recently at his old home in Hudson, Mich.

There is talk of forming a mutual company to purchase the telephone exchange at Mount Ayr, Ia. Mutual companies expect to have exchanges in nearly every town of Iowa of 3,000 population by the end of the year.

The Moline, Ill., telephone exchange gave a telephone concert recently to the patients of the city hospital. The occasion was the appearance of Blatchford Kavanaugh, and a receiver was placed at the cot of each inmate of the hospital.

Stillwater, Minn., now has 240 telephones in use. The number has increased recently, owing to a reduction in rates.

The Iowa Telephone company gave bulletins of the progress of the McCoy-Sharkey prize-fight to people in Iowa.

Direct-reading Ohmmeter.

The accompanying cut illustrates the latest production of the American Electric Specialty company of 123 Liberty street, New York. It is the company's '99 type of direct-reading ohmmeter. The instrument was produced by the company for the purpose of measuring resistance in much the same way that a voltmeter measures volts and an ammeter measures amperes, and to meet the demands of practical men. It is portable, direct-reading, accurate and self-contained, and is a reasonably cheap instrument. It takes the place of the portable testing set, over which it possesses many advantages.

Being direct-reading, it thus eliminates the mistakes that are liable to be made when making the necessary calculations from plug readings. The telephone receiver renders it independent of leveling, of stray magnetic fields and of vibration.

The direct-reading ohmmeters are always ready for service without any previous adjustment. The instrument carries its own battery, which will last from six months to a year with constant use, and can be renewed at a price which compares favorably with the cost of renewing of chloride-silver cells of portable testing sets. The instrument is so simple that a boy, after a few moments' instruction, can obtain as accurate results as an expert.

The operation is as follows: Connect the resistance to be found to the binding-posts marked *XX* and place the telephone to the ear, pressing forward the key marked *K*. This closes the battery circuit. The stylus is then taken in the hand in the same manner as a pen. The two outside binding-posts are first successively touched with the stylus. The point of silence, which is the point desired, is on that half of the scale which gives the faintest click. The other end of the half thus found is then touched, and if less sound is heard there, the point of silence is nearest that end. This divides the portion of the scale to be searched by four. Over the fourth thus determined touch the wire until the point of silence is found, when the scale beneath is read directly. The scale is lettered in three or four colors, according to the grade of the instrument, and on the center block of the ohmmeter is provided a small number of plug holes which are correspondingly colored. This device provides a large range. If the plug is in the hole of a certain color, the corresponding figures are read, thus avoiding multipliers, which confuse the inexperienced man.

So rapidly can this point of silence be located that a resistance is found in an almost inappreciable length of time. The instrument is 17 inches long, five inches wide and 4½ inches high and weighs about 7½ pounds. It is made of polished mahogany with mottled joints, and can stand a great deal of rough usage. It contains a small compartment in one end for storing away the telephone. The middle strip is of polished hard rubber; the brass-work is machine-finished and highly lacquered.

Every precaution has been taken to make the instrument extremely high-grade, simple and practical. The instrument has four scales, lettered in black, red, blue and brown. The black scale reads from zero to 10 ohms, the red scale reads from zero to 100 ohms, the blue from zero to 1,000 ohms and the brown from zero to two megohms, thus giving the instrument a very wide range over a considerable length of scale, enabling very accurate readings to be obtained.

This device has found particular favor among electricians and experts who are frequently called upon to run down faults in cables or lines and similar troubles in electric-light, telephone and telegraph stations. The company reports a large and growing demand for it.

American Institute of Electrical Engineers.

At the meeting of the Institute in New York on January 25th a paper was presented by Lieut. S. Dana Greene of Schenectady entitled "Electricity on Shipboard." It was discussed by Captain Millis, Lieutenant Walling, J. W. Lieb, Jr., T. C. Martin, Elihu Thomson, Townsend Wolcott and others.

At the meeting of the executive committee in the afternoon the following-named associate members were elected: Royal Bradford Daggett, Chicago, Ill.; Ernest J. Dyer, Yokohama, Japan; Geo. Henry Hill, New York city; Ernest Rowland Hill, Pittsburg, Pa.; Wm. A. Lynn, Berkeley, Cal.; J. Manley Simpson, St. Paul, Minn.; Thos. Perrin Thompson, Brooklyn, N. Y.; Alfred J. Thompson, Havana, Cuba; Robert M. Wilson, Montreal, Que.

The following-named associate members were transferred to full membership: Philander Betts, Washington, D. C.; Winder Elwell Goldsborough, Lafayette, Ind.

Amended Porto Rican Tariff.

The United States Treasury Department announces that the port of San Juan is the chief cus-

Underground-contact System Said to Be Practicable for Chicago Street Railways.

The position taken by the street-railway companies of Chicago, which are seeking overhead trolley extensions in the central business district, that it is impracticable to operate the "underground-trolley" system in Chicago, owing to poor drainage, bad pavements and the dirty condition of the streets, is combatted by City Electrician Ellicott, Lieutenant F. B. Badt and others. Mr. Ellicott has made a report to the mayor, in which he takes the ground that the proposed system of underground conductors is perfectly feasible. On the subject of drainage the city electrician remarks that North Clark, Wells, La Salle and Dearborn streets have sewers from nine to 11 feet below the street surface, and that all of the business district is equally well drained.

Some of the other points made by Mr. Ellicott are given:

Numerous catch-basins are connected to these sewers, and in any case except a flood there is certainly capacity enough to carry all surface water away, and the surface water is all we have to deal with. Assuming that water should at some time run into the conduit—is it not more than large enough to carry off all the water that could possibly run through the slot—there is no danger of its entering through any other opening, as none exists.

And why cannot the water that does flow through the slot follow along the bottom of the conduit to suitably arranged catch-basins and from them to sewers, or, if the fall is not sufficient, why not force the water by means of pumps into the sewers?

The telephone company, Edison company and the city of Chicago have built hundreds of manholes in different parts of the city, varying in depth from five to eight feet; they do not make any other provision for draining them than to connect with the sewer, and at no time are they unable to do work in them on account of water. The cable conduits are not so deep as these manholes, and consequently less likely to be improperly drained if connected to the sewers.

The sewers cannot back water into the manholes, as traps are provided to prevent it. There might be a combination of circumstances that would temporarily interfere with the underground service, but such a condition would probably cause the same interference with any system of electric traction.

Only last year the city of Chicago, poor as it is, incurred the expense of placing its own wires underground in North Wells street. Only a few small wires were maintained and a single line of poles on each street, but they had to come down—the peo-

DIRECT-READING OHMMETER.

ports of Porto Rico, with the following as sub-ports: Ponce, Mayaguez, Aricibo, Aguadilla, Humacao, Fajardo, Isabel Segundo, Naguabo, Arroyo and Jobos. Any controversy arising at any of the sub-ports is referred to the collector at San Juan for settlement.

All trade between Porto Rican ports and those of the United States must be carried in registered American vessels, and any merchandise transported otherwise is subject to forfeiture.

On and after February 1, 1899, the Porto Rican or Spanish silver coins now in circulation in the island of Porto Rico shall be received for customs duties at the following rates: Peso, 60 cents; medio peso, 30 cents; peseta, 12 cents; real, six cents; medio real, three cents.

Some items of the amended tariff are as follows: Incandescent electric lamps, mounted or not, \$2 a hundred; wire, covered with tissues or insulating materials, conducting cables for electricity over public thoroughfares, \$6 per 100 kilogrammes (this is construed to mean cables composed of one or more wires of copper or an alloy of copper, whatever be their thickness, providing that they be covered with an insulated wrapper, without taking into consideration whether they are enclosed in pipes of iron or lead or strengthened with cordage or iron or steel wire); carbons, prepared for electric lighting, \$2 per 100 kilogrammes, gross weight; dynamo-electric machines, electric motors and all other electric machines and apparatus, 15 per cent. ad valorem.

New "Interrupted-current" Dynamo.

In the article describing the new "interrupted-current" dynamo of the Triumph Electric company, given in the *WESTERN ELECTRICIAN* last week, it was stated that "This dynamo, the maker claims, * * * will develop current for the same number of lights with the expenditure of only 35 per cent. of the energy required with any other machine." The figure should have been 65 per cent. instead of 35 per cent. A slip of the pen in the statement of the manufacturer is accountable for the unintentional error.

ple demanded it—and now the proposition is to put up twice as many poles, equipped with bare wires, bringing about a dangerous and undesirable condition of affairs (taking a step backward instead of forward, and all for the sole reason of saving a few thousand dollars to a street-railway company.

Walker Street-car Motor Declared to Be Non-infringing.

Judges Colt, Webb and Brown in the United States Circuit Court of Appeals at Boston, January 26th, rendered a decision in the case of the Thomson-Houston Electric company against the Athol and Orange Street Railway company, affirming the decree of the Circuit Court dismissing the plaintiff's bill. The suit was brought for an injunction to restrain the defendant from the alleged infringement of patent No. 448,260, issued on March 17, 1891, to Edwin W. Rice, Jr., for an electric motor. The motor is used on electric cars. The defendant company is using the Walker motor, which is constructed under the Uebelacker patent, No. 554,353, dated February 11, 1896, and the Short patent, No. 546,360, dated September 17, 1895.

The opinion of the Appellate Court, which was written by Judge Colt, reviewed the claims of the patents of both parties at length, and holds "that in construction and mode of operation the Walker motor is distinctly different from that described in the Rice patent, and that it does not infringe any of the claims relied upon by the complainant." F. P. Fish and J. J. Storrow appeared for the complainant and C. E. Mitchell for the defendant.

The Union Copper Mining company of Roselle, N. J., was incorporated on January 27th, with an authorized capital of \$3,000,000, of which \$2,500,000 is paid in. The incorporators are William G. Newman, Walter G. Newman and Byron P. Stratton of New York and Temple Taylor Berden of Roselle. The company will conduct a general mining business and will purchase and operate copper and zinc mines in different parts of the country.

INDUSTRIAL COMBINATIONS.

A bill has been introduced into the New Hampshire Legislature to consolidate the Exeter railway, the Hampton and Amesbury railway and the Rockingham Electric company into one large electric-railway system. It was this project that gave rise, a short time ago, to the rumor that a scheme to parallel the Boston and Maine steam railroad all along the coast, and connect the beaches, from Boston to Portland, was in contemplation.

It is reported from Taunton, Mass., that a street-railway consolidation deal is under way in the southern part of the state, by which the Shaw syndicate, now operating the railway between Brockton and Taunton and the line between Taunton and Providence, is to come into control of systems valued at several millions of dollars. These include the Taunton street railway, the Dighton, Somerset and Swansea railway, the Globe street railway of Fall River and the Fall River and Newport railway.

The directors of the new American Steel and Wire company of New Jersey have elected officers for the coming year as follows: Chairman of the board, John W. Gates; president, John Lambert; first vice-president, William Edenborn; second vice-president, I. L. Ellwood; third vice-president, S. H. Chishelm; fourth vice-president, P. W. Moen; treasurer, W. A. Green; assistant treasurer, F. L. Watson, Chicago; assistant treasurer, T. P. Alder, New York; secretary, C. S. Roberts; assistant secretary, O. Owen, Chicago; assistant secretary, F. E. Patterson, New York; executive committee, I. L. Ellwood, J. W. Gates and William Edenborn; general counsel, Seward, Guthrie & Steele.

The combination of street-railway interests in St. Louis was strengthened by the recent sale of the Union Depot system. The papers were signed and the deal arranged about two weeks ago in New York city. James Campbell of St. Louis, a heavy stockholder, and Harry Scullin, vice-president of the company, conducted the negotiations for the St. Louis people, while P. Calhoun represented Brown Brothers. The deal was negotiated on a basis of \$136.66 a share (par value \$100), or a total of \$4,100,000. This will give the syndicate represented by Brown Brothers control of 180 miles of road. It is believed that the Southern Electric and Hamilton system of roads will be absorbed by the syndicate. H. Sellers McKee of Pittsburg has sold his traction franchise to Brown Brothers, which gives them possession of fully two-thirds of the street-car mileage of St. Louis.

A Baltimore dispatch of last Saturday states that the syndicate formed by Alexander Brown & Sons for the purpose of consolidating the street railways of Baltimore will also engage in electric lighting. It has not been decided whether the syndicate will absorb the electric-light companies now in existence or use its own plant to furnish the power. Existing companies are the Brush Electric company, the Edison Electric Illuminating company and the Northern Electric company. The combined gross earnings of the properties amount to about \$620,000 yearly, and the net earnings to about \$233,000. The plan of financing the United Railroads and Electric company of Baltimore, which is the name of the corporation that will take over the street-railway properties, will be large enough to cover the cost of the three electric-light companies, should it be decided to acquire them instead of using the railway power houses of the company to furnish electricity for lighting purposes. The plant of the company is ample for the purposes, but it is held that it would be more profitable to have all the electric companies under one management.

On January 27th there was filed in Jersey City the certificate of incorporation of the Miners' Copper company, a new combination of copper interests, with \$10,000,000 capital. The significance of this incorporation, says the *Chicago Tribune*, is greater than appears upon the surface. The Miners' Copper company is said to be only one of six copper corporations, the remaining five being not yet formed, each of which is to have \$10,000,000 capital and is to pass over its control to the Miners' company, giving that company's stock the same relative value as the preferred stock in a larger company. The incorporators of the Miners' Copper company are Frederick Buckley Hyde of Boston and George W. Mark and James B. Dill of New York. The company incorporated is believed to be a rival of the real copper trust, which has been in process of formation for some weeks. It is known that the copper interests, which include the Boston and Montana, Butte and Boston, Montana Ore Purchasing, the Tamarack, the Osceola and the Quincy Copper Mining companies, have thus far not completed arrangements for a consolidation. It is, however, possible that the new company may be a dummy, which will eventually play into the hands of the real trust when it is an accomplished fact. In this view it is probable the Miners' Copper company will bear the same relation to the copper trust as the Union Investment company does to the Standard Oil trust. It will hold as trustee the stock of the various subsidiary companies controlled.

The Washington and University Railroad company is again before Congress for the additional privilege of extending its lines over some streets not mentioned in its bill of incorporation.

CORRESPONDENCE.

New York Notes.

NEW YORK, January 30.—The Rapid Transit Commission has memorialized the Legislature for an enlargement of its powers, in order that it may resort to new financial expedients for building the proposed underground system of railways in this city. In the memorial various plans of financing the great undertaking are discussed, whether by pledging the public credit or by the employment of private capital. The commissioners recommend that if power is granted them to sell the franchise to construct the road, such power shall be additional to their present powers and not a substitute for them. In this way the board will be enabled to take advantage of varying conditions as they may arise in the future. "If the city authorities shall see their way to keep the debt sufficiently within constitutional limitation," say the memorialists, "then the board will be in the position to authorize municipal construction; and, on the other hand, if municipal construction shall prove to be constitutionally impracticable within any reasonable time, the board may be enabled to arrange for construction by private capital." The commissioners point out that the testimony taken before the two Supreme Court commissions and the striking success of the subway in Boston have removed any doubts which formerly existed as to the practicability of such a road and as to the possibility of calculating the cost.

It is said that the Manhattan elevated-railway directors, at their meeting on Tuesday, discussed in detail the question of ways and means for providing the money necessary for equipping the elevated-railway system with electricity, and came to an agreement that an issue of stock would be advisable, all stockholders to have the privilege of subscribing pro rata to the new issue at a fixed price, and that an underwriting syndicate made up of large Manhattan interests should be formed for the purpose of taking such part of the new stock as might not be subscribed for by the stockholders. As shown by the interview which I quoted last week, Russell Sage has taken an extremely conservative position in relation to the proposed change. It is reported that the other directors, including Mr. Gould, are inclined to be more progressive, and it is hoped that Mr. Sage's influence may be overborne.

George H. Pegram has been appointed chief engineer of the Manhattan Railway company, and John Waterhouse, formerly chief engineer, has been appointed consulting engineer of the system. Mr. Pegram, who was formerly connected with the Union Pacific, entered the service of the Manhattan company as consulting engineer about a year ago, at the request of President Gould.

John McLeod Murphy, formerly foreman of fire-engine company No. 12 of Brooklyn, has been experimenting with a third-rail system of electric propulsion at Manhattan Beach, and expects within two weeks to have the old Marine railway fitted up with his system. His idea is to provide a means for distributing the current without the aid of exposed overhead or underground conductors. Mr. Murphy's invention is said to consist principally of his automatic switch. Each of the sectional rails is one-half the length of the ordinary trolley car, and so spaced that the car is collecting current from one section before it leaves the preceding one, the current thus being continuous as the car proceeds. There seems to be no great novelty in this, but it is announced that a public test will be given some time next month on the old Marine railway.

The committee which is engaged in the reorganization of the Kings County elevated railroad has sent a notice to the holders of the first mortgage bonds, asking them to place their holdings under the committee's control on or before February 10th. This step is believed to foreshadow negotiations for the absorption of the Kings County road by the Brooklyn Rapid Transit company, and the ultimate consolidation of all the transportation systems, surface and elevated, in Brooklyn. It is rumored further that the intention is to absorb the Long Island railroad and operate it in connection with the Brooklyn Rapid Transit system. This would give the Flower syndicate control of all the railroad and street-car systems of Long Island. The total capitalization of all the companies, is more than \$200,000,000.

The General Electric company having complained to the United States Circuit Court that the injunction formerly obtained against the Nassau Electric Railroad company of Brooklyn, for infringing the Sprague patent (No. 324,892) for the suspension of electric-railway motors, had not been obeyed, Judge Lacombe has ordered that the Nassau company be fined \$25 for each offending car. Of the trucks at present in use the judge says: "It may be that defendant's present device, in which wooden blocks, with a core large enough to allow play of the bolt which passes through them, are deleterious when the parts become loose, but, nevertheless, they do under such conditions give substantially the same freedom of movement to the nose end of the motor as was given by the 'flexible connections' of the Sprague patent. The numerous affidavits which assert that no good mechanic would allow the parts to become loose, that all loose nuts are at once tightened up, and most positive directions given to have all connections

rigid, are of little weight in contradiction of the express statement of car examined in which freedom of movement of the nose end of the motor was found to exist, the distinguishing number of such cars being given. It would seem as if, in view of character of the invention which is to be patented of the rolling stock of a road in a large city where the carrying capacity must frequently be used to its limit for days at a time, the present device does not menace infringement that it should be enjoined unless it be so modified as to insure rigidity even when in constant use." M. S.

Detroit, Mich.

DETROIT, January 28.—Within the next six months it is expected that the projected Lansing, Dexter and Ann Arbor electric road will be completed and in running order. W. W. Churchill of New York and C. W. Register and O. A. Stranahan, engineer for the Westinghouse interests, have gone over the line of the proposed road to obtain an idea of the probable cost.

Dr. R. J. Shank and C. A. Mapes of Lansing, Morris Topping of Plainville, L. C. Chase of Danville and Thomas Burkett of Dexter held a meeting in Detroit a few days ago and conferred with Wallace Franklin, the Michigan representative of the Westinghouse people in Detroit. Through the aid of the long-distance telephone figures were bartered back and forth between Detroit, Chicago and New York, and it is now definitely announced that arrangements have been completed to build and equip the road. It is expected that bonds amounting to \$1,300,000 will be issued and the capital stock of the company will be placed at \$250,000. When the road is built the Westinghouse company will also float bonds to the extent of \$1,175,000.

The projected road is to run from Ann Arbor through Dexter and Mason and a number of connecting towns to Lansing, and is to connect with the present Detroit, Ann Arbor and Ypsilanti road. Work will be commenced in the spring. G.

Canadian Intelligence.

OTTAWA, January 28.—For some time the town of Lindsay, Ont., has been trying to secure a cheap electric power. Culverwell and White-Fraser of Toronto undertook to form a company and transmit the power from Fenelon Falls to Lindsay, but were unable to make the financial arrangements necessary to the undertaking. The matter has now been taken up by some of the citizens of Lindsay. An electrical expert is to be employed to look into the subject, and if it is indorsed by him the plan will be carried through.

It has been decided that the city of Toronto can prosecute the street-railway company before the police magistrate for failing to comply with the by-law calling for vestibules on motors and trailers for the protection of conductors in winter months. The courts have given the city a victory in this litigation, holding that the company could be proceeded against, by summary conviction before the magistrate. The company has unsuccessfully contended that it can be punished by indictment only.

Mr. Wallberg of Montreal has been in Ottawa negotiating with the Canada Atlantic Railway company to have the new shops of the company, which they are about to erect at Ottawa, fitted up in a modern manner and similar to the shops recently completed at Sherbrooke, Quebec. There the power is supplied by electric motors. The Buffalo Forge company's system of fans has been adopted for heating purposes.

The Metropolitan Electric Light company of Ottawa is now an incorporated body. The canal for the development of the water power to be utilized will be 180 feet wide, nine feet deep and 2,000 feet long. The reservoir will extend up the lake for a distance of 30 miles and will be 1 1/2 to three miles wide and 40 feet from shore. The power house will be erected at the foot of the Deschene Rapids.

At Prescott, Ont., the by-law to raise \$75,000 for municipal electric-light plant was carried by 37 majority.

The Toronto Elevated Railway company asks incorporation, with power to construct a system of elevated railways in adjoining municipalities.

Writs of summons against the corporation of the city of London, Ont., have been prepared at the instance of the London Street Railway company, in a suit of damages arising out of the recent strike of the company's employees. The amount claimed is \$20,000, and the wording of the claim is for "inciting riots, causing damage to the plaintiffs, and for neglect of duty and for breach of duty." The meeting of the City Council at which the street-railway company was denounced on all sides and the prospective strikers upheld is what the suit for damages is especially aimed at.

It is not generally known that Canadians are putting in something like \$1,000,000 into Jamaica, in the shape of an electric street railway. The company is formed of Montreal and Halifax, N. S., capitalists. Hon. Dr. Johnston, a member of the Jamaica Legislative Council, who is visiting here, introduced a bill into the Jamaica Council, and obtained for the company the necessary license to enable it to install the plant in Kingston in 1897. An amendment to this bill has now been found necessary, as various complications have arisen by reason of the change of power from steam to elec-

tricity. A waterfall, about 20 miles from the city of Kingston, will supply the electric power needed.

The Toronto electric street-railway gross receipts for 1898 were \$108,924, as compared with \$99,336 for the year previous.

The annual meeting of the shareholders of the London (Ont.) electric street railway was held recently. Notwithstanding the loss entailed by the recent and prolonged strike of the railway's employes, the gross earnings showed an increase of over \$12,000 for the last year. The number of passengers carried in the year was nearly 3,000,000. The gross earnings per capita of the population were \$2.95.

A by-law has been passed by the council of the city of Hull, Que., providing for a loan to purchase dynamo and give the city its own plant for electric lighting, operated by its own water power, which cost the corporation \$23,000. The lighting committee is now asking for tenders for poles, wires, lamps and dynamo.

The first car on a Canadian steam railway illuminated by electricity is now running between Montreal and Toronto.

The directors of the Montreal electric street railway have just decided on a new departure. After much consideration, the board has decided to concentrate the whole of its business at the Hochelaga workshops. The company intends in the spring to build a large brass foundry for the manufacture of its brasses, and a large iron foundry for the iron-work required for the cars, an important part of this being the car wheels. The new buildings required for this great work of centralization and expansion will involve an expenditure of upwards of \$500,000.

In the appeal of the London, Ont., street railway from an assessment of its cars by the city, the Court of Appeal for the province has declared the cars to be personally and not realty, which means they are non-assessable.

The town of Dartmouth, Nova Scotia, is asking power of the provincial Legislature to issue \$150,000 of bonds for the purpose of operating an electric street railway in that town and vicinity. A bill will also be submitted empowering the issuing of bonds to the amount of \$50,000 to establish an electric-light plant for lighting the streets and public buildings.

The Lake Megantic Pulp company of Lake Megantic, Que., will ask the government of that province for an increase of its powers, with a view to supplying electric light and power and constructing tramways.

The Hull and Aylmer Electric Railway company has purchased from the Canadian Pacific railway the line from Hull, Que., to Aylmer, Ont., over which the former company's cars now run. Since the beginning of its service the Hull-Aylmer Electric company has been using the tracks under lease, but a deal has now been completed whereby it becomes possessor of the line for \$100,000.

Mr. E. Hanson of Hanson Bros., bankers and brokers, Montreal, has just returned from New York, where he has been closing the deal for the Havana street railway. He says that they have now actual possession of the Havana street railway, which his company has been operating since January 1st. The cars will, for a time, continue to be drawn by mules, but in a short time electricity will be used.

A. V. W.

Northwestern Notations.

MINNEAPOLIS, January 28.—A council committee at Winona, Minn., will soon report on the cost and advisability of a municipal electric-light plant.

The Badger Electric Light company of Racine, Wis., has paid \$521.71 to the city treasurer, being 1½ per cent. tax on its gross earnings.

A Mr. Lyon, living near Livingston, Mont., has a new theory of the way to produce rainstorms at will. He thinks electricity the secret, and argues that by producing a positive current, well up in the air, and a negative current, also well elevated, the result will be that clouds will form and the rains descend. He proposes to have one positive circuit and four negative, all elevated by means of balloons, and when it is desired to stop the rain he would reverse the currents and put out four positive and one negative. He would have an immense power plant to cover with wires a territory 60 miles square, which should furnish rain for that amount of ground. He is regarded as a crank on the subject, but is said to be thoroughly in earnest as to the feasibility of his scheme.

The Street Railway and Electric Lighting company of Burlington, Ia., is considering the extension of its line to West Burlington this season.

The Des Moines Edison Electric Light company of Des Moines, Ia., will expend \$300,000 in improvement and extension to its system.

The matter of electric light will probably be voted on by Madeline, Minn., in the spring election.

The gas committee of the City Council in Minneapolis is considering the substitution of Welsbach gas burners for arc light in the business portion of the city on account of the high price of arc light.

The Burlington Railway company of Racine, Wis., made its 1897 earnings in 1897 by \$13,000.

The directors of the Burlington Railway company, presented before Appleton, Wis., to carry passengers and freight.

E. Desmar, manager of the Citizen's Traction company of Oshkosh, Wis., was elected vice-president of the company at the recent annual meeting.

The Supreme Court of Minnesota has cut down the verdict awarded S. D. Peterson against the Western Union Telegraph company from \$20,000 to \$1,000. Peterson must either accept that amount or take the chances on a new trial. The case has been in the courts for a number of years and grew out of a telegram sent Peterson at the end of a senatorial contest six years ago, in which Peterson bolted the party nominee. The message read "Slippery Sam, your name is pants," and was signed "Many Republicans."

The Citizens' Heat, Light and Power company is an applicant for a franchise at Waterloo, Ia., and the application will be voted on at the March election.

The council of Cloquet, Minn., has laid on the table for three months the application of F. McCormack of Duluth for an electric-light franchise. The Northwest Paper company is installing a large plant there and expects to be able to furnish electric lighting from its plant cheaper than any steam-power plant can afford to do. Hence a suggestion was made to wait till spring, when the company would put in a proposition.

F. McCormack has been granted a franchise for an electric-light plant at Pine City, Minn.

The people of Valley Junction, Ia., are figuring on securing electric light by the Des Moines Edison Electric Light company extending its system from Des Moines to that village.

The Assembly of St. Paul demands that the street-railway company give five-minute service on the Grand avenue line during the busy hours of the day.

Representatives from several telephone and electric companies have been in Minneapolis recently, studying the new problems in electrical development which have been presented by the operation of the new power dam in the Mississippi River. When the dam was first put in operation the telephone system was seriously affected. The introduction of full-metallic circuits by the telephone company and of reduction coils in the plant by the street-railway company have reduced, though not entirely done away with, the trouble.

The new electric-light plant at Watertown, S. D., has been completed and put in operation.

Telegraph poles along the right-of-way of the Chicago, Milwaukee and St. Paul railway near Marinette, Wis., were recently set on fire. The guilty person is found to be Chris Larson, who seems to have a mania for that sort of amusement. He served a year in the state prison for a similar offense once before, and has been out only since Christmas. P.

New England News.

Boston, January 30.—If an order adapted at a meeting of the Boston aldermen comes to fruition in the shape of legislative enactment, this city will enter upon the municipal ownership of transportation service before many months. The order referred to requests the mayor to petition the Legislature for the passage of an act authorizing this city to establish a system of electric-car service through, or on the outskirts of, the municipal park system.

The multiple uses to which electricity has been put in the new south terminal-railway station excite the wonder and admiration, not only of the general public, but of visiting electricians and engineers, who find the plant and its appurtenances among the most comprehensive and complete ever devised. The generating plant is located in a building 460 by 40 feet in dimensions. Here are 10 large boilers, two economizers, compound engines of 1,500 horse power capacity, four Westinghouse multipolar dynamos, refrigerating and heating apparatus and other necessary appointments planned to meet the requirements of the largest railroad station in the world. Steam, electricity, compressed air and heat are distributed from this point to various parts of the structure. The signals are worked by electricity, so are the 19 elevators, and an electro-pneumatic interlocking system is used for the changing of the switches. Electric motors for pumping apparatus and ventilating fans are also a feature of the outfit.

At the annual meeting of the Boston Elevated Railway company Horatio N. Slater and William S. Spaulding, two of the largest stockholders, were added to the board of directors. William Endicott, Jr., formerly on the board, steps out. The annual report shows gross earnings from operations for the last year to have been \$9,179,096. The operating expenses were \$6,566,584. The net earnings from leased lines were \$2,612,512. Total payments under lease of the West End street railway, including subway rental, interest, dividends and taxes, were \$2,197,724. The surplus for the year is \$214,077. From the report it is learned that the total number of revenue passengers carried during the year was 181,321,295, an increase of 8,766,782. In relation to the elevated railway which the company is getting under way, to be operated by electricity, the report says: "Within a short time we expect to have under contract a large proportion of the structure upon the route upon which we have been authorized to build by the Boston city government. Much thereof will be completed by next fall. The plans for the terminal stations at Roxbury and Charlestown have been completed, and a large part of the land required for the same has been taken by eminent domain or purchased. In another year we believe we will be able to report great progress in our construction operations."

A measure that has attracted the attention of capitalists throughout the state who are interested in electric-light plants was brought before the Legislature last week in a bill whose purpose is to make it easier for municipalities to acquire such plants by purchase. The act of 1891, now in force, provides that in purchasing established plants "the price to be paid therefor shall be a fair market value for the purposes of its use." This has been construed to include as a factor the plant's earning power, but the amendment sought provides that the price to be paid shall not exceed the "reasonable cost of buying and establishing a plant, or like portions of a plant, of equivalent capacity of production and distribution, and as serviceable quality of material and construction, counting at its fair market value the land purchased." And this is obviously a very different proposition. The fate of the bill is in doubt.

At Augusta, Me., before the Maine legislative committee on railroads, attorneys for the Boston and Maine appeared last week to oppose a general act brought up in that body, authorizing electric roads to increase their capital stock to effect leases.

The days of the stage-coach in the White Mountains in New Hampshire will soon be numbered.

An electric road is projected to connect Meredith and Ossipee, running through Center Harbor, Sandwich, Moultonboro and Tiltonboro, and traversing about 20 miles of country adjacent to Lake Winnepesaukee, now without railroad facilities, and reached mainly by the old-style coaches. B.

PERSONAL.

H. T. Paiste of Philadelphia was in Chicago last week.

Russell Stanhope, president of the St. Louis Electrical Supply company, paid a visit to Chicago a few days ago.

President Henry Lescher of the Lescher-Macomber-Whyte company came up to Chicago last week and visited his prospering Chicago branch on South Canal street.

William A. Clark, the newly elected senator from Montana, is said to be the largest individual owner of copper mines and smelters in the world. He is 60 years old and a native of Connelleville, Pa.

General Manager H. K. Gilman of the Western Electrical Supply company of St. Louis was in Chicago for a few days this week. Mr. Gilman reports improved business throughout the Southwest, and all the signs of the times point to a splendid business during the next year or two.

General Sales Agent Frank S. De Ronde of the Standard Paint company of New York appeared in Chicago last week and was warmly welcomed by his many old friends in the electrical business. Captain De Ronde has only recently recovered from a very serious attack of typhoid fever, which was contracted during the late war, while in camp with the Second Regiment, New Jersey Volunteer Infantry.

One of the hardest workers during the Northwestern electrical convention was Miss Katherine Cantillon, the young lady stenographer at the Pfister. Her services were invaluable to those who had hurried work. For over a year and a half Miss Cantillon has held this position at the Pfister and has won a reputation for rapid yet painstaking stenographic work, and has made many friends among the traveling public.

Mr. Bion J. Arnold, the Chicago electrical engineer, who made a personal exhibit at Omaha of his work as an engineer and mechanic, has been honored by the receipt of the diploma and gold medal of the Trans-Mississippi and International Exposition for the excellence of his engineering designs. The diploma and medal are both fine specimens of workmanship, and Mr. Arnold has a right to be proud of them.

Washington G. Benedict, a wealthy citizen of Boston, who established the first electric road operated in Massachusetts, and has ever since been largely interested in electric railways and electric appliances, died on January 24th, aged 62 years. Mr. Benedict was born in Pawtucket, R. I., February 22, 1836, and received the name Washington in honor of the day. His early life was spent in the West, where his father had a packing business. In 1876 Mr. Benedict went to Florida and established the town of Orange Park, now one of the flourishing fruit centers of that state. He came to Boston in 1881, and commenced his railroad career. He was first president of the electric road between Winthrop Junction and the Point of Pines; he helped to build up the beach at Revere, owned hotels, real estate and other property, and was widely known for his genuine charity.

ELECTRIC LIGHTING.

H. V. Gates of Hillsboro has contracted to put in a gravity water system and an electric-light plant in Elgin, Ore.

An engineer has been instructed to prepare working plans and specifications for the proposed system of public electric lighting for Palo Alto, Cal.

The Newport (Herkimer County, N. Y.) Electric Light and Power company was incorporated last

week, with a capital stock of \$15,000. William D. Grant of Newport, N. Y., is one of the directors.

The lease of the electric-light plant of Centralia, Wash., expired on February 1st. The city desires bids from competent persons for the lease of the plant for one year. The city clerk will give particulars.

The Elmwood (N. Y.) Light and Power company has been incorporated. The capital stock is \$100,000, and the directors are Robert C. Pruyn of Albany, W. L. Elkins of Philadelphia and John Dunfee, W. B. Kirk and P. J. Mack of Syracuse.

Bids for installing electric-light plants in the Springfield avenue and Central Park avenue pumping stations of Chicago were opened last week by Deputy Commissioner of Public Works Toolen, the bids being as follows:

	Springfield Avenue Station.	Central Park Avenue.
Arthur Frantzen & Co.	\$3,085	\$3,000
Henry Newgard	2,410	2,200
Western Electric company	2,381	2,218
Roonheld & Gallery	2,198	2,388

ELECTRIC RAILWAYS.

An electric road will be built from Lawton to Paw Paw, Mich., next summer.

It is said that the new electric road between Kalamazoo and Allegan, Mich., is now an assured fact, capital having been secured.

Preparations are making in Battle Creek, Mich., to build a road from that city to Allegan, owing to rumors that the Detroit, Toledo and Milwaukee Railway company intends to tear up its tracks and relay them to Grand Rapids, via Gull Lake.

According to a Los Angeles newspaper, the Terminal Railway company has appropriated \$350,000 for electrical development the coming year, and it is probable that \$500,000 will be spent before long in running the trolley to Alhambra and Sierra Madre, as well as to Pasadena.

Fifteen miles of street-railway track were opened in Zurich, Switzerland, last week for electrical operation, which has replaced animal power. Both cars and power-house machinery are of American construction, and American engineers assisted the city engineers in the installation of the plant.

It is stated that Henry Bucey and his associates in Tacoma and Seattle are preparing to ask the councils of the two cities for a franchise for an air-line electric railroad to connect them. The proposed railroad will be standard-gauge, 31 miles long, and built along the bluff from one to several miles back from the Puget Sound shore.

Consul Erdman writes from Breslau, under date of January 9th: "I wish to inform our manufacturers of and dealers in street-car rails, electric motors, wire and electric supplies that the street-car company of this city, which has been using horse power, has been granted the privilege by the city authorities to employ electric motive power at the expiration of its present charter, which will be in 1902."

A movement has been on foot for some time to reduce the fare on the street railways in Washington, D. C., and the first step has been taken by the introduction of a bill by Senator Carter, providing that over all lines of the Capital Traction company and those of all other street railroads operating in the city, the fare within the hours of 6 and 9 a. m. and 4 and 7 p. m. shall be but three cents; during all other hours of the day the rates are to remain as they are at present. A failure to comply with the provision would be the cause of a penalty of \$10 for each offense. The bill also provides that the gross annual receipts of the Capital and Metropolitan companies shall be taxed one per cent., payable quarterly, the proceeds to be used by the commissioners of the district toward the maintenance of the Washington Public Library.

The Union Traction company, which has eight miles of road in operation between North Arlington, N. J., and Carlstadt, has been sold by William M. Johnson, receiver, and was bought in by William C. Giles, of the reorganization committee, representing 90 per cent. of the stockholders. The bid was \$20,000 more than the indebtedness, which is \$852,000. Mr. Giles stated that it was the purpose of the company to carry out the original plan of extending its tracks to Hackensack as soon as possible. The Bergen Traction company expects to have cars running on its new line from Fort Lee to Bogota, across the river from Hackensack, before March 1st, and it will bridge the river in the spring near the Main street station of the Susquehanna railroad. It is understood that the two companies will be rivals for right-of-way through the town. Refusal to grant a franchise to the Union Traction company through Hackensack forced it into the hands of a receiver more than a year ago.

PUBLICATIONS.

The Ridgway (Pa.) Dynamo and Engine company is distributing a well-arranged bulletin giving data of its products—the Thompson-Ryan dynamo and the McEwen engine. Great improvements have been made, it is said, in the details of the ma-

chines. The advantages claimed for the dynamo are these: "Higher efficiency; fixed brushes with no sparking; light weight; cooler running of armature, commutator and fields; all necessary compounding furnished by the 'balancing coils'; ability to vary the compounding 15 to 20 per cent. by simply loosening clamps and changing the position of the brushes, and this without any effect whatever upon the commutation; very small field coils, thus eliminating the danger from inductive discharge upon opening the field circuit; adaptability for charging accumulators, as machine cannot be reversed as long as direction of current in shunt field remains the same; more even distribution of load with machines in parallel."

TELEGRAPH.

The Canadian government is considering the advisability of asking the Dominion Parliament for an appropriation to build a telegraph line to Dawson, N. W. T., as a government work. At present the government telegraph system extends to Quesnelle, in the Cariboo district of British Columbia. From Quesnelle, over the old Western Union route to Telegraph Creek, and thence to Dawson, the distance is about 1,300 miles. Competent electricians have just reported to the government that it would cost \$750,000 to construct and equip the line.

The Berlin correspondent of the *Daily News* of London says: "A joint stock company has been formed at Cologne, with a capital of £500,000, to lay a cable direct from Germany to the United States. At the same time Wolff's Telegraph Agency decided to establish a branch office in New York city. Evidently the 'yellow'-press campaign against Germany, which has caused great embitterment on both sides, has induced the German government to favor this project, by which it is hoped to exercise a direct influence upon public opinion in the United States."

POWER TRANSMISSION.

The New England Electric Power company, with capital of \$500,000 and head office at Portland, Me., has been incorporated. The incorporators are P. S. Saltonstall, Milton, Mass.; E. P. Shaw, D. K. Snow, Brookline, Mass.; S. R. Anthony, N. Anthony, A. Potter, F. Y. Hall, Boston; W. G. Bencheroff, Auburndale, Mass.; E. P. Kidson, Neponset, Mass.; R. M. Saltonstall, Newton, Mass.; H. E. Boothby, Reading, Mass.; J. Drummond and J. Drummond, Jr., Portland.

A note from San Francisco is to the effect that the Equitable Gaslight company of that city has been incorporated with a capital stock of \$1,500,000. The directors are W. J. Dungee, C. L. Ackerman, W. J. Henshaw and others. In addition to the gas-plant, an electric plant is to be constructed for the generation of electric power for the street railroads, supplying electrical companies with power, and for distribution to such manufacturing establishments as may desire it. The plants will be under the direction of Dr. Chisholm.

The Seattle, Wash., *Past-Intelligencer* says that the Seattle Power company, organized with a capital of \$1,250,000, will install a plant capable of furnishing 12,000 horse power at the falls of Cedar River. The scheme to harness the waters of the Cedar River, to utilize the power for manufacturing purposes in Seattle, through the medium of electricity, will soon be realized. For the present but 12,000 horse power will be generated, but it is understood that later the capacity will be more than doubled. E. H. Amidon is president of the Seattle Power company.

ELECTRICAL SECURITIES.

The North Shore Traction company reports gross earnings for December of \$113,852, an increase of \$5,080 as compared with the same month of the previous year, and net \$45,602, an increase of \$1,603. For the three months ended December 31st the gross earnings were \$341,386, an increase of \$4,848 as compared with the corresponding period of the previous year, and net \$129,655, a decrease of \$102.8.

The New Orleans Traction company reports gross earnings for December of \$113,361, an increase of \$3,425 as compared with the same month of the previous year, and net \$48,480, an increase of \$3,071. For the year ended December 31st the gross earnings were \$1,316,791, an increase of \$79,528 as compared with the corresponding period of the previous year, and net \$512,461, an increase of \$112,581.

The general advancement of securities has brought the stocks of many corporations prominently forward, when, under ordinary conditions, very little trading would be done in them. Among this class is Western Union, which has been made one of the leaders of the market. In view of the enormous business that the telegraph systems of the country have transacted during the last six or eight months, first in connection with the war and now in consequence of unusual activity in business and speculation, it is surprising that Western Union stock should have remained dormant as long as it did.

The directors of the Chicago City Railway company have decided to issue \$1,000,000 of the \$2,000,000 additional stock authorized at the annual meeting, although the shares will not be actually put out

until about July 1st. Resolution adopted by the board explain that the stock had been offered to stockholders of record on June 15th at 110, but the money in payment will be received on and after February 1st, and interest at four per cent a year allowed until the stock is delivered. This is in accordance with the usual custom of the company in issuing new stock. The proceeds will be used for extension and new line.

TRADE NEWS.

A handsome lithographed card calendar is issued by the Joseph Dixon Crucible company, of Jersey City, N. J. Its features are an attractive picture in colors, the calendars for 1899, 1900 and 1901, and a few lines about the Dixon pencils and crayons.

The Chicago Edison company has recently secured the contract for installing a complete electric-light plant in the new Massachusetts building, at the corner of Fayette and Charles streets, in Baltimore, which is to be a modern fireproof office building. The building is to be wired for 1,500 16 candle power lamps in iron conduit.

The electrical trade in general, and particularly in the West and South, will be interested to know that President W. N. Matthews of the St. Louis Electrical Supply company of St. Louis, Mo., has sold out his interest in that company. The company will be carried on, as heretofore, with Russell Stanhope as president and George S. McLaren as vice-president.

The National Automatic Telephone company, 71-75 West Jackson boulevard, Chicago, sole manufacturer of Lundquist's automatic telephones and switches, is putting in a system in Wilson, Kan., of which W. D. Jellison is proprietor. A new telephone exchange is also being installed at Kinsley, Kan., using the National automatic system. Great Bend, Kan., is also putting in the National company's instruments.

The Western Electrical Supply company has quite a number of men on the road making aggressive efforts to secure its share of the business of the West and Southwest. The company is making a special drive on the Warren alternators and is also meeting with success in placing Moloney transformers; in fact, the ability of the company to furnish, not only Warren generators, but alternating-current motors as well, to say nothing of such a fine line of transformers, puts it in a position to bid successfully on heavy-machinery contracts.

Philip Cass has withdrawn from the Cass & Aaron company of Chicago and has interested himself in the firm of Cass & Co., doing business at 54-60 South Canal street, Chicago. He is prepared to fill orders for dynamos, motors, arc lamps, transformers and supplies of every description on short notice and at the lowest prices. The new firm has a large stock of second-hand apparatus and a well-fitted repair shop. It makes a specialty of rewinding transformers at figures which will equal about one-half the cost of new transformers.

The Berlin Iron Bridge company, at East Berlin, Conn., has just shipped several carloads of bridge material to the Hawaiian Islands. It is believed this is the first American bridge to be put up in the islands. The contract for this bridge was obtained through the company's agency at Honolulu, and men will be sent from the United States to put up the bridge, which is for highway travel. It consists of one span of 200 feet, 40 feet wide, and will be located across a river in one of the larger towns of the islands. The Berlin Iron Bridge company is doing quite a large foreign business, having a regular agency established at Honolulu, also one at Guadalajara, Mexico, and another at Berlin, Germany. It also has a representative at the present time traveling through Russia obtaining information in reference to the possibilities of steel buildings for that country.

When a man comes all the way from Warren, O., to attend a Northwestern electrical convention it is a high compliment to the usefulness of the association, and should go on record as such. Elmer W. Gillmer of the Warren Electric and Specialty company arrived at the Hotel Pfister the last day of the Milwaukee convention, just in time to put the finishing touches on the exposition of his new fan motor. This new specialty, which has recently been brought out by the Warren Electric and Specialty company, was the main feature of the exhibit made by the Illinois Electric company. The great claim made for the new fan motor is that it possesses a much greater efficiency than any fan motor now on the market. Mr. Gillmer states that he is prepared to demonstrate this by actual tests, and the knowledge that this is the case will undoubtedly bring large sales. The factory in Warren has been equipped to turn out these machines in large quantities to meet the spring demand.

At the annual meeting of the stockholders of the Warren-Medbery company at Sanly Hill, N. Y., H. E. Tidmarsh, George W. Wait, W. W. Wells, W. H. Cunningham, C. W. Kellogg, H. B. Warren and S. C. Medbery were elected directors. Officers were named as follows: President, H. E. Tidmarsh; vice-president, H. B. Warren; secretary and treasurer, George W. Wait. The officers report a gratifying amount of business done under satisfactory conditions and an encouraging outlook for the year

ing year. In the first year of its existence the company has become well known in the electrical trade. Its sales agencies throughout the entire country are well organized and the inquiries for Warren-Medbery generators are constantly on the increase. The officers and shareholders of the company considered the prospects of the company so encouraging that they have determined to increase their capital stock for the purpose of obtaining increased shop facilities for the manufacture of their apparatus.

BUSINESS.

Bernard Hartley, manager of the Hartley Electrical Works, 263 Randolph street, Chicago, states that the firm has all it can do to take care of the volume of repair work which it is receiving. The careful, painstaking, personal attention which Mr. Hartley gives to all work with which the company is favored accounts for its constantly increasing business.

The Buckeye special coiled filament, for use on alternating systems, and which is used in the Buckeye incandescent lamp, is of the cellulose type, and manufactured exclusively by the Buckeye Electric company of Cleveland, O. Maintained candle power and long life are the two points of merit claimed. The Buckeye Electric company carries a large stock of lamps at 753 Monadnock building for the accommodation of the western trade.

The Electric Appliance company is calling attention to the accessibility of its new location at 92 and 94 West Van Buren street. There is probably not another corner in Chicago that has more transportation lines passing it than the corner of Van Buren and Jefferson streets. Several electrical surface lines pass the building, in addition to cable and

elevated railways. None of the Electric Appliance company's friends when in Chicago should fail to visit it in the new location.

The Chicago Fuse Wire and Manufacturing company, 154 Lake street, Chicago, and 853 Broadway, New York, is offering something interesting in the way of railway fuse links. There seems to be no question as to the quality of goods made by this company.

Owing to increased business demands made upon Baker & Co., the platinum refiners, they have found it necessary to remove their New York office from No. 121 to No. 120 Liberty street, to secure additional space. They have on exhibition at the latter address a number of specimens of crude platinum, among which is their large nugget, which is believed to be the largest nugget in any collection on the American continent. The collection is very interesting to metallurgists, chemists and all persons interested in the different uses of platinum.

J. Holt Gates & Co., Marquette building, Chicago, in addition to orders from Armour & Co., Union Stockyards, Chicago, for one 800-kilowatt and two 500-kilowatt Walker power generators and one 7,000-light and two 3,600-light Warren inductor alternators, report the following sales: One 75-kilowatt Warren alternator to the Marion (Ill.) Electric Light company; one 50-kilowatt Wagner multipolar dynamo to the Jefferson Electric company, Chicago; one 200-kilowatt, 220-volt Card generator to the Davenport (Ia.) Gas company, and one 150-light, 2,000 candle power Excelsior arc machine to the Burlington (Ia.) Street Railway company.

The Western Electric company of Chicago and New York is furnishing its customers Simplex friction tape packed in tin boxes. The boxes are 4/4

inches in diameter and one inch deep, and contain one-half-pound rolls of tape carefully wrapped in oil paper. The tape is prepared from high-grade materials, and is furnished in either white or black. This method of packing tape has advantages which are readily appreciated. The tape is thoroughly protected from the drying-out effect due to the exposure to air, and is also protected from dirt. The box is of a convenient size to be carried by the wireman, and will supply him with a receptacle for the partially used roll which otherwise might be thrown loosely into the tool-bag. It is convenient, always clean and economical, and contractors, central-station managers and users of tape generally are asked to consider the advantages of the new method.

In the line of annunciators many promising improvements have been made during the last few years in the way of guest-call and fire-alarm attachments, which are universally used throughout the country in all the larger and more modern hotels; but a still greater step in advance is the employment of the telephone system, which is now being used in a great many hotels in connection with the annunciators. The telephone enables the clerk to call the occupant of the room, and by connecting a plug in the spring-jack, directly beneath the return-call push, he is enabled to carry on a conversation by means of the telephone, which does away entirely with the old system of speaking tubes, which was formerly used in a great many instances. The Western Electrical Supply company of St. Louis, Mo., has recently incorporated this system into its well-known Perfection Annunciator, and is now in a position to furnish any hotel instrument, with or without return-call attachment, with the telephone attachment, full particulars of which will be furnished on application.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued January 24, 1899.

- 618,054. Train Traction System. Frank E. Case, Schenectady, N. Y. Application filed June 22, 1898.

This system of train control for electrically propelled vehicles includes a cable extending through the train, having connection boards at intervals, with a controlling device adapted to register with any one of the connection boards.

- 618,057. Secondary Battery and Electric Lamp. Walter A. Crowds, Chicago, Ill. Application filed November 22, 1897.

A cylindrical lead-containing cell has its inner surface provided or coated with an active material forming one element, and a laterally perforated centrally located tubular opposing element of the battery open at the top and closed at the bottom forms a central well for the purpose of supplying liquid to the battery.

- 618,071. Motor Speed Controller. Charles A. Dresser, Chicago, Ill. Application filed July 28, 1898.

There is described the combination with a solenoid and the core thereof of a variable rheostat having the movable element thereof connected with the core, a switch for energizing the solenoid to move the core thereof, a lock for holding the core in any position to which the same is moved, a releasing magnet for releasing the lock and a switch for controlling the circuit through the releasing magnet.

NO. 618,137.

- 618,131. Bearing for Armature Shafts of Electric Motors. Herbert L. Parker and Charles R. Weston, St. Louis, Mo. Application filed July 9, 1898.

A suitable frame supports an annular laminated field magnet core. A shaft is fixed in the frame, a sleeve is mounted on the shaft and a laminated armature core is mounted on the sleeve.

- 618,137. Signal for Telephone Switchboards. Charles E. Scribner, Chicago, Ill. Application filed December 8, 1896.

The combination with a telephone line and means for producing current in the line while the telephone is in use of a relay magnet in the line, a local circuit including a supervisory signal, a normally open shunt about the signal controlled by the contact points of the relay, and a magnet winding of the relay included in the shunt.

- 618,144. Electrical Selective Apparatus. John S. Thompson, Chicago, Ill. Application filed October 10, 1898.

The arrangement includes a series of electrical devices, which are constructed so as to be actuated by successively smaller currents and also so as to require successively greater periods of time for actuation, and which are arranged and connected so as to cause their action to be controlled entirely by their respective characteristics, and means whereby, upon the actuation of any one of the devices, the relatively slower ones are in effect rendered inoperative.

- 618,162. Magnetic Closer for Electric Railways. William M. Brown, Johnstown, Pa. Application filed August 27, 1898.

A magnetic closer comprises the combination of a plurality of cores and energizing-coils for the same, a single continuous metallic pole piece provided with perforations and coated throughout with enamel connecting the cores, a series of disconnected metallic plates, and belts passing through the perforations and securing the plates against the under side of the coated pole-piece.

NO. 618,175.

- 618,163. Electric-motor Control. William M. Brown, Johnstown, Pa. Application filed October 7, 1898.

The method of accelerating two electric motors having a plurality of field windings consists in effecting small differences in acceleration by changing the field circuit of one motor without altering that of the other, larger differences by changing the field circuits of both motors and still larger differences by changing the circuit relations between the two motors.

- 618,175. Automatic Switch for Distribution of Electricity. John Hopkinson, London, England. Application filed April 18, 1895.

An automatic switch is provided with a range of contacts connecting with the several cells of a battery, a brush for cutting in or out the several cells, a motor for controlling the switch, an electromagnet for releasing the motor and an auxiliary switch in fixed relation and movable with the main switch connecting part of the battery with the magnet.

NO. 618,179.

- 618,179. Circuit Closer for Electric Railways. George H. McFeaters, Johnstown, Pa. Application filed October 10, 1898.

An electric contact box consists of a cover forming the contact portion of the box, a closed vessel below the same, a fixed electrode within the same and electrically connected to the cover, a movable electrode below the fixed electrode, an armature carrying the movable electrode, ledges formed in the vessel and normally supporting the armature, a continuous flexible ribbon connected to the armature, and a conductor in the bottom of the vessel in connection with the source of electrical supply and with the ribbon.

- 618,231. Trolley Stand. Daniel Moyer, Allentown, Pa. Application filed April 12, 1898.

A pivoted pole-socket is provided with a lever; a pivoted arm is mounted to oscillate independently of the

lever; a device is carried by the lever to engage the arm when the lever is moved in one direction, and tension means for retaining the arm in one position.

- 618,247. Secondary Battery. Henri Dolter, Lyons, France. Application filed April 23, 1898.

The flanged walls of non-conductive material are adapted to be put together to form closed chambers, metallic nipples traversing the walls and fixed therein, positive electrodes having stems attached to the nipples on one side of each wall, negative electrodes having stems attached to the same nipples on the other side of each wall, the electrodes lying in the spaces between the electrodes of the contrary sign of the adjacent walls respectively, and their stems having loose bearing at their unattached ends in recesses in the adjacent walls, two end walls having respectively positive and negative electrodes on one side only and terminals in electrical connection with the nipples of the end walls respectively.

- 618,328. Electrical Signal System. John P. Buchanan, Boston, Mass. Application filed June 10, 1893.

The combination of a track circuit including a polarized translating device, a neutral translating device and a current reverser, a signal controlled by the circuit, means for operating the current reverser, and another circuit controlling another signal and operated by the circuit including the translating devices.

- 618,380. Electric Switch. William J. Ferguson, Baltimore, Md. Application filed February 2, 1898.

NO. 618,247.

An electric switch is described having in combination a case with a stationary circular chamber, the terminals of an electric circuit exposed in the chamber, a segment-shaped non-conducting plate in the chamber pivoted so as to turn therein like a rotary key, and mercury in the stationary chamber which shall be shifted by turning the segment-shaped plate.

- 618,384. Automatic Weighing Machine. Francis H. Richards, Hartford, Conn. Application filed December 11, 1897.

One feature is an electric controlling circuit, an electric power circuit, an electromotor for rotating the valve actuator, brake-controlling means governed by the controlling circuit, an automatic circuit controller operative simultaneously with the brake and governing the power circuit, and automatic circuit-controlling means for the controlling circuit.

REISSUE.

- 11,710. Electrical Hammering Machine. Thomas C. Robinson, Boston, Mass. Application filed November 22, 1897. Original No. 566,537, dated August 25, 1896.

A portable tack-driving machine comprising a casing or holder having a tack-delivering throat, means supported by the casing for delivering tacks to the throat, a driver movable in the throat, suitable means for moving the driver in one direction, an electric motor for moving the driver in the opposite direction, and means under control of the operator for causing the motor to give a single stroke to the driver and then stop.

Western Electrician

EVERY SATURDAY.

Vol. XXIV.

CHICAGO, FEBRUARY 11, 1899.

No. 6

Reunion by Telephone.

At the very successful dinner of the Northwestern association of the alumni of the Massachusetts Institute of Technology, held in Chicago on the night of February 3d, a noteworthy use was made of the long-distance telephone to put the gentlemen present in communication with similar gatherings of alumni in Boston and St. Louis and with the laboratory of Thomas A. Edison at South Orange, N. J., and an orchestra in Milwaukee. The idea originated with the officers of the Chicago association and met with such an enthusiastic reception that it grew to dimensions not anticipated when it was first suggested. The affair attracted great attention from the press of the country and proved a very enjoyable feature of the several banquets.

The long-distance conversations were made possible, of course, by the co-operation of the Ameri-

but a tally showed that nine men were doing the cheering. The arrangements at Chicago were very simple. The University Club is but a few feet from the new Central exchange of the Chicago Telephone company, and a couple of extra wires carried from window to window made the connection. A trunk line connects the Central exchange with the long-distance exchange at Kedzie and Forty-seventh streets, and from that point the long-distance lines diverge from the city. In the banquet room there were about 60 receivers distributed on the tables, not enough to go around, but enough to give every man a chance to hear about half of the time. A portable desk set was placed at the head of the central table in front of President Ferguson, and close at hand was a stationary cabinet set, at which Mr. Andrews officiated to make the opening arrangements. The talking from Chicago was done

Massachusetts Institute of Technology alumni in Chicago to-night?

"I have been called upon to say a few words to the members of the Massachusetts Institute of Technology over a long-distance telephone, and I take great pleasure in greeting the Chicago members of the Massachusetts Institute of Technology alumni in Chicago to-night. It is due, in a great measure, to the efforts put forth in the telephone field of research by the graduates of the Massachusetts Institute of Technology that I am able to talk with the alumni members in Chicago to-night. I have in my employment a large number of graduates of various colleges and institutes, but the advancement and research in the electrical field is, in a great measure, due directly to the graduates of the Massachusetts Institute of Technology.

"I have not prepared any set speech or greeting,

REUNION BY TELEPHONE.—ALUMNI OF THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY LISTEN TO SPEECHES BY WIRE.—SCENE AT THE CHICAGO DINNER.

can Telephone and Telegraph company, which was readily obtained, as the chief engineer and many of the other officers and engineers of the company are graduates of the Institute in whose honor the dinners were given. Mr. F. A. Pickernell of New York, the chief engineer, made the general arrangements, while Mr. E. L. Andrews, the district inspector of the company in Chicago and also an alumnus of the college, supervised the details of preparation in the West. The officers of the Chicago association of alumni took an active interest in the affair. The retiring president, Mr. L. A. Ferguson of the Chicago Edison company, made an eastern trip a few days before the date set, had interviews with Mr. Edison and others interested, and did much for the success of the event.

In Boston, the home of the Institute, the alumni, to the number of about 150, dined at the Technology Club, 70 Newbury street; in Chicago 130 gentlemen sat down at the University Club, 116 Dearborn street; in St. Louis the enthusiasm was so great that it was at one time reported that 1,000 were present,

through these two transmitters, but, of course, everyone who had a receiver could hear. At Boston there were 20 receivers. The accompanying picture shows the members of the Chicago party, many of whom had the instruments at their ears when the photograph was taken.

During the dinner and afterward, except when cut off for conversation, the music of the orchestra at the Palm Garden, Milwaukee, was coming over the wire. The guests could pick up a receiver and listen to a few bars at almost any time. When the coffee-and-cigar period of the dinner was reached Mr. Andrews called up Mr. Edison's laboratory at South Orange, N. J., and asked for Mr. Edison. There was no trouble in getting the connection, and the voice of the speaker came over the wire clear and distinct. Mr. Edison's remarks were listened to with keen interest. Mr. Andrews made the opening salutation, "How do you do, Mr. Edison?" he asked. Mr. Edison's answer was as follows:

"Well, thank you. How are the members of the

and time being limited, I wish to convey my compliments to the alumni gathered in Chicago to-night. Good night, gentlemen."

An experienced stenographer was present at the Chicago dinner, and the foregoing is his verbatim report of Mr. Edison's words as heard through the telephone. The speaker and the shorthand reporter were 900 miles apart.

After Mr. Edison's little speech the alumni in Boston, Chicago and St. Louis received some instruction and a great deal of entertainment through the telephones. Speeches of Mayor Quincy, President Crafts of the Institute and President Miller of the General Alumni association were heard from Boston, not so clearly as Mr. Edison's, but fairly well. Cheers were exchanged; classmates chaffed each other, and "roasts" and "gags" relieved the set speeches, much as if all the "boys" had met in one place. President Crafts expressed the hope that at the next annual banquet the alumni would be able to see one another from afar by electricity as well as hear. Governor Roosevelt of New York was un-

able to talk over the telephone, as had been expected, owing to an imperative engagement that took him to a private residence in New York city where there was no instrument.

For three hours the banqueters "held the wire," and they enjoyed the privilege to the utmost. It was the largest and most successful "telephone reunion" ever attempted.

A cablegram was received by President Ferguson of the Chicago association just before the dinner. It was from George R. Mower, an alumnus at London, and read: "Electricity unites all. M. I. T. 'Rah, 'rah, 'rah!'" Stoughton Walker, a Michigan graduate who was unable to be present, sent a huge cluster of roses. The Chicago dinner was attended by many out-of-town alumni from various points in Minnesota, Wisconsin, Iowa, Illinois, Indiana, Michigan and Ohio.

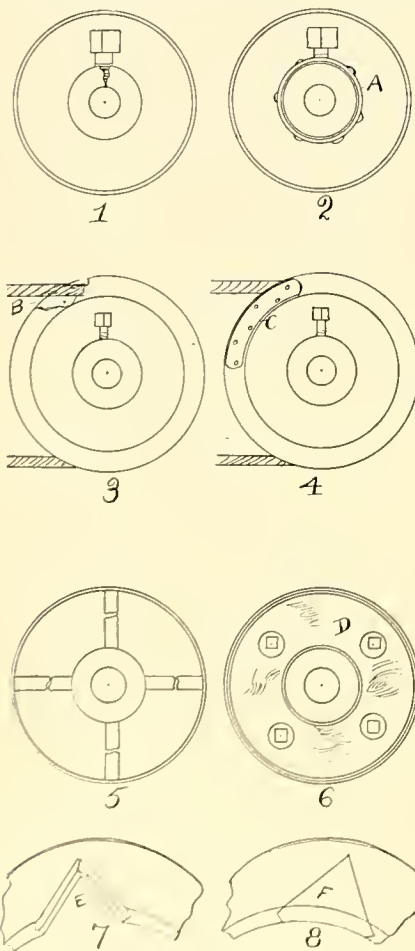

Mr. I. W. Litchfield acted as toastmaster at the Chicago dinner, and speeches were made by Dr. D. R. Dewey, who came to Chicago to represent the faculty, on "Old Technology;" Mr. Samuel Instill, president of the Chicago Edison company, on "The Technical Man in Business;" Professor B. D. Woodward, on "The Paris Exposition," and Ensign B. R. T. Collins, on "Familiar Scenes of Other Days." Ensign Collins' address was illustrated by fine stereopticon pictures of the new college building and scenes in the late war.

The annual election resulted as follows: President, I. W. Litchfield, '85; vice-president, E. L. Andrews, '04; secretary, E. M. Hagar, '03; members of the executive committee, Solomon Sturges, '87, C. M. Wilkes, '81, and L. D. Gardner, '08.

Repairing Electrical Machinery.

By B. F. FELS.

When the pressure of the set-screw in the belt pulley of a dynamo or motor is exerted severely, the hub often cracks under the strain. The pulley at once becomes loose, and further tightening of the set-screw only puts more tension on the fracture, causing the crack to extend perhaps the full width of the hub. If a new pulley is at hand, it is, of course, best to remove the broken one and substitute the new one. If no extra pulley is carried, the broken pulley can be made serviceable again

REPAIRING ELECTRICAL MACHINERY.

in less than an hour by forging a ring from flat iron, about one eighth of an inch thick, and as wide as the available space on the hub. This ring can be slipped over the hub, as at A, Fig. 2. The ring should be shrunk on, and then it will close up the crack shown in Fig. 1 at the base of the set-screw. Several rivets or small screws will do to secure the ring to the hub. The set-screw hole may be bored through this ring, and the same screw will do to secure the pulley to its shaft. If a piece of the

flange of a band pulley breaks off, as at B, Fig. 3, the edges of the fracture will cut and tear the band. The best way to repair this break is to replace the piece broken out, and secure it to its position by means of a side patch C, Fig. 4. This patch may be sheet metal of any kind and riveted both to the patch and to the flange of the wheel.

Not long since a heavy piece of machinery fell upon the driving pulley of an electrical machine and broke off all the spokes, as in Fig. 5. There was immediate need for the machine, and as no extra pulleys were on hand we made an effective repair in 30 minutes by simply turning out two pieces of hard pine board 1½ inches thick, to fit inside the rims and over the hub on either side, as in Fig. 6, in which D marks the wood disk of one side. Then we bored four bolt holes and inserted inch bolts and drew the wood disks together against the spokes. The pressure obtained by gradually screwing up the bolts caused the spokes to sink into the wood, bedding them very tight. This pulley has continued to run satisfactorily.

In another case a piece of the rim was chipped out of the pulley and the driving belt was badly cut by it. First, the broken place was shaped like a V by filing, as at E, Fig. 7, and then the edges were grooved so as to dovetail in a piece F, as in Fig. 8. A very tight fit was made, and then two small strips of metal were riveted across on the inner side of the rim to assure the inserted piece remaining in place.

When electrical machinery is coupled to a drive in such a way that there is quite a distance between the driving belt and the first hanger the tendency is to strain the nearest coupling, sometimes breaking it off next the shaft, as at A, Fig. 9, for example.

I recently had such a case. The connections were such that the broken stub of the shaft could not be removed from the coupling, and as no additional shafting of the proper size was kept on hand, the only way to repair the break for immediate service was to patch it up in some way. Fig. 10 shows how it was done without loss of time. This occurred in a power station that furnished light for some factories which ran at night, and it was necessary that the machinery be kept running. We secured another side of a coupling and keyed it to the shaft, as at B, Fig. 10, and then removed the bolts from the original coupling and substituted others long enough to reach through the old coupling and the new half, as shown. The bolts were tightened and the connection made perfectly tight in this manner.

CRUDE WAY TO FIX A BROKEN FAN BLADE.

As is known to electrical machinists, it is necessary to have a fan in fairly good balance to get good work. In one place where they were having trouble with a fan I noticed that one of the blades carried an excess of weight in the shape of some heavy strips of metal across a place where the blade had been patched (Fig. 11). These pieces were not only much too large, but were not well placed. They increased the weight of that blade and upset the balance of the fan, causing the whole thing to wobble and lose power. A better way was found by ripping off the weighty strips and substituting single beveled pieces across the fracture, as in Fig. 12. This reduced the weight and permitted the fan to turn evenly and without wobbling, though run at a higher speed. An artistic method for patching work of this description is presented in Fig. 13, in which specially cut pieces are made from sheet brass, aluminum or other metal, and riveted on by means of the cars, the rivets passing through and clinched.

RIVETING.

One of the troubles resulting from defective riveting is shown in Fig. 14. The rivets used were too long, and the machinist doubled some of them over, as at C, Fig. 14. These soon worked loose, and the fan rattled, resulting, finally, in the patching dropping out of position and ruining the fan.

Another poor way to do riveting is shown in Fig. 15, in which the rivet is too short, and the head at D is too small to prevent the rivet from pulling through. Many otherwise good riveting jobs are worthless owing to this defect. The writer recently saw a fan revolving with pieces of waste clinging to it. An examination showed that the person who had riveted the work had not stopped to shave off the rivets to proper length but had bent them over, as at E, Fig. 16. The fan was in use in a textile mill, and pieces of textile stuff caught upon these hooked rivets, not only making it harder for the fan to turn, but making it appear poorly cared for. The trouble was remedied by trimming off the hooks with a cold chisel and reheading the rivets. Some use the form of countersinking of rivets shown in Fig. 17. This is a good way in some respects, but will not do for the blades made of brittle metals, for the reason that the tendency of the taper to the rivets is to strain the metal in all directions, sometimes fracturing it. The simple rounded-head rivet is shown in Fig. 18, and may be used for general riveting purposes. A well-designed rivet which is countersunk and is generally effective for the kinds of work under consideration is shown in Fig. 19. The taper line extends only a part way through the plate, as indicated at the dotted line. The distribution of the strain is even, and the contracting power is provided for. I find that this process of riveting gives satisfaction.

Terminal and Transfer Station at Roxbury.

[From the Boston correspondent of the WESTERN ELECTRICIAN.]

Long life and vivid recollections of the event were wished by a large gathering of people to a pair of little folk who performed the unique ceremony of breaking ground in Roxbury for the terminal there of the elevated railway. The principals were the little son, aged four, and tiny daughter, aged two years and six months, of President William A. Gaston of the company. The latter wielded a diminutive pickaxe and the lad turned aside the first shovelful

REPAIRING ELECTRICAL MACHINERY.

of earth on the site of the prospective station, whereupon the crowd greeted them with a cheer.

The contract for the steel structure has been awarded to the Pennsylvania Steel Works, and the plans, as shown in the accompanying cut, provide for a unique terminal station and for the great loops which are to lead up to that station, both from the east and west. The station is to be located on the northerly side of Zeigler street, between Warren street and Washington street, Roxbury, and it will be about three stories high. It will be more than a mere elevated station. It will contain on the first and second floors waiting rooms and toilet rooms.

The building is to be entirely of steel. Cars will pass through the basement and the second story, and those from the west will come up the incline and land passengers for the elevated in the center of the building. East-bound passenger cars will be treated similarly. Two loops run out from the station for the accommodation of both east and west-bound passengers.

How Shall the Value of a Taxable Franchise Be Ascertained?

[From the Minneapolis correspondent of the WESTERN ELECTRICIAN.]

The Supreme Court of Minnesota will listen to argument as to the manner of arriving at the value of a franchise for taxation purposes at the April session. Cases against the Duluth Gas and Water company, Hartman General Electric company, West Duluth Water and Light company and the West Duluth Electric company bring the point up. The county authorities first ascertained the amount of bonds and estimated value of the stock as expressing the total value of the property. Then they concluded that whatever was not real estate or specific property must be the value of the franchise. The trial court held that the company had a right to offset the amount of the debt, but the city objected that the company might cover the whole value of the property by bonds, issued to its own members, and leave the value of the franchise less than nothing under that rule.

No Compensation for Cable Cutting.

It seems that, under the law of nations, there is no redress for a neutral telegraph company whose cable has been cut in the territory of an enemy as a military necessity.

Telegraph Cables in War.

[From the New York Sun.]

The discussion by Commander C. H. Stockton, in the proceeding of the United States Naval Institute, of the law concerning submarine telegraph cables in time of war, deals with a question comparatively new, and thus far meagerly treated by the publicists, although of great and growing importance.

Exactly two years to a day before Dewey fought his last battle the Paris agreement for the protection of submarine cables went into effect. That international agreement, made March 14, 1884, and ratified April 1, 1885, to go into effect on May 1, 1888, our country being a party to it, expressly declared, in Article XV., that its stipulations should "in no wise affect the liberty of action of belligerents."

During the war of 1870 between Germany and France, the war between Chile and Peru and the subsequent Chilian civil war, cables were cut in the high seas as well as in belligerent waters. And this was really the logical result of the rule that makes materials for constructing telegraphs, under certain circumstances, contraband of war.

On the other hand, a cable between two neutral ports, although one link in a chain reaching to the country of a belligerent, or from that country to its own colony, ought to be held inviolable.

At all events, one belligerent is not unreasonable in demanding that the neutral should not permit messages from the other belligerent passing through neutral territory, of a nature injurious or disadvantageous to himself.

When possible cable communication generally should, of course, be kept open for commercial or other innocent intercourse, and in many cases a government censorship can meet the circumstances and requirements of the war and prevent injury to a belligerent.

Examining Admiral Dewey's action in the light of these principles, we learn that the Manila-Hongkong cable was owned and controlled by English and Danish companies and subsidized by the Spanish government.

especially reluctant to do this, after having been subsidized by Spain. The admiral was right, however, as to all he did in this matter, as in others, and it would have added an interesting precedent if his offer to become a joint customer with the governor-general in sending dispatches for Washington and Madrid respectively had been accepted.

Drainage Canal Power Project.

There has been much talk of the possibility of utilizing the fall of the water in the new Chicago drainage canal, which connects the Chicago River with the Illinois River, and hence Lake Michigan with the Mississippi River, for power to be electrically transmitted to Chicago.

TERMINAL AND TRANSFER STATION AT ROXBURY.—SOUTH END ELEVATION.

committee of the trustees it was decided that Messrs. Boldenweck, Carter and Smyth should prepare a letter asking for proposals to be sent out by Chief Engineer Randolph.

Lyman E. Cooley, on the proposition to develop water power, said: "I am opposed first and last to anything that will be in the way of a ship canal, such as the sanitary canal was intended to be and such as it must be if faith is to be kept with the people of the Desplaines and Illinois valleys."

Trustee B. A. Eckert said he did not understand that the water-power plan would interfere with the navigability of the channel. He continued: "I would be opposed to anything that would prevent

the channel from being a navigable stream, but I believe that the idea is to make it both a good waterway and the producer of power. This being the case, adverse criticism fails for want of proper foundation."

Somerville's Woes.

The Brunswick Traction company, which recently absorbed the link of the New York and Philadelphia Traction company between Somerville, N. J., and Bound Brook, has raised a storm of indignation among Somerville citizens as a result of its attempt to introduce innovations in the management of the property.

Work on the job of changing the cable railway in San Pablo avenue, Oakland, Cal., to an electric line has been begun.

Municipal Supervision Proposed for Illinois Electric-light Companies.

A bill has been introduced in both houses of the Illinois Legislature which, if passed and approved by the governor, will have an immediate and important effect on the business of the gas and electric light companies of the state.

A bill for an act to regulate the business of furnishing gas and electricity for light, heat and power, and to provide for municipal supervision of such business.

Section 1. Be it enacted by the people of the state, That any person or corporation engaged in the business of furnishing gas or electricity for the purpose of lighting, heating or generating power is hereby declared to be engaged in a public business, and all corporations so engaged are hereby declared to be public corporations.

Section 2. In every city and village in this state in which there is any person or corporation engaged in the business of furnishing gas or electricity for the purpose of lighting, heating or generating power there shall be appointed and elected one electrical commissioner in the manner hereinafter provided.

Section 3. In every village there shall be one gas and electrical commissioner, who shall be appointed by the president of the Board of Trustees, and his appointment be approved by the Board of Trustees. In every city having a population of more than 100 there shall be three gas and electrical commissioners, who shall be appointed by the mayor, and their appointment be approved by the Common Council.

Section 4. Such commissioners shall be appointed as soon as they take effect, and their term of office shall expire on July 1, 1901, or as soon as their successors are appointed and qualify thereafter the term of such commissioners shall be two years.

Section 5. Such commissioners shall have power during the daytime to enter upon the property of any person or corporation engaged in the business described in Sec. 1 hereof to examine, inspect or test any and all machinery or appliances used in said business, and to examine and inspect all documents, papers, books and records used in the conduct of said business. They shall have power, upon reasonable notice, to enter upon any property on which gas or electricity is used to examine and test any and all machinery and appliances used in supplying such gas or electricity.

Section 6. It shall be the duty of said commissioners First—To see that all laws of the state relative to the business described in Sec. 1 hereof are complied with. If they shall find that there has been or is a violation of law punishable by fine or imprisonment, they shall forthwith report such fact to the state's attorney of the county, whose duty it shall be to diligently prosecute the offending party.

Second—To see that all municipal laws and ordinances relative to such business have been complied with and to prosecute violations of the same.

Third—To see that any and all terms, provisions and conditions of any license granted by any municipality to any such person or corporation are fully complied with. If they shall find that any such license has been violated they shall forthwith report such fact to the attorney-general, whose duty it shall be to forthwith begin and diligently prosecute proceedings to forfeit such license.

Fourth—If any complaint is made to such commissioners that any person or corporation engaged in such business is using a

TERMINAL AND TRANSFER STATION AT ROXBURY.—EAST SIDE ELEVATION.

meter or instrument for measuring the gas or electricity furnished which is not accurate, it shall be the duty of such commissioners forthwith to inspect such meter and instrument and cause the same to be corrected, and the decision of such commissioners that such meter or instrument is inaccurate shall be conclusive on the person or corporation using the same. If such meter or instrument is found to be inaccurate the commissioners shall notify the person or corporation using the same of that fact and the amount of the expense of examining the same, and it shall be the duty of said commissioners, in case such person or corporation does not promptly correct such meter or instrument, to have such correction made and notify the person or corporation using the same of the amount of the expense of making such correction. The person or corporation using such a defective or inaccurate meter or instrument shall promptly pay to the municipality in which such business is conducted the expense of such examination and correction, and in case of failure to do so said commissioners shall compel such payment, by suit in the name of the municipality in any court having jurisdiction, of the amount involved.

Section 7. Every municipality in which such commissioners are appointed shall by ordinance provide for the carrying out of the provisions of this act, and shall have power by ordinance to establish all reasonable rules and regulations for the conduct of such business as is described in Sec. 1 hereof, and provide penalties for non-compliance with the same. Such ordinance shall provide for furnishing such commissioners with clerks, and such assistants as may be deemed necessary, and such salaries and expenses thus fixed by ordinance shall be payable out of the municipal treasury.

Section 8. Such commissioners shall receive as compensation a salary to be fixed by ordinance, not less than \$200 and not more than \$2,000 per annum each.

Section 9. No person or corporation furnishing gas to others shall, during any one month, charge for such gas at a rate which exceeds 25 cents for the first 1,000 cubic feet used, and a rate which exceeds 6 cents a thousand cubic feet for all gas used in excess of the first 1,000 cubic feet.

Section 10. It shall be the duty of the commissioners to be appointed under this act in their respective municipalities to carefully examine into the methods used by those furnishing gas for the purpose of lighting, heating or generating electric power, and to ascertain the cost of generating, distributing and supplying it to others, and to report to the secretary of state their opinion of what would be reasonable charges to be made for supplying such electricity, allowing a fair profit to the person supplying the same. Such report shall be filed with the secretary of state during the month of December. A D. Ross, an Illinoisan, states the facts upon which the commission is based and an investigation which the commissioners may have which would cause the General Assembly in regulating the charges to be paid for supplying such electricity.

Latest Progress in the Application of Storage Batteries.

By JOSEPH APPLETON.

PART II.

It used to be customary to refer to European practice, to show what could be done with storage batteries, and even now I believe that some people think that European batteries and methods are superior to those in this country. In connection with this idea there is one thing that I particularly wish to emphasize, and that is the difference between American and European conditions.

In Europe storage batteries are not subjected to the severe work they have to stand here. They are looked upon more as a reserve, and are not expected to discharge at their maximum rate every day and perhaps twice on some days.

As an example of this, I will tell you what one of the Tudor company experts from Germany said, when he was over here last spring. He was attending the National Electric Light convention at Chicago, and one of the features of interest at that time was the large storage-battery plant which the Chicago Edison had recently installed. During one afternoon, while the convention was being held, a very heavy thunderstorm came on, and the battery was called upon suddenly for its maximum rate of discharge, and the full rated capacity was taken out. The maximum rating of this battery was a complete discharge in one hour. Our German friend thought that was doing pretty well, but when we told him that this storage battery was installed under contract which allowed the battery to be discharged at this rate every day during the winter, he was horrified and said:

"You must not let them work the battery in that way; tell them they must hold it as a reserve." We told him that if we did that we should not be able to do any business, and that we simply had to meet these conditions, and could do so without any difficulty. This instance will show why batteries are maintained at a lower figure in Europe than here, and why it has been customary to refer to the behavior of the battery in Europe.

It is a fact that we have now in this country many storage-battery installations which surpass anything in Europe both in size and method of operation.

The methods of applying storage batteries in connection with electrical engineering work are so numerous that it would be impossible to deal with them all this evening, so I have selected a few for consideration as showing clearly the great flexibility of the storage battery as an adjunct to any scheme contemplating the generation and transmission of electrical energy. We will first consider the storage-battery installation of the Chicago Edison company.

This installation is particularly interesting, as being the largest individual battery ever installed for a lighting station. The peak of the load during the winter, as will be seen from the accompanying curve, occurs about 4:45 p. m. and lasts from 45 minutes to one hour and a half.¹

One of the end-cell switches, which are located near the battery and are operated from the distributing-switchboard room by small electric motors, is herewith shown. It is so arranged that when it is desired to cut in or out any number of cells, it is simply necessary for the switchboard attendant to press a little button, which will operate the motor and move the switch over from one contact to the next, the switch stopping automatically when it is in a proper position on any contact. Indicators are provided on the switchboard to show the attendant how many cells are in circuit on each switch.

By discharging this battery at two or three different pressures it is possible to load the feeders up to their full capacity, a thing which was impossible when the distribution was made from one pressure.

The battery is used, in addition to carrying the peak of the load, for maintaining a constant pressure on the system, and relieves the switchboard attendants at the generating station from constantly watching and regulating the pressure, the battery taking care of any fluctuations automatically.

In a lighting and power station such as this, the maximum load occurs for only a very short period during the year. In one station I know of 50 per cent. of their investment in generating plant and underground conductors is only used for 154 hours during the year. This statement may seem astonishing, but will be found to apply to many such stations. The application of storage batteries to such stations can be made in two ways, viz., at the main power house or in sub-stations.

When batteries are placed in sub-stations they will relieve the generating plants of the maximum load and also effect a large saving in the underground system of conductors, as, at the time of maximum load, the conductors between the main generating station and the sub-stations are relieved

of that portion of the load which is carried by the batteries and distributed from the sub-stations.

The use of large water powers for generating stations from which electrical energy is transmitted and distributed over extended areas is growing. In connection with such installations storage batteries play a very important part.

The power from such a plant is largely sold for manufacturing purposes, and is charged for at so much per horse power per annum, the power being available 24 hours per day, while the mills and factories using this power do not usually run for more than 10 hours per day. Therefore a man who requires a maximum of 100 horse power for 10 hours a day, or 1,000 horse power hours, really has to pay for 2,400 horse power hours, while he uses only 1,000, and probably less, for the average rarely, if ever, exceeds 70 per cent. of the maximum.

With a storage battery capable of supplying 50 horse power for 10 hours, or 500 horse power hours, he need only pay for one-half the amount, or 50 horse power for 24 hours, as the battery will furnish the remainder, and can be charged during the 14 hours he is not using the power. In addition to this, the battery will take care of any fluctuation above the average, and enable the man to buy the average amount of power he requires, instead of the maximum.

Such an installation has been made by the Buffalo Street Railway company. Before describing this installation I would like to mention the different methods of installing storage batteries in connec-

tioner in series with the battery, which is so designed as to increase its voltage in proportion to the increase of load, thereby enabling it to take its proper share and keep the load on the generators constant.

The battery discharges during the morning and evening peak, and is charged between times and also at night from the Niagara Falls power.

By the aid of the battery the company is enabled to make very much more use of the Niagara Falls power. Before it installed the battery it was only able to shut down its steam plant from 11:30 p. m. until 5 a. m. during which time the rotary converters carried the entire load, which averaged about 600 horse power, while it was paying for 2,000 horse power. With the aid of the battery it is enabled to shut down its steam plant from 7 p. m. to 7 a. m., and about 18 hours on Sunday. In addition to this it is enabled to utilize very much more of the Niagara power.

An illustration of the second method of using storage batteries for railroad work is seen in the case of the battery installation of the South Side Elevated company of Chicago. This company operates an elevated railroad about nine miles long, all its trains being equipped with the Sprague multiple-unit system. The power house is located approximately at the center, with two storage batteries near the ends of the line, connected directly across the system without a booster. The charge and discharge of these batteries is controlled by the drop over the feeders from the power house to the bat-

End-cell Switch.

Chicago Edison Load Diagram.

LATEST PROGRESS IN THE APPLICATION OF STORAGE BATTERIES.

tion with railway plants. These may be divided into two classes.

First—Where the battery is installed at the power house to take the care of the peak of the load and the fluctuation of the generators.

Second—Where the battery is installed at the end of a long feeder to keep up the pressure at that point, and to obviate the necessity of sending the maximum amount of current over the long feeders from the power house.

We will consider an installation of each kind and the respective methods of operation.

The Buffalo Street Railway company's plant is of the first class and is especially interesting, inasmuch as it is operated in connection with the Niagara Falls power plant. The company operates practically all the cars within the city limits and has a steam plant capable of delivering 7,000 electrical horse power, in addition to which it takes 2,000 horse power from the Niagara Falls power, this current being transmitted in the form of high-tension alternating current from the Niagara Falls to the power house, and being then transformed by rotary converters to the ordinary 550-volt direct current.

When a storage battery is installed at the power house and is connected directly in parallel with the generators on the bus-bars, as in this plant, some means have to be provided for regulating the voltage of the battery to suit the generators. As you know, railroad generators are over-compounded, the voltage rising as the load increases, while with the storage battery the reverse is the case, the voltage decreasing as the discharge increases. In order to make the battery work properly in parallel with generators of this type and take the fluctuations of the load, keeping the generators constantly loaded, some means of compounding the battery has to be adopted. This is done by using a compound wound

batteries, this drop varying, according to the load on the system, from 10 to 80 volts. When the load on the system is light the drop in the feeders is small, and there is voltage enough to charge the battery. When the load becomes heavy the drop on the feeders is increased; this consequently causes the batteries to discharge into the line. The method of operating is entirely automatic, the batteries discharging at times of heavy loads and charging at time of light load, thereby keeping the load on the generating station practically constant.

One of the most interesting and important storage-battery installations recently made is that in connection with the underground trolley system of the Metropolitan Street Railway company of New York. The system covers a large area, and the company has utilized storage batteries in sub-stations. Two are now in operation, one at the foot of West Twenty-third street and the other at Thirty-second street and Fourth avenue.

The battery consists of 540 cells, each containing 51 plates, 15 inches square. The dimensions of the cells are four feet by 21 inches by 24 inches. The battery is divided into two sections, 270 cells in each, which are operated in parallel. This is done to keep the sizes of the cells within practical limits and to enable them to be more easily inspected and cared for. The capacity of the complete battery is 8,000 ampere-hours, with a one-hour rate of 4,000 amperes. The function of this battery is to take care of a portion of the morning and evening peaks, and to take up the fluctuations of load at all times. The method of operation is as follows:

Sufficient cells are provided so that the voltage of the battery just balances the average voltage of the system; consequently, when the battery is connected to it, it acts as an equalizer and does not charge or discharge except as the fluctuations occur. When the battery discharges on a peak and is being

1. The method of operation and a description of the storage battery plant were published in the WESTERN ELECTRICIAN, June 6, 1897.

charged during the hours of light load a booster is connected in series with it to regulate the amount of a charge and discharge. The output of the booster and, consequently, the charge and discharge of the battery are controlled by varying the strength and polarity of the shunt field. This is done by a special form of switch which makes the operation very simple. The daily work of the battery is about as follows:

- From 7 to 9 a. m. it discharges on the peak.
- From 9 to 12 it floats on the system as an equalizer.
- From 12 to 3 or 4 p. m. it is charging.
- From 4 p. m. to 8 p. m. it discharges on the peak.
- From 8 to 12 (midnight) it is floating on the system.
- After midnight the battery is given its principal charge, this being continued until the battery is full.

We will now consider the use of storage batteries in connection with isolated plants in large office buildings and stores using electric elevators. The modern office building, with its 15 or 20 stories, together with the demand for quick elevator service, has greatly increased the use of high-speed electric elevators. The nature of the work the elevator has to perform and the fact that the power required to start it is from two to three times the hoisting power cause the elevator load to be an extremely fluctuating one, no matter how carefully the operation is watched.

The Commercial Cable building in New York is an excellent example of what can be done with the operation of an electric plant of this description. The building is wired for about 3,500 16 candle power lamps, 240 volts, and has six screw-type high-speed Sprague elevators. The generating plant consists of two 300 horse power water-tube boilers, two 225 horse power engines directly connected with two 150-kilowatt generators, and the storage battery consists of 120 cells, each containing 27 plates, 15 1/2 inches by 15 1/2 inches. The capacity of this battery is as follows:

- At 260 amperes, 1,620 ampere-hours.
- 520 amperes, 1,040 ampere-hours.
- 650 amperes, for the one-hour rate.

The function of this battery is to take care of the fluctuating elevator load between 9 a. m. and 9 p. m., when the plant is running, and at night to supply the whole current required for lighting, and the occasional trips of one elevator.

Before the battery was installed it was found necessary to run one generator for the lighting circuit and one for the elevator circuit, the fluctuations of the latter causing the lamps to be unsteady if both were run from the same machine. The method of operation is as follows:

The elevator circuit is connected directly across the terminals of the battery, and the battery is being constantly charged by means of a constant-current booster, which boosts the current from the lighting generators. By a special winding on this booster the amount of current which it allows to pass from the generator to the battery and elevators is maintained practically constant.

For example, with a fluctuation of 600 amperes in the elevator circuit, the load on the generators is increased by about 50 amperes, or less than 10 per cent., this amount having no effect on the steady-

Capacity Curve for a 29 H Cell.

Education of Electrical Apprentices and Journeymen.

By ARTHUR A. HAMERSCHLAG.

The world has watched with startled eyes the rapid and far-reaching strides the young electrical industry has made and the numerous fields in which electricity has entered. From a total investment of a few thousand dollars it has, to-day, grown to such proportions, that it would be impossible to compute with accuracy the value of the industries in which electricity plays a prominent part. It is almost as difficult to assimilate the figures of value in their proper proportion as it is to define the widening field they have developed for skilled electrical labor. From an industry that gave employment to a few hundred men, in a decade it has expanded until it demands the services of tens of thousands of men, devoting their services exclusively to this work.

It has also demanded men of intelligence of a comparatively high order, well equipped with mechanical skill. That we have made such astonishing progress is remarkable, but not nearly so wonderful as that we have found, in the past, men, sufficiently large in number, capable of developing, manufacturing and devising electrical products on a marketable basis.

Should another generation find a proportional increase in the demands for electrical products and operations (and the prospects are good for such an increase), shall we be equally fortunate in finding the skilled men necessary? Is it just as certain these men will be found?

The birth of an industry is not the most potent factor in determining its development. It needs the nourishment and care of those engaged therein to make it grow to maturity. With its growth it must develop and mature the individuals upon whom it most depends. Merit alone will not enable it to be perpetuated and put upon a successful basis, unless it is capable of placing its raw material in the hands of skilled workers upon whom absolute dependence can be placed.

It is to accomplish this most essential factor of future success, that I believe it time that we give a thought to meeting the coming demand by edu-

now undergoing the same trial, and tribulations regarding the educational means that other trades and professions have undergone, except that the problem in the electrical industry, owing to its rapid growth, is of vastly greater urgency. Because of this growth along scientific and mechanical lines, improvements succeed improvements so rapidly that what was considered good practice yesterday becomes obsolete and defective to-morrow. The men or mechanics who but a few years ago handled cleats and moldings in wiring are to-day a kedd to use iron pipe and conduit, requiring totally different tools, materials and methods. And where do these men acquire the efficiency and facility for this work? They acquire it in the crudest and most uneconomical method possible, by experimentally using their employers' material and time. These improvements certainly result in the loss of journeymen's efficiency, and result in "rule-of-thumb" mechanics. This type of mechanic is to be found in all trades, and sometimes he is exceptionally skilled in his work. This causes a tendency on the part of the employers to desire more men like him, especially when he is placed side by side with the so-called theoretical mechanic who may lack skill. The fallacy of this reasoning is at once apparent when the "rule-of-thumb" mechanics come in competition with the well-grounded and educated mechanics who possess an equal amount of skill. Then the efficiency of the latter is so much greater that there can be no comparison.

Oftentimes we meet men with such a vast preponderance of theoretical training that it has removed the inherent practical skill, and this type of journeyman is almost useless when judged from the working standpoint. This latter condition is not a rare one, by any means, and just a few words concerning it may be appropriate.

A glance over a list of educational institutions causes us to feel proud of our achievements. In almost every settlement or city throughout the country some school, college or university is supported upon as lavish a scale as one could desire. Endless seem the opportunities which the young American has to acquire the learning and higher education which are prized and cherished in the

Battery Plant in Commercial Cable Building.

LATEST PROGRESS IN THE APPLICATION OF STORAGE BATTERIES.

ness of the lamps. The amount of the current boosted in this way is the average elevator load for the time the plant is running, plus the amount of current required to charge the battery after it has carried the previous night's entire load.

The curves show graphically the operation of this plant. The lower curve shows the fluctuating load on the battery, which varies from 350 amperes discharge to 300 charge. Of course, when there is no elevator load, which occasionally happens (all the elevators standing still), the entire amount of current passed through the booster is used for charging the battery. When a heavy elevator load comes on this boosted current is diverted from charging the battery into the elevator circuit, the battery discharging in parallel with it, as may be required. In this installation the booster is passing about 250 amperes; thus when the battery was discharging at 350 amperes the total elevator load was 350 plus 250, or 600 amperes. The second curve shows the variation of load on the generator at the same time. This, you will notice, reaches the maximum of 70 amperes, while the voltage on the lamps is maintained practically constant, the curve being almost a straight line. Such an application is an ideal one for a storage battery, as it not only decreases the size of the generating plant required, but enables the generating plant, when it is running, to be operated at a steady and economical load, instead of a fluctuating one.

cating the apprentices and journeymen to that point which will make it possible for our boldest conceptions in electrotechnics to be skillfully and economically solved.

The old world has given us excellent mechanics through its apprenticeship system; unfortunately, even in those countries, that system is dying out. This country has never had a well-developed apprenticeship system, and to-day it has almost entirely disappeared because of the peculiar restrictions placed thereon by the unions and associations and the centralization of the work under single financial heads. Men are paid by the hour or day, and employees shift from place as the demand for their services varies from busy to dull times. In fact, to-day the apprenticeship system is almost impossible for financial and other reasons, so we must devise some other means of educating the youth who wishes to enter the electrical field.

It is true that three or four of the largest electrical concerns do apprentice young men, but the number is comparatively small, and it requires considerable influence to secure such indentures. The number of applicants is, however, out of all proportion to the number that can be accommodated, and such openings are almost entirely out of reach of the vast majority because of isolated locations.

Electrical work, as a trade and as a profession, is

world to-day. We have schools for every conceivable purpose; we have colleges and universities for every profession, and we have technical institutions almost unmatched in efficiency. But we have only a very few practical trade schools, and for the education of electrical mechanics fewer still. Parents persist in sending their children, regardless of their inherent qualities, to the colleges and universities to master a profession, without giving a thought to the field in which their future labors must be conducted and without considering the compensation they will receive. And what is the result? There can be only one general reply.

After years of study and much money spent in acquiring the profession and an early association with children of wealth and refinement, the born mechanic is lost in the attempt to produce a genius or a great engineer. The field for mediocre engineers is just as narrow and confined as it is for the mediocre artist; the compensation for his labor is equally curtailed and, as a result, when the young man is thrown on his own resources he must suffer that genteel poverty which his training in refined circles has bound him to. He can no longer take pride in the work of his hands, and his brain power being not above the average, he suffers acutely, and eventually becomes neither an excellent mechanic nor a fair engineer.

Each year the colleges and universities are set

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the entire contents of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, \$3.00 for a full year of 52 numbers; in clubs of four or more, \$2.50, with free extra copy for eight subscribers; foreign countries, \$5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—the only general electrical paper published in the West—thoroughly covers a territory exclusively its own. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers desiring western trade will appreciate the UNEQUALLED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

ment of the Chicago Telephone company upon this subject have been changed materially, judging from recent developments. The company has proposed a new schedule to apply to small users, but thus far no relief has been offered business men, and it is not to be expected that the concessions thus far made will be accepted. The people of Chicago can thank the Illinois Telephone and Telegraph company for the meager concessions that have already been offered by the old company, for no serious attempt is made to conceal the fact that the fear of competition prompted the proposition which the Chicago City Council is now considering.

"Chicago, October 17th."

This is the decision of the executive committee of the American Street Railway association upon the question of naming the time and place for holding the seventeenth annual convention and exhibition of that organization. The particulars of the meeting of the officers of the association in Chicago this week, the details of the arrangements for the exhibition and the list of subjects to be considered at the convention are presented on another page. They will be interesting to street-railway managers in all parts of the country and to manufacturers of street-railway machinery and supplies.

To those living in Chicago, however, the decision is of unusual importance. The gathering in October will be representative of the industry, and the local street-railway interests must make the meeting the most important event in the history of the association.

Chicago has the facilities and the men to do it, and by united effort this year's convention can be made a record-breaker.

The practice of building street-railway lines on Sunday to avoid injunctions has provoked much unfavorable comment, and now the Legislature of New York has turned its attention to the subject, with the view of enacting a measure to prevent further desecration of Sunday. Senator Brown has introduced a bill which provides that an injunction order may be granted by a justice of the Supreme Court on Sunday when, in his judgment, it is necessary to prevent irremediable injury, and a summons, with or without a complaint, may be served on that day if so ordered by the justice. One of the earliest cases to attract general attention to the loop afforded by the existing law was when Deacon Richardson, 20 years ago, in order to avoid the opposition of citizens and an injunction order, constructed on Sunday the Seventh avenue portion of the Atlantic avenue railroad in Brooklyn. The latest notable example in Chicago was the attempt of the General Electric Railway company to lay tracks in Custom-house place and Plymouth place, which resulted in a disgraceful row between the conflicting interests. No doubt a measure to prevent a repetition of such scenes would prove popular in Illinois, and, for that matter, throughout the country.

Like many other well-meaning but ill-advised municipal reformers, Sam Jones, Toledo's talkative mayor, is ridiculously inconsistent. In a recent discourse at Boston he advocated "Municipal Ownership of Everything in Sight," declaring that municipalities could manage enterprises for the public weal better than corporations or individuals. This is a favorite topic with the Toledo reformer and he has talked a great deal upon it, but he does not seem to gain additional information upon the subject, and as his ideas were hazy, to say the least, when he entered public life, it may be assumed that he has propagated considerable misinformation in his lecturing tours. Of course, if he had remained at home and attended strictly to his business this deplorable condition would have been avoided, and he might have learned that municipal management under the most favorable conditions was not an ideal policy. But he had absolutely no practical experience, and since his elevation to the office of mayor of Toledo he has been gallivanting about the country, neglecting the city's business and stirring up trouble wherever he went by his extravagant denunciation of quasi-public enterprises. No wonder he advocates municipal ownership; private enter-

prises would not stand such nonsense in an employe. Sam and his political pals would have to earn their salaries if they worked for any other concern. Such public office-holders really furnish an insurmountable obstacle to the advancement of municipal ownership, as conservative men will have nothing to do with a movement dominated by blatherskites.

The absence of precedents and the lack of an international tribunal for the settlement of such questions have made it difficult to predict with any degree of certainty the course which the United States would pursue in the adjustment of the claims of telegraph companies whose submarine cables were cut by the American forces during the late war with Spain. These corporations are English concerns, and their demands for reimbursement for actual financial loss sustained in repairing and replacing the cables cut by order of the American commanders at Manila and Santiago have been formally presented through the representatives of the British government. The subject has been carefully investigated by the law department at Washington, and Attorney-general Griggs has made a report in which he holds that the Eastern Extension, Australasia and China Telegraph company has no ground for a claim to indemnity because of the cutting of the cable at Manila in May last by Admiral Dewey, and upon the same grounds it may be safely assumed that the legal right of the Cuba Submarine Telegraph company to damages will also be rejected. The legal points involved are thus disposed of by Attorney-general Griggs:

Property of a neutral, permanently situated within the territory of an enemy, is, from its situation alone, liable to damage from the operations of war, which this cutting is conceded to have been, and no compensation is due for such damage. It is said that the whole utility of the cable is destroyed for many miles by a cutting within territorial waters; in other words, that the damage extends outside of territorial waters. But is this true? Undoubtedly, the interruption to traffic over it does or may extend many miles, but the interruption of the traffic is not the basis of the claim. When repaired, it was repaired, as it had been cut, within territorial waters, and was then the same as before the injury. It was possible to take up the outer end and operate the cable to Hongkong from the time it was cut; and it was the sealing of the cable at Hongkong and not the cutting that prevented this from being done. It seems to me, therefore, that the injury by cutting can properly be regarded as in no way withdrawn from the rule by reason of the supposed extension beyond territorial waters, even if an extension of the injury could, in any case, alter the rights of the helligerent.

The obvious difference between a cutting within and a cutting without the territorial water, however it may be troublesome to the owner, goes to the foundation of the rule authorizing the destruction of property because it is within the territory. It is equally troublesome to the owner of any property to have it injured or destroyed in or out of the enemy's country. This, however, does not affect the helligerent's rights with regard to his property within the enemy's country. To say that the American admiral desired to use the cable himself, as well as to prevent the Spanish government from using it, is but to attribute to him a motive in addition to one which justified his act. This can in no way diminish the right to cut the cable, nor, seeing that he did not use it, can it give rise to any different rule as to compensation.

When the question of compensation was first suggested, the representatives of the British government did not encourage the management of the companies interested in the hope that their claims would be allowed; in fact, there seems to have been a general understanding that a legal claim could be established only with great difficulty, if at all, and that the corporations would have to rely upon the generosity of the American government to secure any compensation whatever. In cable circles it seems to be the general belief that if the companies mentioned are left undisturbed in the possession of their franchises, and if the concessions they had obtained from the Spanish government were recognized by the Americans, they would have no reason to complain.

However, with the establishment and recognition of the position of the United States in this matter, and providing the government can do so consistently and without establishing a precedent, it might be well to consider the matter of reimbursing the telegraph companies for actual damages sustained. It would be a graceful and generous act on the part of the government and would satisfy the sense of justice of the American people.

We consider the present telephone controversy in Chicago to be the earnest consideration of those who have persistently maintained that the Bell interests were too firmly entrenched in the large cities to admit of the possibility of an independent movement disturbing them. The views of the manage-

American Street Railway Association

The eighteenth annual meeting of the American Street Railway Association will be held in Chicago on October 17th and will be continued four days. This decision was reached at a meeting of the executive committee at the Auditorium Annex on Monday. The following-named gentlemen were present at the meeting: C. S. Sergeant, Boston; Walton H. Holmes, Kansas City; T. C. Pennington, Chicago; George A. Yuille, Chicago; T. J. Jones, Memphis; Ira A. McCormack, Brooklyn, and John J. Beggs, Milwaukee. Messrs. Moore and Woodruff were unable to be present owing to imperative business engagements that demanded their attention.

The first action of the committee was to receive the report of Mr. Yuille on the subject of accommodations, which was outlined in the *WESTERN ELECTRICIAN* last week. The committee visited Tattersall's and held a conference with the owners of the building, which resulted in adopting the report of Mr. Yuille. The building has 50,000 square feet of unobstructed floor space that can be utilized for exhibition purposes; its location is favorable for the handling of freight, street-railway accommodations are excellent and ample power for the operation of machinery exhibits will be available. At first it was proposed to secure current from the Chicago City Railway company's plant, but as a special order from the council would be necessary, and as the underwriters would probably object to the use of current from street-railway circuits in this manner, it was deemed advisable to ask the Chicago Edison company to make arrangements for the event.

It is anticipated that there will be a fine collection of exhibits, and in order to give the delegates ample opportunity to inspect them, there will be no meeting on Friday and no entertainment provided by the local committee. To ensure a general attendance of members it was also decided to hold the banquet on Friday evening and to install the new officers at that time.

The following-named subjects were selected for discussion at the meetings of the association, and prominent members of the association will be invited to prepare papers upon them:

- "Maintenance of Car Equipment."
- "Modern Street-railway Shops; Their Design, Machinery and Shop-practice."
- "Train Service and its Practical Application."
- "Construction and Maintenance of Street-railway Tracks."
- "Investments in Street Railways; How Can They Be Made Secure and Remunerative?"

Another important subject that will command the attention of the convention is the report of the committee on rules for employes. This document was not ready at the Boston meeting and the committee was continued. During the year it concluded its labor, printed its report, and copies were distributed among members by Secretary Pennington, with the request that its provisions be carefully studied with a view to discussing them at this year's meeting, when the report will come up for adoption.

The local street-railway companies were represented at the meetings and in the conferences upon the arrangements for the convention and exhibition. On Monday evening the visitors were entertained by representatives of the local companies at a dinner at the Union club, a fashionable North Side organization. After dinner they visited Powers' Theater and saw William H. Crane in "The Head of the Family." On Tuesday, at the completion of the business session, the committee was entertained by John M. Roach, who took the visitors over the West Chicago Street Railroad system in his private car. Luncheon was served in the car and an opportunity was afforded the visitors to examine the Western avenue power station and other plants of the Yerkes system.

The decision to hold the meeting in Chicago will be enthusiastically received by the manufacturing interests. The first application for space was filed by Maurice Coster of Chicago, representing the Westinghouse Electric and Manufacturing company.

An organization of the local street-railway interests was effected immediately upon the announcement of the decision of the executive committee. George A. Yuille, second vice-president and assistant general manager of the West Chicago Street Railroad company, was selected as chairman of the temporary organization. Another meeting will be held soon to select members of local committees and take up the work of preparation for the October gathering.

Governor Tanner Wants Lower Fares.

Discussing street-railway legislation in the state of Illinois, Governor Tanner said recently to a reporter: "I believe in the idea of a supervising surface-line commission, which shall have the power of passing upon matters pertaining to city street-railway companies. But that commission should be the Railroad and Warehouse body. This is the proper body for overseeing and regulating all transportation companies as applies to city control of the corporation's franchises and rates of fare. The state commission, too, would not be subject to the annual or biennial changes which a local body would suffer. I shall consider no bill which does not provide for reduced rates of fare. In fact, I shall sign no bill which does not make this concession to the traveling public."

Submarine Telegraphy.

By DR. A. E. KENNELLY.

The history of submarine-cable telegraphy is replete with interest, not only to the student of electromagnetics, but also to the student of sociology. Its annals indicate the immense amount of labor which has had to be expended by a large number of men in the best years of their lives' work, in developing conjointly the knowledge and experience which now enable us to set geographical time and space at defiance.

Practically all of this work has been accomplished during the latter half of the century which is now about to close. The first submarine cable was stretched timidly across the Straits of Dover about the year 1850. It consisted of but a single copper wire, insulated with gutta-percha. It had no mechanical protection of any kind. Although the cable lasted but a few hours, being destroyed either by the violence of the elements or the hook of an unkind fisherman, nevertheless it demonstrated its electrical capabilities, and paved the way for greater successes in the years to come.

It was not long before shallow-water cables spread themselves around the shores of the Mediterranean, and in 1859 the first cable bridged the depths of the Atlantic. This was, indeed, a triumph of electrical engineering at that time, but the triumph was short-lived, since the cable died a natural death in a few weeks' time. It was replaced, however, by a far better cable in 1866, the experience of the earlier trial having come to fruition, and since that time Europe and America have never been beyond speaking distance.

At the present time there are some 150,000 miles of cable laid throughout the world, and a fleet of more than 30 telegraph ships is employed to minister to their needs. Although this length of cable would be sufficient to girdle the earth some six times, yet the actual girdle is incomplete at present at the Pacific Ocean, but it is now confidently expected that ere long this gap will be completed by a cable from the western coast of America to China or Japan.

The amount of the capital which has been expended in the enterprise of cable laying will be evident from the fact that cable costs, roughly, about \$1,000 per mile.

Enormous improvements have taken place in the speed of signaling or telegraphing through cables since the ocean was first spanned, a great deal in this direction being due to the inventive skill of Lord Kelvin. The mirror-galvanometer instrument, which is so valuable an adjunct in the electrical laboratory, has been yet more valuable to the electrical fraternity in the operating room, as a commercial signaling instrument, while the siphon recorder of later date has caught the fitful flickerings of the beams of light, and has left their record traced upon a moving band of paper.

There is no difficulty in laying a cable anywhere, but there is a considerable difficulty in laying a cable in such a manner as to minimize the risk of its fracture after being laid. It is a matter of experience that wherever a cable rests upon a rock it will break, and its rupture is only a question of attrition and time. Those who build upon rock, so far as cables are concerned, build to their destruction, while only those who build upon sand can expect dividends. The course on which a cable is to be laid should be thoroughly investigated beforehand by a ship which makes a zig-zag path over the course and sounds at frequent intervals, so as to insure the provision of a smooth and soft bed on which the cable shall be laid to rest, otherwise its slumbers will be interrupted by the rude shocks of rupture.

The size of a cable, and therefore, to some extent, its cost per mile, varies with the depth of water and the nature of the bottom. In deep water a cable is made slender and light; in shallow water it is made of relatively great weight and diameter, with large protecting steel wires to resist attrition.

The speed of signaling does not become any serious consideration until a cable is several hundreds of miles in length. In other words, rapid speed of hand signaling can be obtained over almost any kind of practical submarine cable up to a length of several hundred miles, but after a length of, say, 500 miles has been passed, it is necessary to employ delicate apparatus, and with long cables it is necessary to employ a comparatively large size of copper wire or strand conductor and insulating gutta-percha envelope.

There is scarcely any series of engineering operations which has a greater fascination or possesses more romantic interest than submarine telegraphy, in the picking up or repairing of cables. It is governed largely by time and tide and weather, and its fortunes are governed by a great variety of circumstances; nevertheless, cables have been successfully repaired in the deepest water to which they have yet been committed. The expense of repairs in deep water, say in two miles of water, is naturally much greater, as a rule, than the expense of repairs effected in shallow water, while in some cases very shallow-water repairs may be effected in a small boat or sailing yacht, at an expense that is relatively trivial.

1. Abstract of lectures delivered before the Department of Electrical Engineering, McGill University, Montreal.

Operation of the Storage-battery Road

An increase in receipts of 56 per cent. is shown by the annual report of the Chicago Electric Traction company for 1898, as compared with 1897. This is the company that operates the Englewood and Chicago storage-battery road, and the directors are much encouraged. A 16-mile single-track extension from Blue Island to Harvey will be built in the spring and also about two miles of extensions and connecting lines on the north end of the track system. No addition to the power-house equipment will be needed, but Manager Gilbert will require about 10 new open cars, with trucks arranged for storage-battery operation.

Some interesting figures are included in the report. The receipts per car-day were \$16.82; expense per car-day, \$14.64; receipts per car-mile, 10 cents; expense per car-mile, 8.7 cents. The power-house record shows a total of 1,227,228 kilowatt-hours and a total operating and maintenance cost per kilowatt-hour of \$0.0097.

The cost of operating and maintaining the batteries was \$4,624.82. The number of car-miles run was 609,767, so that the battery expense per car-mile was \$0.00758. This battery expense was a trifle less than nine per cent. of the total cost of operating and maintaining the road.

The experience of the company shows that the average mileage for each car-battery of 72 cells is 23,000 miles. When the limit is reached the positive plates only need to be renewed, as the test of service shows that one set of negative plates will outlast three sets of positive plates. With new batteries the cars are run 22 miles on one charge, but after the cells have been in use a short time the battery is changed both on the up and down trips, making the run 11 miles for one charge. However, the cars have made as high as 40 miles on one battery charge. The schedule speed, including stops, is 12 miles an hour, but the cars are capable of a speed of 30 miles an hour.

During January the record shows 1.65 kilowatt-hours at the power-house switchboard for each car-mile of service. This is about the average for the year.

The officers of the company are: President, Isaac L. Rice, New York; vice-president, Samuel Shipley, Philadelphia; treasurer, J. S. Bache, New York; secretary, E. R. Gilbert, Chicago.

Pacific Cable Project.

In a recent interview in San Francisco, John A. Strymser, president of the Pacific Cable company, is reported to have expressed himself as encouraged to hope that the cable will be maintained and operated by the United States government. He is of the opinion that private capital will not take the risk of governmental control.

Mr. Strymser is also of the opinion that no American cable can land in the Philippines or on the Asiatic coast without the consent of English companies, some of which run until 1904. These are vested rights, and Mr. Strymser thinks the United States government cannot abrogate the contracts without paying heavy compensation therefor, and that the only way for the American cable to gain access to Asiatic territory will be through the liberal backing of the United States government. Such a cable is a military necessity, and the United States should have absolute control and be independent of foreign companies.

The Japanese government, Mr. Strymser says, is willing to go into the proposition, under certain conditions regarding the cost of such a cable. Mr. Strymser said that \$20,000,000 would not cover the cost, for the reason that a duplicate cable must be laid; that if only one cable is laid it would surely go wrong at some period, and that the duplicate cable would then come in for use. Such a cable would require a reserve fund of \$300,000 a year for a renewal of the cable, twenty years being the average life of such a cable.

Four Notable Issues.

[From the *Southern Industrial and Electrician*, 1898.]

With the early January editions of the *Practitioner* of Chattanooga, the *Age of Steel* of St. Louis, the *Manufacturers' Record* of Baltimore and the *WESTERN ELECTRICIAN* of Chicago before us, we are so completely overwhelmed with valuable information and statistics concerning almost every branch of southern industry, especially with reference to the achievements of 1898, that we cannot begin to give our readers the benefit of it, for it would take every page of our regular edition of 1899 to begin to cover the ground. We desire, however, to give testimony to the value of these great journals, which deal with the commercial and industrial side of the almost entirely.

Measures and Men.

From the *New York Sun*.

A bill to cut the claws of monopoly has been introduced in the Illinois House of Representatives. It provides that "cities may acquire, construct, own and operate all public utilities such as street-car, telephone and telegraph lines, gas plants and electric-light plants." The Hon. Carter Harrison introduced the bill, and it will probably be put into the next platform of the Chicago Democracy. Statesmen like the Hon. Bath House John and the Hon. Hinky Dink look forward hopefully to the task of operating public utilities.

DEVELOPMENT OF THE TELEPHONE FIELD.

Self-restoring Drops.¹

By HERBERT LAWS WEBB.

The British Postoffice system, which is fully described in Preece and Stubbs' "Manual of Telephony," has never been adopted in this country, and the first application of automatic work in American practice was made at the exchange end of the system. By the use of what is generally called a self-restoring drop, steps 4 and 11 in the original series of operations are got rid of, step 4 being accomplished by step 3, and step 11 by either step 9 or 10. Self-restoring drops are either mechanically or electrically operated. In mechanically operated self-restoring drops the line drop is so placed that the shutter falls over the aperture of the answering jack, and the plug, in entering the jack, pushes back the shutter, which engages with the armature lever and is held in position to be released by the next call. A clearing-out drop is made mechanically self-restoring by placing it in such a position that the connecting plug on falling back into its socket on the cord-shelf actuates a lever that resets the shutter of the drop. Both of these are simple and ingenious devices.

Electrical self-restoring drops are quite another matter, and achieve various results that are not attained by mechanically restored drops. The self-restoring drop is an essential part of what is generally known as the "bridging" board, in which the spring jacks are connected in multiple instead of in series, as in the older forms of multiple board. In the chapter on multiple switchboards it was explained that the number of contacts in a large switchboard and the "open leg" formed by the test wire were serious disadvantages. In the bridging board the circuit is continuous throughout the board without contacts at the jacks; the test wire is an entirely separate circuit from the talking circuit, and the battery which furnishes the test energizes at the same time the magnet of the restoring coil of the drop. The result of this arrangement of circuits is a complete cure of the electrical difficulties in the series board arising from the numerous

New England Telephone News.

[From the Boston correspondent of the WESTERN ELECTRICIAN.]

A new telephone company has been organized in Lynn by local capitalists, and 110 subscribers are now said to be awaiting instruments. Six prominent business men have subscribed \$15,000 toward the enterprise, and are said to be ready to join with others to increase the amount. They are awaiting the laying of wires and placing of instruments by the big Boston telephone concern, recently incorporated as the Massachusetts Telephone company, and will probably co-operate with the new concern.

President Glidden of the Michigan Telephone company has returned to Lowell with his associates, after spending two weeks in the territory of his latest acquisition. During his trip President Glidden says that all the principal exchanges were visited and the long-distance routes inspected, and it was determined to recommend the construction of 1,500 miles of long-distance pole lines and 20,000 miles of copper wire. Mr. Glidden says:

The press of Michigan received with great favor the proposed extensions of the long-distance system throughout the state. The telephone business in Michigan is 100 per cent. under the Pacific coast development. General Sabin of San Francisco has kindly loaned the Michigan company his chief contract agent, Mr. Charles E. Nestor, who during the last three weeks has been inaugurating a system of canvass in the northwestern territory of the Erie, where he has secured in Minneapolis and St. Paul alone 500 subscribers. General Sabin was informed of Mr. Nestor's success and replied: "You have Nestor, but we have his methods; thirty new contracts in San Francisco yesterday, and still the growth of the Pacific goes on, notwithstanding it is already double that of all companies except the Erie." Mr. Nestor will shake up Detroit, which now has 5,000 subscribers. Mr. Nestor will not leave the field until he has raised the number to 12,000.

The instrument statement of the American Bell Telephone company for the month ended January 20th breaks the record once more. The business for December was the heaviest previously recorded, with a net output of 27,771 instruments, but the latest record breaker shows a net output of 31,829. Following is the summary, with comparisons.

Month ended January 20.	1899.	1898.	1897.
Gross output.....	46,548	25,861	14,437
Returned.....	14,719	10,041	6,401
Net output.....	31,829	15,820	8,036

At the annual meeting of the Southern New England Telephone company on January 31st, the report submitted showed gross earnings of \$644,003, expenses amounting to \$491,475, dividends paid to the amount of \$150,660, and a surplus of \$1,868. There was an increase for the year of 1,213 stations, and all but 14 towns, out of a total of 168 in Connecticut are now reached by the company, which has an aggregate of 10,588 stations. During the year just closed about \$90,000 was spent on underground work, it was stated. Nearly all of the old five per cent. bonds of the company, overdue, on which the company held an option at 103, have been refunded into new five per cent. bonds for a long period.

Proposed Legislation.

In the Illinois Legislature last week, Representative James Hackett of the First district introduced a low-rate "common-carrier" telephone bill, and he claims that the retail druggists of Chicago are ready to indorse the measure. The bill, which was introduced in the Senate also, by Senator Daniel Curley of the Fourth district, declares that all telephone lines in the state are common carriers, and compels a telephone company to permit a competing line to make connections with its whole system. The bill fixes the maximum rate for the rent of a telephone in Chicago at five dollars a month for business and two dollars a month for resident service.

In the New York Legislature Senator Marshall has introduced a bill reducing telephone rates in all parts of the state. It provides that six months after passage, unless companies can show to officers that rates are inadequate, the rates shall be in cities of 1,000,000 and over not more than \$125 yearly; in cities of less than 1,000,000 and over 500,000, \$85; in cities of less than 500,000 and more than 100,000, \$48; in cities of less than 100,000 and more than 20,000, \$36; in cities of less than 20,000 and more than 8,000, \$30; in cities of less than 8,000, \$27. These figures are to be based on the census of 1890. Charges at pay stations are not to exceed 10 cents for five minutes and five cents for each additional five minutes. No yearly subscriber shall have to pay at a pay station unless sending in excess of 50 messages a year. A card is to be issued for him and his employes for business purposes.

Telephone Strike Averted.

The staff of telephone operators employed in the exchange of a large telephone company came very nearly declaring a strike recently, according to the local correspondent of the WESTERN ELECTRICIAN. The trouble was caused by a rumor that the manager was to be asked to retire in order that a former manager might be reinstated. In that case the girls concluded that the chief operator would also be asked to resign and that a former chief operator, who was not too popular, would take her place. The 36 oldest operators were appointed a committee to prepare an ultimatum for the officers of the company, and they did not shirk their duty even if their jobs were at stake. They told the directors that if the

present manager was asked to resign a wholesale bunch of resignations would accompany his. The committee then presented a petition, setting forth their views, signed by every operator except one, who happened to be related to the former manager. The directors told the committee that perhaps such a change was not anticipated. But that was not an acceptable answer.

"Unless we are assured that the present manager will remain," said one of the girls, "before two o'clock, we will give the signal."

The signal was to be four rings of the big bell in the office. Before the hour specified the officers had returned a favorable answer, and the threatened strike was averted. A collection was taken up, amounting to \$15, and a beautiful floral piece, consisting mainly of American Beauty roses, was presented to the manager. During the presentation business was suspended.

Result of Competition.

The Michigan Telephone company is making determined efforts to regain its prestige in Detroit and throughout the state, and the advertising columns of the newspapers are freely used. One of these display advertisements is reproduced herewith from a Detroit paper, and it plainly indicates the desperate character of the struggle that is now occupying telephone men in that section. Another conspicuous announcement, which appeared in last Sunday's Detroit papers, occupied a half-page and contained a diagram showing the long-distance connections which the company "pledged" itself to establish as well as those in operation to-day.

The corporation claims to be "one of the largest

Michigan Telephone Company
FREE RENTAL

You can have a Long Distance Telephone (latest pattern) at your home for five cents per day.
For Particulars call MICHIGAN TELEPHONE 189.

RESULT OF COMPETITION.

home industries of Michigan," and appeals to the people of the state for patronage and support on this account. If this claim has no more foundation than some others made by the company, it cannot have much effect upon the community. One of its claims is worth repeating here:

A large majority of its stockholders have been and are still residents of the state; probably more than a controlling interest in its securities are held in the state.

This will be news indeed to well-informed telephone men and to the stockholders themselves, as it has not been generally understood that the Lowell capitalists represented by Mr. Glidden had acquired legal residence in Michigan. The only other explanation that suggests itself is that "probably more than a controlling interest in its securities are held in the state" as collateral.

NEW COMPANIES.

The Edmonds Co-operative company has been incorporated at Edmonds, Wash., with a capital stock of \$10,000, to construct a telephone line from Edmonds to Seattle.

The People's Telephone company of New Orleans, capital \$600,000, has elected W. L. Holmes of Detroit, Mich., president; P. Curtis, general manager; H. P. Walmsley, treasurer, and H. C. Gage, secretary.

The Little Valley Telephone company, to operate a telephone system in Cattaraugus County, New York, has been incorporated at Albany with a capital of \$500. The directors are S. W. Bedient, S. S. Bedient, F. G. Barnes, W. C. Parker, H. J. Crissey, T. Champlin and M. J. Rich.

The Tradesman reports the following named newcomers in the telephone field: Long-distance Telegraph and Telephone company of Texas, or-

A jack, JK line springs, B contact for sleeve of plug, F contact for tip of plug, N opening of jack, entering which plug restores drop shutter E. I line drop coil, D spring normally in contact with J, which cuts out coil when plug is inserted, breaking contact between J and D; H armature, pivoted at C. Drop E engages with tip of H when drops in normal position. 1 and 2 are binding screws for holding jack and drop in position on the framework of the board.

SELF-RESTORING DROPS.—COMBINED JACK AND SELF-RESTORING DROP.

contacts at the jacks and from the unbalancing effect of the test-wire. The electrical self-restoring drop consists of two electromagnets; one of these responds to the current sent over the subscriber's line, and the other is included in the test circuit—which is closed as soon as a plug is inserted in the answering jack—and attracts and holds the shutter let fall by the action of the line magnet. The clearing-out drop is of the same pattern, the restoring magnet being energized by a battery brought into play by an extra contact on the listening key. The electrical self-restoring drops, not requiring to be touched after having been properly adjusted, are placed in the upper part of the switchboard, thus leaving the lower part free for jacks. The result is to make the working part of the board more compact and the jacks more accessible to the operators. This is an advantage not gained by the use of mechanically restored drops, which have to be in a position to be operated by the movements of the plugs.

In the cut is shown a combined spring-jack and self-restoring drop, designed and manufactured by the Western Telephone Construction company of Chicago. When the drop is operated the shutter falls in front of the opening through which the plug must enter the jack. On inserting the plug the shutter is pushed upward and engages with the tip of the armature lever H, which holds it in position. The plug, entering the jack at N, goes home and makes contact with sleeve at B and tip at F, cutting out the drop by pressing J outward, and so breaking the contact between D, connected to the coil, and J, the line spring. This arrangement is simple and compact. It can easily be removed for repairs by loosening the nuts at 1 and 2. One hundred complete jacks and drops can be placed in a space 13 1/2 inches by 16 inches.

Other types of mechanically self-restoring line drops necessarily employ the feature of replacement of the drop shutter by the plug. In some types the drop coil is not cut out and the plug and shutter are so arranged that the shutter is free to be thrown again while the plug is in the jack. The line drop then serves also as a clearing-out drop, and when the plug is withdrawn in response to a clearing-out word it again trips the shutter and restores it to its normal position.

ganized by C. H. Brown of Waco and others; Monroe and Charlotte (N. C.) Telephone company, William S. Lee and others; Independent Telephone company of Austin, Texas, J. B. Earl and others; People's Telephone company of Dillon, S. C., E. L. Moore and others; Electrical Construction company of Waco, Texas, S. Sawyer and others; Florence (S. C.) and Allison Telephone company, R. C. Commander and others.

TELEPHONY ABROAD.

A trunk telephone line has been opened between Paris and Brest, and it will probably be extended to Cherbourg. A line to Luxembourg, via Longwy and Nancy, is projected.

President Forbes of the National Telephone company of England reiterates the statement that the inefficiency of the company's service is due to the policy of the government, which has hampered the corporation's efforts to improve and extend the system. In a communication to the *London Times*, President Forbes signifies his willingness to co-operate in every way toward securing better service, even to the extent of giving the government control of the plant. He says that the management is and has always been "only too anxious to co-operate with the Postoffice in effecting improvements and development in the business; and if, as it seems to be possible, the drift of public opinion should result in the desire to transfer the telephone business to the state, it would feel it to be its duty, upon reasonable and fair terms, loyally to co-operate in bringing about the change."

In connection with the present French telephone service it is contemplated to establish a system by means of which any subscriber or non-subscriber will be enabled to make an appointment with any other individual (who need not be a telephone subscriber), to be in attendance at the latter's instrument or at a call office at a stated time. These appointment messages will be transmitted for five cents within a distance of 15 miles, and for greater distances a higher charge will be made, but not exceeding 10 cents. The message making the appointment will be delivered at the recipient's house, just as a telegram. A similar system for English trunk service was suggested by Campbell Swinton in the discussion on Mr. Gavey's telephone paper at the Institution in 1896.

London telephone service is still under consideration of the London County Council. The highways committee reports having had under consideration a letter from the city corporation, forwarding a resolution to the effect that application be made for a license to establish a telephone service in conjunction with the London County Council and other local authorities within the London telephone area. The corporation asked the council to appoint six representatives to attend a conference at the Guildhall to consider the subject, and, if possible, to make the necessary arrangements. The highways committee recommended and it was determined to appoint representatives to be present at the conference.

The London County Council a year ago accepted an offer of the Postoffice to provide plug-holes for portable telephones on fire-alarm posts, with a view to enabling the apparatus to be utilized by firemen for the transmission of telephonic messages, but judging from the statements of the *London Electrical Engineer*, little actual progress has been made in taking advantage of this innovation. The chief officer of the fire brigade has obtained provisional protection for an improved appliance, and the apparatus has for some months been tried, with very satisfactory results, with a fire-alarm connected with the chief station. The officials of the Postoffice are also quite satisfied with the result of the experiments, and the chief officer now suggests that an extended trial should be made with the fire alarms connected with 10 stations. The number of fire alarms connected or ordered to be connected with the 10 stations in question is 166, but it is thought that five portable telephones per station will be sufficient. The committee recommends that the council should accept the offer of the Postoffice to fit fire-alarm posts with microphones and plug-holes for telephones, and to provide plug-holes in the corresponding indicators in the fire stations, for an annual rent of £31 15s. per 50 posts; that, in the first instance, the acceptance be limited to fire alarms in connection with the chief station and the Hampstead, Hammersmith, Holloway, Hackney, Stoke Newington, Shooter's Hill, Lewisham, Wandsworth and Tooting stations. The council will purchase the portable telephones direct.

Public interest in the telephone question in England is sufficiently pronounced to secure publication in the *Fortnightly Review* of an article by Mr. A. H. Hastie, entitled "The Telephone Tangle and the Way to Untie It." The writer displays a personal leaning toward the National company. Mr. Hastie is not favorably disposed toward the Postoffice, and he wants the telephone service to be placed under a separate and independent department whose duty it will be, among other things, to enable any gentleman shooting in the north of Scotland to have his London letters read out to him every morning, via the trunk telephone wires. This feature of Mr. Hastie's "ideal system" does not commend itself to the average English "sporting gentleman, nor of a vast number of other persons who desire to be let alone in their privacy and their recreation." This is a characteristic English view of the subject.

First Result of Competition in Chicago.

In spite of their public declarations that competition in telephone service in Chicago would be impracticable, the officers of the Chicago Telephone company have given unmistakable evidence of their interest in the proposition of the Illinois Telephone and Telegraph company to establish a rival exchange system in this city. As a result of the threatened competition the company is proposing a readjustment of rates and basis of compensation to the city, with an extension of the free telephone service to many departments of the city government and greatly reduced rates for others. Even under the present conditions, however, the company cannot bring itself to make a voluntary concession gracefully, and it makes a condition of the granting of the concessions mentioned the extension of the life of its franchise 20 years, giving it 30 years to enjoy the privileges ensured under it.

At the meeting of the City Council on Monday evening, the extension ordinance of the Chicago Telephone company was presented and referred to a committee, and the amended ordinance of the Illinois Telephone and Telegraph company was favorably reported by the committee, and under the rules action was postponed until next week. Consideration of these ordinances was the principal feature of the evening's session.

The principal features of the old company's proposed franchise may be summarized as follows:

Extends the original 20-year franchise granted to the company on January 4, 1889, for 20 years, making it expire in 1909.

Offers the city \$50,000 a year cash compensation, payable in quarterly installments, in lieu of the 3 per cent. of gross receipts provided for in its present ordinance, which, however, amounted to \$50,000 last year.

Increases the number of free telephones furnished to the city, so that the value under the present rates would aggregate \$15,000 a year instead of \$2,000, as at present.

Allows the city free use of the company's telephone poles and increases the amount of space allowed the city to its conduits by 25 per cent.

Makes reduction in telephone rates to small users according to the following schedule: Forty dollars a year, four parties on a line, with 400 calls, residence only; 50 a year, two parties on a line, with 600 calls, residence and business use; 90 a year for special line, with 900 calls, residence and business use. Additional calls at graded rates in proportion to number used, reaching as low as three cents a call for largest number.

As amended the ordinance of the Illinois company meets the criticism expressed by the mayor on the original franchise which he vetoed. The life of the franchise is cut down from 50 to 35 years, a compromise between the company's petition and the mayor's standard, and compensation for the city is provided in the following manner:

After 15 years the company shall pay the city for 10 years 3 per cent. of its gross receipts; then, for five years it shall pay 5 per cent., and for the remaining five years 7 per cent.

Commenting upon the movement for independent service and the action of the old corporation, Mayor Harrison is reported to have said:

It shows at least what competition will do. How much of a reduction in rates it offers I cannot say, as I have not had a chance to look into that phase of the matter, but if the mere introduction of a rival ordinance will cause even this concession from the present company, the question arises, what would the passage of such an ordinance do?

The Illinois company's ordinance as amended seems to be a fair proposition, and even allowing, after it has been established, that one company only lives and the other has to go to the wall, rates will come down at least during the telephone war, and when they are once down they can never be put up again.

President Clark of the Chicago Telephone company is quoted in an interview as follows:

It not only gives the city more compensation than it received under the present franchise, but it allows for much cheaper telephones for a considerable number of users. There is a large number of people who want a telephone for occasional use, but do not use it constantly, as does the large business man. They would be glad to put in instruments could they be furnished them at a price commensurate with the service rendered, and that is what this ordinance proposes to do. It will allow the person having only occasional use for a telephone to put one in at a less price than the man who uses his constantly.

It will be noticed that no provision is made for a lower rate for general telephone service. The changes proposed would really benefit the company, as it would increase the "residence" lists materially, which to-day is the weakest point in the service, and it would strengthen the company with merchants, as the latter would find the telephone a necessary adjunct to their business.

Telephone Patent Litigation.

Judge Allen, at Springfield, Ill., on February 4th, announced his decision in the three suits of the Western Electric company against the Citizens' Mutual Telephone company of Decatur, Ill., in favor of complainant. The inventions involved were controlled by the following-named patents:

No. 202,495, granted April 16, 1878, to Thomas A. Watson, for Improvements in Electric Telegraphy or Telephone Call Signal Apparatus.

No. 303,774, granted August 10, 1884, to Horace H. Eldred, assignor to Western Electric company, for Improvements in Telephone Exchange System and Apparatus.

No. 320,058, granted November 10, 1885, to Charles E. Scribner, assignor to Western Electric company, for Improvements in Operator's Apparatus for Telephone Exchanges.

These suits were commenced in 1894, and arguments on final hearing were had in May, 1897.

Since the Watson patent No. 202,495 has expired, complainant is entitled to an accounting only on that invention. In case of the Eldred patent and the Scribner patent, complainant received an injunction as well as an accounting. Claims 1, 2 and 16 only of the Eldred patent were involved.

Fair Dealing Demanded.

(From the Chicago Tribune.)

Ten years ago the council granted the Chicago Telephone company the right to construct and operate its line for a period of 20 years. The company agreed to pay the city three per cent. of its gross earnings and to furnish it a certain number of telephones free of charge. Although the old grant has 10 years yet to run, the company has applied to the council for a new grant running 20 years from date. In return it proposes to give the city \$50,000 a year instead of three per cent. of the gross earnings to give it the free use of telephone conduits and poles, which, it estimates, will be worth nearly \$50,000 a year to the city, and to reduce telephone rates to meet the needs of small users.

Should the city accept this proposition, or should it demand greater compensation from a corporation which could not carry on its business if not allowed the use of city streets and alley to build conduits for its wires or erect poles to run them on? The corporation in question is no small, struggling concern. Its gross earnings last year were two millions. Its net earnings were \$600,000. It was able to pay 12 per cent. dividends to stockholders and carry over \$100,000 to surplus account. The gross earnings having been two millions, it paid the city about \$60,000. This fact is not brought out clearly in the company's statement, which is that "payments have averaged about \$33,000 a year." They fell below that figure in 1890. They were much above it in 1898. The statement of the company, in view of these facts, is not candid or complete.

The city is asked to accept \$50,000 instead of a percentage which amounts now to \$60,000. That would be progressing backward. The company has dealt disingenuously with the council and the public in seeking to hide the fact that it is asking the city to surrender \$10,000 and more a year. It prejudices its case seriously when it sets out with a misleading statement. A corporation which thinks it worth while to ask for privileges of special and peculiar value at the moment when it sees itself threatened by competition should hold back no facts and should suppress nothing.

Let the telephone company pay the city 10 per cent. of its gross earnings for the next 20 years as an equivalent for the use of the streets and alleys, without which it could not do business. Then \$200,000 a year will go into the city treasury to begin with. A small fraction of that sum will be used to pay for telephone service the city now gets free. The remainder will be expended for public purposes. But it may be argued that if the city, instead of surrendering its three per cent., demands 10 per cent., the company cannot or will not make the proposed reduction in rates. That reduction will benefit some careful, economical telephone users. It will not necessarily reduce materially the gross earnings of the company. The city cannot, however, in justice to all its citizens, accept inadequate compensation for privileges granted in order that a few men may get the use of telephones on better terms. If the company charges too much the Legislature should regulate and reduce charges which are notoriously too high.

The ordinance which the telephone company has presented should not pass. If it will not pay 10 per cent. let the city insist on its three per cent. until 1909. Then it can demand and will get that larger proportion of the gross earnings it should receive. The company is anxious to get an extension. It fears competition. Then let it come forward prepared to deal honestly and fairly with the city. When it does that it will be met in a spirit of fairness and moderation.

EXTENSIONS AND IMPROVEMENTS.

Williams, Ariz., will soon have a telephone system.

The Sunset Telephone company is at work putting in suburban telephone at ranchers' homes near Redondo, Cal.

The Twin City Telephone company of Benton Harbor, Mich., has increased its capitalization from \$25,000 to \$50,000.

The Oregon Telephone and Telegraph company is putting up a new telephone line between Portland and Astoria, Ore. The distance is 110 miles.

The Seattle (Wash.) *Times* announces that arrangements have been perfected to extend the telephone system from Snohomish to Monroe, a distance of seven miles.

A franchise has been granted to the Spirit Lake Transportation and Improvement company to construct a telephone line along the public highway from Rathdrum, Idaho, to Spirit Lake.

The stranded Red Star Line ocean steamer Rhyndland, off Lewes, Delaware, has been connected by telephone with the company's offices in New York through the government coast line, and the operations have been directed from headquarters.

Frank Cole of Grass Valley, Cal., announces that he will build a telephone line in the spring from the Mountain House, which he is conducting, to Forest City. As soon as weather is favorable the Sunset Telephone company will send a man from San Francisco to look over the route from Grass Valley to Moore's Flat, and if the line is built Dr. Brooks of Forest City will have a line constructed from that place to Downville.

New General Electric Motor.

To meet a demand for larger direct-current stationary motors as compact and efficient as motors of the type "C. A.," which range from one-eighth horse power to two horse power, the General Electric company has perfected a line of motors known as the type "C. E." These embody all the features of excellence characteristic of other General Electric motors, as well as the latest ideas in motor construction, and the design is such that it may readily be modified to meet special requirements.

The motor frame, which is also the magnet yoke, is of soft steel of high permeability. It is cast in the form of a hollow cylinder, with projecting feet on the outside and seats for the pole-pieces on the inside. The short magnetic circuit which this arrangement gives and the use of the best material contribute to make the new motor efficient in all its capacities. To obviate eddy-current losses, the pole-pieces are built up of iron laminations and are secured to the yoke by through bolts with nuts on the outside. The field coils are held in place by the extended lips of the pole-pieces, and as the face of the pole-pieces covers a large surface of the armature without increasing the size of the field coils, the efficiency of the motor is materially augmented.

The armature is built up of iron laminations assembled directly on the shaft. To prevent eddy currents, each sheet is japped on both sides, and good ventilation to core and winding is provided by air ducts. The laminations are clamped solidly between two cast-iron spiders, extended at each end as flanges to support the coils.

The armature coils of copper wire, form-wound, insulated and tested, are placed in the core slots, the ends of the coils lying along the flanges. This arrangement constitutes the "cylindrical" armature winding. As it provides a large ventilating surface for the conductors and reduces the length of wire necessary with consequent decreased resistance, it conduces to cool running and high efficiency, as well as to ease of removal and replacement of any coil. The insulation employed is that used with all General Electric railway motors, and is tough, impervious to moisture and practically indestructible. The coils are securely held in a rigid position, and injury to the insulation from sliding or vibration is impossible.

The commutator and brush-holders are of the types used with the company's railway motors. The armature leads are soldered into slots in the segments, and, being short, are not liable to become displaced and, by abrading the insulation, cause a short-circuit. The brush-holders are of cast-brass, arranged for radial carbon brushes, which slide in finished ways and are pressed against the commutator by independent pressure fingers, giving uniform pressure throughout the life of the brush. There is no sparking, and change from no load to full load requires no shifting of the brushes. The

and more expensive machine to give the same output. The most economical speed for a given duty is determined by a careful consideration of the relative advantages to be derived from a slow speed and the increase in cost required to obtain it. In the motors under consideration the four-pole construction has been adopted for all sizes down to and including the three horse power, slow-speed motor. By the adoption of this construction, the use of a steel magnet yoke and the use of end shields to support the bearings, an economy of material is effected which permits, without sacrifice of strength or stability, of the construction of mo-

LA ROCHE IDEAL ALTERNATOR.

tors much lighter for a given output than other machines running at even higher speeds. The magnetic material is economically arranged; the machines are light and compact; the center of gravity is low and the floor space occupied small.

The "C. E." motors are built in capacities of from two horse power to 10 horse power in slow speeds, and from three horse power to 15 horse power in moderate speeds. They are conservatively rated, and will run under full load at an unusually low temperature. It is said that the standard type will deliver the rated output continuously without rising in temperature above 40° C. above the surrounding air. With the wire screens over the hand-holes this will be slightly exceeded. The motors will carry a temporary overload of 40 per cent. without injurious heating. Following its usual practice, the General Electric company makes all parts of these motors to gauge, and duplicate parts can thus be obtained without delay.

La Roche Ideal Alternator.

The illustration shows the Ideal alternator, which is manufactured in all sizes up to 150 kilowatts by F. A. La Roche & Co. of New York. This firm makes a specialty of building experimental alternators for colleges and scientific laboratories. These experi-

ment machines are generally of small size, and the following description of the five-kilowatt, three-phase alternator furnished to the Alabama Polytechnic Institute brings out the main features of the type. This alternator is designed to generate three-phase currents at 220 volts, and is therefore supplied with three collector rings, between any two of which it is possible to obtain a current of 13.3 amperes and 220 volts when the armature is revolved at a speed of 720 revolutions per minute. Two additional pulleys are provided, by means of which it is possible to drive the alternator at 600 revolutions per minute and 420 revolutions per minute, at which speeds 180 volts and 100 volts are obtained, the field excitation being maintained constant at 110 volts.

The bearings are of the self-oiling type, and the armature is so well balanced that there is no vibration, even, it is said, when the machine is driven at the speed of 2,500 revolutions per minute. For varying the degree of tension on the belt, a hand-wheel and belt tightener are provided on a special sub-base furnished with the machine.

The La Roche & Co. also build larger alternators for single, two or three-phase currents, and wind the armatures for any voltage up to 2,000 volts. The fields can be furnished either separately excited or provided with a composite winding; the latter is excited by a portion of the total armature current, which is rectified by passing through a special commutator. By this means the field excitation is increased as the load increases, and by making the proper adjustments any degree of compounding can be obtained.

New District Telegraph Company.

Some curiosity has been excited by the incorporation of the Illinois District Telegraph company of Chicago. The new company has a capital stock of \$100,000, and the incorporators are F. H. Tubbs, Edward M. Mulford, Jr., and William J. Lloyd. The gentlemen named are respectively district superintendent, local manager and assistant district superintendent of the Western Union company at Chicago. The Illinois District Telegraph company is licensed to give a district telegraph and messenger service. It is not believed that the Western Union Telegraph company itself has any intention of engaging in the district messenger business.

American Automobiles for Bombay.

Indian princes and European nobles are to be supplied with electric carriages made in Chicago, and it is but natural to assume that the example of these illustrious leaders of fashion will be faithfully followed by courtiers of less importance.

The American Electric Vehicle company, 1545 Michigan avenue, closed a contract last week to supply electric carriages for several Bombay princes. The orders aggregated \$26,000, and the vehicles will be shipped during the early summer.

The same company is also estimating the cost of

Fig. 4. Motor Armature without Coils.

ing wear on the commutator is that of friction, and the use of carbon brushes renders this negligible.

The bearings are supported by cast-iron end shields. This method of support is lighter, but not so rigid as pillow block, and, while affording protection to the working parts, does not lessen the compactness of the motor. Furthermore, the motor being symmetrical a simple quarter or half-turn of the end shields allow it to be fastened to a wall or to be suspended from the ceiling. The end shields have hand-holes, which provide ventilation and give easy access to the working part. In motors intended for use in dusty places, the hand-holes may be covered by wire screens, which offer little resistance to the air, and for continuous service are superior to solid covers.

Slow speed in motor means diminished belt wear and friction of belt, bearing and commutator, but a decrease in speed necessitates a corresponding decrease in output in motors of a given design a reduction in speed requires a heavier

mental machines are generally of small size, and the following description of the five-kilowatt, three-phase alternator furnished to the Alabama Polytechnic Institute brings out the main features of the type.

This alternator is designed to generate three-phase currents at 220 volts, and is therefore supplied with three collector rings, between any two of which it is possible to obtain a current of 13.3 amperes and 220 volts when the armature is revolved at a speed of 720 revolutions per minute. The field frame is an angle steel casting with 10 poles. The 10 field spools are connected in series, each having 410 turns of No. 14 B. & S. wire, requiring a field current of three amperes at 100 volts to excite the field at full load.

The armature, 16½ inches in diameter, is of the

a line of stage coaches for the Fifth avenue stage line of New York. The company operating the line has decided to adopt the automobile, and the equipment is to consist of 20 vehicles.

Chicago Electrical Association.

The spring programme of papers and meetings of the Chicago Electrical association contains the following announcements: February 17th, "Police and Fire-alarm Systems of Chicago" (illustrated with apparatus), Edward B. Ellicott; March 3d, "Patent Systems of the United States and Foreign System Compared," W. Clyde Jones; March 17th, "Electric Street Lighting of Yesterday and To-day," Albert Scheible; April 7th (subject to be announced), Charles A. Brown; April 21st, "The Adaptation of Electricity to Existing Steam Trunk Lines," W. D. Ray; May 5th, "The Electric Protection of Safes and Vaults," Clyde J. Coleman; May 19th, annual banquet.

The meetings are held at 1736 Monadnock building.

Education of Electrical Apprentices and Journeymen.

(Continued from page 81.)

ing into the world large numbers of young men, who, after years of work, take the title of "electrical engineer." How many of these will ever have an opportunity to do any genuine electrical engineering? How many of them are destined never to earn, in electrical engineering, a \$1,000 or so a year, the pay of a skilled mechanic?

For every single opening for an electrical engineer there are a hundred openings for the skilled journeyman, and for every successful engineer there are a hundred successful journeymen.

And to be a journeyman does not mean to be debarred from engineering.

Who have made the notable inventions? Who have carried out the greatest engineering problems? Not the trained engineers, but journeymen who have started at the bottom, and by their individual efforts raised themselves to the highest level. "By their deeds ye shall judge them" is true of men, whether they have been educated up to a high standard or not, and self-training is often the more effective.

The compensation for skilled electrical labor, such as journeymen bring into the market, has been on the increase; it will continue to increase, and in an unfair degree, unless those who are the employers think in time of a method of supplying the increasing demand, or of making the labor which is offered worth the increase in results achieved.

Every new electrical equipment, each railroad equipped electrically and each industry which depends on electricity is taking some of our skilled men from the open market and retaining them permanently, and confining their energy to maintaining such equipment.

Whence will come the men to replace these deflections? Has no one a solution to offer as to the best way of replenishing the supply?

Many methods of solving this problem have been tried, some of them without proper consideration of the case.

Some have been the education of journeymen in other trades, such as carpenters, draughtsmen, etc., by means of actual experience during their employers' time, a poor means at best, and which places the burden directly on the shoulders of the employers, while the resulting mechanic leaves much to be desired in all-around efficiency.

Oftentimes young men imbued with the desire to be electrical artisans attend, in a desultory fashion, popular lecture courses, witness a few experiments in static and galvanic electricity, and find them of such interest that, even though they possess little or no qualifications and have been educated and trained for other lines, they determine to make electricity their life work. Their methods of securing the necessary instruction is usually a so-called apprenticeship in a shop manufacturing some article, which in itself gives them comparatively little instruction, and which makes them eventually skilled in head work, without giving them any breadth of training, and merely enables them to fill the position of a slim automatic machine.

Sometimes they read electrical lectures and trade papers, in many instances finding themselves very much at sea because of the technical character of the papers and articles, which their previous training has done nothing to enable them to understand.

Sometimes, as a final resort, they become recipients of the training offered by correspondence schools, and these schools are certainly gathering an ever-increasing clientele, which their merit justifies.

In very many instances they attend by far the best and most modern form of securing this training, and that through the trade school. There are, however, such a very few of the latter institutions, in spite of their acknowledged merit, and they are so little known, that only a very small percentage of the number who wish to become electrical craftsmen can reap their benefits.

The superiority of the trade school for educating and equipping young men for trade work is so vastly superior to any other means of performing the same work that we must look to it in the future to solve this very serious problem. Foreign countries have realized this fact for many years and profited by it. Is it not time that this progressive country began to realize it also, and to stimulate and support such institutions? They certainly are bound to spring into existence, and those that exist and have an honorable record are bound to improve that record, and it is but a question of time when intelligent thinkers must give them their proper place and dues.

It has been my good fortune to have been connected with trade schools for some years, notably with the New York Trade School, St. George's Evening Trade School of New York and the Highland Falls Trade School of Highland Falls, New York. They have taught me that trade schools have an equally high aim and purpose as any educational institution in the country, and that the field which they cover cannot be covered in any other way, and if they were accorded the same support and encouragement that other educational institutions receive their effect and beneficial influence would be as widespread, if not felt in even a greater degree, because of the class which they aim to assist.

It seems strange to me that trade schools should be subject to such marked indifference by employers and by such intense persecution and criticism by the fraternity which they aim to assist merely because of the possible future competition their graduates will cause them when they have come to the journeymen's estate. Was there ever a scientific institution aiming at higher education, a medical college, a law or an art school, but received the support and indorsement of the leaders of the respective professions, if its object was not to make money, but to benefit the arts and sciences?

Are lawyers, physicians, artists and men of other professions less free from the thought of competition that the journeymen and the employer should be found wanting in that which tends to advance his profession?

The governing societies, the trade associations, the employers' associations must see the wisdom of the trade schools eventually, and when they realize the necessity for them, and are compelled to support them, then, indeed, will they see the error of their ways.

A society like the American Institute of Electrical Engineers, whose members comprise a very large number of the engineers engaged in electrical enterprises, can do much to bring this problem before the men of their line, and can materially assist in a solution of this problem, of so much importance to the welfare of the electrical industry. The youth of the country imbued with the desire to become electricians will force their way in, and the inevitable is bound to occur. These young men will eventually enter the field of their choice. Why not help them and encourage them to enter under the best conditions and highest possible standard, instead of leaving them to drift in, unequipped, inefficient and lacking in essential requirements. Is it not best for them to live up to the studies exacted of skilled artisans in other lines, so that they can not only become self-reliant and successful, but reflect credit on the fraternity to which they have given their allegiance?

Trade schools have in the past done much to assist young men to acquire the rudiments of trades in other lines; they have tended to raise the standard of the individuals styling themselves helpers and journeymen by determining the capacity of the beginner, and they have put the highest premium on skill and efficiency.

What I wish to impress most seriously on my hearers is that this question of educating apprentices and journeymen bears a vital and urgent relation to the future success or failure of an industry in which we all feel commendable pride. The New York Trade School, owing to the far-sightedness and philanthropy of its founder, Colonel Tylden Auchmuty, has been in the field to remedy this dearth of skilled mechanics and the crowding out of our home industries of the native-born American workers by foreign skilled labor. Aided by the munificence of Mr. J. Pierpont Morgan and other gentlemen, it has been able to broaden its scope until, to-day, it ranks as the pioneer and largest trade school in the country. With its 6,000 graduates, it has demonstrated its utility and shown the way to those who wish to follow.

Three years ago it took cognizance of the electrical situation, and immediately inaugurated a thoroughly practical course for electrical workers, which became at once an assured success, filling the class room to its utmost capacity and having a waiting list of young men eager to enter the classes.

The first year the class numbered 32. The second year a larger department was inaugurated and 50 were accommodated, and still the waiting list continued to be as large. This year 50 are again at work, and fully that number were turned away.

The course is thoroughly practical, because nothing is taught which is not done by the students themselves, and tested and proved before acceptance. This year a course for journeymen workers in the form of practical lessons will be inaugurated. Its success is problematical, but should it show any signs of growth and interest, it may lead to results which cannot fail to be of interest to the whole electrical fraternity.

American Association of Municipal Electricians.

[Special correspondence of the WESTERN ELECTRICIAN.]

BOSTON, February 4.—The executive committee of the International Association of Fire and Police Superintendents and Municipal Electricians met in this city on January 31st, and among the more important matters considered was a change in the name of the organization, which hitherto has rivaled that of the M. S. F. T. P. O. C. T. A. The object of the committee, however, was to secure a more appropriate name rather than the attainment of brevity, although the latter was also accomplished by the change. It will be known hereafter as the American Association of Municipal Electricians. The membership scope will be enlarged to include any person engaged in municipal electrical work. There were present at the sessions of the committee President J. W. Aydon of Wilmington, Del., F. C. Mason of Brooklyn, N. Y., W. H. Thompson of Richmond, Va., W. T. Elliot of Elmira, N. Y., M. W. Mead of Pittsburg, Pa., and William Brophy of the Boston Wire Department. By invitation there were also present at the conference Wire

Commissioner Flood, John Weige of the Police Department and Brown S. Flander of the Fire Department, this city; S. L. Wheeler of Springfield, Mass., J. S. Wilson of the American Central Light company and W. E. Decrow of the Gamewell Fire Alarm company.

A convention will be held in Wilmington, Del., September 5th.

Pan-American Exposition.

The people of Buffalo and the Niagara region manifest much enthusiasm in the Pan-American Exposition which is to be held at a site on the Niagara River, not far from the Falls, in 1901. The idea is to celebrate by a great fair the achievements of the countries on the American continent during the nineteenth century. As Niagara Falls has played so conspicuous a part in electrical development, and as Buffalo has a respectable claim to be known as the Electrical City, from its extensive use of electrically transmitted power, a very prominent feature of the exposition will be the use of electrical energy in many forms. The show will be given in the twentieth century and is to be essentially up-to-date, modern and progressive. Electricity is relied upon, largely, to attain this purpose.

About \$1,300,000 has been raised already by popular subscription in Buffalo. It is proposed to make the sum \$2,500,000 at least, and Congress has been asked to appropriate \$500,000. Among the electrical contributors were the Buffalo General Electric company for \$25,000 and C. R. Huntley for \$5,000.

A recent issue of the Washington *Past* has the following: Mr. Edwin Fleming, for many years a Washington newspaper correspondent and later editor of the Buffalo *Courier*, is at the Arlington with the large delegation of Buffalo business men who are urging recognition by Congress of the proposed Pan-American Exposition to be held in 1901. "No doubt," said Mr. Fleming last night, "the exposition will embody the greatest display of the practical application of electricity that the world has ever seen. As an electric city Buffalo leads the world. Its natural location, adjacent to the great falls of Niagara, has, together with the wonderful strides made in the development of electrical science, insured for our city a future the possibilities of which can hardly be estimated even by an enthusiastic Buffalonian. In the past five years the steady stream of water which for centuries has poured over the falls has been partially harnessed and converted into a commercial product, and the street cars of our city, 20 miles away, are propelled by the currents generated by the rushing torrents, and the streets are lighted in the same way. Nearly every factory in and about Buffalo is operated by electricity, derived from this source, and the sites along the river bank from our city to the falls are rapidly building up with manufacturing establishments, attracted thither by the unparalleled facilities for obtaining power to revolve the wheels of commerce."

CORRESPONDENCE.

New York Notes.

NEW YORK, February 6.—After about five years of talk the electrical equipment of the elevated railroads in this borough seems at last to be assured. The improvement has been approached slowly, cautiously, falteringly by the management of the Manhattan Railway company. Even now old Russell Sage says: "The board simply gave President Gould the power to go ahead and ascertain which was the better power, electricity or compressed air. We did not determine to equip the road with electricity. The board did not determine on any motive power. The tests with electricity were satisfactory as far as they went, but we have other tests and testimony from engineers that compressed air is much more easily handled, less dangerous and cheaper. It is for President Gould to determine which, after a thorough examination, he thinks is the better motive power." But there is, as a matter of fact, no doubt that electrical equipment will be used. The matter was left entirely in the president's hands at a meeting of the executive committee of the directors held on Wednesday of last week, and on the next day it was announced that Kuhn, Loeb & Co. had undertaken to underwrite the authorized issue of \$18,000,000 of new Manhattan stock and to take all the stock of the issue which is not subscribed for by the present stockholders. It is said that the brokers receive a commission of 2½ per cent. on the entire new issue, or \$450,000, for their services in finding the cash. The old stockholders will be entitled to subscribe for 60 per cent. of their present holdings in new stock at par. "No one seriously doubts that the new motive power will be electricity," says the *Sun*. "Compressed air has been talked about, but the experiments made with it for driving street-cars, both on a branch of the Third Avenue road and also upon the Metropolitan Street Railway company's lines, have evidently not been satisfactory, at least so far as economy is concerned, and the expensive experiment made with an air motor on the elevated road a year or more ago was a failure. The motor tested at that time worked all right, as, in fact, most of the air motors do, some they do not differ materially from steam engines, but the amount of air stored in the motor was inadequate for the work." It is said that a 70,000 horse power plant will be required and that the

cost of the whole electrical equipment will be \$10,000,000 or \$12,000,000. The new stock issue will leave a good margin for other betterments. A special meeting of the stockholders to consider the directors' plan of financing the improvement will be held on February 28th. With the proposed new issue the capital stock of the road will be \$48,000,000. President Gould is credited with the statement that the saving in operating expenses alone will be more than \$1,000,000 a year, which, with other economies possible, is sufficient to pay five per cent. on the new capital which it is proposed to the stockholders to put into the elevated roads, and one per cent. additional on the present capital; in other words, to put the whole property on a sound five per cent. basis. Mr. Gould said this result would be accomplished even if the road should not add an additional passenger to the present traffic, and it is expected, of course, that the greater attraction of the road with electrical operation will greatly increase the traffic. As to the strength of the elevated structure, it is said to be more than equal to any demand that the electrically operated trains will put upon it.

I find this in the *Tribune* of yesterday: "The Metropolitan Street Railway company is pushing the construction of its new power house at Twenty-fourth street and Thirteenth avenue, in which air is to be compressed for use as motive power on the Twenty-eighth street and Twenty-ninth street Crosstown line, but all information as to the progress of the work of installing the compressed-air plant is refused, and no visitors are admitted to the building. Adjoining the power house in Twenty-fourth street, and extending to Eleventh avenue, are the new car barns, which, it is reported, are to house 40 cars. Each car will be equipped with a motor, comprising a cylinder and piston, with a crank attachment to the wheels. The air is to be carried in cylindrical steel 'bottles,' from three to eight feet long, which will be placed under the seats, and the air will be taken from these 'bottles' at 2,200 pounds pressure and delivered by means of a reducing valve to the motor cylinder at 150 pounds pressure. The refilling of the 'bottles,' which is done by means of a hose attachment from the reservoir, it is said, can be effected in less than one minute. It is expected that the line will be in operation with compressed air as the motive power by May 1st."

Much attention has been attracted by the newly organized Astoria Light, Heat and Power company. One paper says that it will erect the largest gas and electric plant in the world at Long Island City. It is stated that a combination has been formed by which the Astoria company will furnish gas to the patrons of all the companies in Manhattan with the exception of the New Amsterdam Gas company. A tunnel is projected under the river starting from Woolsey's Point, on the Astoria shore, running under Ward's Island and coming out at One-hundred-and-tenth street. According to the present plans the tunnel is to be sunk 200 feet below the river bed and will probably be about 6,000 feet long. The tunnel would contain both gas pipes and electric cables. A bill has been introduced in the Legislature giving the company power to build such a tunnel, provided that the mains and pipes be so laid as not to obstruct navigation. This bill also authorizes the Astoria company to "supply gas or electricity to any other company or companies engaged in supplying gas or electricity in the city of New York, and may lease the property of any such other company upon terms to be agreed upon by the boards of directors and trustees of the respective companies, and assented to in writing by the stockholders of such companies holding at least two-thirds of the capital stock of the respective companies." A mortgage for \$500,000 was filed in the office of the Clerk of Queens County at Jamaica on Friday by the Astoria Light, Heat and Power company in favor of the Union Trust company, as trustee, on all the holdings of the power company in Astoria. The mortgage is given as security for an issue of \$500,000 50-year five per cent. gold bonds in denominations of \$1,000 each. The money is to be used in developing and carrying on the business of the new company. M. S.

Canadian Intelligence.

OTTAWA, February 4.—The Dominion Coal company of Cape Breton, in the province of Nova Scotia, proposes to adopt electricity for hauling purposes in its mining operations.

Mr. T. A. Gorham of Port Arthur, Ont., will ask the Ontario Legislature for a charter for an electric railway from Nipigon Station, on the Canadian Pacific railway, to Nipigon Lake.

It is understood that the Cataract Power company of Hamilton, Ont., will very soon make a survey of a definite route for the proposed electric railway from Hamilton to the cities of Galt, Berlin and Gravelly, Ont., with a view to the commencement of building operations in the spring.

Mr. P. Wadell of Trenton, N. J., who owns a controlling interest in the water-works system of that town, is negotiating for the amalgamation of the electric and water-works companies with a view to increasing the power plant, so as to operate both systems and supply power to manufacturers. He has also in view the lighting of the town of Belle Mead, N. J., and the operation of the electric railway and water-works in that town.

The Electric Traction company of Halifax, Nova

Scotia, has increased its capacity recently to a large extent, as well as the track and overhead equipment of its road. In its power station a large quantity of new machinery has been put in, including the latest alternating machines, rotary transformers and tandem-compound engines. Alternating incandescent arc lights have been introduced throughout the city of Halifax, and there are also a great many motors for manufacturing and elevator purposes.

The Sun Life Assurance company has taken possession of the electric street railway of Cornwall, Ont. The road has been considerably run down and will require a large outlay to put it into proper shape. A couple of local men, backed by a syndicate, made an offer of \$70,000 for the road, which was refused. W.

PERSONAL.

F. E. Newbery of St. Louis was a Chicago visitor last week.

The *Scientific American* styles the late John W. Keely a "nineteenth-century thaumaturgist."

Albert Smith, of the firm of Keelyn & Smith, general lighting contractors of Milwaukee, was in Chicago early in the week.

Hugh L. Childress, superintendent of the southern division of the Postal Telegraph company, with headquarters at Birmingham, Ala., died at Chattanooga on February 4th, after a long illness, of meningitis. Mr. Childress was formerly manager for the Postal Telegraph company at Cleveland, O.

Mr. Henry J. Conant, who has been well known as the manager of the Boston office of Westinghouse, Church, Kerr & Co., has been called upon to give his attention to the larger business problems of that concern. Mr. Conant will, however, continue to make Boston his headquarters. As is well known, the entire contract for the new Boston Terminal was executed by him. Mr. Conant was graduated from the Massachusetts Institute of Technology with the class of '87. He is entirely capable of meeting the greater responsibilities of his new position.

Announcement is made of the resignation of John McGhie, manager of the advertising department of the General Electric company, in order to accept an important and responsible position with the *American Machinist* at Cleveland. Mr. McGhie's management of the General Electric company's advertising business was marked by intelligent discrimination, which resulted in most satisfactory returns, and the record which he leaves behind him is highly creditable to himself and satisfactory to the company.

Street-railway men throughout the country will appreciate the *New York Sun's* tribute to "Tom Johnson's self-sacrifice," in which that journal says: "The Hon. Thomas L. Johnson of Cleveland, O., having recently pocketed several millions of dollars by the sale of street-railway franchises in Brooklyn, which cost him little or nothing, announces his purpose of desisting from further efforts to increase his own wealth, and of devoting his energies to the sacred cause of depriving real estate owners of theirs."

A pleasing characteristic of Westinghouse, Church, Kerr & Co., the well-known engineers, is the promotion of their old employes along with the progress and development of their business. The most important appointment recently made by this company was the promotion of Mr. W. W. Churchill to the position of mechanical engineer. Mr. Churchill has identified himself with all of the important contracts handled by Westinghouse, Church, Kerr & Co. during the last nine years. He graduated with the class of '89 at Cornell University, and remained at that institution another year as Sibley fellow in mechanical engineering.

ELECTRIC LIGHTING.

The electric-lighting plant at Royal Oak, Mich., is now in full operation.

The talk of a municipal lighting plant at Three Rivers, Mich., has been dropped.

The city of Algonac, Mich., voted against the issuing of \$10,000 worth of bonds to erect a lighting plant.

The Corunna (Mich.) Lighting company has filed articles of association for \$20,000 with the secretary of state.

The Henderson (Tenn.) Electric Light company has been chartered by T. B. Hardman, N. J. Ozier and others.

An election for the bonding of the city of Charlotte, Mich., to build an electric-lighting plant will be held in the spring.

The electric-light system in Kalkaska, Mich., has been extended. Many private houses and two churches will soon be lighted.

The city of Mount Airy, N. C., will probably issue bonds for erecting an electric-light plant. It is said that George R. Quincy can give information.

The plant of the Tehama Electric Light and Power company of Red Bluff, Cal., recently completed and owned by James Cross of San Francisco, was burned last month. The loss was about

\$12,000; insurance, \$2,000. It is probable that the plant will be rebuilt at once.

The trustees of Nevada City, Cal., rejected the bid of the Nevada County Electric Power company for an electric-light plant, as it was considered too high. It was resolved that a committee of three be appointed to get estimates of cost of an appropriate electric-light plant for the city and report to the board at an early date. Trustees Carr, Rich and Gault were appointed as the committee.

PUBLICATIONS.

Bulletin No. 1 of the Electric Machinery company of Minneapolis has been issued. It treats of direct-connected generators, which are clearly described and illustrated. This company calls particular attention to the quality of material and workmanship entering into its dynamos, and invites comparison with all other manufacturers' products.

A well arranged, well printed catalogue of telephone apparatus, with cover of flexible muslin, is issued by the Holtzer-Cabot Electric company of Boston. The catalogue is No. 35 of the company's issue, and in it are listed magneto bells, hand and power generators, motor-generators, desk-telephone sets, interior telephones, automatic intercommunicating telephones, telephone annunciators, receivers, transmitter arms, repeating coils and other telephone apparatus. The company calls attention to its reputation for high-grade apparatus and its facilities for manufacture.

In the series of attractive Westinghouse publications the descriptive pamphlet on "The Westinghouse Standard Engine," dated MDCCCXIX., holds a prominent place. It gives the essential information (except prices) about these tried and well-known engines in 54 pages of letter-press and illustration. One important statement is this: "In point of economy the Westinghouse standard engine is unequaled by any other simple non-condensing single-valve engine made. On variable loads and light loads we believe it to be superior to the best accepted types of four-valve simple non-condensing engines." The mechanical execution of the book is of high excellence.

ELECTRICAL SECURITIES.

The plan for financing the United Railway and Electric Companies of Baltimore has been completed. There will be a total of \$76,000,000 of stocks and bonds issued. Of this amount \$38,000,000 will be 50-year four per cent. gold bonds, \$14,000,000 cumulative preferred four per cent. stock and \$24,000,000 common stock. The subscribers will be given the privilege of taking a proportion of the cumulative preferred stock. They will be given a bonus in the shape of 25 per cent. in common stock. It is understood that of the authorized issue of \$38,000,000 of bonds \$15,850,000 will be held in the treasury to retire old bonds as they mature and \$4,150,000 to pay for acquisitions, betterments, extensions, etc., leaving \$18,000,000 to be brought out.

Commenting on the fluctuations in the stock market on February 3d, the financial writer of the *New York Sun* says: "The most sensational feature of the day was an advance of more than 10 points in Metropolitan Street Railway after an early decline of more than two points. The net result of the day's trading in this stock was an advance of 8 1/4 per cent. The movement was accompanied by a rumor that the company had acquired control of the Third Avenue surface railroad. A more substantial basis for the rise may be found in the progress that the company is making in the direction of supplying the city or a large part of it with electric light, heat and power. In the last hour the entire list rallied so sharply that many of the early losses were recovered, while in other cases they were reduced to fractions."

INDUSTRIAL COMBINATIONS.

It is reported that negotiations are in progress for the consolidation of all the important freight and passenger car manufacturing companies of the United States. Among the concerns which are said to have given their adhesion to the plan are the Barney & Smith Car company, the Michigan Peninsula Car company and companies in Wilmington, Del., and Buffalo. It is said to be possible that Pullman's Palace Car company will in time enter the projected combination, but this statement is denied.

All the small electric-lighting and power companies in the borough of Queens, New York city, will soon be absorbed, it is asserted, by the Electric Company of America, incorporated on January 5th under the laws of New Jersey with a capital of \$25,000,000, and having its headquarters in Philadelphia. One of the latest acquisitions of this company is the Electric Light and Power company of Jamaica. It is said that the stock of this company has been increased to \$1,500,000, about five times the original amount. With this company as a nucleus the Electric Company of America anticipates spreading out over the entire borough.

The consolidation tendency is shown in all parts

of the country—on the shores of the Pacific as well as in the Atlantic states. It is now announced that all the Tacoma street railways, embracing over 30 miles of cable and electric roads, have been sold to a New York syndicate, which will transfer them to a new company with \$2,000,000 capital, to be styled the Tacoma Railway and Power company. The purchasing syndicate is composed of C. H. Corter of J. P. Morgan & Co., which firm will be the chief stockholder; T. Jefferson Coolidge, Robert Treat Paine, Samuel Carr, C. A. Coffin, Bird S. Coler, Frank Coler, L. H. Hole of New York; Gordon Abbott, S. Endicott Peabody and C. E. Cotting of Boston. The lines will be improved and newly equipped and so connected as to give every part of the city a better service. About half of the capital will be expended on constructing big plants for generating electricity by water power, the latter to be secured from the White, Nisquilly, or Puyallup rivers. It is intended also to promote various manufacturing enterprises, which will utilize the surplus power.

MISCELLANEOUS.

Among the incorporations at Trenton, N. J., last week was that of the Auto-electric company, with \$1,000,000 capitalization and Timothy M. Cheesman of Garrisons, N. Y., Nelson Hiss of New York and Duncan T. McLaren of East Orange as incorporators. This company is to make all kinds of patented articles into which electricity enters as a factor.

Discussing the introduction of automobile vehicles, the *Southern Industrial and Lumber Review* predicts that "It will only be a matter of a few years, no more than 10, before some of the more progressive cities will prohibit the keeping of horses within their corporate limits, just as pigs are now barred from city residence. Streets will soon begin to be set apart for motor traffic only, just as certain paths and sections of parks are now set apart for the bicycle, and gradually the horse will become as rural a sight as a calf or a sheep."

Municipal ownership is attracting so much attention in Chicago that it has become a topic for high-school debating societies. At a recent contest between the Lake View and North Division schools the question was, "Resolved, that the street railways of Chicago shall be owned and operated by the municipality." Paul Steinbrecher and Miss Catherine Mayes, for Lake View, took the affirmative; Florence Weil and Dagny Grevstad argued the negative. Judges Brentano and Smith and Mr. H. H. C. Miller decided the contest, awarding victory to the debaters on the negative side.

A dispatch from Indianapolis states that that city is undergoing an examination, the purpose of which is to discover whether the gas and water pipes are affected with electrolysis. John R. Pearson of the Indianapolis Gas company said that the companies had undertaken the investigation. Mr. Pearson added that the evidences of injury to the gas mains had been few. F. A. W. Davis, vice-president of the water company, said the company did not have evidence that its mains were being seriously injured, but still the injury might be in process.

M. Lockroy, French minister of marine, has communicated to the *Matin* of Paris an account of the successful torpedoing of the French battleship *Magenta* by the submarine boat *Gustave Zédé* in recent practice. "All on board the *Magenta*," he says, "were in a state of feverish excitement, watching the surface of the sea. Suddenly the cupola of the *Gustave Zédé* appeared abreast of the *Magenta*, about 4,000 yards distant, but before the guns of the warship could be trained upon her the submarine boat disappeared beneath the water. The *Magenta* was then ordered to steam ahead, which she did, yet within a minute the *Gustave Zédé's* blank torpedo struck the warship below the waterline."

The War Department, through the chief signal officer, is inviting sealed proposals until February 18th, for furnishing the Signal Service with a quantity of telegraph supplies. Among the articles required are the following: Twenty-five electric bells (five ohm), 100 boxes bluestone, 10 barrels bluestone, 40 battery brushes, 30 dampening brushes, 10 electric buzzers, 50 carbons and prisms, 250 dry-battery cells, 500 Leclanché cells, 500 battery connectors, 2,000 glass pony insulators, 5,000 glass insulators, 250 legless telegraph keys, 250 telegraph sounders, 500 pounds office wire (No. 18), 2,000 battery zincs, 100 push-buttons, 1,000 battery coppers, 25 battery hydrometers, 500 battery jars, 300 telegraph relays, 150 telegraph switches, 30 switchboards (from four to 10 lines) and various other supplies. Prospective bidders may obtain blank forms of proposal upon application to A. W. Greely, chief signal officer, Washington, D. C.

TELEGRAPH.

The Western Union Telegraph company and the Commercial Cable company announce that from March 1st the cable rate to points in Holland and Belgium will be the same as to Great Britain, Germany and France, or 25 cents a word. This is a reduction of seven cents a word to Holland and of five cents a word to Belgium.

"Half-rate telegrams are rapidly becoming a thing of the past," said an official of one of the telegraph

companies to a reporter of the *Pittsburg Dispatch*. "The new fast express trains that leave Pittsburg in the evening are responsible for killing the business. Half-rate telegrams are those filed after 6 o'clock p. m. for delivery early next morning. Business firms here used to send thousands of them. Since the new trains were put on, these firms now write letters and mail them instead of using the wire. We used to depend on these half-rates or 'reds' to keep our operators employed at night. The long-distance telephone has also hurt the business. It will be but a short time until there are no night telegrams."

General Greely, chief of the Signal Service of the army, is preparing a cipher code for use in the army, which, it is estimated, will save the government some \$50,000 or \$60,000 annually in the cost of cable communication with Manila, Porto Rico and Cuba. The tariff to Manila is over \$2 a word, and dispatches to General Otis have been found expensive. It was discovered by the department some time ago that a saving could be made by substituting a designation for the different heads of the War Department, and, carrying this idea further, it was determined to supplement the commercial code now used by the adoption of a number of words to represent certain military phrases and sentences. The code, when completed, will comprise about 2,000 phrases and sentences, each represented by a single word. The saving by this arrangement will be about three-fourths of the total number of words used.

TECHNICAL SCHOOLS.

According to the *Chicago Daily News Almanac* for 1899 the number of schools of technology in the country is 48, with 1,184 instructors and 12,448 students. Of the latter, 1,503 are women. The total income of the schools is \$3,500,190.

POWER TRANSMISSION.

The Collins Gold Mining company of Mammoth, Ariz., is about to utilize the Aravipia River for generating electric power for the entire work of the mills.

The Rosland (B. C.) Air Supply company proposes to erect an electric plant and operate it by water power for the purpose of supplying compressed air or electricity to the Trail Creek mines. The subscribed capital of the company is \$200,000. Work must be commenced within six months.

Los Angeles, Cal., is jubilant over the completion in every detail of the longest power-transmission system in the world, that which supplies the city of Los Angeles with electricity from power developed at the head of the Santa Ana River, 80 miles away. The news was sent from Los Angeles on January 26th, by Senator G. H. Barker of the Edison Electric company and Southern California Power company, to C. A. Coffin, president of the General Electric company in New York, informing him of the completion of the work and its successful operation for 48 hours. The system has occupied several years in building and has caused the expenditure of large sums of money. The wires enter the city through underground conduits.

ELECTRIC RAILWAYS.

Frank A. Miller has been granted an extension of 60 days for the completion of the electric road at Riverside, Cal.

The Council of Pasadena, Cal., has rejected bids of the Terminal company and J. G. Rossiter for a franchise for an electric railway.

It is reported that S. N. Griffith, acting as agent for capitalists, is considering the erection of an electric street railway at Fresno, Cal. A route 10 miles long has been mapped out.

It is reported that the Visalia, Cal., and Tulare motor line is to be changed into an electric road. The stockholders of the road have the matter under consideration. Power is to be supplied by the Mount Whitney Power company.

James H. Boyd of San Bernardino, Cal., will apply for a franchise for an electric-street railroad in that city, to be operated on Third street, from the Santa Fe station east to D street, thence north to Base Line, and out Base Line, continuing to Redlands.

The master's deed conveying to the present owners of the Metropolitan West Side Elevated Railroad company Chicago, all the real and personal property of the company for the consideration of \$6,000,000 was filed for record on February 1st. The master was Elijah B. Sherman. The document bore revenue stamps of the value of \$6,000.

S. N. Griffith has issued circulars stating that a company is now organizing for the purpose of constructing an electric street-railway system in Fresno, Cal., with branches to the extent of 20 miles. Mr. Griffith estimates the cost at \$350,000, and of that amount local capital is expected to subscribe \$50,000. The San Joaquin Electric company will furnish the power.

The Yarmouth electric railroad of Portland, Me., has changed hands, the new owners being a syndicate organized as follows: President, Hon. Seth L. Larrabee; treasurer, Henry P. Cox; directors, the

president and treasurer, with E. B. Wadsworth, W. H. Milliken, Hu ton B. Sargent and J. B. Wharlow. They will put in new machinery and equipment of the most modern character.

The Pacific Electric Railway company has been incorporated for the purpose of constructing and operating electric railway in Los Angeles, San Bernardino, Riverside and Ventura counties, California, and to sell electric power, etc., etc. The principal place of business is Los Angeles, and the capital stock \$1,000,000. The incorporators are I. W. Hellman, Charlie Seyler, J. W. Hellman, I. M. Nickell, W. C. Patterson and others.

One of the most important measures that will come before the present session of the Massachusetts Legislature is the bill compelling the electric-railway companies of Boston to equip the front platforms of their cars in winter with vestibule protection for the motormen. The matter has even been made the subject of pulpit eloquence, some of the ministers of Boston churches taking up the cause of the employes and preaching against the iniquity of exposing the men to the weather. The existing law on the subject exempts cities of over 50,000 inhabitants, and only in smaller places is the protection afforded. It was claimed that vestibules on cars in crowded cities would tend to increase the liability to accidents, by reason of their obstruction of the view of the motorman.

The company which proposes to build an electric railway from Chicago to Lake Geneva has been incorporated. The capital stock is \$150,000. The incorporators are H. H. Windsor, H. T. Windsor, C. N. Bates, C. T. Bundy, and L. C. Church. H. H. Windsor was elected president, C. N. Bates vice-president, H. T. Windsor secretary and treasurer, C. T. Bundy was appointed attorney for the road and H. T. Windsor general manager. The name adopted is the Chicago, Harvard and Lake Geneva Electric Railway company. The principal office will be in Walworth. The ordinance granting this proposed road a franchise in Chicago was introduced in the council by Alderman Kimbell. The plan is to start at State street, near the river, on the North Side, then follow a sort of zigzag route parallel with the river to North avenue, thence west over a right-of-way to be acquired to the city limits, where it will take a northerly direction to the summer resorts in Northern Illinois and Southern Wisconsin.

TRADE NEWS.

The Cleveland Woolen Mills of Cleveland, Tenn., are in the market for a dynamo of from 35 to 50 kilowatts' capacity, direct or alternating current. Julius Hardwick, Cleveland, Tenn., is the secretary of the company.

The offices of the Westinghouse Electric and Manufacturing company and allied companies in Chicago have been brought together on the twelfth floor of the New York Life building, La Salle and Monroe streets. The rooms are very conveniently arranged around the eastern end of the corridor, the numbers ranging from 1217 to 1224. They are handsomely appointed, and pleasant quarters are afforded for managers, engineers, salesmen and the office force.

The Moloney transformer has many new and essential features embodied in its construction that merit the careful consideration of central-station managers. It has been constructed strictly upon scientific points, with a view of combining every modern improvement known in the manufacture of transformers. It covers desirable features of economic distribution, combined with other salient features of importance. This transformer has met with unprecedented success wherever it has been used, and the selling agent, the Western Electrical Supply company of St. Louis, Mo., have been kept busy in supplying the constantly increasing demands for it. The manufacturers of this transformer have, however, recently increased their plant to such an extent that the Western Electrical Supply company is now placed in an excellent position to give prompt shipment and handle all orders to the entire satisfaction of its patrons.

Mr. Hugo Reisinger, the importer of the Electra Nuremberg carbons, says that the change now taking place in electric-arc lighting is strikingly shown by the increasing demand for Electra carbons. This is largely due to the rapid introduction of enclosed long-burning arc lamps for direct-current, alternating-current and series lamps. "It has become necessary to run the Nuremberg carbon factory night and day to keep up with the orders that are sent from this country," says Mr. Reisinger, "while at the same time the demand for carbons for the constant-potential, direct and alternating-current, open-arc lamps shows no falling off. The facts cited tend to show that the enclosed long-burning arc lamp is rapidly superseding the open-arc lamp for interior use, while it is displacing the series high-tension open arc lamp from the streets. One need not be a prophet to see that the present rate of change will very shortly revolutionize the carbon trade, and that the low-tension carbon, like the poor old base, will have to give place to uses or give up the fight entirely. Professor Henry S. Carhart, some years ago, predicted this, by stating that the days of cheap and inferior carbons should soon be past."

BUSINESS.

The Western Electrical Supply company of St. Louis gives notice of a change in prices. It says: "On account of the rapid and marked advance in prices of so many goods in the electrical supply line, we are compelled to withdraw all prices quoted either by letter or by discount sheets of our catalogues Nos. 14, 16 and 18. Corrected discount

sheets will be prepared and forwarded to everyone having our catalogues at the very earliest possible moment."

The Electric Appliance company is very proud of its new building at 92 and 94 West Van Buren street. It claims that its new location gives it the largest electrical supply house in the country, with unequalled facilities for doing business and carrying very large quantities of material. The building

is about 50 by 90 feet, five floors and basement, with light on three sides, and is certainly an ideal building for any line of business. It should be visited and inspected to be appreciated.

The Manhattan Electrical Supply company, 32 Cortlandt street, New York, is kept busy supplying orders for its Mesco dry battery. An output of over 5,000 cells a day is reported, and the factory force is said to be working night and day.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued January 31, 1899.

618,391. Electric Furnace. Hugues Boyv, Geneva, Switzerland. Application filed April 14, 1898.

The furnace body is composed of conducting material, carbon blocks are supported in upright position on the body, each of the blocks forming a lower electrode, with a filling of carbon powder between the blocks, carbon plates are arranged between the upper ends of the blocks and resting upon the filling, and additional electrodes are arranged and supported above the lower electrodes, the lower electrodes being of such size as to be rendered incandescent by the passage of the electric current.

618,404. Electric Pump. Carl Eickemeyer, Yonkers N. Y. Application filed January 22, 1898.

The electric motor is provided with vertical field-magnet cores, and the incased pumping mechanism is driven by the motor, the casing being supported by the field-magnet cores, and the piston rods and armature shaft being substantially parallel, a worm is connected with the armature shaft, and a suitably supported gear wheel intermeshing with the worm and connected with the piston rods of the pumping mechanism.

618,429. Electric Railway. James F. Munsie, New York, N. Y. Application filed July 26, 1897.

A surface-contact electric railway is described comprising a series of circuit-controlling boxes distributed along the track, and arranged in groups laterally displaced at intervals to engage different circuit-controlling bars carried by the vehicle, to prevent heating of the same.

618,562. Ventilating Apparatus. Frank P. Donahy, Washington, D. C. Application filed August 10, 1898.

The transom-operating means are controlled by a motor with electrical devices embodying a pivoted armature with projections and spring contacts in the path of the ends of the armature constructed and arranged to be actuated by a change in the temperature.

NO. 618,727.

618,578. Alternating-current Motor. Edward C. Newcomb, Brookline, Mass. Application filed May 16, 1898.

Included in this arrangement are an armature, with coils closed upon themselves, a field-magnet with two sets of poles, the one set being in short circuit to the other set, means for cutting in and cutting out the short coils, the ampere turns of the main coils gradually diminishing from the outer edges of the poles to the center.

618,579. Commutator Short-circuiter. Edward C. Newcomb, Brookline, Mass. Application filed June 21, 1898.

The circuit closer is movable into and out of contact with the segments of the commutator, and a device is provided manually and mounted upon the shaft of the commutator for controlling the circuit closer, the device consisting of a handle connected by a rod to the circuit closer, and having a hole therein, and adapted to turn upon the rod relatively to the shaft, a pin carried on the shaft and located to fit into the hole in predetermined positions, and a spring tending to press the circuit closer against the segments.

618,604. Signal-controlling Track Instrument. Edgar A. Holloway, Gilroy, Cal. Application filed April 14, 1898.

An apparatus for signaling the approach of trains consists of electromagnets, with armature, latches and latch bars, insulated track sections, battery and connecting wires and a means for restoring the parts to their normal position after the train has passed, consisting of an electromagnet with an armature mounted upon a fulcrumed movable bar, disengaging arms connecting with the latches of the first-named magnets, the arms being acted upon by the movable bar of the disengaging magnet, and wires connecting with independent insulated track sections, and a battery whereby the disengaging magnet is energized.

618,619. Telephone Switchboard. James M. Overhimer, E. Wood, Ind. Application filed October 10, 1898.

One claim is given. The combination with a jack, a drop and a pl. z. of a drop-restoring device actuated by

the plug to restore the drop only when the plug is withdrawn from the jack.

618,635. Electric Battery. Arthur R. Adams, Surrey, England. Application filed March 29, 1897.

The process of compounding an exciting fluid for electric batteries consists in preparing first a chromate solution, adding sulphuric acid, then adding a solution of a nitrate of the alkali metals, then adding a solution of a mercury salt and then mixing thoroughly at a temperature of about 150° Fahrenheit.

NO. 618,562.

618,646. Electric Illuminated Clock Dial. Richard T. Crane, Jr., Chicago, Ill. Application filed February 18, 1898.

The indicating pointer moves over the clock dial, and means for illuminating the indicating characters successively and synchronously with the registration therewith of the pointer are provided.

618,670. Electric Clock. Walter W. Hastings, Jersey City, N. J. Application filed November 24, 1897.

A swinging pawl is movably mounted on the pendulum rod and forms part of an electric circuit, and means are provided for closing the circuit operated by the pawl when the limit of movement of the rod reaches a predetermined minimum point.

618,674. Trolley Wheel and Support. William P. Holt, Savannah, Ga. Application filed June 2, 1898.

A trolley wheel support comprises a trolley-pole having a forked frame at its upper end, a ring pivotally mounted in the ends of the forked frame, a second ring pivotally mounted within the first-named ring, forming a gimbal-joint, a shaft having bearings thereon for the trolley wheel, mounted within the inner ring, and means for preventing the gimbal-joint from swinging too far.

618,699. Prepayment Electric Meter. Francis M. Long and Ernest Schattner, Norwich, England. Application filed July 18, 1898.

Claim one is given: In a prepayment electric meter and in combination, a lever, a circuit, a contact-making device in the same operated by the lever, means controlled by a coin for moving the lever and making the contact, a voltmeter, the passage of the current through which will raise the lever and break the contact, and means connecting the voltmeter and the lever.

NO. 618,429.

618,702. Direct-acting Reciprocating Electric Motor. James H. Mason, New York, N. Y. Application filed March 24, 1897.

A direct acting reciprocating electric motor is described comprising a pair of field magnets spaced apart, an armature arranged to reciprocate between them, the one being provided with centrally arranged conical recesses and the other with centrally arranged conical projections located at all times partially or wholly within the recesses, the pair of magnets and the armature being provided with adjacent vertical annular faces surrounding the projections and recesses, whereby the magnetic field is enlarged, means for maintaining a constant electric current in one direction through the armature, means for energizing the field magnets and means under the control of the movement of the armature for changing the direction of the current through the field magnet coils.

618,703. Apparatus for Manufacturing Filaments

for Electric Lamps. Hiram S. Maxim, London, England. Application filed November 8, 1898.

This apparatus consists of a vessel provided with trunnion bearings to permit of its moving in a vertical plane, of a screw cover for hermetically closing the vessel, of an electrically insulated plug therein, of a hollow head to the plug communicating with inlet and outlet nozzles through which water enters and leaves the hollow head to keep the latter cool, of electrodes mounted in holders located at opposite ends of the vessel, of stems on the holders extending to the exterior of the vessel and formed with passages communicating with the holders and with inlet and outlet nozzles through which water enters and leaves the holders to keep them cool, of a nut carried in a frame and engaging with screw threads on one of the stems of the electrode holders, of handles on the nut for turning it and thereby shifting the holder so as to adjust the distance between the electrodes, of a lining for the vessel, such lining having a spiral water course for the entrance and exit of cold water, and of a source of electricity for supplying electric current to the electrodes.

618,704. Method of Manufacturing Filaments for Electric Lamps. Hiram S. Maxim, London, England. Original application filed November 8, 1898. Divided and this application filed January 5, 1899.

The process of manufacturing high resistance filaments for electric lamps consists in subjecting solid or liquid carbonic acid and carbon in a closed vessel under great pressure to the action of the voltaic arc, thereby converting the carbon into a dense crystalline form, then comminuting the resulting product, mixing the same with a suitable binder, molding the mixture into filaments and finishing the filaments in the usual manner.

618,706. Electric Lamp. John S. Mead, Mount Vernon, N. Y. Application filed September 19, 1898.

The claim is given: In an electric lamp, a casing, a battery in the casing, a reflector arranged in said casing and having a lens socket, a block of insulating material, a contact plate secured to the rear side of the block, fingers extended from the front of the block and connected to the reflector, whereby the said block and contact plate are supported by the reflector and removable therewith from the casing, a contact point on the reflector and a circuit closer for closing the circuit through the contact point and plate.

618,727. Armature for Dynamo-electric Machines. Edward D. Priest, Schenectady, N. Y. Application filed August 26, 1898.

An armature for a dynamo-electric machine is described comprising a toothed body of metal, having coil slots between the teeth, the teeth being so arranged that they decrease in height toward the slot adjacent thereto, and coils mounted in the slots.

NO. 618,699.

618,773. Automatic Circuit Closer. Henry F. Blackwell, Jr., New York, N. Y. Application filed January 8, 1898.

Comprised in an alarm box are a main circuit, an auxiliary circuit, an alarm circuit, a switch normally closing the main circuit, a cam for moving the switch to close the alarm circuit, a rack for rotating the cam, and an electromagnet in the auxiliary circuit for controlling the rack.

618,812. Electrical Protector. David J. Cartwright, Boston, Mass. Application filed January 11, 1897.

This is an automatic electromagnetic strong-current protector for electrical devices, and consists of an electromagnet, a base plate supporting the same, a laminated core for the same, a pole piece of magnetic metal on the core, a block of hardy fusible electric conducting non-magnetic material secured on the pole piece and a metallic piece extended at right angles from the pole piece and attached to the base plate and forming part of a circuit through the magnetic pole piece and contact block secured thereto.

REISSUE.

11,713. Storage Battery. Ralph Ashley, Port Republic, N. J. Application filed April 9, 1898. Original No. 591,265, dated October 5, 1897.

A storage battery comprising a series of cups or trays each formed of relatively thin, hard rubber or non-conducting material, and one nested within another and having its weight transmitted directly to the bottom portion of the one below it by having its bottom portion contacting directly with and resting upon the bottom portion of the one below it, there being openings between the trays for the escape of gases.

DESIGNS.

30,102. Core Plate for Dynamo-electric Machines. Edward D. Priest, Schenectady, N. Y. Application filed November 4, 1898. Term of patent, 14 years.

30,109. Lightning Arrester. Abraham Morgan, Youngstown, O. Application filed June 16, 1898. Term of patent, 14 years.

Western Electrician

EVERY SATURDAY.

Vol. XXIV.

CHICAGO, FEBRUARY 18, 1899.

No. 7

Two New Telephone Exchanges in Chicago.

As the result of about 18 months' work in the downtown district in Chicago, the Chicago Telephone company has opened two new exchanges and added very largely to its plant of underground conduits, providing offices in each of which upward of 5,000 telephones can be handled, in addition to the main office in the Telephone building at Washington and Franklin streets. This will make the total capacity in the downtown district in Chicago about 18,000 instruments.

The first of these offices was opened late in October at the Chicago Title and Trust building, 100 Washington street, and is known as "Central." To it all "express" lines have been transferred and all the metallic-circuit lines in the district south of the Chicago River, east of La Salle street and north of Adams street. The second office, known as "Harrison," is located in the Manhattan building, 315 Dearborn street, and will accommodate circuits south of Adams as far as Twelfth street and east of Clinton street to the lake.

Photographic views of the new exchanges are reproduced in the illustrations on this and succeeding pages. Fig. 1, the upper picture on this page, shows the greater portion of the telephone switchboard at the Harrison exchange. The lower view (Fig. 2) represents the operating

this battery are of exceptional size; some of them are shown at the left in the picture. The smaller machines in front are the combination ringing and busy-back signaling machines. They are operated on the 220-volt circuit. The power-plant switchboard is of white marble and is shown back of the machines. The machinery equipment is in duplicate; one motor-generator and one ringing machine are ample for the requirements of the plant. As a further measure of safety, several sources of current are available in an emergency. A portion of the large distributing board is shown on the right. The framework of this board is of iron, and each circuit

The telephone switchboards are of the automatic signaling type, each line terminating in an answering jack, giving a signal by means of an incandescent lamp. The calling subscriber governs the movements of the operator throughout the call by means of a lamp opposite her cords. These exchanges represent a number of improvements over other boards of this type which have been installed during the last year, and in operation they have proven to be very successful. The methods for handling trunk lines are said to be the most rapid and accurate yet devised. The machine ringing plan, which was thoroughly tested in the "Express" exchange,

Fig. 1. "A" Switchboard at "Harrison"

Fig. 2. "A" and "B" Switchboards at "Central."
TWO NEW TELEPHONE EXCHANGES IN CHICAGO.

boards at the Central exchange, where all the succeeding photographs were taken. Fig. 3 shows the chief operator's desk and affords a better view of the "B" or trunk board than is given in the general view of this exchange (Fig. 2). A portion of the rear of the "A" or answering board, with the line relays on the left, is shown in Fig. 4, while the operators' sitting and lunch room upstairs is illustrated by Fig. 5.

The power plant of the Central exchange is shown in Fig. 6 (page 94). The machines are elevated from the floor and stand on a marble slab. The two larger machines are motor-generators taking 220-volt current from the Chicago Edison mains and reducing it to about 24 volts for charging the storage battery. The current for the talking circuits is furnished by the storage battery. The cells of

is provided with a lightning arrester. In case of a heavy discharge of current on the line the normal insulation protection of the arrester is broken down and the high-potential current is grounded through the frame of the switchboard without damage. The overhead running-box containing the circuits from the cable-heads to the distributing board is shown in the upper right-hand corner of the picture.

Both in the Central and Harrison exchanges relay multiple boards of the most modern type have been installed, together with generating plants, storage batteries, etc. The current for signaling and for transmission is furnished from the Central office, where a constant pressure of 24 volts is maintained. Thus the transmission is always at the maximum of efficiency.

is used, and the bell of the subscriber is rung intermittently until the call is answered.

In the Central office, which occupies the rear half of the second story of the Title and Trust building, the "A" or answering boards extend along the west wall of the large operating room (Fig. 2), and the "B" or trunk boards along the east wall. The relay racks (Fig. 4) are built into a partition which separates the wire chief's room (Fig. 6) from the operating office. The floors are laid throughout. In the wire chief's office are located the cable terminals, the distributing boards, motor and generator plants, storage-battery plant and power switchboards.

The traffic handled over the lines and trunk lines of this Central office continues to be the heaviest ever recorded on a like number of telephone lines. The subscribers whose lines are here operated use their telephones more than in any other exchange of which a record has been made. The operating forces which have handled this heavy traffic so successfully in the old Express office during the last four years are doing even better work with the new relay boards in Central. "In respect to every detail of mechanism," said an officer of the Chicago Telephone company recently, "the design of relays, lamps, keys, plugs and the many other pieces of apparatus necessary to the operation of the exchange, probably the best work ever done up to the present time is to be found in the new Central and Harrison exchanges." It is perhaps unnecessary to remark that the switchboards were built by the Western Electric company.

The Harrison office is located on the seventh floor of the Manhattan building, occupying the north half of that building. The cables are led up through iron pipes from a manhole in front of the building on Dearborn street. They are led first through the

wire chief's room, where distributing boards, relay boards, power plant, etc., are located. The operating room occupies the north end of the building. Here the relay multiple boards extend in two lines—the "A" boards along the north wall of the room and the "B" boards along the south wall. In Fig. 1 the "A" board is shown.

In both Central and Harrison exchanges commodious quarters are provided for the operators. A large buffet, from which luncheon is served each noon, contains dishes and the necessary paraphernalia, in charge of the matron. A cosy reading room, with electric reading lamps, lounging chairs, etc., is provided for the operators while at rest. The girls' sitting room in the Central exchange is shown in Fig. 5. The quarters are to be enlarged in the spring.

The next move to be made by the company in the enlargement of its exchange will be the building of an addition to the main office at 203 Washington street, which will occupy a space as large as the present building, 40 by 90 feet, and in which a new operating office will be located on the seventh floor. Here a relay multiple board will be located, which will provide for metallic circuits of the district, and the toll and long-distance operating rooms will also be cared for, as well as the general offices of the company. It is expected that the new building will be completed by July 1st. A new exchange, to be known as "Monroe," is also to be established in a new building to be built by the company and completed in June. This will be located on Sangamon street, near Monroe street, and will care for the telephones in the eastern portion of the West Side.

Sale of the "Electrical World."

It was made known last week that the *Electrical World* of New York had been sold by Mr. W. J. Johnston to Mr. James H. McGraw, the principal owner of the *Street Railway Journal* and the *American Electrician*. The transfer includes the publishing and book-selling business of the W. J. Johnston company. It is said that Mr. Johnston will retire from electrical journalism.

Institute Meeting in Chicago.

Through the efforts of the recently appointed local honorary secretary, Mr. R. H. Pierce, a meeting of members of the American Institute of Electrical Engineers was held at the Technical Club, Chicago, on Wednesday evening, February 15th, the date of the regular Institute meeting in New York. Mr. B. J. Arnold read Mr. Lloyd's paper on "Storage Batteries and Railway Power Stations," and there was a discussion in which Joseph Appleton, chief engineer of the Electric Storage Battery com-

Interior Electric Wiring.

By H. N. GARDNER.

Probably the kind of electric wiring in which there is the most poor work done, because poor workmanship can there be hidden, and because many young and comparatively inexperienced wiremen believe that they are capable of performing the work, is the ordinary concealed house wiring for lights.

well as the inside of the door, should be lined with asbestos cloth.

If an overhead service is used outside, so that the wires will enter through a gable, this box can probably be best arranged for in the wall of a second-story closet, as near the center of the house as possible, and placed a suitable distance from the floor to be easily accessible.

When possible it is always desirable to have the

FIG. 3. TWO NEW TELEPHONE EXCHANGES IN CHICAGO.—CHIEF OPERATOR'S DESK AND "B" BOARD AT "CENTRAL."

Starting with the wiring of a frame house of moderate cost, where the simple method of porcelain knob and tube work is followed, an effort will be made to give a few rules that will apply to such work.

The first thing to determine is where the center of distribution for the circuits will be placed. In a house of not over 10 rooms, it will probably be possible to arrange to run all circuits economically from one center. Should there be more rooms, it may be found more convenient to arrange for two or more centers. It should never be planned so that the center of distribution will be in the ceiling

entrance made through a side gable. A fusible "main" block should be placed as near as possible to the entrance, and near that should come a double-pole switch. It is usually convenient, and far better, to arrange for enclosing the entrance cut-out and switch in an asbestos-lined box; and if a meter is to be used, the box can easily be made large enough to contain that also.

Large enough wire should be used, in running the mains from the entrance to the center of distribution so that the voltage drop with all the lights of the house burning, will not be at most one per cent. The proper sized wire for this can easily be determined from the tables given in the article appearing in the *WESTERN ELECTRICIAN* for October 8, 1898. These main wires can usually be most conveniently led directly from the entrance to the third-floor timbers, and along them and down the studding, to enter the box at the center of distribution at the top.

The wires for the branch circuits can usually be most conveniently led from the central box through the sides, the holes being bored through the sides of the box and the studdings to which the box is attached. Sometimes it is easier to use main blocks for the bottom cut-outs instead of branch blocks, when the circuits fed from them will be taken out of the bottom of the box.

In leading the wires for the different circuits from the center they can be run up or down on the studding, but care should be taken not to run the wires less than six inches apart, and wherever possible concealed wires should be kept at least 10 inches apart. If it is necessary to run three wires for a short distance in some places between two timbers 16 inches apart on centers, the wires can be kept six inches apart by nailing pieces of boards between the studdings wherever knobs should be placed, and screwing the middle knobs to these boards.

In planning for the different lights, it should be arranged so that not over eight, or at most 10, 16 candle power lamps, or their equivalent, should be placed on any circuit with a 100 or 110-volt service, or not over six or seven for a 50 or 52-volt service. This will permit the use of a five or six-ampere fuse, and the fuses can all be placed in the asbestos-lined box at the center of distribution, making it unnecessary to place a fuse in a fixture canopy—something that should not be done.

Wire large enough to carry current for all of the lights of the circuit with not over a one per cent. drop should be used. It is best, however, to use no wire smaller than No. 12, B. & S. gauge, except to run for short distances for single outlets, and some inspectors will not permit the use of anything smaller than No. 12 for any wiring. Nothing smaller than No. 14 should be used even for fixture wiring.

In boring through timbers to run wires, care should be exercised not to bore holes in places that may have too much of a weakening effect. All holes should be bushed with porcelain tubes, and where thick timbers or two timbers together are encountered two tubes or pieces of two tubes should not be used for bushing, but tubes long enough to go entirely through the timbers should be procured.

Holes should be bored as near the center of timbers as possible, and they should not be bored any more on the slant than is necessary. An appliance is now to be had making it possible for a workman

FIG. 4. TWO NEW TELEPHONE EXCHANGES IN CHICAGO.—BACK OF ANSWERING OR "A" BOARD AT "CENTRAL," WITH LINE RELAYS ON THE LEFT.

pany, and others took part. Many of the gentlemen present took dinner together at the club, previous to the meeting, and the evening was a pleasant one socially as well as profitable from a practical point of view. No western meetings of the Institute had previously been held for some time, and Mr. Pierce's effort to revive them seems to promise success.

A concession for the construction of an electric street railway at Chihuahua, Mexico, has been granted to Frederico Sisniega, Julio Meyer and Salvador Arellano.

of a clothes closet and the fuse blocks screwed up on the ceiling exposed, as is still done in some cases. Nor should the fusible cut-outs be put up exposed in any part of the house. It is usually more convenient, both for installation and future maintenance, to arrange so that the cut-outs can all be placed in a small box in a side wall between two studdings. Such a box can be made just the depth of the studding, including the back, and a door can afterward be placed over the front, so that it will be no disfigurement to a wall; and it can usually be placed in the wall of a closet or some place where it will be out of sight and out of the way. This box, as

to stand on the floor and bore holes in the joists of the floor above, boring them squarely through the timbers, and also making it possible for one workman to bore as many holes in a day as can three men using an ordinary brace and bit. By this process, too, the tubes can be placed in a direct line, making it much easier to pull the wires through several tubes at a time, and decreasing the danger of breaking the tubes by the process. If the holes are bored slanting, the tubes should be inserted with the head up, except for occasional places, where the other way may be better without leaving danger of the tube slipping out.

The location of all wires of a circuit should be planned before the holes are bored; and whenever it is necessary for the wires of a circuit to cross, or the wires of different circuits, the holes should be bored either higher up or lower down than ordinarily, thus giving an opportunity for other wires to pass and still leave a good distance between them. The holes should never be bored nearer the edge of the timber than $2\frac{1}{2}$ inches, in order that the tubes may not be in danger of being broken by having nails driven into them.

Wires can be run straight through from timber to timber without any other support than the tubes; but if the timbers are far apart, the wires should be supported on knobs placed on both timbers near the tubes.

Whenever wires are run along timbers, they should be supported by and tied to knobs placed not more than five or six feet apart in any case, and the underwriters say $4\frac{1}{2}$ feet. Knobs should be

the plaster; but I believe that it is better to put them through from the other side. The tubes should be left projecting well through the plaster, and when the fixtures are put up they can either be broken off or pushed back. Of course, care should be taken in all places to keep the wires drawn tight, whether when running through the joists or along them.

Wherever it is possible to induce the house builder to add enough to the cost of wiring, the convenience of electric lighting should be thoroughly brought out by controlling the lights of chandeliers especially by switches conveniently placed in the side walls, near the door most frequently used to enter the room.

The convenience can be greatly increased at a slight additional expense by having the lights in both the upper and lower halls controlled from both floors by three-point switches. In some cases it may be still more convenient to arrange a light so that it can be either turned on or off from three or more points. This can be easily done by a system of wiring resembling that for three-point switches, and for which a special switch can be arranged.

Where current is used in combination fixtures, it is better to use double-pole switches. Some insurance inspectors insist on this, but inconsistently permit the use of three-point switches, which are practically the same as the single-pole.

If surface switches are used, a board should be fastened between the studdings at the switch outlet, the same as for light outlets. Holes should be bored

Electricity on Board Ship.

BY S. DANA GREENE

PART I.

While the title of this paper is intended to embrace the application of electricity aboard ship in the merchant marine as well as in the navy, I shall confine my remarks principally to the war vessel, for the service requirements of electrical apparatus on the latter are quite as severe as on the former, while the limiting conditions of weight and space are much more severe. It may be safely assumed, therefore, that any application which can be made to advantage aboard a man-of-war will be equally advantageous on board a merchantman.

On shore the advantages of centralizing the manufacture of electric power for industrial purposes in one plant and distributing this power by suitable means to individual consumers are so well known and the industry is so well established, that it seems hard to realize the fact that it has all been accomplished in less than 20 years, and that it is less than 10 years since it was a difficult matter to interest capital in such undertakings.

For several years after the industry was well established ashore little or nothing was done aboard ship. This was due principally to two causes:

First—Seafaring men are notoriously conservative about introducing new ideas or new apparatus aboard ship, which may not prove successful, and which may, on the other hand, fail in the middle of a long voyage when facilities for repairs are not at hand, and when a breakdown may be a very serious matter to the safety of the ship or the lives of the officers and crew. This conservatism is particularly strong in the British navy, the greatest in the world, where no machinery is ever introduced when the work can be done as well by hand, and where "simplicity" is the first requirement for all machinery.

The modern warship is a complex piece of mechanism at best, and I think the established policy of our English cousins to eliminate rigidly all unnecessary complications is wise—one that can well be followed by other navies, and particularly our own, where there has been a tendency to introduce too many novelties and labor-saving devices, at the expense of simplicity and safety.

Second—Electrical men, while generally unfamiliar with the conditions of sea life, knew nevertheless that three great enemies of electrical apparatus—salt air, moisture and heat—were always present aboard ship, and they feared them.

However, the great advantages of electric lights gradually overcame the sailor's conservatism and the electrician's fears, and lighting plants have been generally installed aboard ship for several years, in spite of numerous troubles at first, both with the apparatus and with the wiring.

The great advances made in the construction of electrical apparatus and the methods of distribution enable us to say to-day, and to prove, as I shall hope to prove with a full knowledge of service conditions, that electrical applications can be made with as little fear and with as great certainty of success aboard ship as they can ashore.

The recent position reported to have been taken by one of the naval-bureau chiefs that such applications should not be further extended on our warships at present, because we did not have the trained men to care for the machinery, it seems to me, absolutely untenable. If it is demonstrated that an electric motor is better adapted to drive a deck winch, for example, than a steam or hydraulic or compressed-air motor, then it should be installed, and the necessary men to operate it can and should be obtained. If the course suggested by the naval officer referred to had been followed in our navy for the last 50 years, we would still have sailing vessels (the frigates and line-of-battle ships of Nelson's day), and our recent unpleasantness with Spain would have terminated with very different results.

Assuming, then, as every reasonable man both in and out of the navy does assume, that electrical apparatus can be made to work on shipboard, let us examine the conditions of the modern war vessel as we find them, and see where electricity can be advantageously introduced, having in mind always the necessary requisites—safety, simplicity, efficiency and reliability.

The modern first-class battleship requires about 2,000 indicated horse power to drive all the auxiliaries at full load, and the first class cruiser about 1,200 indicated horse power. These auxiliaries, however, are never all in use at the same time, using maximum power, and it can be assumed that about one-half these amounts (i. e., 1,000 indicated horse power and 600 indicated horse power) will be required at any one time. They are scattered all over the ship, from the anchor hoist forward to the steering engine aft, and from the deck winches and boat cranes on the spar deck to the bilge and fire pumps in the engine and fire rooms, 30 or 40 feet below. Some of them, such as condenser, air circulating, feed, bilge and fire pumps and fire-room blowers, are necessarily located within the engine and boiler-room compartments, where the temperatures are always high and where steam, oil, water and coal dust are always present in greater or less quantities. Others, located on the spar deck, are exposed to salt water and air and to the varying conditions of sea and weather.

With these scattered locations, it is obvious that

FIG. 5. TWO NEW TELEPHONE EXCHANGES IN CHICAGO.—OPERATORS' LUNCH AND SITTING ROOM AT "CENTRAL."

placed in many places closer than this. A knob should always be placed near a bridging between the joists when the wire runs beneath it. If one wire running along a timber crosses another running from one joist to another, a knob should always support it as near as possible to the place of crossing. Whenever a wire passes through a timber and then runs along the side of it, a knob should always be placed near the tube, and even if it brings the head end of the tube down, that end should always be placed so as to come on the side where the turn is made, unless it is turned on both sides of the joist.

A knob should always be placed at the point nearest the iron if it is necessary for the wire to pass near a water or gas pipe. The wires should also be supported by knobs, placed as near as possible to light or switch outlets. The rules given for fastening wires to knobs in a former article (WESTERN ELECTRICIAN, October 8, 1898) should be followed in this case. Knobs should never be fastened to the timbers with nails, but should be put up with screws.

If a house is also being piped for gas, the plumber should be requested to make the gas nipples as short as possible and permit the threaded part to project beyond the plaster. In this way it will be possible, in putting up the fixtures, to bring the insulating joint close to the wall and prevent the wires from being twisted up against the grounded part of the pipe.

In bringing out the wires at light outlets, a board should be nailed up between the joists or studdings, with its face coming flush with the edge of the timber. Three holes should be bored in this, one to be slipped over the gas nipple, or else a notch can be cut for the nipple to slide into, and the other two holes near that, through which the wires and tubes can be slipped. Some underwriters demand that the tubes at outlets shall be slipped up after the wires are drawn out, leaving the head outside of

in this, through which tubes can be placed, so that the wires will come just about far enough apart to be handy for the switch terminals. The wires should be supported near the outlets by knobs.

If flush switches are to be used, the better way is to arrange for them by placing iron boxes for them at the outlets. If the boxes are not used, holes can be cut in the board at the outlet, either square or round, according to the kind of switch that is to be used, and the switch afterward fastened to the board. If boxes are used, they should be put up with a level, and great care should be used in fixing up the switches afterward, to make them exactly level. There is no feature of electric wiring where poor workmanship is so frequently apparent as through flush switch plates out of plumb.

In putting up the switches, the wires should be drawn up perfectly tight, and care should be taken not to have them twisted, or so that they can come in contact with each other.

For fixture wiring it is better always to use rubber-covered wire, and nothing smaller than No. 14 should be employed, although lamp cord is frequently used for this purpose.

In wiring a fixture care should be taken not to abrade the wires in drawing them in. The wires in all fixtures having more than one light should be carefully spliced, soldered and taped, and every joint of the gas fixture should be carefully put together with lead. Where simple electric fixtures are used, of course, a crow's foot is necessary. For all combination fixtures an insulating joint should be used, and the unions should be put together with lead. In doing this the lead should not be put into the joint or sleeve, but it should be carefully put on the threads of the pipe so that it will be impossible for any of it to squeeze down into the pipe itself. Before the fixture is put up, the wires should be tested to see that none of them touch the pipe, and the pipes should be tested to be sure that they are air and gas tight.

power generated at a central point must be distributed throughout the ship. For this purpose there can be used either steam, hydraulics, compressed air or electricity. Hydraulics and compressed air not only have a low efficiency of conversion (from steam), but it is difficult to prevent leaks, freezing, bursting of pipes, etc. They have both been tried to a limited extent and both found wanting in service. This leaves steam and electricity as the two remaining systems of distribution from which to choose.

Electricity Direct from Coal.²

By A. J. ROGERS.

All who have thought of this subject at all recognize how important it would be to have a carbon battery, where carbon is consumed, instead of zinc or other metal, and where the oxidizing agent shall be oxygen of the air, or other cheap and abundant material that will directly or indirectly act upon carbon in some suitable electrolyte.

We all know how wasteful the steam engine is of energy. In the best equipped stations, where the steam engine furnishes large amounts of power, the minimum quantity of coal used per horse power hour is from four to 4½ pounds, while in smaller plants from 10 to 15 pounds are consumed, although the theoretical amount should be about .175 pound.

Engineers tell us that the steam engine is nearly to the limit of its possibilities for improvement. But

and three amperes was given by one cell. In attempting to verify these results I could obtain only from .1 to .2 of a volt, and this did not materially change by the addition of a blast of air. The same voltage can be obtained even when the carbon rod touches the bottom of the iron pot, seeming to indicate thermo-electric rather than electro-chemical action.

In June, 1894, Professor Ostwald proposed an ideal CO consuming cell. He proposed the use of an outer copper containing vessel, which should serve as anode. Within this vessel was a porous cup containing the carbon cathode with lumps of carbon. Surrounding the porous cup was a saturated solution of Cu_2Cl_2 and a constant supply of CO, forced into the solution that would be absorbed by it. A stream of air was also supplied to the cathode compartment.

Following out this line of investigation, Dr. Borchers, some five years ago, undertook a series of experiments, using CO and air in an electrolyte of Cu_2Cl_2 , which really absorbs CO and O.

Since the heat energy of CO with O is 75 per cent. of the total energy of the carbon with oxygen, if the two gases can be caused to combine, either directly or indirectly, setting free electrical energy instead of heat, a tremendous step would be gained.

Borchers thought he had accomplished the desired result. He claimed to obtain as high as 27 per cent. of the calculated energy of combination

similar results, except that the electromotive force would more rapidly diminish, probably from decreased internal resistance.

The direction of the current was from the CO charged plate, through the external circuit to the O or air plate. To what extent, if at all, the Cu_2Cl_2 acts as a conveyor of CO to O, I think still a matter of doubt.

As early as 1883 Carl Hering and Dabrowsky report having obtained considerable current with carbon electrodes, H_2SO_4 as an electrolyte, and coal gas brought in contact with one plate and air with the other.

As an aid and a guide to experimental investigation, it would seem to be desirable to determine if the element C can exist in an electrolyte in the ionic state.

With this end in view, Dr. Alfred Koehne, in a paper before the Physical society of Berlin, on February 14, 1896, attempted to show that coal does form ions, and therefore it is theoretically possible to oxidize carbon at ordinary temperatures and obtain electrical energy instead of heat.

He used pure coal as anode, hot H_2SO_4 as electrolyte and Pt as cathode. The liquid became yellow, then dark brown and black, and a thin layer of graphite was deposited on the cathode.

Using C and PbO_2 as electrodes and hot H_2SO_4 as electrolyte, he obtained a galvanic cell, giving an electromotive force of one volt on a resistance of 100 ohms.

Bartoli and Pasogli had previously found that using H_2SO_4 as an electrolyte and carbon electrodes, CO, CO_2 and O formed at the anode.

Koehne obtained 70 per cent. CO_2 , 29 per cent. CO and one per cent. O.

In the *Zeitschrift für Electrochemie* for 1896 (Vol. 2, p. 581), Franz Vogel thinks that Koehne did not obtain carbon in solution, and he thinks the carbon deposited was of mechanical origin and not electro-chemical. So it is perhaps hardly yet proven that carbon does form from free ions in electrolytes at ordinary temperatures. If it does not, the field for investigation in this direction would not seem promising of great practical results.

Within the last two years experimenters have returned again to the fused electrolyte for the carbon-consuming cell.

W. W. Jacques of Newton, Mass., employs fused NaHO as the electrolyte contained in an iron melting pot. This vessel also serves as an electrode. Air is admitted at the bottom of the iron vessel and mixes with the electrolyte and comes in contact with the carbon electrode suspended in the liquid. CO passes off through an opening in the top of the iron tank.

To produce fusion the NaHO is heated to 400° to 500°, MnO_2 and MgO added, and MgCO_3 forms and decomposes, so that only a small amount of the oxide is necessary. Jacques states that he used 100 cells, each 30 centimeters deep and 36 centimeters diameter, and obtained a current of 18 amperes at 30 volts for 18¾ hours with a consumption of eight pounds of carbon.

In another experiment he reports that with 100 cells he obtained 90 volts and 16 amperes, giving him an efficiency of 85 per cent. of the energy of the carbon consumed.

C. J. Reed says the process is electro-thermic and not electrolytic. He finds that illuminating gas will also produce the same effect as air. He also finds that the carbon may be replaced by a metal and that the polarity changes at a red heat.

Without having carried these experiments to the same extent as reported by Jacques, I nevertheless, have been able to get only a maximum of about .3 of a volt electromotive force with an iron containing vessel and electrode, and I question his results, even though they are reported to be supported by the authority of Professors Cross and Rowland.

Employing a Pt crucible instead of iron as the containing vessel and electrode, I find an electromotive force of nearly .5 volt at a red heat of the NaHO.

According to a United States patent issued to Blumenberg nearly a year ago, superheated steam is injected into the fused electrolyte, consisting of CaO , NaHO and eryolyte. He claims these oxides give up a part of their oxygen to the carbon electrode, forming CO and CO_2 , and then receive back their oxygen from the steam, setting free hydrogen. If this is the end of the process, it would hardly seem probable that heat or electrical energy would be liberated.

While the problem of obtaining electricity from carbon direct has not yet received a practical solution, it cannot yet be regarded as insoluble.

The chance for success, however, would seem much better in endeavoring to oxidize the easily obtained hydro-carbons and CO.

We are chasing no "will-of-the-wisp" in working upon this interesting and far-reaching problem. What is necessary is to discover the right conditions.

If we keep closely to the theory of the galvanic cell, as worked out by Nernst and others, we cannot get far astray and are likely to reach valuable results in the solution of this greatest of technical problems.

If any approach to 100 per cent. of the energy of the coal can be secured, an industrial revolution would follow, in comparison with which the invention and perfection of the steam engine is almost insignificant.

FIG. 6. TWO NEW TELEPHONE EXCHANGES IN CHICAGO,—GENERATING PLANT AT "CENTRAL," WITH DISTRIBUTING BOARD ON THE RIGHT.

how imperfect a machine it is and must continue to be if in practice only five to 10 per cent. of the energy given by the coal can be realized in actual mechanical work.

It is hence well worth the attention of investigators and practical men to make earnest endeavor to explore this field of scientific research to determine what conditions, if possible, are necessary to change carbon into electrical energy instead of first transforming into heat.

Earlier attempts were made to get a practical carbon battery using a rod of carbon dipping into a vessel of molten KNO_3 or other powerful oxidizing agent.

As early as 1855 Becquerel had used various molten electrolytes with carbon as one electrode and a platinum containing vessel and electrode. In 1877 Jablockhoff procured a patent on the use of a solid electrolyte in a state of fusion which would set upon a carbon electrode. Thompson, Edison and others proposed practically the same method. In 1882 J. A. Davis proposed to infuse air into the electrolyte, and in 1883 A. M. Clarke used KHO or NaHO and regenerated with air. I believe Rowland states that in his experiments with the process there is no regeneration.

The cell of C. S. Bradley, described by Professor F. B. Crocker in a paper before the American Institute of Electrical Engineers in 1888, has a fused electrolyte of Na, MnO_2 contained in an iron vessel having as the negative electrode, and a carbon rod dipping to near the bottom of the liquid mass as the other electrode. With the iron pot at a red heat it is stated that an electromotive force of one

1. Borchers' experience with hydraulic turret machinery.
2. Read before the Northwestern Electrical Association at Milwaukee, January 13, 1899.

of $\text{CO} + \text{O}$ to form CO_2 , and with gas from bituminous coal he obtained as high as .64 ampere on short-circuit and .56 volt on high resistance with his apparatus, giving him an efficiency of 38 per cent. Many experimenters, including C. J. Reed in this country, H. H. Barnes and E. Vesemmyer of Stuttgart, Rhodin of Manchester, England, Robert Mond, William Tatlow and others, have repeated Borchers' experiments, varying the conditions, and criticize his results. They consider that the electromotive force is due, not to the union of CO with O, but rather as the result of the oxidation of the Cu of the Cu_2Cl_2 .

In July, 1897, Borchers read a paper before the Electrical society of Germany, in which he claimed that he had eliminated all sources of error in his coal element.

By the use of glass plates instead of porous diaphragms, he separated the Cu_2Cl_2 and CuCl_2 , and prevents diffusion. These glass plates extend into Hg, covering the bottom of the cell. The electrodes are made to revolve in the CO and in the Cu_2Cl_2 , to absorb the CO in the best possible manner. By using plates of the PbO_2 or MnO_2 instead of metal, he obtained an electromotive force of .5 volt.

Since it is still questioned whether Borchers' experiments are conclusive that an electromotive force is possible with CO and O, I strongly heated two like plates of carbon in an oven, then immersed one of the plates and allowed it to cool in an atmosphere of CO and the other to remain in air. After cooling they were partially immersed in a vessel of ordinary lake water, and the electromotive force noted was as high as .4 volt. The experiment was also repeated, using a dilute solution of H_2SO_4 , with

Typewriting by Telegraph.

The accompanying diagram illustrates the principal features of the electrical selective apparatus invented by John S. Thompson of Chicago, who claims to have solved the problem of successfully controlling the action of any one of a series of devices from a distant point by means of a single electrical circuit. Mr. Thompson connects in parallel as many electromagnets as there are devices or characters to be selectively operated—if a typewriter, one magnet to each typebar or lever. These electromagnets vary in construction throughout the series, their cores being given successively a larger number of turns of the same size of wire, or the same number of turns of successively smaller wire, either arrangement resulting in magnets requiring electric currents of different sizes or strengths to energize them. The magnets having the greater number of turns, and, therefore, responding to the smaller currents, require relatively long periods of time for their actuation.

By suitable cut-outs the actuation of any one of this series of magnets simultaneously breaks the circuit at a point immediately beyond itself, thus cutting out all the slower magnets before they have had time to become energized and attracting their armatures. Another feature is that the breaking of the circuit by the actuation of any one of the magnets simultaneously throws into circuit a resistance equal to that of all the devices so cut out, thus maintaining the resistance of the entire series substantially uniform. To operate, then, any one of a series of devices, it is only necessary to develop in the transmitting circuit the current necessary to energize the magnet associated with that particular device. The current sent over the circuit by the depression of a certain key, for example, will divide itself among the electromagnets at the receiving point, and if insufficient to energize the nearest and most quickly acting magnets, it will pass without affecting them and, energizing the magnet adapted to it, cause it to attract its armature and break the circuit, cutting out the slower magnets before they have time to act, and thus secure individual selection.

The principal application of this invention will be in meeting the demand for better, cheaper and more rapid transmission of telegraphic messages. Secrecy, so highly desirable in telegraphy, is assured, the ticking of the sounder being eliminated and the actuation of the relays in the circuit or the typebars at receiving stations, telling no audible tale of the message being transmitted. Moreover, as the receiving is entirely automatic, the liability of error is reduced to a minimum and an exact copy of the message as sent is retained at the transmitting station, the typewriter being capable of use, both as a receiving and sending instrument.

The possibilities of this invention are not limited to this application. In party-line telephony, annunciators, signals, typesetting machines and other kindred devices it will find its field of greatest usefulness.

Mr. Thompson was assisted materially in his work by A. Miller Belfield of Chicago, whose experience in electrical work and as a patent expert proved valuable to the inventor.

New Scheme to Utilize Wave Power.

The possibility of utilizing the power of the waves and tides of the ocean to perform useful work has long been an enticing one to inventors, and many attempts have been made to "harness" the mighty forces of the deep. One of the inventors who has attacked the problem is Herbert E. Rider of New York, and the Ocean Power company, with a capital of \$5,000,000, has been organized to commercially exploit his ideas and appliances. It is claimed that \$50,000 has been spent in perfecting the invention. An experimental station has been erected at Galilee, N. J., on the sea coast. This plant, Mr. Rider says, is equipped with engine, dynamo, piping, regulating devices and other machinery with which to convert the power of the waves into electricity. The idea is to utilize a volume of air under low pressure by the use of various buoys working independently by the rise and fall of the waves, compressing a volume of air under low pressure into a large receiver or reservoir, from which it can be drawn off in volume under low pressure to run engines with specially constructed large cylinders. It is said that a small experimental buoy, anchored about 700 feet off shore, has worked effectively in forcing compressed air through iron pipe one-fourth of an inch in diameter. This buoy, it is declared, worked accurately throughout a number of severe storms along the coast, and the only effect of the rough weather upon it was to cause it to compress a larger quantity of air. Three large buoys are now in the course of construction, and it is asserted that a large plant will be built at Rockaway Beach.

Nassau Company Fined \$1,825.

The amount of the fine taxed against the Nassau Electric Railroad company of Brooklyn last month by Judge Laconbe of New York was \$1,825. It was imposed for contempt of court in continuing to use, after restraining injunction had issued, electric motors attached to car trucks in such a manner as to infringe patent No. 324,892, granted to F. J. Sprague. The preliminary injunction was granted June 20, 1898, at the instance of the General Electric company. The Nassau company was fined \$25 each for 73 offending cars.

Carbon Duty Assessed at Twenty Per Cent.

The United States Treasury Department has been informed that the government's appeals in the cases of United States versus Hugo Reisinger and the United States versus Dingelstedt & Co., and Dingelstedt & Co. versus the United States, have been decided in the United States Circuit Court of Appeals for the Second Circuit adversely to the government.

TYPEWRITING BY TELEGRAPH.

The merchandise involved in these suits consisted of arc-light carbons, imported under the provisions of the tariff act of August 28, 1894, and classified for duty under paragraph 86 of that act, under the enumeration for "all articles composed of earthen or mineral substances, including lava tips for burners, not specially provided for, * * * not decorated," at 30 per cent. ad valorem. The importers protested, claiming the merchandise to be properly dutiable at 20 per cent. ad valorem as a "non-enumerated manufactured article," under section 3 of the act. This claim was sustained by the United States Circuit Court for the Southern District of New York on the original trial of these cases, and the appeals have been decided, as above stated, upholding the 20 per cent. interpretation.

Ice Palace at Niagara Falls.

The electric roads in and about Niagara Falls have had their winter business materially increased by the travel to see the ice scenery. In addition to the natural scenery there is an "ice palace," which stands on the riverway, immediately opposite Prospect Park and near the end of the upper steel arch bridge. When the palace was first started warm weather set in and ruined that part of the structure then

ICE PALACE AT NIAGARA FALLS

completed. Nothing daunted, the promoters of the enterprise set to work to rebuild the palace and carry out their original idea. Ice became scarce and it was necessary to call on Buffalo and St. Catharines, Ont., for a supply, so that the palace as it was finished was not fully up to the original plans. An enclosure within a fence of ice is used as a skating rink. Electricity was brought into service to light the palace. A picture, entitled "Mischievous Brewing," is lighted and transformed by incandescent lights. There is an electric shield 11 feet high and a waving flag. There is also a windmill made of small incandescent lights. On the upper steel arch bridge a large searchlight is in operation, and its beams on the ice interest all. Under this light the ice palace is very pretty.

The California Legislature is considering a bill appropriating \$13,000 for an electric-light plant in the Yosemite Valley.

Combination of Chicago Street-railway Companies.

Mr. Yerkes has publicly announced his plan in favor of the combination of the Chicago Street-railway Companies on the North and West Sides of Chicago. As he is heavily interested in all of them, his will probably be carried out. The Chicago Tribune asserts that the Chicago Consolidated Traction company has been organized for the purpose, with authorized capital stock of \$15,000,000, and that all the outlying Yerkes roads (not the main North and West Side systems) will be absorbed by it. The company will be incorporated under the general law of the state authorizing a horse and dummy railway business. The names of the companies that are said to be about to enter the combination, with their stocks and bonds, are tabulated thus:

Companies.	Capital.	Bonds.
North Chicago Electric Railway Co.	\$ 2,000,000	\$ 700,000
Cicero and Proviso Street Railway Co.	2,000,000	1,000,000
Chicago North Shore Street Railway Co.	6,000,000	800,000
Chicago Electric Transit Co.	1,500,000	1,000,000
North Side Electric Street Railway Co.	1,500,000	150,000
Suburban Railroad Co.	1,200,000	2,000,000

St. Anthony Falls Power Plant.

The equipment of the power house at the lower dam of the Falls of St. Anthony at Minneapolis, Minn., is about to be completed, and the necessary arrangements have been made by the St. Anthony Falls Power company with the General Electric company, which manufactured and installed the plant now in operation. The hydraulic work and the power house were finished in the spring of 1898, and five three-phase alternators of 700 kilowatts each and two direct-current generators of the same capacity, with the necessary rotary converters and static transformers, were installed. The full equipment of this power plant as originally laid down contemplated the use of eight alternators and two direct-current machines of the total capacity of 10,000 horse power. The present plant has been in full operation since May of last year, the current being used to drive the street and interurban railway systems of the Twin Cities Rapid Transit company, which operates the electrical railways of Minneapolis and St. Paul. The additional equipment will consist of three 700-kilowatt, three-phase, revolving-armature alternators, with rotary converter,

step-up and step-down air-blast transformers and switchboards for the generators and converter. The installation of this machinery will increase the generating capacity to the 10,000 horse power originally contemplated.

Line Material on Mexican Free List.

On March 1st there will pass into effect a revised Mexican tariff in which have been made several changes, and among them one of especial interest to electrical men. Under the present reading of the tariff there is only a provision for free entry of poles, cross-arms and spikes of wood for telegraph and telephone lines. This has been changed so that the paragraph will now read "poles, cross-arms and spikes of wood for the stringing of electrical wires," and this will also include the poles, etc. for electric railroads, which have heretofore been excluded from the privilege of free importation. This was accorded to the first mentioned articles.

EVERY SATURDAY.

view of determining whether transmitters are the means of spreading disease. The inspectors will be provided with a quantity of absorbent cotton, with which they will thoroughly clean the transmitters and receivers.

President McKinley has sent a special message to Congress urging that body to recognize the importance of the subject of laying a telegraph cable in the Pacific, connecting the island possessions of this country with the seat of government, and take immediate action upon the plans already before it.

An interview published in the daily papers represents Mr. Scrymser as taking a gloomy view of the situation. He says existing cable companies enjoy a monopoly of the telegraph business in the Philippines, and all Asiatic connections are under their control.

Liability for injuries sustained by workmen in the discharge of their duties has proved a subject of legal contention in every department of industry, and many fine distinctions have been made by the courts, especially in electrical cases.

A man employed in the work of substituting iron poles for wooden trolley poles that had become rotten was injured by the breaking of one of the old poles. He sued for damages and got a verdict in his favor, but the Supreme Court of Minnesota reversed the judgment of the lower court, and, in its opinion, says the old wooden pole was not, as the man's counsel contended, an instrumentality furnished by the master for the purpose of raising the iron pole, and of such a character that the master was liable for failure to repair that instrumentality.

Street-railway legislation for Chicago is confidently anticipated by the management of this class of properties and by the representatives of the anti-Allen law movement. It is announced that a bill has been prepared which will provide for an extension of franchises for 25 years and a lower fare for those who purchase tickets.

empowered to draw the ordinance, fix the terms and make the contract, leaving nothing for the council to do but either ratify or reject its work. It will provide that the company seeking an extension must file its petition with the commission three years before the expiration of its franchise, and that the commission must place an ordinance before the council within one year thereafter.

Platinum has been discovered in the Yukon district, and, should the first indications be confirmed by more thorough investigations, the wealth of the region will be increased materially and the market for the metal correspondingly affected. It is explained that the black sand which is found in almost every stream in the Yukon territory, and which has heretofore been considered a nuisance to washers, although an indication of the presence of gold, has been thrown away as a worthless by-product.

At the outset it was ascertained that 25 per cent. of the black sand was not magnetic iron oxide, and the two grades were carefully separated. The magnetic sand was subjected to furnace tests under varying conditions, and, at the proper heat, it was found that all but the metals wanted were volatilized or converted into slag, leaving buttons of platinum and gold. One ton of black sand contained 96 ounces of platinum and considerable gold, in addition to the placer gold caught in the sluices and upon the amalgam.

Forty cubic feet of gravel in place gave 12 pounds of black sand by the usual lixiviation process. This black sand, assayed and analyzed, gave a high value in gold and platinum, with traces of silver, copper, tin and iridium. The sample, when analyzed for platinum, gave the enormous amount of 96 ounces to the ton, the platinum being the shape of finely divided minute grains of metal, combined with similar sized grains of excessively fine gold, to the value of \$102 to the ton.

Very little platinum is produced in this country, the total output in 1897, according to the government statistics, being 150 ounces, worth in the crude state \$900. During the last few years there has been a systematic search made for platinum throughout the United States, Canada, Alaska and South America, but nothing was discovered as promising as the reports from Dawson City. Most of the platinum used in this country comes from Russia, the average production of late years being 175,000 ounces and the average price \$11 per ounce.

The New York Board of Health has taken official notice of the fact that disease germs are propagated and distributed through the agency of the telephone. It has accordingly ordered inspectors to make an examination of the public telephones, more especially those which are extensively used, with the

Dr. Rowland's Printing Telegraph Machine.

For a long time Dr. Henry A. Rowland, the eminent physicist of Johns Hopkins University, has been at work on an invention designed as an improvement in the art of telegraphy by sending several messages over one wire, both ways, at once.

Professor Rowland and those interested with him in the machine are convinced that it will completely revolutionize the art of telegraphy. The advantages claimed for the Rowland printing-telegraph machine, as given in the Chicago Tribune, are that it enables several messages to be sent and received together and at the same time from the same or separate points over the same wire; that it makes it impossible to "tap" a wire and catch any one or more of the passing messages, and that it will not be affected by the weather.

The operation of the instrument may be most readily understood by beginning with a consideration of any part of the mechanism situated at the sending station. The sending instruments are fitted with a keyboard, like typewriters. Their numbers are the same as that of the messages that it may be desirable to send simultaneously. Light is the regular number of messages that the instrument is designed to handle at once, but it could be taken without special inconvenience. Each keyboard must have a person to operate it; the economy in labor is experienced at the receiving end of the line. Still considering the sending instrument, and supposing all eight of the keyboards—it matters not how widely separated—to be in use, the operators rattle ahead with their messages as rapidly as they choose and without regard to one another.

It would seem as though the eight dispatches, switched on to a single wire, would produce hopeless confusion, but one of the devices of Professor Rowland's instrument adjusts the words in such a way that the separate letters of the respective messages cannot start on the main wire out of their regular turn.

For example, suppose the first words of six sentences, started simultaneously, to be respectively "Wheat," "The," "Jarvis," "Yonkers," "League" and "Armenian," the adjuster would select in turn the letters W, T, J, Y, L, A, h, h, a, o, e, r, etc., the order of rotation being constantly preserved.

So long as the message-sending capacity of the instrument is not exceeded it makes no difference whether the messages all be sent in one direction or part of them in one direction and part in the contrary. The adjuster will accomplish its work as well with four messages going north and four coming south or one going north and five coming south as it will with the whole group of messages proceeding in the same direction. This result is made possible by the nature of the alternating current.

At the receiving station the Rowland receiver performs its work without human aid. The eight messages are automatically separated and distributed to the instruments. These print out the messages as fast as received. At present Dr. Rowland's instruments are fitted to print on ribbons of paper, such as is used in the familiar "ticker," but his perfect machine will print the messages out on sheets of paper of any desirable shape and size. Hitherto there never has been a successful attempt to attain this result.

The only attention necessary at the receiving station is to supply the instrument with paper and take away the printed sheets.

The receiving instrument has the appearance of complication, but Professor Rowland says that it is not apt to get out of order.

Incidental to his work on the "multiplex printing telegraph," as the above-described instrument is called, Professor Rowland is developing a "sex-tuplex" instrument, to send and receive messages by the Morse system. Except that it will not print its messages, this instrument will have substantially the same advantages as the printing telegraph. It will do the same work in the way of sending several simultaneous messages in either or both directions on the same wire, but will require an operator, of course, at every instrument. It is this instrument that Professor Rowland hopes to make popular in this country.

A second incidental to the experiments leading up to the "multiplex" has been the partial development of a receiving instrument that will print two messages at the same time. This result will be accomplished by a single set of type.

Electrical Development in Nicaragua.

In Nicaragua a system of telegraph lines about 1,800 miles in length has already been established. The wires and telegraph instruments used are American products. There is another telegraph line to San Juan del Norte and one to Bluefields on the Atlantic coast. The principal cities along the railway are connected by telephone, the line being about 200 miles long; the wire used is hard-drawn copper wire. The apparatus used is the French Roulet and the American Hunnings transmitter.

Electric plants are used in Managua, the Nicaragua sugar estates of San Antonio, the Barillas coffee estate, Santa Francisca mining syndicate and the

Rodriguez sugar estate. The dynamos used in the plant at Managua were furnished by a New York concern; those of Rodriguez and Barillas are of American origin, while the lighting apparatus for the Santa Francisca mines and the San Antonio sugar refinery are of English manufacture.

A plan is under consideration now to use the water power of the Lake of Nicaragua for electric light purposes. This can be achieved by cutting a canal one mile long from the lake to the town of Tipitapa. By this canal a waterfall of 15 feet will be made available throughout the year, the force of which will feed three-phase alternating current generators of 300 kilowatts' capacity, that would furnish 245 arc lights of 2,000 candle power and 3,000 incandescent lamps of 16 candle power, to be distributed among the towns of Managua, Masaya and Granada. The motive power obtained in daytime would equal 300 horse power at the end of the lines. The cost of this plant is estimated at about \$150,000 gold, including buildings.

Innovation in Incandescent Lighting.

Professor Walther Nernst of Göttingen University has invented a new electric lamp which he claims reduces the cost of incandescent electric lighting by half. The new lamp needs no glass bulb and burns with a filament much less fragile than the carbon ones used in the ordinary incandescent lamps.

Nernst's lamp has been in operation at the Society of Arts, London. James Swinburne, who is the inventor's representative, explaining the advantages of the lamp, said:

"First, this lamp needs no enclosing. It burns in the open air. The filament is essentially a thin rod of highly refractory oxides, which, as it will not convey the electric current at an ordinary temperature, has to be heated to a dull red heat before the electric current will flow. This heat can be produced by a match or spirit lamp or other device. Once the rod reaches the desired temperature it becomes a white light, giving a light that is as near sunlight in quality as possible. The lamps can be made all sizes and utilized for street purposes, giving a light less dazzling but more steady than the arc lamp. It is vastly superior to the gas lamp. The invention is of recent date, but already lamps are made to last 500 hours, as against 1,000 of the usual incandescent lamp. It requires less than one-half the quantity of electrical energy, and, compared light for light with existing incandescent lamps, the consumer will benefit largely by its introduction."

London correspondents say that electrical experts present at the demonstration admitted the excellence and illuminating power of Nernst's lamp, and the meter showed that the inventor's claim as to its economic properties was scarcely exaggerated, but the general opinion prevailed that the necessity of using other artificial light to start the lamp was a serious defect. Nernst is now engaged in experiments to remove this objection.

It is said the Nernst lamp gives one candle power for the expenditure of 1 1/2 watts of electrical energy.

Death of J. H. Bunnell.

By the death of Jesse H. Bunnell, head of the firm of J. H. Bunnell & Co. of New York, the electrical fraternity of the East loses a well-known figure. Mr. Bunnell, who was born in Massillon, O., in 1832, distinguished himself when a young man as a military telegrapher. He entered the local telegraph office at the early age of 11 and became an expert operator, winning the record for fast sending in 1860. At the outbreak of the war young Bunnell entered the military telegraph service. He was an active participant in some of the most stirring scenes of the Rebellion. He was attached to the Army of the Potomac and the Army of the Cumberland, serving at the headquarters of Generals McClellan, Burnside, Rosecrans, Thomas and Sherman as their personal telegrapher. At the battle of Antietam he set up his office on the field and sent and received messages under fire. He was with General Rosecrans at Chattanooga, and after the flight of the right wing was the last man on the field. He remained on the spot and opened communication with Rosecrans. He rejoined the army at Atlanta, but was so much overcome with the long hardships he had endured that he was unable to accompany Sherman on his march to the sea, and returned to his home in Ohio. All through his perilous service with the army he had distinguished himself for coolness, discretion and bravery.

After the war Mr. Bunnell came to New York and engaged in business, organizing the electrical supply firm to which he belonged about 20 years ago. He died in Brooklyn on February 8th, from weakness following an attack of the grip, leaving a widow, two sons and two daughters.

Electric Railway for Princeton, Ill.

An ordinance is under consideration by the City Council of Princeton, Ill., providing for a franchise for an electric railway that will furnish the people of that city transportation facilities within the city and give them connections with neighboring towns. The term of the franchise is to be 50 years, and the company will be permitted to use its tracks for hauling freight at night, but restrictions will be imposed prohibiting the handling of freight through the principal streets of the city during the day.

The Recent "Spell of Weather."

The exceptionally severe cold weather prevailing along the Atlantic coast by very heavy snows that prevailed in the north and cold temperatures in the United States for the first half of February, has been the resource of many of the electric street-car companies to the amount of a month for work on street-car traffic was at a standstill for hours or even days at a time. The snow and ice on the roads in New York and Washington, D. C., have fared as well as the overhead trolley lines. One Washington correspondent, writing on February 8th, says: "The principal street-car lines of Washington are operated by an underground electric system and have since Sunday been compelled to close on a severe snowstorm as Washington has known in years. More than 14 inches of snow has fallen, and it is still on the street, but the cars have for a time furnished an uninterrupted service. Later, however, as the depth of snow steadily increased, the companies operating the lines with underground contact wires were forced to discontinue the running of trains.

Fortunately, the snow was dry and fine and did not attach itself to any great extent to the overhead wires. Therefore, the operation of the telegraph and telephone lines was not greatly interfered with.

In Chicago, for two weeks, the temperature ranged from five to 20 degrees below zero nearly all the time, and great difficulty was experienced in heating the cars. The heat of the coal stoves in the surface cars was felt only by those who could huddle over them. In the elevated trains the electric heaters, distributed throughout the cars, were somewhat more efficient; but the trouble was that the companies were not prepared to spare enough current from the driving motors to heat the cars properly. There was insufficient generating capacity at the stations to move and light the trains and at the same time supply the enormous heating current demanded.

Government Electrical Work.

[Special correspondence of the WESTERN ELECTRICIAN.]

WASHINGTON, February 13.—The secretary of war has asked for an appropriation of \$9,851.24 for restoring the power house, machinery and electric plant at the Rock Island arsenal, which were destroyed by fire on January 3d. On account of this fire it is necessary to run a large part of the plant by steam instead of water power, at a greatly increased cost of manufacture. The estimated cost of replacing the electric plant is \$2,000, and, in the interest of economy, the secretary asks that the appropriation, if practicable, should be made immediately available.

The Treasury Department is inviting sealed proposals, until February 21st, for the installation of a system of conduits and wiring for electric lighting in the United States Postoffice building at South Omaha, Neb. Plans and specifications can be had upon application to O. L. Spaulding, assistant secretary, Washington, D. C.

The Bureau of Supplies and Accounts of the Navy Department has invited proposals for furnishing the New York navy yard with the following electrical supplies: Four testing generators, 50,000 ohms; four portable, direct-reading voltmeters, scale, 0 to 125; four hand tachometers; four hand speed-indicators; eight engine indicators; 694 80-volt lamps of 16 candle power, and 48 of 32 candle power; several thousand feet of single and double-conductor wire; several thousand feet enamel conduit; insulating outlet elbows, ceiling fixtures, reflectors, side lights and desk lights.

Sealed proposals have been invited by the Treasury Department for the installation of a system of conduits and wiring for electric lighting in the United States public buildings at Pottsville, Pa., Akron, Ohio, and St. Albans, Vt. A. F. T.

President's Cable Message.

President McKinley's message on the Pacific cable, transmitted to Congress February 10th, is as follows:

As a consequence of the ratification of the treaty of Paris by the Senate of the United States and its expected ratification by the Spanish government, the United States will come into possession of the Philippine Islands, in the further States of the Pacific. The Hawaiian Islands and Guam being United States territory and forming convenient stopping places on the way across the sea, the necessity for speedy cable communication between the United States and all the Pacific Islands has become imperative.

Such communication should be established in such a way as to be wholly under the control of the United States, whether in time of peace or war. At present the Philippines can be reached only by cables which pass through many foreign countries, and the Hawaiian Islands and Guam, especially being surrounded by steamers, involving delay and expense, it is greatly to be regretted that the present conditions should not be allowed to continue for a moment longer than is absolutely necessary.

The time has now arrived when a cable in the Pacific may extend as far as Manila through the Hawaiian Islands and Guam on the way. Two methods of establishing the cable communication are suggested. First, the establishment and maintenance of such a cable at the expense of the United States government, and second, the establishment of such a cable by a private United States corporation, the charter to be granted as Congress shall decide.

I do not make any recommendation. I believe that these methods would be equally desirable. A cable of the length of that proposed requires a substantial expenditure, and having that in its estimate, at least two or three years after giving the contract for the cable, the government should be successfully laid out in operation. For the reasons soundness must be taken west of the Hawaiian Islands, the best route for the cable in the Pacific is the one that stands it becomes a point of interest that the cable should be taken by the route that is most economical and that means as may be desirable for the establishment of a cable system.

I recommend that the whole subject be referred to the Joint Committee on Commerce and Navigation, and to the Senate and House of Representatives, as a basis for their consideration.

DEVELOPMENT OF THE TELEPHONE FIELD.

Modern Bridging System.¹

By HERBERT LAWS WEBB.

The diagrams shown give a clear idea of the principle of the electrical self-restoring drop and of the circuits of the bridging board. This system was designed by the Western Electric company of Chicago. It marked a great step in advance in telephone-exchange operating, and has been extensively adopted all over the world. The principal features of the system, as already stated, are a balanced metallic circuit, absolutely free from jack contacts, for the line, an entirely separate test circuit and an automatic resetting of both line and clearing-out drops.

The self-restoring drop is of the same pattern for both line and clearing-out drop. It consists of two separate electromagnets operating on two distinct armatures. *A* is the line coil, wound to a high resistance, usually 600 ohms, as it is bridged permanently across the line. *B* is the restoring coil of low resistance, which is included in the test circuit and is energized by the test battery. When *A* is energized by the line current the armature *a* is

Self-restoring drop. *A*, line coil; *B*, restoring coil; *a*, armature; *c*, *d*, releasing lever attached to *a* and engaging in *b*; *b*, drop bearing; *r*, aluminum shutter covering *b* when *b* is in normal position.

Diagram of spring-jack and plug of bridging board. *a*, line spring; *t*, tip of plug; *b*, *b'*, test springs; *c*, collar on plug making contact between *b* and *b'* and so throwing *TRB*, test and restoring battery, in circuit with test wire and restoring coil of drop; *d*, barrel of jack connected to second line wire; *s*, sleeve of plug, making contact with *d*; *e*, rim of jack connected to test wire; *T*, line wires; *T*, test wire.

MODERN BRIDGING SYSTEM.

attracted and the drop-shutter *b*, normally held by the tip *d* of the armature lever *cd*, is allowed to fall forward; *b* only falls forward a short distance, but in falling it pushes outward and upward a light shutter *e*, pivoted at the top, which normally hangs over *b*. The drop number is painted on the face of *b*; a very slight movement outward of *b* pushes *e* out and up, allowing the number on *b* to come into full view, and a very slight movement back allows *e* to fall back and completely cover the number on *b*. The back of *b* is hollowed out to fit the pole of the restoring-coil, which has an oblique pole-piece, so as to get as strong a pull as possible on *b*. When the insertion of the plug closes the test circuit the restoring coil *B* is energized, *b* is attracted and brought to its normal upright position and *e* falls, covering the number. As the test circuit is closed as long as the connection is up the drop is locked by the attraction of *B* on *b* during the time the plug is in the jack.

The diagram of the plug and jack shows that the jack consists of one short spring, *a*, to which one side of the line is connected, two long springs, which form a break in the test circuit, containing the test battery and the restoring-coil of the drop, a barrel *d*, to which the other side of the line is connected and a rim *e*, which is branched in the test circuit. The plug consists of three parts: a tip *t*, to which one conductor of the cord is connected, a sleeve *s*, to which the other cord is connected, and a collar *c*, which is insulated from the rest of the plug. When the plug is inserted in the jack *s* makes contact with *d* and *t* with *a*, thus bridging in on the line, while *c* makes a metallic bridge between *b* and *b'*, and so closes the test circuit. The wires marked *T*, *I* and *F* go to the other jacks in the series; the drop and restoring coil are not shown. The line drop is bridged across *I* and *F*, and the restoring-coil is included in the test circuit between *T* and *E*.

The bridging system, as will be seen from the foregoing description, not only cuts down the number of operations in each connection, but materially improves both the electrical conditions of the lines and the mechanical arrangement of the switchboard. The provision of a balanced circuit throughout the board and the elimination of the jack contacts remove the worst features of the series-multiple board, while the placing of the automatic drops above the jacks effects a marked gain in the compactness of the manually worked parts of the board, with a resulting improvement in speed and accuracy.

The system now being introduced in this country. Abstract from new edition of "Telephone Handbook" (Electrician Publishing Company, Chicago), now ready.

try which combines all the automatic features referred to (see WESTERN ELECTRICIAN, February 4, 1899) with a fundamental improvement in the subscriber's station is the common-battery relay system. In the relay system the battery is at the central office, and the subscriber's magneto generator and battery are done away with. In the signaling devices at the exchange a relay connected to the line and controlling an incandescent lamp in its local circuit takes the place of the drop. The operation of the board is reduced to the six steps for each connection, referred to above as being the present possible minimum. The subscriber—whose instruments are reduced to a transmitter and receiver, a switch-hook and a call bell—by taking the receiver off the hook operates the relay and lights the lamp corresponding to his number. The operator plugs into the answering jack, and by so doing extinguishes the line signal. Having got the number wanted, the operator plugs into the multiple jack and rings the called subscriber. When the conversation is ended the two subscribers hang up their receivers and the depression of the switch operates a lamp in each cord, which are the disconnection signals. The operator, by removing the plugs, extinguishes the disconnection signals and restores everything to its normal condition. It is not the province of the "Hand-book" to describe in detail an elaborate system, such as the common-battery relay system is. It would take a fair-sized volume to do the subject justice, both in its technical features and in its general bearing on the working of large telephone exchange systems. But, briefly, it may be said that the relay board, with all its adjuncts, produces radical improvements in all directions. It reduces the subscriber's station to the three indispensable elements, call bell, transmitter and receiver, doing away with the vexatious question of battery inspection and renewal. It makes the operation of the connection as nearly automatic as it ever will be made in a large system, and gives the operator easy supervision of the progress of each call, effecting a marked gain in speed and simplicity of operation over previous systems. It provides the most distinct and easily supervised signals that can be had, a lamp being decidedly superior to any form of drop or needle indicator. And, finally, with all these improvements, it preserves the multiple system, which experience shows is still the best for large exchanges, but which was at one time threatened by transfer boards employing automatic lamp signals.

EXTENSIONS AND IMPROVEMENTS.

There is talk of connecting Pala by telephone with San Diego, Cal., and Oceanside.

A trunk line between Flushing and Jamaica, Long Island, is being constructed by the New York and New Jersey Telephone company.

The Fulton (N. Y.) Telephone company will soon connect with Oswego, Phoenix and other points. E. E. Summey of Syracuse is general manager.

A proposition has been made to the Skagway City Council by a Seattle man to put in a telephone line. He asked that a franchise for that purpose be granted him.

C. J. Townsend of Boonville, Mo., will soon build a telephone exchange in that place and extend lines to Pilot Grove and Buncheon. Subscribers will receive free service to Buncheon, Pilot Grove, New Franklin, Fayette, Glasgow, Armstrong, Estill and Boonsboro.

Assistant Superintendent Bush of the Oregon Telephone company states that arrangements have been made for construction early next summer of a telephone line from Roseburg, Ore., to Myrtle Point, via the Middle Fork wagon road. He has let contract for poles.

W. E. Herron of Chicago has purchased the entire plant of the Oak Telephone company of South Haven, Mich. The exchange served 170 subscribers and had connections with all the principal towns in that section and in the outlying farming section between Holland and St. Joseph.

Application has been made to the supervisors at Sacramento, Cal., for a franchise to erect and maintain poles, wires, etc., for telephone and telegraph purposes in Sacramento County. The franchise is now advertised for sale, bids to be received up to 2 p. m., March 11th, by W. B. Hamilton, clerk.

It is believed that the consolidation of the small telephone systems of Connecticut would strengthen the independent movement in that state. In many of the towns and cities there are small exchanges with from 200 to 500 subscribers, and it is now proposed to connect all of these into one system extending throughout the state.

The Union Telephone company of Plainfield, Wis., has made arrangements to extend its line to Stevens Point, a city of 9,000 inhabitants, which is only 23 miles north of Plainfield. This company now has lines from Plainfield to Hancock, Coloma and Wautoma. The owners of the line are B. B. Borden and F. R. Borden of Plainfield and F. C. Wood and M. Plank of Hancock. B. B. Borden is president of the company.

Telephones in Hawaii.¹

By CHARLES L. RHODES.

Nowhere in the world, perhaps, is the telephone a greater factor in life than in Hawaii. In the islands there are about 2,000 telephones to a population of 110,000, or one telephone to every 52 inhabitants. On the island of Oahu, on which Honolulu is situated, there are 1,090 telephones to a population of about 45,000, or about one to each 41 of the population.

The telephone was introduced here in the latter part of 1880 and soon became an established part of the business, social and political life of the country. It may sound strange to use the word "political" in this connection, but it is true in a sober and literal sense, for in every revolution that has been planned or attempted the seizure and control of the central telephone office has always been one of the first strategical moves thought of.

The telephone is much more of a public institution here than it is in most places. Isolated as the islands are, the arrival of a steamship from a foreign land is of personal interest to almost every individual. The government maintains a lookout station on Diamond Head, from which approaching vessels in any direction can be sighted while still from 20 to 40 miles distant, depending on the state of the atmosphere. As soon as a steamer is sighted "central" is notified. "Central" then notifies the pilot office, the port physician, the board of health, the custom house, the postoffice, the newspaper offices and a few other persons who have a particular interest in having early information of this character. Then the electric-light company is notified, and it gives two long whistles if the steamer is from America and three if it is from any other part of the world. For two minutes after these whistles are blown no telephone connections are made, but the force at "central" keeps repeating the name of the steamer and its location, as "Australia off Koko Head," or "China off Waianae." So that all any individual needs to do is to go to the nearest telephone, put the receiver to his ear and listen, and he will know what steamer it is, where it is, and if he has lived here any length of time he can form an accurate judgment as to how long it will be before the steamer will be at the wharf.

If the steamer brings any striking piece of news of general interest, "central" gives it to everybody who calls up for a connection. In this way the destruction of the Maine was known all over this island within 10 minutes after the Zealandia, which brought the news, was at the wharf.

If an important personage dies the news is distributed in the same way, and "central" can always be depended on to give the hour and place of a funeral as soon as the hour has been fixed. In New York and Chicago, if you want to make an inquiry you ask a policeman. In Honolulu you ask "central."

The meatmarkets have a list of their regular customers at "central," and about six o'clock each evening "central" calls them all up in order and takes their orders for the next morning's breakfast.

Liliuokalani, in her book, "Hawaii's Story by Hawaii's Queen," gives a very naive and wholly unconscious illustration of how thoroughly the telephone enters into life here. She says that in 1888 a proposal was made to her for the dethronement of King Kalakaua and her own accession to the throne. She dismissed the messenger with an emphatic rejection of his proposal. The messenger, however, told her she would hear more of it. "In conformity with his words," she continues, "about a week from that day my telephone was rung by Mr. W. R. Castle, who wished to know if I would be at home that morning; if so, he would like to call and see me on an important matter, and would arrive in about half an hour."

On the island of Hawaii, the largest of the group, and, next to Oahu, the most populous, there are about 500 telephones. The telephone company is just completing the circuit of the island, so that every part of it will be in direct communication with every other part. When the news of annexation reached here the first island steamer to leave was bound for an unimportant port on Hawaii. But there was a telephone there, and within a few minutes Hilo, on the other side of the island, had heard the news, and from there it was distributed to every part of the island, and flags were going up at points which did not get mail advices on the subject for days afterward.

The pursers of the steamers Mauna Loa and Kinai are, by reason of the telephone, two of the most important personages in the islands.

The Mauna Loa makes a round trip once in 10 days between Honolulu and the ports on the leeward side of Hawaii. At the first port the steamer touches the purser is besieged with inquiries for the news from the outside world, and from his lips it goes over the telephone to all parts of the island, the statement that it comes from Mortimer Tuft of the Mauna Loa being accepted as the seal of authenticity wherever it goes. On the return trip, at the last port on the island which the steamer touches, he gathers up the thread of happenings, accepts messages to people in Honolulu on every subject from engagements and births to deaths and marriages.

1. From the Chicago Record.

the sale of sugar plantations, or news of an earthquake in the Kau district, so that on arrival here he is the most sought-after man in the city.

The Kinan makes weekly trips to the windward side of Hawaii, and Purser George Beckley alternates with Tuft as oracle and Mercury.

Not long ago there was a wedding on Maui to which nearly every one in good social standing on the island was bidden. It happened that there was a drought at the time, pasturage had become scant and every horse not absolutely needed for regular daily service had been turned out into the mountains to forage for himself. There was therefore a scarcity of horses to take all the guests to the wedding. But by dint of combination and co-operation, arranged over the telephone, every available horse and conveyance was made to meet the fullest requirements of which it was possible, and every guest in a territory 40 miles square knew just how he and every other guest would be conveyed to and from the wedding.

On Kauai, where there are about 200 telephones to a population of about 10,000, a very small proportion of which is white, a stranger is surprised to hear himself accosted by name wherever he goes, and almost from the moment he lands from the steamer. But the secret of it is the telephone. Gossip is busy over the wire from the time his identity is learned from the steamer's cabin list, and before he is through looking after his luggage his name and description, with such observations concerning him, pleasant or unpleasant, as strike the first observer, have gone over the telephone circuit from Nawiliwili to Hanalei.

NEW COMPANIES.

The Montgomery (Mo.) Telephone company has been incorporated with a capital of \$3,000. The incorporators are A. B. Chance, A. E. Kemper, J. W. Jacks and H. S. Jacks.

The Cameron Telephone company of Cameron, Mo. (capital, \$10,000), has been incorporated by E. C. Baker, S. D. Thompson, J. A. Livingston, C. F. Thompson and M. J. Baker.

The Duquoin Telephone company has been incorporated at Duquoin, Ill. (capital stock, \$16,000), to operate a telephone exchange. The incorporators include B. A. Youngblood, F. H. Stamper and H. H. Onstort.

The Trenton Telephone company of Trenton, Mo., has filed incorporation papers. The capital is \$8,000, and the incorporators are P. W. Bain, W. W. Bain, C. J. Bain, J. B. Wright, A. U. Spickhard, B. C. Nichols and E. M. Harber.

The Winchester, Ford and Richmond Telephone company of Winchester, Ky., has been formed to build a telephone line from Winchester to Richmond by way of Ford. S. T. Prewitt, David Prewitt and D. L. Pendleton are the incorporators.

The Fahnestock Transmitter company of New York has been incorporated in West Virginia to manufacture and deal in electrical transmitters. The authorized capital is \$100,000, and the incorporators are G. O. Robbins, Bloomsburg, Pa.; E. B. Fahnestock, N. Chase, J. E. Chessman, W. S. Logan.

The Florida East Coast Telephone company has been organized at Boynton to build and operate a line connecting the towns along the Florida East Coast Railway company's system. The capital stock is \$10,000, and the following-named officers have been elected: President, N. S. Boynton of Boynton; vice-president, G. W. King of Little River; secretary, P. H. Loud, Jr., of Miami; treasurer, M. B. Lyman of Lantana.

A bill has been introduced in the House of Representatives at Washington providing for the incorporation of the Columbia Telephone company, to construct and maintain an underground electric telephone system in the District of Columbia, with all the necessary ducts and conduits, mechanical and electrical devices. The bill provides that it shall be unlawful for the proposed company to charge at any time more than \$50 per annum for its regular service in any business establishment and \$30 for any residence. The incorporators are John D. Langhorne, Orrin G. Staples, John A. Baker, Tallmadge A. Lambert, T. Cushing Daniel, J. E. Keelyn, W. G. Waggaman, W. S. Knox, Lawrence Gardner, J. A. Blundon and Thomas Armat.

The Maryland Telephone company was incorporated at Baltimore, February 6th, with a capital stock of \$1,250,000. Henry A. Parr, George R. Webb, Pinkney W. Wilkinson, Thomas F. McGlone and John Waters are the incorporators. It is the purpose of the promoters to establish a complete plant for 6,000 telephones. At present the company will issue \$1,000,000 of its capital stock and bonds amounting to \$1,000,000. The officers of the company are: President, George R. Webb; vice-president, Seymour Mandelbaum; directors, Henry J. Bowdoin, William H. Bosley, David E. Evans and John Waters. Others interested in the enterprise are the Guardian Trust and Deposit company, Security Storage and Trust company, William F. Stone, Bartlett S. Johnson, George Blakistone, August Berkemeier, Leopold Strouse, William J. Donnelly, James Bond, John J. Mahon, Solomon Frank, Charles Adler, Lloyd L. Jackson, William G. Wetherill, Richard H. Pleasants and F. H. Hambleton.

Michigan Telephone War.

[From the Detroit correspondent of the WESTERN ELECTRICIAN.]

So far the Detroit Telephone company (independent) has not made an open move to counteract the activity of the Bell company in the state telephone war.

Charles H. Seitz, who was recently appointed to the new office of manager of the central district of the state by the Michigan Telephone company, has resigned. It is rumored that he may assume charge of the development of the independent companies in the state.

The managing committee of the reorganized Michigan Telephone company has completed its inspection of the state service, and the policy of the new management to extend and improve the service has already borne fruit. The Detroit residence and business service rates are to be reduced and also that of the long-distance and complete metallic circuits. In addition to the one-way service at \$12 per year, which furnishes an instrument upon which calls can be made and none received, recently introduced here, the company has also started a one-way service at \$18 per year, the subscriber being allowed one call of another subscriber per day, but as many calls for his telephone as others may wish to make. This service is especially designed to favor merchants and others having many incoming messages. It is also intended to make the rates for the state line service considerably lower than heretofore, and to base it upon the amount of time a line is in use.

Main exchange buildings, together with the new multiple switchboards of the relay system, will soon be erected in Battle Creek, Bay City, Lansing, Marquette, Port Huron and Kalamazoo by the Michigan Telephone company, which has also bought 1,000,000 pounds of copper, 100,000 feet of cable and 75,000 poles in Cleveland.

Troubles of a Telephone Promoter.

The *Evening Journal* of Jersey City has made a complete retraction of the charges printed a year ago against the Hudson Telephone company and George H. Atkinson, the moving spirit in that enterprise. Mr. Atkinson, accordingly, has discontinued the libel suit instituted by him against the newspaper. Concerning his plans, Mr. Atkinson made the following statement:

I planned to provide cheap telephone service to all the towns of New Jersey that desired it, so that my patrons would be united throughout the state and be benefited by their enterprise.

I started telephone exchanges in Newark, Trenton and Jersey City. The Newark exchange is doing a large business, and I connected all the exchanges with Jersey City, in which city the business is growing rapidly. I am connected with the Home Telephone company in Trenton, which is about twice as large as the Bell company's system in that city. I have started systems in Monmouth County and a large part of that county is being rapidly covered. I am treasurer of the State Telephone company, and am endeavoring, with that company, to connect all the companies, so that all the subscribers can reach each other. I am interested in a company that covers a large part of Somerset County, and have that system now connected with Newark and Jersey City, and am at work trying to connect the Monmouth and Somerset County systems with Trenton, and if I am successful there will be upward of 3,500 telephone subscribers in this state, talking together at rates which would never have been possible except for my work. In this same field, before I commenced my work, there were about 2,400 subscribers using Bell company's telephones.

Switchboard Company Dissolves.

The Fowler Switchboard and Telephone company of New York has applied for the voluntary dissolution of the corporation, and Justice Bookstaver has set down the order to show cause for May 2d. The directors are Samuel B. Fowler, John T. McRoy and L. Victor Fleckles. The company was incorporated on November 14th, with a capital stock of \$5,000, to manufacture and sell telephone switchboards. There are no creditors, and the company has property worth \$400, consisting of tools. In the capital-stock account there is a balance of \$500 on deposit in a Brooklyn bank and agreements of assignment of patents by S. B. Fowler, valued at \$2,000, and services rendered by L. V. Fleckles, valued at \$1,000.

MANUFACTURERS AND DEALERS.

The Eureka Electric company of Chicago is placing on the market a magnet bell for which many interesting claims are made. The contacts used throughout are platinum; the bell is full-nicked ringer coil of the Western Electric style, and the generator is highly finished. The new No. 44 transmitter is meeting with a ready sale and is giving general satisfaction. This transmitter is designed on scientific lines and is built for lasting qualities and good service.

"Everything used with telephones" is included in the stock handled by the Central Telephone and Electric company at 909 Market street, St. Louis, which recently moved into its new office, sample room and factory, the new quarters containing 8,500 feet of space entirely devoted to telephone goods. Everything, from telephones to fuse blocks, is carried in stock, and thus all orders can be promptly handled. The company's business is growing with the development of the independent field.

E. J. Noble of Chicago, manufacturer of woodwork for telephone and other electrical construction, has received several large orders of late from the Chicago Telephone company and the Central Union Telephone company. He has done business

with the Chicago Telephone company for over five years, and during that time has been called upon for woodwork of every variety. He has made many thousands of cable and terminal boxes for these companies, which have given especial satisfaction. Telephone companies in need of woodwork of this character will find it to their advantage to communicate with Mr. Noble when in the market.

The Western Electrical Supply company of St. Louis has recently made arrangements for the manufacture of a strictly high-grade bell of special design and construction, to be made exclusively for the telephone trade of this company, and in the future all its high-grade telephones will be mounted with these bells. The company is in a position to furnish this strictly high-grade bell, either bridging or series, separate from the instrument, when so desired. These bells are all made with a long hook, with excellent german-silver contacts and of the most modern design. Broad, noiseless gearing, automatic shunt and five magnets, all nickel-plated throughout, make it one of the most complete bells on the market.

Bert Hubbell, formerly of the Keystone Telephone company of Pittsburg and later with the American Electric Telephone company of Chicago, has recently associated himself with the Williams Electric company of Cleveland. Mr. Hubbell is one of the pioneer telephone men working in opposition to the Bell company, dating his experience from 1890, when he built an opposition telephone exchange. After that he organized the Keystone Telephone company and was largely instrumental in its rapid advancement. Since the consolidation of that company with the American Electric Telephone company Mr. Hubbell has had charge of its business at Chicago. The ability of the Williams Electric company to manufacture a superior grade of apparatus in the telephone line, coupled with Mr. Hubbell's knowledge of the telephone trade, insures a combination that should be eminently successful. This company has hitherto confined its product to magnetic bells and receivers, and its success in producing high-grade work of this nature has been so pronounced that it has recently gotten out a long-distance, solid-back transmitter that it claims possesses superior advantages, and is going to sell complete telephones and switchboards.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the WESTERN ELECTRICIAN.]

M. C. Curfman of Moorhead, Minn., complains that the telephone company refuses to put in a telephone for him. The council ordered the company to put it in or show cause why it should not. The company claims that it would cost \$200 to make the connection, and there is no prospect of other patrons in that direction. Curfman may try to induce the council to declare the company's franchise forfeited.

The Northwestern Telephone Exchange company will extend its wires north from Winnipeg Junction, Minn., in the spring to Hitterdal and Ulen, Minn.

A meeting of the Chamber of Commerce in St. Paul was recently devoted to the matter of the telephone service and the long-distance company's reasons for refusing to come in under the offers made by the council. The manager of the Northwestern Telephone Exchange company asserted that there was nothing more than a traffic arrangement between his company and the American Telephone and Telegraph company, and that his company had no particular interest in the matter whether the long-distance company was admitted or not.

The mayor of Duluth thinks that a saving of \$175,000 would be effected by the citizens putting in a telephone exchange now, instead of waiting five years, as has been proposed. He estimates the cost of an exchange system with 1,000 connections and providing for subways in the business part of the city at \$125,000.

The Northwestern Telephone Exchange company has concluded not to build from Bathgate, N. D., to Pembina.

News comes from Detroit, Mich., of a scheme to unite all the lake ports by telephone. It would give connection from Quebec to Duluth and Superior, and would include the Soo, Marquette, Calumet and other towns in the upper Michigan peninsula.

C. F. Townsan is canvassing Belmont, Ia., for subscribers to a prospective telephone exchange. He is having good success.

The business men of Red Lake Falls, Minn., are considering a project to put in a local telephone exchange and also to secure telephone connection with Crookston.

The Hutchinson (Minn.) Telephone Exchange company has been granted a franchise and has begun installing an exchange.

The new telephone exchange at Bloomfield, Ia., is proving very popular and satisfactory.

The exchange at Stuart, Ia., is about completed. De Smet, S. D., now has connection with Sioux Falls, S. D.

The Standard Telephone company of Waukon, Ia., proposes to extend its toll lines to Dubuque, Iowa.

Bruening Brothers and others of Akeley, Ia., propose to form a stock company and establish a telephone exchange.

Representative Schurman has introduced a bill in the Minnesota Legislature providing for the plac-

ing of telephone and telegraph companies under the authority of the railroad and warehouse commissioners and making them common carriers.

The Standard Telephone company is canvassing Elkader, Ia., with a view to establishing an exchange there.

Telephone connection has been completed between Mount Etna and Bridgewater, Ia.

The Home Telephone company of Fort Dodge, Ia., will add another section to its switchboard, to accommodate 100 more instruments. The first board was provided for 300 drops, and was thought big enough to meet all immediate needs, but the exchange has proved so popular that the new section is needed.

The Blue Earth Valley Telephone company has arranged to connect its toll lines with the new Citizens' Telephone company in Mankato, Minn.

A mutual telephone company has been organized at Marengo, Ia., to build a line from Ladora, Ia., to Genoa Bluffs and Marengo, with exchanges at the towns.

The Central Telephone company has bought the interests of J. W. Gregg and R. B. Dixon in the exchange at Rockwell City, Ia., and now has complete ownership.

Williams Long-distance Instrument.

The cut shows the new long-distance telephone which the Williams Electric company of Cleveland is just placing upon the market. This instrument

WILLIAMS LONG-DISTANCE INSTRUMENT.

embodies many new features which are interesting to telephone users in general and which add greatly to the efficiency of the telephone itself.

The magneto bells and receivers manufactured by this company have acquired such an enviable reputation for careful workmanship and general excellence that it is but natural to presume that in manufacturing a complete line of telephones the company will meet with the same success and maintain the same high standard.

Long Electric Railway.

The proposed electric line between Vincennes, Ind., and East St. Louis, crossing the state of Illinois, will be built by the Wabash and Mississippi Construction company, whose headquarters will be at Salem, Ill., about half-way between the termini of the road. This, it is said, will be the longest electric line in the world, and will be 160 miles long. It will follow the old stage road and will be almost parallel with the Baltimore and Ohio Southwestern road, passing through Olney, Clay City, Flora, Carlyle, Trenton and Lebanon. Over 100 miles of the right-of-way is now ready for the rail without grading. An officer of the company says that none of the stock is for sale, as all the money necessary for the completion of the road has been secured. The company, of course, will have to compete with the Baltimore and Ohio Southwestern. That road, he says, has had undputed possession of this fine territory since 1849. He thinks his company can cut rates in two and still make good profit. Work will be begun early in the spring, and it is expected to have the entire line ready for business by next fall.

New Photometer.

Illustrated herewith is a modification of the Queen standard photometer as made for the Fostoria Incandescent Lamp company. It was designed from suggestions of Mr. Hart of the Fostoria company.

The lamp manufacturer is often under contract whereby his lamps are sold at a rate depending upon the results of tests on a certain percentage delivered, and therefore he must be absolutely assured of their uniformity and correctness. But a small amount

FIG. 1. NEW PHOTOMETER.

of time can be placed individually on the lamps in testing them, so the photometer must be possessed of the greatest accuracy and rapidity of measurement. The instrument described herewith is said to embody these characteristics in the highest degree.

Fig. 1 shows the complete instrument. At the left is a pedestal of iron carrying a stage, screen and curtain, and supporting one end of the photometer bar. An adjustable lamp support on the stage holds a secondary standard, a 16 candle power incandescent lamp. This is standardized by comparison with a pair of certified lamps furnished with the photometer.

The pedestal on the right supports the other end of the photometer bar and carries a screen and an automatic rotating socket.

The photometer bar carries a metal scale, graduated in inverse squares, and having the 16-point centrally located. By this arrangement the photometer reads directly in candles when using a 16 candle power standard. The scale is inclined from the vertical, so as to be illuminated by the test lamp and render the graduations legible.

The photometer carriage illustrated has a screen

FIG. 2. NEW PHOTOMETER.

of the Lummer-Brodhuu type, an optical screen of great accuracy. When so desired, either a Bunsen or Leeson screen may be substituted.

The two rheostats below the photometer bar are for controlling the potential on the standard and test lamps respectively. They have each about 900 steps and permit of so small a variation of the candle power or potential as to be imperceptible on the most sensitive voltmeter.

The rotating socket supported by the right pedestal is more clearly shown in Fig. 2. The main driving shaft A is hollow and journaled in a step U. It has attached to it a pulley D, driven from some power shaft, and a friction-driving pulley B. This shaft runs at 180 revolutions per minute. Within

this shaft is a central one E, carrying a plate C and the screen F. Upon the plate C are mounted two rotating sockets G and H. They have journals swung from centers at X and adjustable boxes at the bottom. Spring plugs keep a suitable pressure between the friction pulleys B, I and L. Collecting rings and brushes carry the current to the lamp.

At J is a lever which engages in the plate C, preventing it from moving. Under this condition the main shaft A, which is continuously rotating, will cause both lamps to revolve about their own axis at 180 revolutions per minute. If, however, the lever J is momentarily released, the lamps will revolve about the axis of the main shaft and one replace the other.

At K is a release, which attaches to a pedal below. Depressing this throws over the shaft of the rotating socket, which happens to be there, releasing the pulley I from the driving pulley and at the same time stopping the lamp.

The operation is as follows: When the operator at the photometer has tested the lamp Y the operator at the socket trips the lever J, and the lamps exchange places. In doing so they exchange brushes and therefore circuits. This construction is to permit of having lamp at Y on normal voltage and lamp at Z on low voltage. By this arrangement the operator in adjusting lamp at Z is not annoyed by a strong light. After exchanging the lamps the operator depresses pedal, and by means of the release K stops lamp Z. It is then removed and another substituted. Releasing the pedal starts the lamp rotating slowly or fast, as may be desired. If not running truly it may be pressed to one side, and it will stay where it is placed. This is accomplished

LYNN INCANDESCENT LAMP.

by using a special socket N, which is adapted to take lamps without base and has fluted contacts, to secure a proper adjustment of the lamp terminals. When the lamp runs truly, the lever J may be tripped, exchanging the positions of the two lamps as before.

The apparatus is manufactured by Queen & Co. of Philadelphia.

Lynn Incandescent Lamp.

The illustration shows the Lynn (Mass.) Incandescent Lamp company's "New Lynn" lamp, with oval anchored filament. The filament is anchored to the glass stem, and the company has a patent on its method of anchoring. The company claims to have "altogether the finest, most symmetrical and most pleasing lamp yet produced," "all that good workmanship and the best of materials can make it." It is said that each lamp is individually tested before it is permitted to leave the factory.

To Build Electric Boats.

The Electric Boat company, with authorized capital of \$10,000,000, was incorporated in New Jersey last week "to construct boats and other means of navigation and to operate steamship lines." The incorporators are Charles Blizard of the Electric Storage Battery company, William H. Palmer and Augustus Treadwell. Half of the stock is eight per cent. preferred and the rest common.

It is stated that the new company will devote special attention to submarine boats, and that it has undertaken immediately to resume the prosecution of the work on the Plunger, which has been suspended at the Columbian Iron Works for nearly a year, and also to put the submarine boat Holland into condi-

tion for service at once. Interested in the new company, it is said, are Clement A. Griscom, Moore & Schley, Perry Belmont, William McAdoo and others.

Latest Progress in the Application of Storage Batteries.

By JOSEPH APPLETON.

PART III.

The centralization of generating plants and their location in districts where the facilities for obtaining coal and water are good has developed. The system of high-tension, alternating transmission and the distribution of direct current through rotary converters seems to be the one which will be employed in most of the large engineering undertakings to be solved during the next few years. The advantages of direct current for distribution over the alternating are so marked that at least until further improvements are made in alternating-current distribution, the direct current will undoubtedly be the one most generally used. With this system of large central power houses and sub-stations for distribution through rotary converters, storage batteries are almost essential. They reduce the size of the generating plant in the first place, and also the size of the rotary converters, and enable them both to be operated with a much greater load factor than would be possible without.

The installation of the Hartford Electric Light company, with which you are probably familiar, was the first of this description in this country, and has proved the many advantages which were claimed for such a system.

An interesting application of this sort has recently been made on a small railroad plant in Montpelier, Vt. This plant was, I believe, the first railway plant in this country to be operated exclusively from rotary converters with a storage-battery auxiliary. The line operated is about nine miles long, and the sub-station is located about three miles from one end. The power is furnished from the Winooski River, the current being generated by three-phase alternators at 2,200 volts, and carried to step-down transformers, where it is raised to 6,300 volts. At this pressure it is carried to the sub-station, a distance of eight miles, where step-down transformers reduce it to 480 volts, at which pressure it is fed into the rotary converter. The capacity of this converter is 160 kilowatts, and it is especially wound for running directly in parallel with a storage battery. Its characteristic curve is similar to a shunt-wound generator; that is to say, as the load increases, its voltage would fall. By this means the battery will take care of all fluctuations, maintaining a fairly constant load on the rotary. The battery consists of 248 cells, each containing 11 plates 10 inches square. The one-hour rate of this battery is 200 amperes. With a maximum load of 300 amperes the rotary carries 125 and the battery 175. The greatest amount of variation of load on the rotary is 50 amperes, while the variation of load on the line is nearly 300 amperes. Such an installation shows clearly the advantages of battery regulation on a fluctuating load. The size of the rotary is reduced by practically one-half and the load on it is kept almost constant.

Most of the plants dealt with to-night have been those of a large size, supplying a large amount of energy. It must not be imagined that storage batteries are applicable only to these large stations. The results obtained are just as satisfactory in the case of smaller stations, but I have referred to the larger ones to-night as being of more interest. I will, however, give the results obtained in one of the smaller type.

The Claremont Electric Light company, at Claremont, N. H., operates a small plant by water and steam power, which consists of two Edison bipolar dynamos, running on the three-wire system, and an arc-light service supplied by a 50-light Thomson-Houston dynamo. In connection with the Edison dynamos, which are operating on the three-wire system, there is a battery plant of 134 cells; containing 11 plates in each cell 10 inches square. These batteries are operated directly in parallel with the Edison dynamos, and relieve them of a portion of the load during the time of heaviest demand. They also help out the steam plant, enabling the water power to be used to its fullest advantage. During the month of January, 1896, before the batteries were installed, it was found necessary to run an auxiliary engine 180 hours to supplement the water wheel, and in the same month in 1898, after the battery was installed, the same conditions of water power prevailing, the station load was 33 per cent. heavier, and it was only necessary to run the auxiliary steam engine 133 hours during the month.

In addition to this saving, the service given was far superior, owing to the steadier pressure which was maintained. The battery has also enabled the company to reduce its staff. The entire force employed in this plant now consists of a superintendent, a dynamo attendant and a lineman. The lineman also attends to the lamp trimming. Before the battery was installed there was, in addition, an engineer, while the average load was considerably less than at the present time.

There is one application of storage batteries in connection with central stations which I believe will

in time become very general, but which at the present time has only been tried in a few instances. It is the use of storage batteries in office buildings, stores, etc., instead of the usual isolated plant or direct supply from the central station. The method of operation is as follows:

During the few hours of maximum load at the central station the storage battery supplies the entire current for the building, it being disconnected from the street mains. During the hours of light load the building is connected with the street mains and the battery charged from them. By this means the central station can take as customers these buildings, and only have them on their system during the hours of light load. This is a class of customer which is not profitable for the central station, in the ordinary way, as they have a large number of lamps which are only used for a short period, and that at a time when the station has its maximum load. This means that they have to provide capacity for these lamps, and yet the plant is only needed for an hour or two each day. In one installation of this sort, the electric-light company says it can charge the battery at a time when it is glad to sell current for $\frac{1}{2}$ cents a kilowatt-hour, and it relieves the system at a time when current is worth 13 cents. This leaves a good margin for profit for both the user and the electric-light company. The cost of such a battery plant is less than the isolated plant would be for the same capacity and occupies very much less space, which, in some buildings, is an important matter. By this method the central station can also take customers having a fluctuating power load without feeling its disturbing effect on the system, the battery maintaining an even pressure at all times. This is particularly advantageous when the fluctuating load is some distance from the power house and the feeders are not large.

The use of storage batteries in connection with isolated plants for private houses is increasing very much. Such a generating plant without a battery requires a lot of attention, as the engine and the dynamo must, of course, be kept running all the time that current is required, and, moreover, it runs under a variable and uneconomical load. With a storage battery, however, current is available at any time, and the generating plant need only be run to charge the battery or when an unusually large amount of current is required for special occasions. This class of work is very light on the storage battery, as usually it is only charged two or three times a week, and is only discharged for a short time every day.

The power house of a plant of this kind, which I have in mind, is situated about 100 yards from the residence, and is 21 feet long by 16 feet wide, divided into two rooms, one for the engine, dynamo and switchboard, the other for the storage battery. The residence is wired for 300 16 candle power lamps, and the plant consists of a 19½ horse power Otto gas engine, belted to a shunt-wound dynamo of 12½ kilowatts capacity, wound for a range of voltage 110 to 150. The storage battery consists of 60 cells, each containing 13 plates 10½ inches square. These elements are mounted in glass jars, placed in sand trays. Plates hang on the sides of the jars, small lugs being cast on them for this purpose. The capacity of the battery is 60 amperes for eight hours, 81 amperes for five hours, 120 amperes for three hours. The switchboard is built in the partition between the battery and engine room, so as to save space and to allow a free access to the back of the board.

Circuits are arranged so that any combination can be effected, viz., to supply lamps while charging the battery, or to charge the battery alone; to supply the lamps from either battery or dynamo direct, or with the two running in parallel.

The storage battery of to-day is a practical piece of apparatus; the days when it was considered an experiment have passed. Large sums of money are being expended in experiments to reduce the cost of manufacture and lighten the weight, and it is in these directions that the greatest future improvements may be looked for.

Electrically Driven Printing-presses in Kansas City.

Two installations of electric motors to operate printing-presses have been recently made in Kansas City—one in the *Star* newspaper establishment and the other for the Union Bank Note company.

In the *Star* plant each of five large double perfecting presses, having a combined capacity of 120,000 papers an hour, has been connected with a 35 horse power, slow-speed, multipolar motor. The motors are direct-current and are operated on 220-volt circuits from two 75-kilowatt dynamos which are driven by a Corliss engine. In connection with each motor a 20 horse power Cutler-Hammer speed-regulating rheostat is used. These rheostats are provided with a sensitive overload and a releasing automatic. The rheostats stand on the top of the presses, and from each a circuit in which a number of switches have been placed extends to all parts of the press. By opening any one of these switches the automatic is thrown and the press is brought to an instant stop. By means of these rheostats the press can be started at the lowest possible speeds and operated at all intermediate speeds to the maximum. This not only facilitates the changing of plates and rollers, but

makes a great saving in paper wasted in breaking where other power is employed.

The Union Bank Note company has a complete plant, consisting of an Ideal engine and direct-connected Lundell generator, with motors ranging from one-quarter to three horse power, all direct-connected to various presses on different floors. Upon the extended driving shaft of each press a separate motor is mounted, the armature of the motor being placed directly on the press shaft. Controllers and rheostats give all desired variation of speed from 75 to 1,800 revolutions per minute on the different presses.

These installations are believed to be the only ones of the kind between Chicago and San Francisco. The work of installing them was done by Hodge, Walsh & Loring of Kansas City.

CORRESPONDENCE.

New York Notes.

NEW YORK, February 13.—The daily papers have told the readers of the *WESTERN ELECTRICIAN* all about the great storm and its interference with all street traffic, so I will not reiterate a tale that has been told. But I may note that the underground-conduct roads held their own very well when compared with the other surface lines.

There have been no important developments in the Manhattan situation. President Gould favors electrical equipment, but as for old Russell Sage—well, he has his doubts. However, Mr. Gould is the larger stockholder and has the principal following in the board of directors. It is said that for a long time Mr. Gould refrained from pressing his views and deferred to Mr. Sage's wishes. This deference was sentimental rather than wise, Mr. Gould has not cared to oppose the old gentleman because Jay Gould had always borne the closest business relations with the venerable financier. It is Mr. Gould's policy to retain the friendship and the collaboration of his father's associates. But in this instance George Gould has been compelled to institute an exception. It is believed that no opposition to the proposal to issue \$18,000,000 additional stock for the purpose of effecting the projected improvements will develop at the special meeting of stockholders of the road to be held on February 28th for the purpose of authorizing the issue. George Westinghouse was in town last week, and it was asserted—and denied also—that he was on the lookout for the Manhattan contract. There is another rumor connecting the Electric Storage Battery company with the contract, but it seems unlikely that the Philadelphia company would make any attempt to get any more than the share of the business coming within its line.

The special meeting of the stockholders of the Brooklyn Rapid Transit company, called to consider the proposed increase of the capital stock of that company from \$20,000,000 to \$45,000,000, was held at the office of the company on Saturday morning. All the stock was represented and the vote was unanimous in favor of the increase. In addition, the holders of 149,386 Central Trust company's certificates of beneficial interest gave their consent to the proposed increase. No further business was transacted at the meeting. It is believed that the increase was for the purpose of enabling the Transit company to take up the Nassau holdings of the Johnsons, Mr. Wilson and others, who together held 60 per cent of the shares, and also to place at the disposal of the Transit people \$15,000,000 of stock for the acquisition of the two elevated lines when the elevated people are ready to sell out reasonably.

The Brooklyn Union Elevated Railroad company, a reorganization of the Brooklyn Elevated Railroad company, has been incorporated, with a capital stock of \$18,000,000. The officers of the new company are: President, Frederick Uhlmann; vice-president, William Halls, Jr.; treasurer, General George W. Wingate; secretary, Elmer E. Whittaker. Arrangements were made for the dissolution of the receivership, and it is expected that within 10 days the new company will be in complete control of the road. The next step will probably be the renewal of the negotiations looking to the absorption of the road by the Brooklyn Rapid Transit company. M. S.

New England News.

Boston, February 13.—Contracts were awarded last week by the Boston elevated railway officials for the building of the new elevated structure of the company on Washington street in the section through the Roxbury district, and on Main street in the Brinker Hill district. The Pencoed Iron Works will furnish the material and put up the structure, and the cost will amount to nearly \$500,000. Upward of 8,300 tons of metal will be used in carrying out the contracts. This does not include tracks and stations. Other sections of the road are in the plan stage, and bids will soon be called for.

The subway idea is popular in the metropolis of New England. Mayor Quincy has just petitioned the Legislature for permission to build a few more subways, and the new project contemplates the construction of underground ways from the south end of the city proper to Causeway street and to Scollay square, connecting at certain points with the existing subways and passing near the Northern and Southern Union stations.

The declaration of a further distribution of

\$19.05 2-3 on General Electric preferred stock by the directors last week closes up the gap and settles the outstanding account of \$59.89 a share which was left over from the old regime when the capital stock was reduced. This puts the common stock on a prospective dividend-paying level and has created a bullish feeling in that property.

The Boston Transit company has been organized in this city and incorporated under Massachusetts laws, with an authorized capital of \$100,000, to act as a common carrier, using vehicles propelled by gasoline, electricity, compressed air or other means of locomotion. B. D. Hyde, H. N. Rice, A. A. Pope, C. N. Cole, G. H. Whitcomb and W. H. Coolidge are the incorporators.

John Lundie, widely known as an expert in railroad engineering, has been secured as consulting engineer by the Boston Elevated Railway company in connection with the construction of the new overhead lines for this city.

The Massachusetts Construction company of Boston has been organized, with a capitalization of \$150,000, to handle electrical supplies. Charles G. Kidd is president and Wallace D. Lovell, treasurer.

At Whitinsville, Mass., a street-railway company has been formed to operate an electric line between that place and Whitin Station, with a capital of \$12,000.

The Woodbury and Southbury Electric company has been organized at Woodbury, Conn., with a stock of \$50,000, to operate a road through Waterbury, Woodbury and Southbury. The officials are: President, James Huntington; secretary and treasurer, E. S. Boyd.

Bids for the construction of the big drydock for the Boston navy yard, which were opened in Washington recently, took a wide range on the electrical machinery to be used in connection with the dock. The lowest bidder was the Thresher Electric company of Dayton, O., which named \$149,892 as its price.

The Boston Elevated Railway company has placed an order for 80 open cars, deliveries to begin May 1st, with the American Car company of St. Louis. Fifty of the cars will have single trucks and 30 double trucks.

The students and faculty of Tufts College have formed the Tufts College Engineering society. Undergraduates in the engineering courses are eligible for active membership, and alumni of the department are eligible for associate membership. Eugene E. Gibson of the class of 1899 is president and the charter membership is 52.

From the 34th annual catalogue of the Massachusetts Institute of Technology it is learned that there are 104 students in electrical engineering, 140 in civil engineering, 162 in mechanical engineering, 66 in mining engineering, 43 in chemical engineering and seven in sanitary engineering.

In the Maine Legislature a bill has been introduced abolishing the \$10,000,000 limit on the capitalization of corporations. It is a bid for the business that now goes to New Jersey in the formation of large corporations, and it is expected that the state will receive a large revenue from the increased number of companies formed there in case the bill becomes a law.

A corporation with authorized capital of \$5,000,000 is projected in Boston, to be known as the International Construction and Power company. The principal promoters are E. P. Shaw, who is treasurer of the commonwealth, his two sons, N. Sumner Mirick, P. W. Sprague, J. A. Brackett and George A. Butman. These gentlemen are all well known in connection with railway ventures, and the corporation will succeed the firm of J. F. Shaw & Co., of which the elder Shaw and his sons are the principal members. They have asked for a very broad charter, which gave rise to all sorts of surmises regarding the scope of their operations. Mr. Shaw states, however, that in asking for power to construct in the United States and territories or colonies they had nothing more definite in mind than the possibilities that may arise in the development of this country's new possessions. He expressly denied any intention of absorbing a large number of Massachusetts roads—a possibility which had been suggested in connection with the matter of incorporation by interested observers.

A Boston syndicate has secured control of the stock of the electric-light corporation of Lowell, Mass., paying the par value of \$100 per share for about 1,800 shares of the stock. There had been dissatisfaction with the previous management, and control was secured in order to bring about a change in the directorate. The annual meeting was held in Lowell February 1st, and the following-named directors were chosen: F. R. Hart and W. C. Forbes, Milton; E. S. Webster and C. A. Stone, Newton; L. J. Webster, E. Wadsworth and G. W. Lee, Boston. W. H. Bent of Lowell was re-elected clerk and treasurer.

In the Massachusetts Legislature a bill has been submitted, providing for the appointment of a commissioner of railway-telegraph service by the governor. The measure provides for an examination before the commissioner of every telegraph operator employed in the state by any railway company, and certificate of competency will be given, in the case of engineers, pilots and others, upon whose skill depends the safety of the traveling public. No railway shall employ other than certified operators in case the bill becomes a law. B.

Western New York.

NIAGARA FALLS, N. Y., February 11.—Tonawanda is having a great deal of trouble in regard to the rate of speed at which the cars of the Buffalo and Niagara Falls electric road and the Buffalo and Lockport road are run through the streets of that village, and of late the village officials have been engaged in enforcing the ordinance, which says the speed of the cars shall not be over eight miles an hour. A policeman was ordered to watch the cars, and he boarded several in citizen's clothes. One day he took the conductor of one of the cars to the police station with him, where the police justice fined the conductor \$5. The rate of speed at which the cars passed between certain points was secured, it is alleged, and then the village officials started out to serve papers on the company. It was over three weeks before any of them were found in the village, and when the cases were to be heard an adjournment of a week was taken. Finally the cases were called. No one appeared to represent the railway company. In all there were nine cases, seven against the Buffalo and Niagara Falls road and two against the Buffalo and Lockport road. Eight of the cases were in regard to the speed of the cars, and the other alleged that a car had been run through the village without having the life-guard attached. Judgments were entered against the railway companies in all the cases, the penalty of \$100 for each violation making, with costs, a judgment of \$927. The superintendent has notified motormen and conductors to observe the legal rate of speed. It is said that the reason the railway companies were not represented at the hearing was because President Ely had an understanding with a village official for another adjournment, which the justice would not grant. No doubt there will be more to the cases, for President Ely is a lawyer of prominence and a fighter from the shoulder. It is understood the ordinance will be changed to at least 12 miles an hour, as Tonawandas themselves object to the slow speed of eight miles an hour.

It is expected that by October 1st next the Niagara Falls Power company will have 10 generators in operation in its station, the contracts for two additional turbines and generators having just been awarded. The I. P. Morris company of Philadelphia will make the turbines, and the Westinghouse Electric and Manufacturing company will make the generators. This will make the total capacity of the station 50,000 horse power, which is believed to be the total capacity intended for it. As the tunnel has a capacity of 100,000 horse power, the announcement that the Niagara Falls Power company will soon break ground for a new station would not be surprising.

Recent high, easterly winds resulted in low water at Niagara, and some little difficulty was experienced by the mills on the hydraulic canal and in the power house of the Niagara Falls Park and River railway on the Canadian side. The low water allowed the ice to settle on the reefs and bottom in front of the entrance to the canal, diverting the water, and the same results were experienced on the Canadian side, where trouble from ice is expected at this time every year. For three days the electric current of the Niagara Falls Park and River railway was shut off and the cars idle, all the water that came to the power house being employed in operating the wheel connected to the generators of the Canadian Niagara Power company, so that patrons of that company might have current. The low water interfered with the water supply of Niagara Falls, Ont., for fire and household purposes, and Mayor Slater asked Mayor Hastings of Niagara Falls, N. Y., to furnish a supply through a line of hose laid across the lower steel-arch bridge. The municipal water plant of Niagara Falls, N. Y., is on the hydraulic canal, and although the supply of water there was none too plentiful international courtesy demanded that the request be granted, and so Mayor Hastings had a line of fire hose stretched across the arch from a hydrant at the New York end. In this way a water famine was averted. O. E. D.

Northwestern Notations.

MINNEAPOLIS, February 11.—It is understood that George C. Edwards of Bridgeport, Conn., is investigating the prospects for a successful electric line from Albert Lea, Minn., to Clark's Grove and Geneva.

M. E. Helmer of Fond du Lac, Wis., has been East to secure estimates of cost for an electric power plant, and will probably put one in soon.

Morse & Zimmerman have been granted a franchise for electric lighting at Lone Tree, Ia., and will proceed to install a plant at once.

The Minneapolis Board of Trade recommends the construction of a third interurban electric line to St. Paul by connecting the Minnehaha line in Minneapolis with the Snelling avenue line in St. Paul. There is only about a mile of track to be laid to connect the two lines.

The water-works committee of the Minneapolis Council is considering putting in two new pumps of the "Jumbo" pattern, and operating them by electricity, at the North Side pumping station.

A consolidation of the five different electric transmission lines in Sioux City, Ia., will be effected in 60 days. It will greatly reduce the cost of urban transportation and will also enable the lines to be operated more cheaply. The companies affected are the

Sioux City Traction company, with 30 miles of track; the Central Traction company, with 10 miles of track; the Riverside Electric company, with five miles of track; the Leeds Electric Railway company, with four miles of track, and the Morningside Elevated Railway company, with four miles of track. They all use electricity for motive power.

The Street Railway and Power company of Menominee, Mich., has let the contract to the Filer & Stowell company of Milwaukee to furnish a new Corliss engine of 518 horse power for the remodeled power station.

The Supreme Court of Minnesota holds that the contract of the city of Little Falls, Minn., with the Little Falls Electric and Water company, running 34 years, is unreasonable, owing to the length of time, and therefore void.

The syndicate controlling the street-car lines of Davenport, Rock Island and Moline has bought the Moline Central line.

The electric-light station at Iowa City, Ia., was burned, with a loss of \$20,000; the insurance is \$13,000. The company will rebuild at once.

The Chicago, Harvard and Geneva Lake Railroad company has filed articles of incorporation in Wisconsin to build from Harvard to Geneva Lake. C. T. Bundy and L. C. Church of Eau Claire, Wis., are incorporators.

Milton, Ia., is considering the electric-light question.

Electric lights are projected at Pulaski, Ia. The Citizens' Traction company of Oshkosh, Wis., has won its case and the right to cross the tracks of the Chicago and Northwestern Railroad company in Oshkosh before the appraisal committee.

The electric machinery for the new electric-light plant to be installed at Lewistown, Mont., has been received at the shipping point, and will be hauled overland as rapidly as possible. It is expected to have the system in operation by April 1st.

B. F. Ramsdell has been promoted from manager of the Postal Telegraph company's office in Anacosta, Mont., to manager of the office at Helena, Mont.

An ordinance requiring fenders on the street cars has been introduced in the council of Des Moines, Iowa.

Fonda, Ia., has voted to establish an electric-light plant.

The Mount Vernon Electric Light company of Mount Vernon, Wash., offers to remove its plant to Sedro-Woolley if given a franchise and exempted from taxes for a number of years.

The Fox River Valley Electric Railway company announces that it will build the interurban electric line between Neenah, Wis., and Oshkosh whenever the cities of Neenah and Kankana evince any desire for it.

The Fort Wayne Electric corporation will submit a proposition to the city of Elroy, Wis., for the establishment of an electric-light plant which the city can buy at any time at cost.

Capitalists of Cleveland, O., are after a franchise for an interurban electric line from Stillwater, Minn., to St. Paul. The Twin City Rapid Transit company is also after the franchise, and offers to have the road in operation by July 1st, if given the franchise.

It is reported that the Chippewa Valley Electric Railway company will extend its interurban line between Eau Claire and Chippewa Falls, Wis., to Bloomer.

The Perry Electric Light company of Perry, Ia., has sold its plant to John R. Swearingen and Frank Dobson of that city for \$20,000. M. S. P.

PERSONAL.

Henry B. Cutter, president and general manager of the Cutter Electrical and Manufacturing company of Philadelphia, was a welcome visitor to Chicago last week.

Dr. Louis Duncan and M. K. Eyre have formed a partnership as consulting engineers, under the firm name of Duncan & Eyre, with offices in the Empire building, New York.

Mr. H. P. Broughton has closed his electrical business in St. Louis and has taken a position with the western sales department of the Abendroth & Root Manufacturing company at Chicago.

Herbert Lloyd, general manager of the Electric Storage Battery company of Philadelphia, was in Chicago for a few days last week. Joseph Appleton, chief engineer of the same company, is now in town.

ELECTRIC LIGHTING.

H. V. Gates of Hillsboro, Ore., will put in an electric-light plant in the spring.

The authorities of Tepic, Mexico, are trying to arrange for an electric-lighting system for the city.

The city of Chicago has begun a prosecution in Justice Gibbons' court against the Jefferson Electric Light and Power company, charged with stringing wires without a permit under sidewalks at 246, 245 and 254 State street.

The Auburn (Cal.) Electric Light and Power company intends to put in a plant of 300 horse power capacity of the latest style machinery. The current will be alternating and multiphase, suitable for both lights and power. The works will be

located at the North Fork dam, about two miles from the town.

The Massena Electric Light and Power company (capital, \$10,000) has been incorporated. The directors are Thomas H. Gillespie, R. A. Johnson, E. M. Stathers of New York, Henry W. Merwin of Brooklyn and Robert Swan of Massena.

The Black Oak Mine company is making arrangements to supply electric lights to Soulsbyville, Cal. A larger dynamo is to take the place of the smaller one that furnishes light for the mine alone. The undertaking is to be pushed to completion as rapidly as possible.

The Consolidated Canal company has been granted right-of-way in Tempe, Ariz., for constructing a line for electric-light and power purposes. Bowen & Ferry of Detroit are the principal owners of the company. Mesa has been lighted by the company, and the plans include an extension of the system to Phoenix, 16 miles distant.

ELECTRIC RAILWAYS.

An ordinance has been introduced authorizing the San Diego, Pacific Beach and La Jolla Railroad company to electrically equip its road. The road has recently been purchased by Spreckels Bros.

An investigating committee in St. Louis has discovered that, owing to the carelessness or corruption of city officials, the city has been deprived of annual revenue from street-car licenses estimated at between \$7,500 and \$15,000.

At the annual meeting of the stockholders of the New Orleans, La., Traction company, the following-named directors were elected: R. M. Walmsley, J. C. Denis, A. Baldwin, C. H. Hyams, Frank T. Howard, C. D. Wyman and John C. Russell.

James H. Boyd, leader in the movement looking toward the building of an electric road in San Bernardino, Cal., and continuing to Highland and Redlands, asks the people of the first-named city to contribute \$15,000, which amount Mr. Boyd considers necessary to insure the success of the enterprise.

The *Los Angeles Herald* of recent date asserts that the Southern Pacific Railroad company has decided to electrically equip 220 miles of road, branch spurs, etc., including lines to San Pedro, Santa Monica, Santa Ana and Tustin, Sangus and Chatsworth Park, Riverside and San Bernardino, Duarte and other points.

A bill has been introduced in the New York Legislature providing that all street-railway companies in cities of the first class shall issue coupon tickets for a round trip. These tickets are to be furnished by the roads to school principals and head teachers, who will sell them to the pupils. They will be good from 8 to 9 a. m., 12 m. to 1 p. m., and from 3 to 4 p. m.

The Massena Electric Street Railway company of Massena, St. Lawrence County, New York, has been incorporated. The capital is \$100,000 and the directors are Thomas H. Gillespie, H. A. Johnson, E. M. Stathers, Howard Hasbrouck, Edward M. Nolan, Thomas D. Harris, Willard A. Esselstyne and James R. Jones of New York and Robert Swan of Massena.

The Georgetown, Rowley and Ipswich (Mass.) Street Railway company is in process of organization. It is capitalized at \$150,000 and will build an extension of the Haverhill, Georgetown and Danvers road by way of Georgetown, Byfield, Rowley and Ipswich. The directors are Charles E. Barnes of Plymouth, Arthur Bishop of Rowley, W. B. Ferguson of Malden, Lewis R. Hovey of Ipswich, Benjamin Parsons, Jr., of Georgetown, George A. Butman (treasurer) of Malden and E. B. Fuller (clerk) of Haverhill.

Employees of the Union Railway company of New York worked all night recently laying an electric railroad track nearly a mile long in Fourth street, North Pelham, with which to connect the belt line around the cities of Mount Vernon and New Rochelle. The haste of the company was due to a decision given in the Supreme Court that both the Union and the New York, Westchester and Connecticut Traction company had legal franchises on the street. The judge is said to have expressed the opinion that the first company to begin work would have the right to use the middle of the street. As soon as the Union company heard the decision it fitted out an expedition of two cars, and, loading them with ties and rails and 100 men, hurried them to North Pelham. The next morning when the residents awoke they were dumfounded to find a trolley road running down the middle of the principal street.

A test case of a very important question to all street railways has just been decided in Rochester. It was an action brought by Charles Summers against the Rochester Railway company to recover detectors' fees and other expenses in caring for the injuries to his six-year-old boy, who was run over

in front of the Frank street school by a trolley. The question at issue was whether a street-railway corporation is guilty of negligence in not running its cars slowly by a schoolhouse, around which young children are in the habit of congregating. Judge Sutherland made a ruling in the affirmative. He held that the contention as to the speed of the car in the case on trial was a question of fact for the jury. After a few minutes' deliberation the jury returned a verdict in favor of the plaintiff, fixing the damage at \$400. A suit for \$20,000 damages, brought by the injured lad, through a guardian, is now pending in the courts.

POWER TRANSMISSION.

An ordinance has been passed granting the Southern California Power company permission to construct and operate a pole line through South Pasadena for transmitting electricity from Shorb Station to Pasadena.

PUBLICATIONS.

The Royal Electric company of Peoria issues a bulletin of alternating-current generators. It claims to have been the first to introduce in the United States the inductor type of alternators, and the circular is devoted to description and illustration of this type. The simplicity and reliability of the machine are emphasized. The manufacturing company presents it to the trade as the highest embodiment of the art.

TELEGRAPH.

The president of Venezuela has directed the laying of a submarine cable to connect Margarita with other parts of the republic. It is also announced that the secretary of the Postal and Telegraph Department of Venezuela has ordered new postal and telegraph maps to be made, as those now in existence do not show sufficient details.

The Western Union Telegraph company has announced that on and after February 15th the rate from all its offices in the United States east of the Mississippi River, including St. Louis and Galveston, to Havana, Cuba, would be 25 cents a word instead of 40 cents, as formerly. From offices west of the Mississippi River the rate to Havana, Cuba, will be 35 cents a word instead of 50 cents, as formerly, and from British Columbia and Northwest Territories to Havana, 45 cents a word instead of 60 cents. The rate beyond Havana to Cienfuegos, Casilda and Tunas, Cuba, will be 20 cents a word, and to Jucaro, Santa Cruz, Manzanillo and Santiago, Cuba, 25 cents a word. From the same date the rate from all offices east of the Mississippi River, including St. Louis and Galveston, to Porto Rico, will be 75 cents a word instead of \$1.17, and from all offices west of the Mississippi River in the United States, excepting St. Louis and Galveston, and from British Columbia, to Porto Rico, will be 85 cents a word instead of \$1.27.

INDUSTRIAL COMBINATIONS.

Arrangements have been completed for the consolidation of illuminating and natural-gas and electric properties, plants and franchises in central and southern Indiana and Ohio. E. C. Benedict, who has large investments in gas property throughout Indiana, is the principal factor in the combination. Associated with him are Anthony N. Brady, Frederick P. Olcott, Samuel Thomas, Charles F. Dietrich, John Sloan and Samuel Thorne.

Articles of incorporation of the Wahmita Copper Mining company were filed at Trenton on February 11th by James B. Dill of New York. The company's principal office is to be in Jersey City, and its capital is stated to be \$1,000,000, with the right to increase. The company is a Boston concern. The incorporators are all of that city. They are Frederick H. Clark, James H. Fuller and Henry F. Whitney. The incorporation of the company is said to be another step in the fulfillment of the plan for combining all the copper interests of this country and other countries in one large company.

The *New York Tribune* asserts that negotiations are going on for a combination of all the large steam-engine building companies of the United States into a new corporation, to be capitalized at \$20,000,000 or \$25,000,000. The Corliss Steam Engine company's plant at Providence, one of the largest engine works in the world, has already been secured, it is said, in the interest of the syndicate. Joseph H. Hoadley of New York, president of the New York Auto-truck company, is interested in the engine-building consolidation project, and is quoted as saying in reference to it: "It is the intention to take in all the large steam-engine building plants in America. The organization is composed of the Cramps of Philadelphia, Lewis Nixon of Elizabeth and this city, and bankers in New York, Philadelphia, Providence and Boston. The company that has been taken in in Providence and which starts

the combination is the original Corliss company which has been in existence and famous for many years. We paid \$3,000,000 for it. This company will be followed in a few days by the Providence Steam Engine company and the American Wheelock Engine company of Worcester. When the deal has been closed for these, several large western concerns will be absorbed. The arrangements for acquiring them will be completed at a meeting to be held in this city within a week. The president of the new company is Colonel D. M. Thompson of Providence, and the directors will include Edwin S. Cramp, Lewis Nixon, W. H. Knight and Charles A. Lieb. Our principal object in gaining control of these companies is to supersede the power of steam with that of compressed air. I think that ultimately compressed air will be the power popularly used, and that at some future time it will be on an equal footing with electricity."

The stock of the Citizens' Street Railroad company and the franchise of the City company, both of Indianapolis, have been purchased by capitalists of that city, New York and Philadelphia, and the stockholders will reincorporate soon under a new name, and the plant will be placed under an entirely new management. The negotiations have been conducted by Hugh McGowan of Kansas City, who organized the purchasing syndicate, and the price paid was about \$3,000,000. Mr. McGowan states that when he came to look over the field he was convinced that the conditions were such that the people would never be in hearty accord with the Philadelphia owners of the Citizens' plant, and he candidly informed them of the fact and suggested that the best way out of the trouble was to sell the property. "When the Supreme Court granted a hearing in the litigation between the companies and the city," said he, "it was clear that the case would be reversed, and that the City company would be deprived of its charter by that court, which would uphold the law of 1897, declaring all charters void after 1901. The City company was ready to sell, and it was purchased by the syndicate."

TRADE NEWS.

The Sommer Electrical company, doing a general electrical contracting business, announces that it has opened at 785 Broad street, Newark, N. J., a thoroughly up-to-date establishment for electrical work.

The Kester Electric Manufacturing company of Buffalo has leased the building at 241 South Jefferson street, Chicago, and will remove its manufacturing plant to this city about March 1st. The company was recently incorporated in Illinois. J. F. Kester, who designed the apparatus manufactured by the company, is the president.

The Utica (N. Y.) Gas Engine Works, of which H. R. Illingworth and J. J. Lanz are the proprietors, is steadily at work turning out its product. The engine is of the four-cycle type, self-lubricating, with poppet valves. It has a simple regulator, said to be very efficient. It runs steadily on gas or gasoline and is adapted for driving small dynamos. Illingworth & Lanz are also agents in Utica for the Lundell dynamos and motors.

Mr. E. G. Acheson has organized a company, under the laws of New Jersey, with a capital stock of \$1,000,000, to manufacture graphite and pure carbon at Niagara Falls. The company is called the Acheson Graphite company, and its plant will be located on the lands of the Niagara Falls Power company. The process will consist of the conversion of the amorphous form of graphite, as found in coke, to the graphitized form, and it is expected that the company will be able to put its manufactured product on the market much cheaper than any of the establishments now doing business. If the Graphite company can prevail upon established concerns to use its manufactured article, it will not go into the details of the business and manufacture all the articles in which graphite and carbon are used. If it is necessary, however, it will make all articles in order to get its product on the market. At first the company will start with about 500 electrical horse power, which will be increased as the growth of the business demands. Charles R. Huntley of Buffalo is vice-president and treasurer of the company.

BUSINESS.

Laird & Lee, the Chicago publishers, call attention to their stock of practical books of all kinds.

A 125-kilowatt light and power plant has been installed in the National Bank of Commerce, Kansas City, by W. T. Osborn & Co. There are two dynamos and engines, supplying about 1,000 lamps and an elevator motor. The electrical contractors are congratulated on the character of their work.

The Electric Appliance company desires to call the attention of everyone in the electrical industry to the map of Chicago's business district. From a good

map of the downtown part of the city one may get an idea of the accessibility of the new location of the company at 92 and 94 West Van Buren street. Everybody is urged to look it up and see for himself.

The Central Electric company, Chicago, is calling the attention of users of copper wire to the attractive prices which it is enabled to make on weatherproof, magnet, office and annunciator wire. As is well known, the price of copper wire has increased, and is still going higher, but nevertheless the Central Electric company, by commendable foresight, is enabled to make attractive prices. Buyers will find it to their advantage, it is said, to find out what the Central Electric company has to offer before placing their orders.

The principal claim of merit made for the primary-battery cell made by Harrison Bros. & Co. of Philadelphia is the high electromotive force of 2.45 volts. The cell is especially adapted to open-circuit and what may be termed semi-open-circuit work. The high voltage is obtained by the use of zinc as the positive element and peroxide of lead as the negative. Peroxide of lead is the active material of the storage battery. By placing it in juxtaposition to zinc, the high voltage of nearly 2.45 volts per cell is obtained, the electrolyte being a dilute sulphuric acid. In this cell, which is the result of several years' experiments, one ounce of zinc will, it is said, give 20 ampere-hours at an average of 2.2 volts. Theoretically, there is enough lead peroxide in each cell to depolarize three ounces of zinc. This would give a capacity of 60 ampere-hours. In actual practice, with a slow rate of discharge on open-circuit work, about two-thirds of the theoretical is possible, or 40 ampere-hours. One charge of acid will dissolve

one ounce of zinc without undue increase of internal resistance. Local action does not occur, even when the zinc gets rough, as the zinc is self-amalgamating to the last. Eight ounces of the peroxide of lead is used in the manufacture of one stick of negative element. It is estimated that the cost of the electrical energy obtained from this cell is a little over one cent per watt-hour. In a test of these cells made recently by Mr. Milford Lewis, it was shown that after nearly four months' working the electromotive force, originally 2.49 volts, had decreased to only 2.4 volts. Besides its special adaptation to open-circuit work, such as electric bells, burglar alarms, telephone transmitters, etc., the cell is adapted for the operation of physicians and dentists' miniature lamps, two cells six inches high by four inches square being sufficient to light up such lamps to full brilliancy. The Thermo-electric company, Times building, New York, is the sole agent for the sales of this cell.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued February 7, 1899.

618,837. Conduit for Wires or Cables. Edward H. Callaway, New York, N. Y. Application filed December 24, 1897.

Perforated sections of suitable non-conducting material have a countersunk recess around the end of each perforation, a connecting sleeve made of insulating material adapted to fit into the countersunk recesses of two adjacent sections and to thereby unite the sections so that the ends of the sections will come into contact with each other, and removable inner sections of tubes made of insulating material and of such diameter as to project into the connecting sleeve and of such length as to meet at their ends.

NO. 618,837.

618,848. Electric Arc Lamp. Walter E. Dennis, New York, N. Y. Application filed January 22, 1898.

In a mechanism for operating the electrodes of an electrical arc lamp the continuous rack bar is secured to the armature or movable core, and arranged to move with the same, and to clutch the carrier and to release it by the movement of the armature or core, controlled by the electric current in its passage from one electrode to the other.

618,853. Brush Holder for Dynamo-electric Machines. Gano S. Dunn, East Orange, N. J. Application filed April 30, 1898.

The brush-holder rigging is centered upon the axis of the commutator and is revolved in the center thereof, and brush-holder supports are mounted upon the rigging and independently adjustable thereon circumferentially around the commutator, and adjustable together around the commutator by the movement of the rigging.

618,864. Apparatus for Operating Electric Brakes. Herman S. Graber, St. Louis, Mo. Application filed July 25, 1898.

A circuit in which a storage battery and an electric motor are arranged in series, a second circuit leading to and from the battery and which receives no electricity from the first circuit; a series of electromagnets permanently out of circuit with the motor arranged in the second circuit, and means for opening and closing the latter circuit, are features of the invention.

618,876. Circuit Breaker and Closer. Alva T. Hill, Detroit, Mich. Application filed June 8, 1897.

The combination is claimed with a track circuit and an independent signal circuit, both normally open, of an electromagnet arranged in the track circuit, an independently operating motor, a circuit-closing device actuated and controlled by the magnet, the device being adapted to be driven positively by the magnet upon the closing of the track circuit into the signal circuit to close the latter; means for automatically and positively locking the closing device in the signal circuit, means operating independently of the magnet for withdrawing the closing device from the circuit when on locked, a tripping device operated and controlled by the motor, adapted to release the closing device and an automatically operating starting and stopping device for the motor.

618,911. Trolley Connection for Canal Boats. Frederick J. Shewring, Toronto, Canada. Application filed February 7, 1898.

The trolley consists of a frame embracing in its construction two vertical members, each member composed of two opposite sides united at their upper ends, a depending arm from each vertical member at one side thereof, bent horizontally below the wheel and then perpendicularly, a counterbalance connected to the lower ends of the depending arms, a rod connected to the arms above the counterbalance having a ring loosely mounted thereon, a swiveled trolley pole connected to the bar, and a flexible electrical connection between the sliding ring and trolley pole.

618,935. Rotating Electric Motor. Warren P. Freeman, New York, N. Y. Application filed February 25, 1898.

The motor is mounted to turn or rotate upon a support or standard; there is a set of ball bearings between the motor and the support or standard and two movable contact connections lying inside of the circle formed by the ball bearings and connected with respective terminals of the circuits of the motor.

618,950. Lightning Arrester. Eugene C. Parham, Johnstown, Pa. Application filed June 26, 1897.

The movable plunger has a magnetizable electrode at its end, and a second electrode is adjacent to and separated from the magnetizable electrode; a contact member is carried by the plunger, and a contact member in the line of movement of the contact member, each of the contact members being in electrical connection with one of the electrodes.

618,992. Cleaner for Commutators. John T. Morrow, Great Falls, Mont. Application filed September 29, 1898.

A cleaning device is described combining a frame, means for movably supporting thereon cleaning fabric or material, one or more presser rolls over which the material passes, one or more bearing blocks movably mounted to the frame and carrying the roll or rolls, and means for yieldingly passing the block or blocks toward the surface to be cleaned.

618,993. Electrical Battery. Leonard Paget, New York, N. Y. Application filed July 8, 1897.

This battery has a metallic retaining vessel, in combination with a metallic electrode which fits snugly within the vessel, the electrode and the inner surface of the vessel being amalgamated.

619,014. Electric Arc Lamp. Thomas E. Drolan, Chicago, Ill. Application filed December 1, 1898.

The mounting permits the carbon holder to be moved away from its normal position for trimming, switching mechanism controlling the continuity of the lamp circuit, and a connection between the carbon holder and switching mechanism, whereby the latter is automatically actuated by the movement of the carbon holder.

619,023. Torpedo-controlling Device. Walter D. Litchfield, Somerville, Mass. Application filed August 30, 1897. Renewed November 17, 1898.

A torpedo-controlling device comprising means contained within the torpedo for electrically governing a propelling mechanism, means therein for electrically governing a steering mechanism, two series of electrical contact points having connections with the respective means corresponding to the several evolutions of the torpedo, a multiple switch adapted to have positions whereby the connections may be transferred so that both propelling and steering evolutions are controlled from one series of contact points, a trailer for each series of points, and devices for moving the trailers successively upon the several contact points.

619,028. Electrochronograph. Clark W. Thomson, La Crosse, Wis. Application filed June 27, 1898.

A notched wheel is attached to the hour-hand arbor, a pin is carried thereby; the toothed wheels are adapted to be operated by the wheel by means of the notch and pin, which a hollow arbor carries an index hand and index, and an electromagnet, adapted to set the operative mechanism in motion when a current is flowing through the magnet, and to stop the operative mechanism when the current ceases to flow through the electromagnet.

NO. 618,864.

619,038. Automatic Electric Signal for Railway Crossings. Urias J. Fry, Milwaukee, Wis. Application filed September 26, 1898.

In signal apparatus for the protection of a crossing or danger point on a line of railway, the combination of a local circuit including a signal and source of current, primary and secondary switches each arranged to close the circuit independently of the other, primary and secondary magnets for operating the switches, a detent normally holding the primary switch open, a releasing magnet for disengaging the detent and permitting the switch to close, a circuit including the primary switch arm, the detent, the releasing magnet and a source of current and adapted to be closed by a train approaching the crossing or point to be protected, and another circuit adapted to be closed by a train at or near the point to be protected and including both the primary and secondary magnets and a source of current.

619,090. Electric Arc Lamp. Albert Schweitzer, Allegheny, Pa. Application filed June 7, 1898.

In an arc lamp the combination of a central support or column having a plate secured thereto, an electromagnet and dash pot mounted on the plate, a cross-beam connecting the magnet and dash pot, a rod or bar pivotally secured to the dash pot and connected to the upper carbon holder whereby a steady feed of the upper carbon to the lower carbon is attained.

619,091. Automatic Magnetic Circuit Breaker. William M. Scott, Philadelphia, Pa. Application filed January 28, 1898.

In an automatic magnetic circuit breaker having fixed and movable contacts, in combination with means for effecting the separation of the movable contacts from the fixed contacts, means for restraining the operation of the separating means until actuated to permit the same, means for actuating the restraining means, and an electromagnet and armature for controlling the actuating means during predetermined flow of current through the magnet, and a pivoted lever adapted to be manually operated to force the armature into engagement with the poles of the magnet.

NO. 619,157.

619,100. Electric Crane. William R. Thomas and James Thomas, Catauqua, Pa. Application filed June 6, 1898.

In a boom crane the combination with a supporting car of a boom mounted thereon, a power shaft carried by the boom, two counter shafts mounted on the boom, means connecting one counter shaft with mechanism for moving the car, means connecting the other counter shaft with hoisting mechanism, loose gears mounted upon the power shaft, means connecting one loose gear with one counter shaft, and means connecting the other loose gear with the other counter shaft, the loose gears having frictional cups upon their adjacent faces, a double clutch splined to the power shaft between the loose gears, and means for reciprocating it so as to bring it into engagement with the friction cup on one or the other loose gear according as it may be desired to actuate the car-propelling mechanism or the hoisting mechanism.

619,157. Composite Signaling and Transmission System. Stephen D. Field, Stockbridge, Mass. Application filed December 24, 1897.

A composite system of one telephonic circuit and three telegraphic circuits is formed of two main conductors, the conductors serving severally as the line conductors of two of the telegraphic circuits, being connected in parallel to constitute the third telegraphic circuit, and being connected in series to constitute the metallic telephone circuit.

619,187. Prepayment Mechanism for Electric Meters. John C. Kinney, San Antonio, Texas. Application filed April 18, 1898.

The first claim is for the combination with a meter and the main circuit for its coil or coils of a normally open circuit closer included in the meter circuit, a magnetically controlled means for respectively opening and closing the circuit closer, a coin-controlled device for setting into action the means for closing the circuit closer, and a separate device for setting into action the means for opening the circuit closer.

619,217. Electric Motor. Oscar H. Pieper and Alphonse F. Pieper, Rochester, N. Y. Application filed March 21, 1898.

An annular magnet for motors is employed embodying two sections, each composed of separate plates secured together and having the projections forming the interior jobs pieces and the exterior depressions, the ends of the plates lapping, means for securing the lapped ends together, and the bearing plates on the magnet opposite the exterior depressions.

619,249. Toll Counter or Register for Telephonic Circuits. George K. Thompson, Malden, Mass. Application filed June 21, 1898.

In a registering apparatus two straight electromagnets are provided, one being relatively sluggish in operation, both having armatures pivoted to swing at a right angle to the poles thereof and to hang away therefrom by gravity; the one having a projection adapted to lie in the path of the second and lock the same when so retracted and the latter terminating in a pawl or escapement, with a counter mechanism provided with a ratchet wheel.

Vol. XXIV.

CHICAGO, FEBRUARY 25, 1899.

No. 8

Effect of Electrical Discharges on Photographic Plates.

Interesting results may be obtained by the disruptive discharge of the high-potential current of a spark coil on a glass photographic plate treated as a condenser. The pretty effects of the photographs—if such they may be termed—herewith reproduced were obtained in this manner by Mr. Clyde H. Thompson of Chicago. The apparatus required for the experiments is simple and it affords a pleasant scientific entertainment, while giving some results that are not easily explained.

Mr. Thompson used four storage-battery cells and

film with the negative wire at the point from which the paths of discharge radiate. This picture is a fine representation of an artificial discharge of lightning, and it is surmised that in the lightning flashes of nature there is a myriad of branches and still finer tentacles from the main path of discharge, not visible to the observer in the instant of sight, but nevertheless existing in the manner generally indicated, by this picture.

The beautiful result secured in Fig. 3 was obtained by placing a Columbian half-dollar on the film and reversing the connection—that is, connecting the tinfoil on the glass side with the negative wire and touching the coin with the positive wire. The

of the plate and touched with the negative wire to produce the effect in Fig. 5 (page 166). It will be noticed that the lines of force from the four arms of the cross appear to repel each other, as in a magnet. The lines of demarcation from the neutral point where the arms cross are distinct. At the left is a curious positive discharge.

In Fig. 6 a coin was placed within the bell of Fig. 1 and the negative wire was brought to the bell as before. There was but one discharge, but the positive and negative characteristics are both present—the positive within the metal rim, in the direction of the coin. The metallic bodies appear to show the effects of mutual induction. The equality of the

Fig. 2.

Fig. 4.

Fig. 1.

Fig. 3.

EFFECT OF ELECTRICAL DISCHARGES ON PHOTOGRAPHIC PLATES.

an induction coil capable of giving an eight-inch spark. The experiments were, of course, conducted in a dark room. Five-by-seven-inch glass photographic plates were used. The glass side of each plate was backed completely by tinfoil connected to one side of the spark-coil circuit. The discharge was obtained by making a connection between the other wire of the spark-coil circuit and the film side of the glass plate.

In Fig. 1 a small electric bell was placed on the film side of a plate treated as described. The positive wire was connected with the tinfoil beneath and the bell was touched with the negative wire. The plate was then developed, and the print from it showed the result in the reproduction.

Fig. 2 was obtained by touching the surface of the

resulting palm-leaf or fan-shaped discharge is termed the positive discharge, and the effect is very pretty. In this case, too, the side of the coin touching the film was photographed—just how it is difficult to explain, for it must be remembered that no camera or lens was used in the experiments. If it is an X-ray effect, it was secured without a vacuum tube. Perhaps some of the readers of the WESTERN ELECTRICIAN can classify the phenomenon.

Fig. 4 shows the effect of two discharges on one plate—negative at the left and positive on the right. It is interesting to observe the contrasting characteristics of the two discharges—the forked lightning of the negative and the palm-leaf shape of the positive.

A cross made of tinfoil was placed on the film side

discharge in all directions outside of the rim is to be noticed in the bell pictures.

Fig. 7 is similar to Fig. 3, only the coin on the film was touched by the negative wire instead of the positive wire. In addition to the general radiating discharge, a distinct and strongly marked path of discharge is seen in this picture. No reason for this is given.

The War Department, through the Corps of Engineers, is inviting sealed proposals until March 6th, for furnishing and installing an electric-lighting plant at Fort Preble, Me. Specifications and full information will be furnished upon application to Major S. W. Reessler, 537 Congress street, Portland Me

Electric Cabs in New York.

There seems to be no doubt remaining of the success of the electric-cab service in New York. The company supplying it, the Electric Vehicle company, is arranging to place orders for the construction of 200 more cabs. There are to be 25 of the ordinary coupe pattern, 75 hansom cabs, 50 full-extension broughams seating four persons each, and 50 three-quarter-extension broughams accommodating three persons each, the last two being new styles of vehicles. All are to be delivered by June 1st. A new building in Forty-second street, near Third avenue, is to be used as a construction and repair shop, and

FIG. 5. EFFECT OF ELECTRICAL DISCHARGES ON PHOTOGRAPHIC PLATES.

a charging station is to be built downtown and another on the East Side, the company to operate 100 vehicles from each station.

Engineers in other cities will be interested in the report of Mr. W. F. D. Crane's remarks to the New York Electrical society, which visited the station of the Electric Vehicle company at 1684 Broadway on Tuesday of last week. Mr. G. H. Condict, the chief engineer of the company, was to have given the society a paper on "The Automobile Situation and Prospects," but was detained in Philadelphia by the storm. In his absence Mr. Crane consented to make a brief address. Mr. Crane said:

"Mr. Condict had prepared an address giving figures and details of operation and some of the results of his rather large experience in the manufacture and handling of these vehicles, which I cannot hope to furnish you; and all that I can do in these brief remarks is to attempt to explain partially what the electric cab or vehicle is, and explain something about its operation, the handling of the batteries, etc.

"As your president has remarked [Mr. Dunn had made a brief opening address], the body of the vehicle, as it appears upon the wheels to-day, is what we got from those who have gone before; it is a work of the past. The running-gear below is a little more up-to-date. In this matter the engineer is confronted with the fact that he is trying to combine the old with the new. The body is not connected with the running-gear below, and so far the running-gear below is inadequate for the service required of it. But if some radical change were made in the appearance and shape of that body—if a vehicle very different in appearance from what you see here should be put upon the streets—the people generally would probably criticize it for being queer; and yet we can expect, as the natural development of the vehicle goes on, to have what would now seem queer shapes appear upon the streets, and they will no doubt start a new fashion in vehicles.

"One of the difficulties that must be faced in designing the mechanism to run the cab or carriage is the spring-body. You must have a running-gear—truck, wheels, axles, whatever you call it—below, fairly rigid and stationary to receive your machinery, and at the same time make all allowances for the spring motion which contributes to the comfort of the rider. This carriage at present does not seem to follow any known laws of ordinary machines, where things are made rigid and fast. For example, when these cabs leave this building, and they are obliged to make a quick turn, the front wheel will go on to the roadway, and the other three wheels will remain on the sidewalk, meaning an elasticity throughout all the lower part of the vehicle; whereas the old-fashioned springs take the weight of the vehicle the best way they can. Changes are under way to modify the lower structure as to make it stronger and more durable. I suppose every electric carriage in the United States to-day is going to speed, and one of the first things to be done is to make the vehicle so that it will not go to pieces. All wear and the electric-vehicle manufacturer is going through the same stage that the street cars did

in times past, when everything went to pieces and would not stay together.

"I suppose you will be most interested in the way in which the motors, batteries, switches, etc., are combined in the vehicle. The motors are placed upon the axle, two of them in the case here, with the gear rigidly fixed upon the wheels. These wheels are not rigid with the axles, but are independent. The pinion upon the motor comes out and meshes with the gear which is attached to this wheel; so you can imagine the result if one motor ceased to revolve and the other did—the thing would spin around. The steering arrangement is applied to the hind wheels. The axle does not turn with the wheels, but the wheels are arranged upon separate spindles, which are hinged to the axle, which is rigid with the body attached to the springs. The wheels are steered by the steering mechanism, so as to produce the steering action.

"The batteries are placed within the cab, either from the front or rear, dependent upon the character of the vehicle, whether a brougham or hansom. These batteries, when shoved into the vehicle, make automatic contact, so that the operator has nothing to do except to put the door over the compartment. The motorman, or driver, as he is still called, has everything within hand-reach or foot-reach at his side. With his hands he operates the controlling lever for operating the switch beneath his seat; he also steers with his hands. The braking is done with his foot, and he rings the bell with his foot. There is an emergency switch placed near his heel, by which he can throw out the switch and break the current in case it is necessary to do so. In order that no tampering with the vehicle can take place while he is absent, he can remove the lever, so that the machine cannot run away if an idle boy attempted to fool with it.

"One of the difficulties that appears in this par-

FIG. 6. EFFECT OF ELECTRICAL DISCHARGES ON PHOTOGRAPHIC PLATES.

ticular line of work, as it does also in storage-battery practice for other classes of work, is that when you place the batteries within the vehicle—these batteries weigh between 1,300 and 1,500 pounds—the vehicle sags. For that reason you will notice later, when you inspect the batteries and table below, there is an arrangement to lift the body of the vehicle so as to bring the floor of the battery compartment on a level with the table over which the batteries come. This feature has been most ingeniously worked out here, and I think I am right in saying that Mr. Condict deserves the greatest credit for the ingenuity he has shown in designing the various movements for the handling of these heavy batteries quickly, economically and satisfactorily, for, of course, the batteries, which take the place of horses, fuel, steam and all other methods of propulsion, are the essential elements in the whole problem. You will see the batteries picked up and carried around sideways, backwards and frontwards, as if they had no weight at all; but when you think of their weighing almost three-quarters of a ton, you can readily appreciate that it took some ingenuity and requires a great deal of strength in the batteries to handle them so quickly and easily. In street cars run by storage batteries, one of the early difficulties was to get the car to a position where you could put in the battery. The same thing occurred with the electric cab, but the difficulty has been overcome by that table [indicating], on which the cab stands.

"The table is split in two parts, and balanced below, so that the parts are free to move in either direction sideways. The cab enters and takes its position on any part of that table; then levers forced by hydraulic cylinders on the sides come up and engage the hubs, and make the movement which forces the cab in a right line from the table. This is a great improvement and a vast step in this business—to conceive such a remarkable way of aligning the carriage with the battery which is to

enter it. While this is going on, you have the jacks coming up under the floor of the table, also operated by hydraulic power, to raise the carriage to the level of the table. Meanwhile, the batteries, which have been charging on the tables further on behind, have been brought forward by the crane.

"The operation there seems very simple. While the cabs are on the street they are using the charge which has been put into the batteries. When they come back they require a new charge. The cab or carriage as it enters upon this table is centered as described, and raised to the proper level, and a hydraulic ram comes out, takes hold of the batteries and pulls them out so far that they are left on the table, which carries them sidewise. These batteries are then moved out of the way, and a set of batteries which has been charged and which is resting upon the table is brought opposite the opening in the cab, and the ram forces the batteries into the carriage. Then the set which has been exhausted is picked up by the jaws, carried down the length of the room and deposited upon a table, where it will be recharged and made ready for service next time.

"The operation of the station here is certainly most fascinating. I think you could all come up here—you who are interested in mechanical problems—and sit upon this balcony several times a week and watch the loading and unloading take place, and find it always a matter of interest to you. There is a great deal to be improved upon, of course, although it would appear now as though the shortness of time required to load the vehicles could not be very much reduced. The other evening a cab came in, the old battery was taken out and a new one put in in a minute and a quarter. This is prompt work, and it would be impossible to unharness horses and harness them again in that time. That is one of the modern advances.

"Mr. Mailloux suggests that something be said about charging the batteries. When the batteries are let down on the table, they are moved by automatic contact by jaws coming up on the side. On the battery boxes are contacts which fit similar contacts in the cab and also the contacts upon these tables. As the battery falls the contacts are driven up on the side, and the contact is automatically made with the switchboard, and the charging takes place in the regular way."

The "Cape to Cairo" Telegraph.

Mr. Cecil Rhodes, the noted advocate of British expansion in Africa, is exerting himself to the utmost to bring about the accomplishment of two great projects—a north-and-south railway running the whole length of Africa, "from the Cape to Cairo," and a line of telegraph connecting the same points. These schemes, while necessarily related to some extent, are yet distinct. The transcontinental telegraph is practically Mr. Rhodes' own private enterprise. The greater part of the cost is paid from his own pocket, and the scheme can be completed without public help. The transcontinental railway is a design of greater magnitude. The expense of building a railway is much more considerable than that of constructing a telegraph line, and it is estimated at \$50,000,000. Recognition and assistance

FIG. 7. EFFECT OF ELECTRICAL DISCHARGES ON PHOTOGRAPHIC PLATES.

from the government will, therefore, greatly facilitate the rapid execution of the railway enterprise. But the telegraph line is now believed to be within three years of its completion, and though the course of telegraph and railway will not be absolutely identical, the knowledge of the country which has been acquired in the construction of the telegraph line will be of great service in the building of the railway line.

In a late article in the London *Times* it is stated that the total length of telegraph wire, which will stretch from the Cape to Alexandria when telegraphic connection with the Egyptian system has been made, will be 6,666 miles. Of this the Cape system to Mafeking supplies 870 miles; the Egyptian

system, if carried to Fashoda, will supply 2,000 miles. Upward of 3,500 miles represents the gap in the connection left for Mr. Rhodes and the Chartered company between them to fill. The Chartered company is responsible for a section from Mafeking through the southern portion of its territories. The African Transcontinental Telegraph company, of which Mr. Rhodes is the founder and principal shareholder, has undertaken to construct 2,725 miles, connecting Salisbury, the capital of Rhodesia, with the southern boundary of the Sudan. Thus the whole telegraphic system between the Cape and the Mediterranean coast is divided into three sections—the South African, the North African and the Transcontinental.

The principal stations of the Transcontinental telegraph line from Salisbury northward will be Tete, on the Zambezi; Blantyre, the capital of Nyassaland; Karonga, at the north end of Lake Nyassa; Abercorn, at the south end of Lake Tanganyika; Pamlilo, on the western shore toward the southern end of Tanganyika, where British Central Africa meets the border of the Congo Free State; Uvira, in the Congo Free State, near the north end of Lake Tanganyika; Fort George, upon the northwestern shore of Lake Albert Edward; a point not yet decided at the southern end, and another at the head of the Albert Nyanza; Lado, Abu-Kuka

ward Heaton, Harry Robert Benda, Marcus B. Waterman, J. A. Lynch, Bartow V. Van Voorhis, Jr., Henry Drucker and Harry N. Ramsey.

Northwestern Elevated Railway.

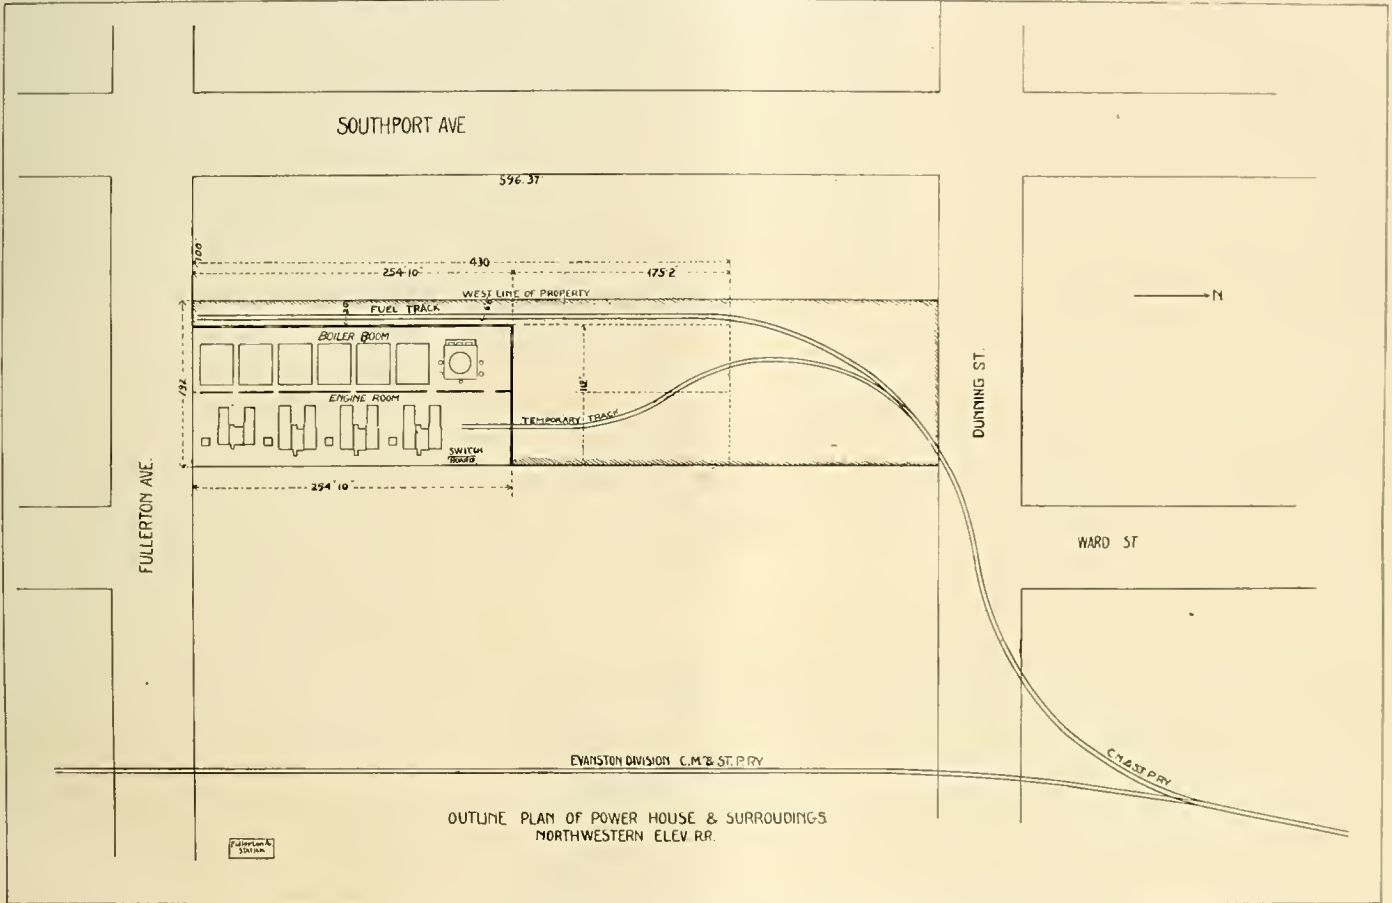

About half of the Northwestern Elevated Railway company's track structure has been erected on the streets of the North Side, Chicago. The structural iron for the remainder is being finished in the shops and will be put up this summer. In the meantime work has been begun on the site of the power house in which the electrical energy to operate the trains will be generated. This plant has been located on Fullerton avenue, near the corner of Southport avenue. A plan of it and an outline map of the surroundings are given herewith. The power house will be 3,000 feet from the nearest point on the elevated structure, at Fullerton and Sheffield avenues, and the connecting feeders will be laid in conduits in Fullerton avenue. The site was selected for convenient access to fuel and water. The coal will be taken from cars or tracks of the Chicago, Milwaukee and St. Paul railroad, and water for condensing is to be obtained from a 12-foot conduit in Fullerton avenue, through which the city pumps water from the lake to create a current in the North Branch of the Chicago River. The power house will be a single-story rectangular

Electricity on Board Ship.

By S. DANA GREENE
PART II.

As between steam and electricity steam has the following disadvantages:

First—Danger to life. The bursting of a steam pipe, whether in or out of a fight is a serious matter and likely to disable any of the crew who are in the compartment where the accident occurs. It has been abundantly proven in our Civil War that men will not stand up against steam or hot water, when they will face shot and shell without flinching. Many of our vessels operating in inland water during that war had several lines of hose coupled to a hot-water tank and laid out every night to guard against boat attacks. These hoses were successful on more than one occasion in repelling boarding parties. While the main steam leads fore and aft can be run below the protective deck or behind the armor belt, vertical branches must run to all auxiliaries on the upper decks and many of these must be used in action. The effect of a steam pipe carrying 100 pounds pressure bursting or being shot away, in a compartment where there may be 30 or 40 men at the gun or passing ammunition, would undoubtedly be to kill or disable every man in the neighborhood and demoralize thoroughly that part of the ship. On the

NORTHWESTERN ELEVATED RAILWAY.—PLAN OF POWER HOUSE AND SURROUNDINGS.

and Sobat, upon the Nile. There are intermediate stations of which the names are even less familiar to the public than these which have been cited, and the line will be divided into sections averaging about 200 miles in length, with an inspector and an efficient staff of linemen to every station. Branch lines will also be constructed to important points, as, for instance, from Fort George to Uganda on the one side and to Stanley Falls upon the other, and from Uvira, at the head of Lake Tanganyika, to Mwanza, at the foot of Victoria Nyanza. The portion of the line which is now completed and in working order is from Salisbury to Karonga, at the north end of Lake Nyassa. A message was recently received at Cape Town from Karonga within three hours of its dispatch. The section from Karonga to Abercorn, at the south end of Lake Tanganyika, is nearly finished, and the further section to Pamlilo, on the Congo Free State border, has been surveyed. One object of Mr. Rhodes' journey to Egypt is to obtain permission to start simultaneous work upon the telegraph line from the northern end at Sobat, whence material for construction can now be more readily conveyed than it could be from the southern end. Construction will at the same time be pushed on from the south, and the two ends will presumably meet at Fort George, upon Lake Albert Edward.

New York Electrical Society.

Last week's meeting of the New York Electrical society was held in the station of the Electric Vehicle company and the members listened to an address by Mr. W. F. D. Crane, one of the company's engineers. The following-named new members were elected: E. S. Keefer, Walter F. Wells, Robert O. Bacon, Ed-

ward Heaton, Harry Robert Benda, Marcus B. Waterman, J. A. Lynch, Bartow V. Van Voorhis, Jr., Henry Drucker and Harry N. Ramsey.

brick structure 112 feet wide on Fullerton avenue and 255 feet deep. It is planned for an engine capacity of 7,000 horse power, but the location and capacity of the stack permit of an extension for 5,000 horse power to be easily made in the rear, as shown by the dotted lines on the plan. The walls of the building will be 49 1/2 feet high, and the octagonal stack, built of brick, will be 203 feet high, with a 16-foot flue. The stack will rest on a foundation of piling, which is now going in. The roof will be flat and of concrete.

A longitudinal brick wall divides the station into boiler and engine rooms, the former 50 feet wide and the latter 58 feet wide. The boiler room will contain 12 boilers, each of 400 horse power, arranged in six batteries. Water-tube boilers, made by the Babcock & Wilcox company and fired by Murphy furnaces, will be used, and a complete coal and ash-handling plant will be provided, with outside and indoor storage bins for coal. In the engine room there will be four direct-connected engine-dynamo units—three of 1,500 kilowatts each and one of 800 kilowatts. The engines will be cross-compound, condensing, slow-speed Corliss, built by the Atlas Engine Works of Indianapolis. They will drive Siemens & Halske generators having internal armatures—the first machines of this type to be built by this company. The larger units will turn at 75 revolutions per minute and the smaller one at 80 revolutions. Two 35-ton overhead traveling cranes, built by the Walker company, will span the engine room. The switchboard will be of the usual type.

Mr. J. R. Chapman is the designing and supervising engineer for the power-house plant.

other hand, if a wire is shot away one or more auxiliaries may be disabled but no one is injured; furthermore, the wire presents a much smaller target than a steam pipe, and is, therefore, less liable to injury from shot. It is always a difficult matter, too, to keep steam and exhaust pipes tight and to prevent leaks at the joints and at water-tight bulkheads.

Second—Injurious heating of living quarters. Steam and exhaust pipes must necessarily run to every auxiliary, and some of the latter, such as the ice machine, anchor hoist, steering engine, ventilators, etc., are in the officers and men's quarters, or the pipes leading to them must pass through these quarters. The heat of the pipes and engines not only makes the quarters uncomfortable, but it is impossible to prevent more or less oil and dirt around the auxiliaries. In the tropics, the heat is often so great that the officers and men cannot sleep below at all. This was the case on a number of our vessels operating in Cuban waters last summer.

Third—Efficiency. Here the contrast is very striking in favor of electricity, surprisingly so to one who has not seen the actual economy figures of steam auxiliaries. Some data will be presented on this subject later on.

There remain the two important factors of simplicity and reliability to be considered. No one who has had experience with the modern, well-designed and well-insulated carbon-brush generator or motor can have any doubt as to its greater simplicity as compared with the steam engine. There are no joints to keep tight, no nuts or bolts to set up, no packing to renew, no cylinders to cut, and only two self-oiling bearings, as compared with a dozen or more oil

cups on an engine. In fact, it is difficult to imagine a simpler piece of machinery than the modern dynamo. It seems like a return to elementary principles to discuss such a point; and yet many men aboard ship imagine the dynamo a most complicated affair, simply because they know nothing about electricity and think everything connected with it is mysterious and complex. This feeling is not confined to seafaring men, as we all know.

The question of reliability is a vital one, for no matter what the advantages with respect to safety, economy and simplicity may be, if the electric auxiliary cannot be relied upon at any and all times to do its work it is a failure and must be discarded. It must not only be able to work well under normal and favorable conditions, but it must also be able to stand a certain amount of abuse and neglect. Stress of weather and other conditions, particularly during a war, sometimes play havoc with the established routine of a ship, and the sailor's tools must not only be sound; they must be hardy. The normal conditions aboard ship are not favorable to ordinary electrical apparatus, as has been explained, but this simply means that apparatus for such work must be specially designed and built to meet these conditions. The ordinary motor would not last long under a street car; nevertheless, thousands of car motors are built and sold every year which run day in and day out with a remarkably low maintenance account. Similarly, apparatus for ship work must be specially

Electrical Shop Practice.

By B. F. FELLO.

The high speed at which some types of electrical machinery are run necessitates the use of lock or jam nuts to check the set nut and prevent its working loose. I have noticed that many electrical machinists make the mistake of putting the lock nut in the wrong position, as in Fig. 1, in which the set or regular nut is marked *B* and the thinner nut, which is the check nut, is marked *A*, and is on top. The thin nut can be smaller in diameter if necessary, and its thickness need be only sufficient to allow enough threads to get a firm hold on the bolt. This nut, practically speaking, is the check nut, and its rightful position is second from the end of the bolt, as at *D*, Fig. 2. It answers entirely as a check nut in this position and is subject to no strain or weight. The threads of the top nut *C* sustain the weight and strain, and this nut must be of full proportions.

BALANCING DRIVING PULLEYS.

Another little "kink" that is of more or less importance in the electrical-machinery line is the bal-

ELECTRICAL SHOP PRACTICE.

insulated, a larger margin of capacity must be allowed, and in exposed places it must be thoroughly inclosed. Several years ago an English manufacturer asked permission to install an electric deck winch on the spar deck of a new cruiser fitting out at Portsmouth. When the captain, who was superintending the fitting out of the ship, saw it, he gave orders to have the deck hose turned on the motor for 10 minutes, and then to operate the winch. The manufacturer protested and said that the motor was not intended to be abused in that way. "Then take it off the ship," said the captain, "for I cannot guarantee that we will ship no seas during our cruise, and I want that winch ready for service whether the ship seas or not." The captain was quite right. The motor was taken off and a "rough-and-ready" gear motor substituted.

Experience alone is the final test of reliability, and fortunately we have some experience in our navy on which to rely. During the late war all of our regular war vessels were fitted with electric-lighting plants, and many of the larger ships were supplied with electric fans and ammunition hoists. Two of the Brooklyn's turrets were controlled by steam motors and two by electric motors. So far as I have

ancing of pulleys on dynamos or motors. The writer knows of cases in which some very excellent electrical machines failed to run satisfactorily simply because of the poorly balanced driving pulley. If the pulley is but very little out of balance, the high speed of the machine will add to the defect, often throwing the whole machine out of line. Humming, heating of bearings, rattling of parts and general disorder will result if the wheel is not attended to. In one shop they had a direct-driven multipolar dynamo running with a driving pulley so far out of balance that the floor under the machine was shaken at each revolution. This was remedied by locating the light side of the pulley and riveting on a piece of metal inside the rim, as at *C*, Fig. 3. Previous to putting on this weight, the pulley swung as far out of line at each turn as indicated by the dotted circle *A*.

To get a running balance of a pulley, run the pulley to full speed and hold a piece of chalk against the rim. At points which do not take the chalk, and which will probably be all on one side of the wheel, loading is necessary, so as to bring up the weight of that side to balance with the weight of the opposite side. When the chalk marks take completely over the entire rim, the wheel is evenly balanced. Adjustable loading of the light sides of wheels can be done, as shown in Fig. 4,

in which a threaded stud *B* is screwed into the rim of the wheel, from the inside, and nuts *DD* are turned on this stud. As many nuts may be used as are needed to get the right balance.

REPAIRING A BROKEN CRANK-PIN.

In a power plant where a generator was planned for direct connection to an engine, the crank-pin of the latter snapped off close to the crank, as at *E*, Fig. 5. As it was necessary to keep the machinery going, this pin was repaired in about three hours by boring a 1½-inch hole straight through the pin and into the crank. A steel bolt was then turned to fit this hole and was provided with a head *G* at the crank end and a nut *F* at the pin end. When this bolt was tightened up on the head of the pin, the latter was held securely against the seat of the broken portion on the crank, and resulted in a strong piece of work, which has run satisfactorily.

RECTIFYING A WORN PIN.

Sometimes the pin wears off, as at *H*, Fig. 6, after having been in use for a few years. This results in an unsteady motion to the connecting rod, and poor work is done by the machine. The best remedy is to procure a new pin and substitute it for the worn one. If, however, a new pin is unobtainable, the old pin can be removed, placed in a turning lathe and the worn portion turned off true to the shape shown by *I*, Fig. 7. Then a steel shell or sleeve should be turned out and placed over the shaft of the pin, like *J*, thus bringing the diameter up to its original size. This sleeve can be held in place by means of pins *K*.

BROKEN SHAFT OF CYLINDER REPAIRED.

The pulley end of a cylinder shaft broke short off recently, and the way we repaired it is shown in Fig. 8. The remnant of the broken stub of the shaft is marked *A*. The part which broke off was thrown away and plans made for a complete new end. First the end of the shaft was drilled out and cut with a thread to take the two-inch-diameter steel rod *B*. This rod was put into the shaft, as indicated by the dotted lines *C*, and the inner end was wedged by means of the beveled key which passed through shaft and rod. Then a sleeve *F* was turned out and placed over the rod, as shown. This sleeve was turned to the original proportions of the first shaft. Then a nut and washer *E* were placed on to tighten the sleeve and to form a flange for the shaft. This completed the work and resulted in a practical job.

SHAKING ELECTRICAL MACHINES.

There is no electrical machine that can run well if it is not secured firmly to the floor or other foundation. Often trouble with electrical machinery is directly traceable to loose or shiftless connection to the bed. I have seen many fastenings into work floors made with common wood screws, as in Fig. 9. These screws hold well for a time, but they soon work loose and allow the machine to work out of alignment. Almost as bad are the lag screws in Fig. 10, although these frequently serve well for years if the screws are inserted firmly at the start, have a good grip on the grain of the wood, and if the wood itself is in good condition. If the lag screws are put into soft, oily or defective wood they will soon draw out. In Fig. 11 is the plan used by the writer, as a rule, for the reason that a firm and lasting hold can be secured, regardless of the conditions of the wood. A hole is bored directly through the floor and a common bolt is used. The bolt is pushed up through the floor from below and the nut placed on and tightened from above. If the feet of the machine loosen at any time, it is only necessary to tighten up the nuts.

BROKEN CONNECTING ROD.

Fig. 12 shows how a broken connecting rod was repaired recently. The rod snapped off at *B*. The ends of the rod were cut with a thread several inches in each direction, and nuts *CC* were screwed on. Then a case *D* was made from soft steel and the ends slipped into this. Holes were then cut through the case and rod ends for the keys *EE*. The key drew the ends of the rod up, and additional firmness was obtained by tightening the nuts *CC* to the ends of the case, as shown. This rod has been running without springing since it was fixed.

BAND KEPT RUNNING OFF.

The banding on the grooved wheels of an electric arc-lighting dynamo gave trouble by running off occasionally. An examination showed that the strain of the band had bent down the wheel bearing, allowing the wheel to slant, as in Fig. 13. This allowed the band to run off. The remedy was found by taking out the bearing, heating and straightening it, after which it was replaced and further danger of the bearing springing prevented by means of the wrought-iron brace *F*, Fig. 14. The lower end of the brace was bored out to fit over the end of the wheel bearing, just inside the nut *G*, and the upper end of the brace was secured to the frame of the dynamo by a set-screw *H*.

The new government cable across the mouth of the Columbia River, between Fort Stevens and Fort Canby, near Astoria, Ore., was laid two weeks ago under the supervision of Captain Green of the United States Signal Corps. The cable will be used exclusively by the War Department.

Niagara in Winter.

By ORRIN E. DUNLAP

This year the ice has caused an unusual amount of trouble in the power development at Niagara Falls, and for days some of the manufacturing plants have had to shut down. In many years the people of Niagara Falls do not recall a time when there were such quantities of ice coming down the river from Lake Erie. The conditions for an ice jam at the falls are cold weather followed by a thaw

Down on the ice bridge a row of shanties was constructed, stretching along the path from shore to shore. One of these was called the "power house," for in it good Canadian whisky was obtainable to furnish "power" for the remainder of the jam across the bridge.

Owing to the shutting off of the electric current for motor use, one of the Niagara Falls daily papers was forced to send its forms to Buffalo to be printed, while another daily paper hurriedly strung a line of wire from a planing mill to its plant, and by this

Underground Trolley Roads in the Storm.

New York, Feb. 25, 1899.

The stoppage of the under trolley cars was explained yesterday by the officials of the Metropolitan Street Railway company, who reported that the power by which the cars are run had been cut off to the wind and the fineness of the snow. The cars simply would not stay where it was put, and the tracks could not be kept clear. Sixty men and sweepers were in operation on the different electric roads, but they were unable to keep any of the lines open for traffic while the wind lasted. Another difficulty the company had to contend with in its fight with the storm was the exhausted condition of its men. Since Saturday morning the men had been working continuously with the sweepers and plows, and, despite frequent relays, many had to give up on Monday.

The good showing of the cable road, compared with the electric lines is not considered by the railroad people as reflecting seriously upon the utility of the under-trolley system, as it is only in the case of unusual storms, they say, that a stoppage of the service would occur. Harry MacDona of the Metropolitan Street Railway company, to whom reporters were referred yesterday, said that at no time during the storm had there been any lack of power on the electric lines, as was shown by the fact that the lights burned brilliantly in cars that were stalled. "The trouble was," said Mr. MacDona, "the wheels could get no grip on the rails. This difficulty is not met with on the cable roads, of course, as the cars are not propelled by the wheels. The cable will drag a car along with the brakes set, so long as a grip is had on the cable. When an electric car strikes a heap of snow the wheels go round but no headway is made. In the usual heavy snowstorm the sweepers can keep a trolley line open, but in the last storm 15 minutes after a sweeper had passed the effect would be scarcely discernible. Then, again, if a car got stalled ahead of a sweeper, the sweeper was put out of commission for the time being. For this reason it was decided late on Monday afternoon to abandon running passenger cars and attention was confined to the sweepers. These had no difficulty in running all night when the passenger cars were out of the way. Twelve sweepers were run on each line with crews of from 12 to 15 men. Only the oldest men in the service are put on the sweepers, as, owing to their enormous power, great experience is needed in controlling them. The sweepers were run about a mile apart. In certain places, however, the sweepers were unable to remove the drifts and men had to be sent out this morning to shovel them away. The worst drifts encountered were on Central Park West, at Eighty-sixth street and One-hundredth street. They were not removed until noon to-day.

"We consider that the under-trolley system has made a better showing in storms than the overhead trolleys, as nearly all the latter stopped running before we did. It happens this year that we have en-

NIAGARA IN WINTER.—ELECTRIC-LIGHT WIRES IN PROSPECT PARK COVERED WITH FROZEN SPRAY.

and high winds. The wind, sweeping down Lake Erie, drives the water and ice into the entrance of the river, where it is caught by the current and carried down stream. The river above the falls is quite wide, and at many places it is shallow, while many reefs abound. It is on these reefs and in the shallow places that the ice lodges and has a tendency to divert the water into the deeper channels toward the center of the stream. With a reduction in the force or a change in the direction of the wind, the water lowers, and then the ice keeps the water out of the inlet canals.

This year, in the case of the canal of the Niagara Falls Hydraulic Power and Manufacturing company, the ice was very troublesome, and day after day it was found necessary to blast it to pieces, and in this condition drive it down the waterway to the canal basin and out the waste gates. Several nights the blasting was continued until morning, and the company's tug was also brought into service to break the ice and hurry it out of the canal. The very severe weather experienced in the Niagara region formed ice very rapidly, and forced a general shut-down of the mills on the canal.

On the Canadian side of the river the cars of the Niagara Falls Park and River Railway company were forced to stop running for days, owing to the lack of power caused by the shutting off of the water supply by the ice.

The WESTERN ELECTRICIAN has described and illustrated the great ice bridge of 1899, and since then the amount of gathered ice in the jam has very materially increased, while the zero weather has formed additional vast fields of ice up in Lake Erie, the greater part of which is expected to pass down the Niagara River and over the falls. The severity of the weather has also had a tendency to solidify the mass of ice now in the gorge, and should there be another great floe come over the falls something unusual is expected to occur. The ice mountain of 1899 will always be remembered as a very novel formation. In size it exceeds any mountain of many years past, and there is no doubt that some of it will be there for the hot summer sun of next July to feed on.

In Prospect Park and on the islands the manner in which the ice gathered on the trees, bushes and shrubs made a very beautiful and never-to-be-forgotten picture. One of the remarkable sights in Prospect Park was the ice formation on the electric-light wires. At Prospect Point the extent of this ice formation excited much attention. From the falling spray of the falls the ice gathered on the wire until it was nearly, if not fully, a foot in diameter, and between the trees right at the point it hung down in a festoon nearly to the ground. Further back in the grove of the park the wires were also heavily covered with the icy coating and appeared like huge cables of white metal. The sides of the trees facing the falls were whitened by the ice until they looked like purest marble, while the other side showed the bark. To walk down through the park to the point and then turn around brought about a transformation scene of wondrous beauty. Prospect Point is now protected by a slender iron railing instead of by the stone parapet wall of old. The ice on the river side of this railing was many feet thick.

means received current from the Buffalo and Niagara Falls Electric Light and Power company. On the Canadian side of the river the electric lights were out for many days, and in Niagara Falls the incandescent service was interrupted.

Electric Launches on the Thames.

The business of charging electric launches on the Thames is growing year by year, says the *Electrical Engineer* of London, and although some of the large suppliers of electric launches have their own stations at different parts of the river, some of the towns on the Thames have arranged that their municipal electric supply shall be available for charging electric

NIAGARA IN WINTER.—ELECTRIC LIGHT WIRES IN PROSPECT PARK WEIGHTED WITH ICE

launches. This is especially so at Windsor, where during the summer a fairly large amount of current is sold for this purpose. At Kingston, where the alternate system of distribution is in use, the charging arrangements are not so easily provided for. Mr. J. E. Edgemo, the engineer in charge of these works, has laid a special armored cable from the works to a small launch-charging house on the riverside. This circuit is supplied from the spare exciter in the station. The arrangements on the exciter panel of the switchboard are such that although any exciter can be put on to this charging circuit, it cannot be switched on to a dynamo while used to excite the alternators. In this way an interruption to the general supply through a fault in the launch-charging station is avoided.

countered two peculiar storms. The first was on November, while not as bad as this, it was very much affected the trolley system because the snow was of such a nature that it froze on the wheels and tracks and dissipated the electricity. This storm was experienced yesterday, the difficulty being due to the high wind, which destroyed the work of the sweepers."

President Vreeland of the Metropolitan Street Railway had this to say:

"We simply couldn't do anything. The cars couldn't get through the snow. The cars got along all right because the snow was blown through the great drifts, where the cars were turned or not. We have had to replace with new ones during the storm."

DEPARTMENTS.

Table listing departmental articles with page numbers, including 'Correspondence', 'Electric Railways', 'Electrical Securities', etc.

A statement recently credited to Mr. Edison is surprising; but it appears in a daily newspaper and may be accurate. It is contained in the following: There is no year a horse will be a rare sight. The automobile carriage is here to stay. It is now practicable, and will soon be cheap enough for general use. Gasoline will be the motive power, for it is more economical, and a larger supply of it can be carried. Electric storage batteries are too heavy, and besides, they are not practicable. The horse-carriage will also have the good-roads movement. It seems unlikely that Mr. Edison said that electric railways are not practicable. Hundreds of them on city streets prove the contrary. They have their own peculiar advantage, and seem alto-

gether likely to hold the field for pleasure riding on well-paved city streets, where sources of electricity are available. Gasoline vehicles have also their distinct advantages; but if they are to compete with the electric carriages for city use the demonstration has still to be made.

The celebration attending the seventy-fifth anniversary of the establishment of Franklin Institute impresses the observer with the importance of the work of Philadelphia's great citizen. The influence exerted by Dr. Franklin is still a potent factor in the scientific and industrial world. His works have left a lasting impression and his example has proved a guide to many. Dr. Franklin's scientific attainments are only beginning to be estimated at their real value. His qualities as a statesman and philosopher have long been appreciated, but his contemporaries were not sufficiently advanced to recognize the great value of his scientific work

It will not be for lack of means if the Armour Institute of Technology in Chicago falls short of filling the field of usefulness which its admirers see for it. Mr. Armour is very generous. He has just transferred land and securities valued at \$750,000 to the endowment fund of the institution, bringing the latter up to \$2,000,000. The school is now assured an income of \$100,000, and tuition fees may swell the amount as high as \$125,000. A complete course in civil engineering will be established; there are already departments of mechanical and electrical engineering. All friends of technical training will hope that the institution will fully rise to its opportunities.

Of the holding of expositions, like the making of books, there is no end. One of the most promising of the coming events of this character is the Pan-American Exposition, which will be held in or near Buffalo in the summer of 1901. Owing to proximity to the great power-transforming plant at Niagara, a prominent feature will be made of applied electricity, and the display will be of especial interest to electrical men in consequence. The show will undoubtedly be of benefit to the electrical industry, and those interested in electrical pursuits should hold it in friendly regard and help it as they can. The backers of the enterprise are now seeking assistance from Congress and the New York Legislature. Any reasonable request they may make should have the support of electrical men.

Nearer at hand and of less pretension is the exhibition of electrical appliances for household use which will be given in Brussels next May by the Belgian Society of Electricians. This exposition will be held in the new post and telegraph office, Place de la Monnaie, Brussels. It is the purpose of the society to make a complete exhibition of the various uses to which electricity may be applied in the household. Besides devices for illuminating purposes, there will also be exhibited small motors for operating dumb-waiters, coffee-grinders, sewing-machines and other household machinery and for cleaning and polishing shoes, electric heating and cooking utensils, domestic telephones—in fact, all appliances operated by electricity with a view to lightening the labors of the household and to the total suppression of the use of coal for domestic purposes.

Nernst's new electric incandescent lamp was exhibited for the first time in public before the Society of Arts in London on February 8th and at the same time described by James Swinburne. From the brief dispatches of the enterprising London correspondents of the American press, the WESTERN ELECTRICIAN made a brief reference to this important event last week. Now that mail advices from London are at hand, we can describe Professor Nernst's invention somewhat more fully and with greater precision.

In his address Mr. Swinburne first briefly reviewed the history of the incandescent lamp in England, deploring what he declared was the extraordinary neglect of its improvement. "The carbon incandescent lamp has made practically no advance in 15 years," he said. The average electrical engineer really knows little about incandescent lamps and pays no attention to them, according to the lecturer. This seems a rather summary reproof to the engineering profession, and, whatever the conditions

in England, we do not believe that such a sweeping characterization will hold true in the United States.

But, coming to Professor Nernst's lamp, we find that things are altogether different. Mr. Swinburne regards the new lamp as "the greatest invention in electric lighting that we have seen for many years." Professor Nernst is a chemist of the University of Göttingen. He chose as the incandescing material of his electric lamp a substance that would stand higher temperatures than the carbon filament, having, at the same time, the advantage that its specific resistance is so high that strong rods can be used for high pressures. But let Mr. Swinburne describe the lamp in his own words, in abstract:

Nernst takes highly refractory oxides as his material. It does not seem promising, because such oxides are notoriously good insulators. But such insulators are electrolytes when hot; Nernst, therefore, heats the rods to make them conduct, and then heats them electrically, preserving a temperature which is within the limits that the material can bear without softening. Such efficiency also means whiteness of light, so long as the efficiency is not too high. The material is worked up into little white rods. Each rod is mounted on two platinum wires, a little paste made of refractory oxides being applied to the joints. The little rod, with its two wires, is then mounted in a holder which fits ordinary electric-light fittings. As the rods fall in resistance as the temperature increases, after the manner of electrolytes, an increase of current produces a decrease of resistance. This tends to give some instability in running in parallel on supply circuits. This instability is corrected, as in an arc lamp, which has analogous properties due to a different cause, by a series resistance. The Nernst rod has therefore a resistance in series. This is made up of exceedingly fine wire, and for ordinary circuits amounts to 10 or 12 per cent. of the whole resistance of the lamp. The consumption, including the resistance, is 1.5 watts per candle for large lamps and 1.6 for small lights or low pressures. In small or low-pressure lamps the loss of heat at the ends is larger in proportion.

Such a lamp as I have described will not light up of itself, for the rod is an insulator when cold. The simplest way to start it is to warm it up with a match or, better, with a small spirit lamp. Such a lamp as this is not only very cheap as regards first cost, but very economical in running. The life of rods, running at an efficiency of two-thirds of a candle per watt, including the resistance, is already more than 500 hours in good specimens. If the Nernst lamp advances as much in the first few years of its existence as the carbon lamp did between 1880 and 1882, it will soon be made so well that the rods last a lifetime. When the rod is worn out a new rod with its wire mounts is all that is replaced. The whole lamp is not thrown away at all.

The small lamps and the lamps of medium size are in practice started by a heating resistance. This is arranged close to the rod and in shunt to it. As soon as the rod is hot enough to conduct, its current works a tiny cut-out in the resistance circuit. In large lamps the heating system is a little more elaborate, as the resistance arrangement is arranged as a sort of hood which covers the rod. As soon as the rod conducts, not only is the resistance circuit broken, but the electromagnet lifts the little hood clear off the rod. In all these forms, the rod and its mounting are replaceable without interfering with the rest of the lamp.

Mr. Swinburne recognizes the disadvantage of the necessity of heating the rods before they will act as conductors, but suggests the use of an ordinary lamp to show the way to heat and light the new lamps. In lamps of from 20 candle power to 200 candle power, and even smaller lamps, in which it is worth while to have automatic ignition, the first cost will be higher than the first cost of incandescents, but as the rod itself has alone to be replaced, that is considered a matter of very slight importance. "This size of Nernst lamp," says Mr. Swinburne, "has, further, every chance of completely ousting the carbon incandescent on the score of cheapness, as to renewals, higher efficiency, better colored light, and perhaps more especially high pressures. Once the Nernst lamp becomes so general that systems of distribution are laid out to suit it, instead of to suit the carbon lamp, the carbon lamp is practically out of the running." In large sizes it is said that the Nernst lamp will compare with the arc lamp in efficiency and be cheaper in first cost and maintenance. As to pressure, lamps may be worked at 500 or, by using double rods, even 1,000 volts, if desired. The sample lamps were operated on an alternating-current circuit, but Mr. Swinburne said that they would work with continuous current.

Mr. Swinburne was very sanguine of the new invention, but he thought not too sanguine. On this side of the water we shall need further demonstration and explanation before sharing his enthusiasm to its full extent.

Public Supervision of Private Business.

By FRANKLIN H. WENTWORTH.

The bill to provide for municipal supervision of gas and electric-light companies, which has been introduced in both houses of the Illinois Legislature, has not a single reasonable or justifiable feature to commend it. Indeed, it is difficult to determine from its perusal whether its sponsors are merely stupid or whether they are offering the bill with the expectation of possible personal profit. It is a pitfall for the thoughtless, being ostensibly in the interest of the people, just as were the bills which formerly were with great regularity introduced for the professed purpose of lowering Pullman sleeping-car rates, but were never enacted, for obvious reasons.

That the present measure is not really in the interest of the people is apparent. It makes it imperative for every village and city of the state to appoint what it calls "gas and electrical commissioners." It provides that their salaries (not less than \$500 nor more than \$2,000 per annum) and those of their assistants, together with their office rent and expenses, shall be paid out of the municipal treasury from the proceeds of general taxation. This is not optional; it is mandatory. All the little villages and small cities, in few of which electric lighting is profitable, are to have a new officer saddled upon them, whom every citizen must be taxed to support, whether he will or no, and whether he himself uses electricity or kerosene lamps.

There are 160 villages and cities in Illinois in which electric-lighting plants are operated. In the majority of them but little residence lighting is done, as the profits from such service do not warrant the outlay in copper feeders necessary to do it. Then we here have the statesmanlike proposition to tax all the people of a city in order that a possible fifth of their number may have someone to defend them against the alleged extortion of the lighting company. Taking the average salary of the proposed commissioner at \$1,000 per annum, and adding a gross \$40,000 for assistants' salaries, office rent and other expenses in the 160 municipalities, we have \$200,000 per annum added arbitrarily to the taxes of the people of the state. And absolutely to no good purpose. Such an office would result in benefit to no one except to the faithful politician whom it would support in idleness at the expense of the taxpayer. It would be another fruitful source of corruption in the larger cities, enabling the incumbent regularly to blackmail the corporation holding the franchise. The amounts paid him to obviate the irritation of frequent examinations of books at inopportune and inconvenient times, which the law is framed to allow, would be recouped at the expense of the users of light and power. In the smaller cities and villages, where crookedness is impossible, it would be simply a useless, tax-eating office, for the lighting companies in these small places are now selling their current at prices that barely pay their operating expenses and the percentage of depreciation of their machinery and plant. An officer, therefore, saddled upon small cities for the purpose of compelling such franchise holders to offer reasonable rates would be of value to no one, although increasing the general tax burden in the amount of his salary and office rent and expenses. The utter absurdity of maintaining such an office in small cities will be too obvious to make it worth while for the electric-lighting interests of the state to pay any attention to the bill. Should the country legislators lend themselves to such oppression of their constituents, their seats would be jeoparded.

But deeper than such shallow manifestations of greed and prejudice, aimed at the holders of public franchises, lies a great principle, a principle that, sooner or later, all intelligent persons must recognize. A business is either public or private. If it is public, private interests should not be concerned in it. If it is private, the public has no right to arrogate to itself powers of control. Attempted municipal regulation of a natural monopoly in private hands must result either in injustice and useless irritation to the holders of such privileges or, on the other hand, in debauchery of municipal servants. If the municipality must enter the field of electric lighting in order to insure justice to its citizens, it cannot secure that result by assuming to dictate the policy of a private business. Justice does not spring out of injustice. The municipality may perhaps in justice buy the plant of a private corporation at a price which it would cost to duplicate it, and grant no further privileges; but it cannot, in reason, expect private interests to continue in such business harassed by the unintelligent and often stupid restrictions imposed by ignorant legislators.

Electric Railway for Vicksburg.

It is said that Vicksburg, Miss., with a population of from 15,000 to 20,000, is the largest town in the United States without an electric street railway. But this omission will soon be rectified, for work is in progress on a system 5 1/2 miles in extent for the Vicksburg Railroad, Power and Manufacturing company, the company that operates the electric-light plant. The lines, which are single-track and laid on the principal streets of the city, have been put down by the North American Railway Construction company of Chicago, and the Electrical Installation company of this city has the contract for the overhead construction, and has already begun work.

Municipal Electricians.

The revised constitution and by-laws of the National Association of Municipal Electricians (the new name of the institution organized in Brooklyn, N. Y., September 15, 1896, as the International Association of Fire and Police Telegraph Superintendents) have just come from the press in very convenient pocket form. They should be of interest to every municipal electrician. The new constitution and by-laws were revised and adopted by the executive committee, at Boston, January 28, 1899, in accordance with resolution passed at the third annual convention at Elmira, N. Y., August 9-10, 1899.

Considerable interest is exhibited throughout the United States in this association. The following are the titles of some of the important papers that will be read at the next annual convention at Wilmington, Del., in September:

"The Laws and Government of the Wire Department of Boston," by Commissioner Thomas W. Flood. This is the first time that Commissioner Flood has consented to personally review the very important work carried on by his department, and as Boston is the only city that has such a department, it will no doubt greatly interest and instruct not only the municipal electricians throughout the country, but the electrical public as well.

"Licensing of Employees Engaged in Electrical Work and the Improvement of the Quality of Work and Material," by Captain William Brophy of Boston.

"Advisability of Concentrating the Control of All Municipal Electrical Interests under One Head," by Morris W. Mead of Pittsburgh.

"The Underground System as Applied to the Fire-alarm Telegraph," by S. L. Wheeler, city electrician, Springfield, Mass.

"The Police Signal System of Boston," by John Weigel, superintendent police telegraph, Boston.

"Aerial Construction of Fire and Police Telegraph Lines," by W. H. Thompson, city electrician, Richmond, Va.

"Progress and Development of the Municipal Electrical Interests of Canada," by G. F. MacDonald, Ottawa, Can.

In connection with the next meeting of the association will be held an exhibition of electrical and mechanical apparatus used in various departments of municipal work. A large building, well adapted for this purpose, and ample power will be supplied. The Board of Trade of the City of Wilmington has taken an active interest in this feature of the meeting, and has already appointed a committee to assist in making the exhibition a successful one. The railroads have agreed to make special freight rates to exhibitors.

English Review of American Electrical Progress in South America.

Some time ago the London Board of Trade sent a special commissioner, in the person of Mr. Worthington, to investigate the conditions of British trade in several South American countries. The following extracts from his report cannot fail to interest American electrical manufacturers, for they plainly show that a decidedly favorable impression prevails where American products have been tried.

Mr. Worthington found that the electric-lighting trade of the nitrate works at Iquique, Chile, was leaving English makers, because there is a very capable resident representative of the Westinghouse company in Iquique, who is always ready to negotiate for new installations, to supply small refts for American machinery, and, for a moderate monthly charge, to look after the electric plant continually—an arrangement which suits the companies well.

According to Mr. Worthington the bulk of the electric plant and practically all the electric-traction machinery in Buenos Ayres, Argentine Republic, was made in the United States. "Small electric motors and fittings, too," says the report, "are chiefly American. The American motor is neater, lighter and cheaper. For example, I have seen a three horse power American motor with a hook at the top for carrying it about, which was certainly a neater and less cumbersome machine than an English two horse power motor which was shown me. The English motor is often capable of working far above its indicated power, or, say the power which has been contracted for; but this is not wanted, and only adds to the cost. English makers, too, have given dissatisfaction in their careless packing of delicate machinery, especially voltmeters, which arrive broken, a thing which never happens when they come from the United States."

The hold which American electric machinery has obtained upon the Argentine market is sometimes attributed to its having been introduced in a more energetic and business-like manner, and there may be a good deal in this; but Mr. Worthington is inclined to think, from what he has learned, that its perfection, as a rule, for doing its work, combined with the neatness and lightness of the American machinery, is what has kept it to the front. German machinery—frequently a poor and cheap copy of the American—finds a market, and even Italian work is now being introduced. The American electric machinery is looked upon as the most advanced. The English, Mr. Worthington was told, have not kept pace with the American improvements and inventions, while the Germans have carefully watched and promptly copied the American.

American Institute of Electrical Engineers.

The regular monthly meeting of the Institute, held in New York and Chicago, on the evening of February 15th, a week earlier in the month than usual on account of the regular date falling on a Wednesday's birthday. At the New York meeting Mr. Pierce, Mr. A. Lloyd read a paper entitled "Storage Batteries and Railway Power Stations." It was discussed by Messrs. Hill, Malouin, Bradford, Smith, Hines, Henshaw, Lujar and others.

At the meeting of the executive committee in New York in the afternoon the following associate members were elected: Frank Perry, Adams, Stockton, Cal.; Julia Le Roy Adams, Manchester, Conn.; Paul K. Brown, St. Peterburg, Russia; N. M. Currie, Conneaut, Ohio; John Stungo Codman, Boston, Mass.; Clifford E. Dunn, New York, N. Y.; Chas. William Hutton, Sacramento, Cal.; Edmund Oscar Schweitzer, Chicago, Ill.; Arthur E. Truesdell, Newark, N. J.; Martin B. Waterman, New York, N. Y.; John S. Reece, Jr., Philadelphia, Pa.; Mr. George T. Hancock, consulting electrical engineer, New York, was transferred to full membership.

In Chicago R. H. Pierce presided, and Mr. Lloyd's paper was read by B. J. Arnold. Those who participated in the discussion were Joseph Appleton of Philadelphia, Alex. Dow of Detroit and George W. Knox, Maurice Coster, Mr. Arnold and Mr. Pierce of Chicago. Others present were L. S. Cass of Waterloo, Iowa, and Chas. L. Brown, W. S. Rugg, Geo. M. Mayer, Frank H. Clark, E. H. Clency, Alex. M. Hanbrick, C. Y. Atkins, H. M. Wyckoff, A. C. Libby, George A. Damon, Fitzhugh Taylor, F. S. Willhoit, H. A. Seward, Lucien H. Gilmore, W. D. Ball, James E. George, A. de Khotunsky, C. W. Register and Taylor E. Brown of Chicago.

There was an informal discussion of the advisability of holding further meetings of the Institute in Chicago, and the matter was finally referred to Secretary R. W. Pope and Mr. Pierce, the local honorary secretary, to call western meetings in their discretion.

Trade with Mexico.

Many cities of Mexico are advocating public improvements, such as electric-light plants and electric railways. England, France and Germany are represented on the ground and their manufacturers are vigilant.

American manufacturers enjoy many advantages, however, and as Mexico is so easily reached and has a population as large as that of Canada, New England and all the Rocky Mountain and Pacific states and territories combined, it is well worth attention. The language of the country is Spanish, and circulars in English are so much waste paper. Every route by rail into Mexico has its customs agent, whose business it is to give information as to duties and to facilitate the passing of goods through the Mexican custom house. They are men of exceptional intelligence and experience, whom it is well for manufacturers to consult. Long credits are the rule in Mexico, and with established houses are entirely safe. A mercantile agency under American auspices is in working order in Nuevo Laredo, and is performing those functions so necessary to the safeguarding of trade.

Proposed License Fees in Washington.

A bill is pending in Congress to regulate licenses in the District of Columbia. One of its provisions is to the effect that proprietors of electric-light plants shall pay five cents on every hundred dollars of capital stock. The provision is made, however, that the tax required for a license shall not be construed as exempting any company, association or person engaged in the distribution of electric light to patrons from such general or personal taxes as may be assessed upon its capital stock, gross receipts or other property under existing laws.

The bill also provides for a tax on automobiles used for the transportation of passengers or merchandise for hire, profit or gain. Proprietors of all vehicles not running upon railway tracks, and using electricity or other approved agency as a motive power, shall pay \$12 per annum for each vehicle with a capacity not to exceed to passengers, and \$15 each per annum for vehicles with a capacity exceeding 10 passengers. Automobiles for conveying merchandise are to be taxed \$10 each per annum.

Electrical Machinery Exports.

The Washington correspondent of the WESTERN ELECTRICIAN writes as follows: "It is gratifying to observe that American electrical manufacturers have learned the significance of our industrial supremacy, and it may be assumed that the conditions of foreign trade are now being studied by every manufacturer who is confronted by the problem of finding outlets for his productions. This fact is shown by official statistics, which show that the value of our export trade in electrical machinery in 1897 were valued at \$9,745,371, while in 1898 they passed the export reached the value of \$22,644,644, a net gain of \$12,900,000 in a single year. To be noted, too, that the value of electrical machinery and 'other electrical equipment' in the general classification in the general trade reports...

DEVELOPMENT OF THE TELEPHONE FIELD.

Illinois Telephone and Telegraph Company.

The twice-amended ordinance of the Illinois Telephone and Telegraph company, which purposes to furnish telephone service in the city of Chicago, in competition with the Chicago Telephone company, was passed by the City Council on Monday night. The ordinance now complies with all of Mayor Harrison's objections and will undoubtedly be signed by the executive. The new company is given the right to construct and operate a telephone system in the city of Chicago. The last amendment provides that there shall be nothing in the grant to interfere with the full and free exercise of the city's power to regulate telephone prices or license companies.

For the first time officially the list of backers of the new company was presented through a communication to the mayor from Charles H. Aldrich, the company's counsel. The promoters, said to represent \$100,000,000 of capital, were named as follows: Adolphus Busch, William J. Lemp, Hopkins J. Hanford, C. Marquard Forster, Philip Stock, Lawrence B. Pierce, Henry Nickolaus, George J. Kobusch, William F. Nolker, William D. Orthwein, Breckenridge Jones, Charles H. Turner, C. K. D. Walsh, Rolla Wells, William F. Haarstick, Otto U. von Schrader, Ellis Wainwright, August Gehner, Samuel M. Kennard and Julius S. Walsh, St. Louis; E. A. Everett and associates, Cleveland; S. P. Sheerin, Samuel S. Morss, Indianapolis; Milo G. Kellogg, Chicago.

Mr. Aldrich is also credited with the statement that other Chicago capitalists and large employers of labor, whose names he had not yet received written permission to disclose, were interested in the new company. He stated that some of these capitalists probably would not disclose their attitude until the exchange was well under way, and perhaps not until it was completed.

The ordinance as amended provides for a franchise for 30 years, covering all the territory inside the limits of the city of Chicago.

The compensation to be paid the city is nothing for the first 10 years, three per cent. of the gross receipts for the second 10 years, five per cent. for the next five years, and seven per cent. for the remaining five years.

In the territory bounded by Fullerton avenue, Western avenue, Twenty-second street, Halsted street, Fifty-fifth street and the lake, all wires are to go underground.

In all conduits one duct shall be given to the city, and the city can use all the company's poles.

If the company does not have an exchange with 2,000 subscribers in operation within five years the franchise is forfeited.

The cost of telephones shall not be more than \$85 a year for business instruments, \$50 for residences, and \$25 for public telephones.

The city is given a number of telephones free, and can rent instruments for fire and police use for five dollars a year.

An option is given the city to purchase the plant at the expiration of the franchise.

Cheap Telephone Rates Abroad.

[From the Washington Star.]

There are two Swedish telephone companies—the Government Telephone company and the General Telephone company (formerly the Bell Telephone company). The former charges per year 80 crowns, or \$22, in every city, and 90 crowns, or \$25, in the country. The latter company charges 60 crowns, or \$16, per year in the cities, towns and villages, except in Stockholm, where you pay only 30 crowns, or \$9.75, per year. By paying these charges you are entitled to have your telephones repaired, whenever needed, besides having them inspected twice a month.

In the city of Stockholm alone, with a population of 230,000, there are no less than 36,000 telephones. Outside the city limits, in any town, you pay for telephoning a distance of 30 English miles 15 up to 30 ore, or four to eight cents, for three minutes' conversation. The telephone system has been extended to the northernmost town in this country, Haparanda. From this place to Stockholm, a distance of 720 English miles, you can communicate by telephone for just 27 cents.

There is hardly a village in the whole country where there is not a dozen telephones are not found, and in the woods you may, during your travels, find a telephone put up for the accommodation of the hunter, trapper, or tourist. In these wild and deserted places there are no people living for miles around, and he that might be able to communicate with friends far away. He is expected to pay the charges, and he will find in the guide books hanging up at the telephone.

Well-grounded Fears.

[From the Washington Star.]

The proposed construction of a 2,000 independent telephone lines in the State of Iowa, 100 of which are to be in the city of Des Moines, is said to have become a source of concern to the Bell telephone people.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the WESTERN ELECTRICIAN.]

The Central Wisconsin Telephone company held its annual meeting at Black River Falls, Wis., and voted to put in a new switchboard there. The present board has 50 drops, but the new one will either have 100 or 200 drops.

The Huefner Telephone company has extended its wires to Mondovi, Wis., and installed an exchange with 30 instruments.

The new telephone company at Janesville, Wis., charges the old company with stringing dummy wires to lamper the new company. The old company denies this, but says all the new wires will soon be in use, and also charges that the new company is neglecting the rule which requires its lines to be three feet over the Wisconsin Telephone company's wires.

The report of the Wausau (Wis.) Telephone company reveals an increase of over \$7,000 in the value of the plant in three years and four months and the payment of 46 per cent. dividends. The local paper declares the service excels that of the Wisconsin Telephone company prior to the time it had competition.

John Gallagher, a lineman in the employ of the Northwestern Telephone Exchange company, fell from a ladder in St. Paul and sustained concussion of the brain.

It is reported the local telephone company at Oelwein, Ia., contemplates building a line to West Union, Ia., by way of Scott, Maynard and Fayette.

The Duluth Telephone company of Duluth, Minn., has announced a reduction in rates on party-line service for business and residence use. The company also contemplates putting in sub-exchanges at Lakeside and possibly at other points.

The mayor of Duluth, Minn., wants a bill passed to levy a tax for five years for the purpose of constructing and operating a telephone plant for the city.

The telephone company at Reinbeck, Ia., seeks to shame the telephone-borrowing fiend by publishing a card to the public stating that if one must borrow from a neighbor the least to do is to help him pay for the instrument.

The Northwestern Telephone Exchange company is securing a right-of-way into Fertile, Minn.

The Michigan Telephone company announces at Marquette, Mich., that the upper peninsula is to have a much improved service, including copper metallic circuits, long-distance connection with Detroit, Chicago and the West.

R. H. Evans of Detroit, Mich., is an applicant for a telephone franchise at West Superior, Wis. He is also an applicant at Duluth, Minn., and offers to make as good terms with one city as with the other.

The Northwestern Telephone Exchange company has consolidated the local exchange at Spring Valley, Minn., with the long-distance office.

The central office of the Martin Telephone company at Williams, Ia., was burned, which rather crippled the service and entailed considerable loss.

The Pipestone (Minn.) Telephone company will shortly move to new quarters with its central office. A new switchboard will be put in and other changes made.

There is talk of a telephone exchange at Belmond, Ia.

The telephone company has decided to put in a cable at Morris, Minn., over the tracks where the wires recently broke from the weight of ice and sleet.

Rowe Brothers of Pierre, S. D., propose to construct a telephone line from Sioux City, Ia., to the Black Hills of South Dakota, via Ponca, Newcastle, Niobrara and Valentine, Neb.

The Fergus Telephone company will extend its toll system from Battle Lake, Minn., to Amor, Phelps and Maine, Minn., in the spring.

The Minnesota Senate has passed a bill permitting telephone companies to take advantage of rights-of-way controlled by railroads, by resorting to condemnation proceedings.

The Mississippi Valley Telephone Exchange company now announces that its exchange in Minneapolis will be in operation by July 1st. The company claims 3,500 subscribers in Minneapolis and 2,000 in St. Paul.

The Home Telephone exchange at Sioux City, Ia., was damaged by crossed wires with the electric-light system recently.

The Tri-city Telephone company has placed a new switchboard in its Lyons, Ia., office.

The telephone toll line has been completed between Grand Forks, N. D., and Inkster, Orr and McCanna, N. D.

Charles E. Wisard will soon install an exchange at Howard, S. D.

The Village Board of Wittenberg, Wis., has granted telephone franchises to the Little Wolf River Telephone company and to the Northeastern Wisconsin Telephone company. A local exchange will be put in.

The Central Telegraph and Telephone company of Stevens Point, Wis., has been incorporated, with \$100,000 capital stock.

Robinson & Wilson of Washington, Ia., will build a telephone line to Wellman, Ia., in the spring.

Paul N. Krauer, formerly with the Bell com-

pany of Chicago, has signed a contract to take the management of the Mutual Telephone company's business in Des Moines, Ia.

Arrangements have been completed by which the Ralston telephone interests centering at Marysville, Mo., and the Mount Ayr and Clearfield Telephone company will connect with the Mutual Telephone company of Des Moines. The system will then connect Des Moines with Kansas City, St. Joseph, Marysville, Savannah and all the larger towns in Northwestern Missouri, with Omaha, Council Bluffs, Nebraska City, Plattsmouth and other towns in Southwestern Iowa and Eastern Nebraska.

The Cedar Valley Telephone company will probably build a toll line between Hampton, Ia., and Dumont.

The La Crosse Telephone company is putting in a new switchboard at Onalaska, Wis.

A telephone line has been completed between Monticello, Ia., and Scotch Grove.

Farmers of Northern Iowa in several districts are fixing up telephone connection with their neighbors by means of their barb-wire fences.

John W. Kelly, the alleged absconder from the Iowa Telephone company's Waterloo office, has been arrested and brought back for trial.

The Iowa Telephone company will establish an exchange at Humboldt, Ia., in the spring.

The new telephone company has 360 instruments in use in Eau Claire, Wis., 200 in Chippewa Falls and about the same number in Menomonie, Wis.

Cold weather and high winds have been destructive to telephone toll lines near Colville, Wash. Connection with both Spokane and Republic was discontinued.

The Cedar Valley Telephone company has added 60 subscribers to its system in Cedar Falls, Ia., since last July, and now has 250.

Telephones of the World.

The government of Sweden has collected statistics upon the development of the telephone industry in all parts of the world, and the result of this investigation is presented in tabulated form by Edward D. Winslow, consul-general at Stockholm, in a report to the United States government at Washington. Mr. Winslow furnishes no particulars as to the manner of obtaining the information or the sources depended upon. Following is the table presented, which, although incomplete, is nevertheless interesting:

Countries.	Instruments in use.		Distance covered.	
	Number.	Kilom.	Miles.	
Sweden (1897).....	56,500	120,000	74,568	
Norway (1897).....	20,678	53,889	33,481	
Denmark (1895).....	10,500	15,000	9,321	
Finland (1895).....	7,351	21,000	13,049	
Great Britain and Ireland (1894).....	69,615	134,215	83,461	
Holland.....	8,000	8,000	4,971	
Belgium (1895).....	9,227	26,127	16,235	
Germany (1896).....	151,101	236,712	147,093	
Austria (1896).....	21,616	74,630	46,375	
Hungary (1896).....	10,293	28,870	17,940	
Switzerland (1897).....	28,846	76,593	47,594	
France (1894).....	27,736	101,754	63,250	
Italy (1896).....	11,951	21,000	13,049	
Spain.....	11,038	22,984	14,282	
Russia.....	18,495	65,000	40,391	
Roumania.....	750	227	141	
Bulgaria (1893).....	300	600	372	
Japan (1897).....	3,232	8,468	5,262	
British India.....	1,601	3,695	2,296	
French India.....	89	556	345	
Philippines.....	452	951	592	
Algiers.....	235	391	224	
Tunis.....	200	452	281	
Senegal.....	50	87	54	
The Cape and Natal.....	600	1,770	1,100	
United States (1896).....	772,627	1,296,655	805,711	
Cuba.....	1,818	1,900	1,181	
Canada (1898).....	33,500	70,840	44,020	
Mexico (1896).....	9,000	10,000	11,807	
Paraguay (1896).....	500	1,000	625	
Uruguay (1896).....	3,209	13,063	8,117	
Australia.....	855	3,846	2,390	
Total.....	1,288,163	2,429,254	1,509,499	

Some of the reports have no commercial value at the present time. Great Britain and Ireland, for instance, have made considerable advancement since 1894, when the data here presented were obtained. In June, 1898, the National Telephone company had 820 exchanges open, and 112,769 instruments in operation, which will indicate the rate of advancement in England. The statistics from France are equally valueless for present use, and the returns from the United States do not include the period of greatest activity in this country. However, the attempt of the government of Sweden to collect statistics of this character should be encouraged and the co-operation of other countries should be given.

EXTENSIONS AND IMPROVEMENTS.

The Oregon Telephone and Telegraph company has had a representative at Cottage Grove, Ore., working up a local system. Sixteen telephones have been subscribed for and the extension is now assured.

The act of Congress authorizing the Missouri and Kansas Telephone company to construct and maintain lines and offices for general business purposes in the Ponca, Otoe and Missoula reservations, all in the territory of Oklahoma, has been approved, and work on the extension is expected to be commenced at an early date.

Telephone Privileges in China.

[From the London *Statist.*]

Shanghai, as our readers are aware, is a town founded as a consequence of our wars with China. There is a British settlement and a French settlement, the British settlement being far the larger and containing considerable numbers of Americans and Europeans of all nationalities. The French settlement is almost exclusively French. Each settlement is administered by a municipality, and it is the action of the British municipality—which the French in this case follows blindly—in regard to the telephone company working in Shanghai which we would bring to the notice of our readers and commend to the consideration of Lord Salisbury. The fortunes of the China and Japan Telephone company have very little interest for the public, and we certainly should not intrude their affairs upon our readers were it not that the attitude assumed by the municipality is an object lesson which, we venture to think, supplies a useful comment upon Lord Salisbury's policy in China. The telephone company has been working since 1883 or 1884 without any privilege of any kind, or, according to the municipality, any agreement even with the municipal authority. And it has gradually built up a business, which, to put it briefly and clearly, the municipality now proposes to set up to auction, inviting capitalists all over the United States, all over the continent, and here at home, to bid eagerly for. The municipality has issued a little pamphlet, inviting tenders for the working of the telephone system in Shanghai, with an offer of a concession for 30 years, the municipality, however, to have the right of purchase at the end of 15 years. The pamphlet tells us that at the time it was made up the company had 338 subscribers, and that these subscribers and such others as may be added before the concession is granted will be handed over to whomsoever is successful. Of course, we are aware that the municipality cannot compel these subscribers to join a new system. What the municipality means, no doubt, is to hold out an inducement to capitalists in Europe and America by telling them that there are already 338 subscribers to the existing company, and that no doubt these find the telephone of so much use that they will continue their subscriptions whoever may supply the service. Is not this a very plain expression of opinion that British enterprise in China needs neither encouragement nor protection; that British traders are very well able to take care of themselves; and that any of them who are fools enough not to take security for the safe enjoyment of whatever enterprise they may build up deserve to suffer? And remember, that the expression of opinion is from the trading community of Shanghai. Again, it will be noted that the trading community of Shanghai invites Americans and the people of the continent, without exception, to send in tenders. . . . It would be wearisome and serve no useful purpose to go into the various conditions imposed upon those who tender. But there is one point which throws so much light upon the allegation that encouragement and protection are required by merchants in China that we cannot refrain from noticing it. Those who send in tenders are obliged to state the charges they intend to make to subscribers. But the municipality reserves to itself the right to revise the terms if those who carry on the telephone business extend that business anywhere in China beyond the British and French settlements. It is hardly credible that any capitalist in his senses will agree to this. And, therefore, we do not expect that very many will tender. But, as defining the very little importance attached by the British residents in Shanghai to either encouragement or protection, the proposal is exceedingly instructive. The tenderer must first state what he intends to charge. And the charge, one would suppose, is the main point in the business, for nobody will carry on the telephone system except for the purpose of making a profit. Yet, the tenderer, having stated what he requires, is told in the same breath that if he extends his business the municipality may change the terms altogether. Now, it is obvious that if China is about to be opened up and to advance economically, it may be of the very greatest importance to those who in future will carry on the telephone business in Shanghai to establish themselves in other great centers. But if they do so the threat is held over their heads that the municipality of Shanghai reserves to itself the right to alter the terms of the contract. Whether this is law we do not pretend to say. But, at all events, it is a very eloquent comment upon the alleged necessity that is felt for encouragement and protection.

MANUFACTURERS AND DEALERS.

The Eureka Electric company of Chicago has met with success with its telephone apparatus, and is securing nice contracts daily. The principal feature of its telephones is the amplifying, long-distance transmitter, which is guaranteed to ring indefinitely, and which, for articulation and quality of tone, is said not to be equaled by any in the market. The receivers are double-pole, and the work is of the highest finish. The new No. 44 transmitter is adapted for replacing upon instruments, either upon the magneto or upon the transmitter boxes, and is guaranteed to give entire satisfaction. The company is located at 157 and 159 South Canal street.

The street-railway company of Des Moines, Ia., will test the various kinds of fenders.

Bell Companies' Mortgages.

An Indianapolis dispatch of February 17th says: The Central Union Telephone company to-day filed with the recorder of Marion County and the recorders of 69 other counties of the state where the company has property a mortgage for \$4,000,000, given to the Old Colony Trust company of Boston to guarantee the issue of \$6,000,000 five per cent. gold bonds, payable January 2, 1919. The money derived from the bonds will be used in the extension and improvement of the company's lines. The document bears \$3,000 worth of revenue stamps, and the total cost of recording the mortgage in Indiana is more than \$5,000. The recorders of the 69 counties besides Marion were assembled in this city to receive the mortgage.

Poor & Greenough, bankers of New York, advertise for sale \$2,500,000 of consolidated-mortgage five per cent. bonds of the Michigan Telephone company of Detroit. They state that the capital of the company is \$2,500,000, and that the total bonded indebtedness, including the new issue, is \$2,785,000. The number of subscribers is placed at 19,052, and the structural value of the property on December 31, 1896, is stated to have been \$2,127,001.81, with \$809,870.63 expended since. The letter of President C. J. Glidden of the company to the bankers is of some interest. It is as follows:

The board of directors and executive committee of the Michigan Telephone company have authorized the proceeds of the sale to you of \$2,500,000 consolidated-mortgage bonds to be applied as follows:

- First—To purchase and cancel the \$650,000 outstanding first-mortgage bonds of the company. Contract has been entered into with the holders of these bonds for the purchase of \$365,000, leaving outstanding bonds to the par value of \$285,000.
- Second—To purchase land and erect exchange buildings for the exclusive use of the company at the following places: In Detroit, for branch exchange buildings, five. For main exchange buildings, one each at Battle Creek, Bay City, Kalamazoo, Lansing, Marquette and Port Huron. The company already owns land and buildings to the value of \$264,552.84, consisting of main building and one branch at Detroit, and main exchange buildings at Jackson, Saginaw and Grand Rapids.
- Third—To extend the long-distance service to all important sections of the state not already covered, including the iron and copper district of the upper peninsula, thereby connecting this district with all long-distance points of the state and the entire long-distance service of the United States and Canada.
- Fourth—To place extra copper metallic circuits for long distance service on pole routes already established throughout the state, providing for a large and increasing business.
- Fifth—To pay the cost of connecting new subscribers at all exchanges, and general additions to the company's extensive plant. Our past experience has proven that extensions and improvements of the character outlined have largely increased the revenue of the telephone companies, thereby providing for all fixed charges and regular dividends upon the capital stock.

Telephone Girls Housed in Hotels.

As the result of the recent storm, the New York Telephone company was, on February 13th, deprived of the services of nearly half of its operators, the latter being snowbound at their homes. It happened to be a holiday, and the service was not materially crippled. To avoid a recurrence of this emergency, over 200 of the girls were lodged in downtown hotels the next night, as the storm still continued.

A telephone message was sent to the Astor House in the afternoon asking if 100 rooms could be engaged for the use of the girls in the Franklin street and Cortlandt street exchanges. The Astor House was already crowded, and the reply made was that only 21 girls could be accommodated. Four rooms, with two double beds in each, accommodated 16 girls, and five others were put in another room.

The Cosmopolitan Hotel at Chambers street and West Broadway took care of 160 more of the operators. At the Broadway Central Hotel 24 girls from the Spring street exchange stopped for the night. A crowd of girls from the Eighteenth street plant went to the Continental Hotel, Twentieth street and Broadway, while 32 girls from the Thirty-eighth street exchange went to the Hotel Normandie.

In each case the hotels served dinners and breakfasts to the girls at the telephone company's expense. The order for the girls to go to the hotels was not compulsory, but they gladly accepted the offer rather than make the trip to their homes through the storm.

Motor Plant for Wholesale Grocery.

Reid, Murdoch & Co. will occupy the new Garrett building at Lake and Market streets, Chicago, and will install probably the largest electric-power plant possessed by any grocery house in the country. The building is equipped with its own generating plant, which will supply current to over 40 motors used in different parts of the large establishment to drive spice mills, coffee roasters, fans, elevators, etc. The motors will be both direct-connected and belted to shafting. Thirty-nine of the motors, ranging from two to 25 horse power each, were sold by Kohler Bros., and are of a special slow-speed type made by the Northern Electrical Manufacturing company.

The East Jersey Electric company was incorporated in New Jersey last week, with an authorized capital of \$1,000,000. The company is empowered to manufacture and deal in electricity, light, heat and power of all kinds, including compressed air. The incorporators are Charles F. Johnson of New York, S. Hand Taylor of Philadelphia and Joseph P. Cooper of Rutherford, N. J.

Electricity on Board Ship.

[Continued from page 10.]

been able to learn from the electrical engineers in charge, all the electrical apparatus on board, and stated the supreme test of the success of the project. The officers of the Brooklyn are confident that the performance of the electrical machinery will be satisfactory. They report that with respect to the efficiency of the machinery and fineness of control there is no room for improvement, rather a compliment. The chief project is the complete authority, for the officer in command, to have the actual command of the current in the event of an emergency. This is not only unprejudiced and impartial, but final and conclusive.

It is hardly necessary to say that electrical machinery to be reliable must have reasonable care and attention from men who know something about it. This is true of any machinery, and it is a bad policy, as well as untrue, to say, as is sometimes said by those who should know better, that an electric motor requires no attention. Cleanliness is very necessary, and may be considered as a first essential of successful operation. It is astonishing to see how little has to be done to an electric motor if it is kept scrupulously clean; but this cleaning must be regular and intelligent. From what has been said, it may safely be affirmed that electric machinery can be made a reliable on shipboard as any other machinery, and with this in mind we can turn to the question of efficiency, including weight of plant and first cost.

There has been very little data published on the performance of ship auxiliaries, but a valuable contribution to the subject appeared in the February (1898) number of the *Journal of the American Society of Naval Engineers*, by Passed Assistant Engineer W. W. White, United States Navy, entitled "Steam Consumption of the Main and Auxiliary Machinery of the U. S. S. Minneapolis." This vessel, as is generally known, is a first-class protected cruiser of about 7,500 tons displacement, with three screws (each operated by its own engine) and a trial speed of over 22 knots per hour. She represents the highest type of her class, and is in every way a credit to her designers and builders. She has between 30 and 40 steam auxiliaries and more than 150 separate steam cylinders. Her only electric auxiliaries are the lighting generators and a few small ventilating sets and ammunition hoists. In order to ascertain the steam consumption of her main engines and auxiliaries, Mr. White, who was serving on board the Minneapolis at the time as one of her engineers, made a series of careful observations during a run of the vessel of seven days from Gibraltar to League Island, Philadelphia. Indicator cards were taken on all auxiliaries fitted for the purpose (31 in number), and the losses from leakage, condensation and radiation were carefully estimated and the water evaporated carefully measured. The results obtained were certainly startling.

The average weight of steam used by the main engines per hour was 33,620.6 pounds, and by the auxiliaries 10,146.7 pounds. That is, the auxiliaries consumed nearly 25 per cent. of the total coal used. The main engines consumed an average of 20.83 pounds of steam per indicated horse power per hour, and the auxiliaries an average of 119 pounds per indicated horse power per hour (the lowest being 55.06 pounds and the highest 318.68 pounds per indicated horse power per hour). The steam consumption of the same or similar auxiliaries varied greatly, due, doubtless, to the varying conditions of packing rings, bearings and valves, and of the load. These results are not exceptional. In fact they are probably better than the average obtained on most warships or merchant vessels. The new British cruiser Powerful (14,000 tons displacement) is reported to have used 8,300 tons of coal from England to Hong Kong of which 3,400 tons (or over 40 per cent.) was required for the auxiliaries.

Under the most favorable conditions the auxiliaries of a large ship probably consume at least 20 per cent. of the total coal and water used. This is more than twice as great as the consumption in a modern central station, and there is no good reason why as good results should not be obtained at sea as ashore.

Let us assume a required central-station capacity for a first-class battleship of 1,000 horse power effective at the motors. The present standard electric motive force for naval installations is 80 volts, and for the merchant marine about 100 volts. This low voltage was originally adopted on war ships in view of the searchlights, which require 50 volts only, and it was desired to introduce as little back resistance as possible. At this time 100 volts were, of course, in use, and the electric plant was used for lighting exclusively. Such a voltage is, however, entirely unsuited for a 1,000 horse power plant, the weight of the distribution system would be very excessive, but the size and weight of the generator would be prohibitive. The three-wire system of 220 to 250 volt two-wire system should be adopted, using the necessary resistance in the distribution circuits when they are in service, sure they consume a relatively small percentage of the total energy, and are not regularly in use, this can be done without undue sacrifice.

The generating plant should consist of two units of the same size, each unit consisting of a compound engine driving a pair of generators, one a single generator, depending upon whether the two-wire or two-wire system is used. Assuming an efficiency of

82 per cent. for engine and generator and an average line and motor efficiency of 80 per cent., the total efficiency of the system (between the indicated horse power of the generating engines and the effective horse power of motors) is 65.6 per cent. In other words, to develop 1,000 horse power at the motors will require 1,500 indicated horse power at the engines or about 900 kilowatts generator capacity. Six sets of 150 kilowatts each, with one in reserve, would be required. A good compound engine working at approximately full load (and with six units, those in actual service can always be operated at or near full load) will require 20 pounds of steam per indicated horse power per hour. Assuming a total efficiency of the system of 65.6 per cent., as above, it will require about 30 pounds of steam per effective horse power per hour at the motors. If we allow 25 per cent. margin for losses due to steam leakage, condensation, mechanical friction of gears, etc., we still have an economy of 37.5 pounds per horse power per hour, as against 119 pounds as shown by the Minneapolis test. In this case the auxiliaries tested aggregated 471 horse power developed, using 56,049 pounds of water per hour. At eight pounds of water evaporated per pound of coal, the coal consumption was 7,000 pounds per hour, or 84 tons per day, assuming that this power was required for 24 hours. If the water consumption had been at the rate of 37.5 pounds per indicated horse power per hour instead of 119 pounds, the coal used per day for these auxiliaries would have been 26.5 tons, a saving of 57.5 tons, or nearly 70 per cent.

It is fair to assume that by the introduction of compound engine and improved mechanical appliances on some of the auxiliaries, the average steam consumption can perhaps be reduced to 75 pounds per horse power per hour, but this is still 100 per cent. in excess of that required for the electric drive. Assuming an average daily use of 800 horse power effective at the auxiliaries on a first-class battleship at sea, this difference in efficiency means a saving in water used of 360 tons per day, and in coal a saving of 45 tons per day. All steam cylinders connect with the condensers, so that the water used by the auxiliaries is not lost but is used over and over again, it being necessary to supply only that lost by leakage in the pipes and condensers. The extra pumping duty is large, however. The coal saved, on the other hand, means that with a given coal endurance (or "steaming radius") a vessel can carry from 10 to 20 per cent. less coal, or, expressed in another way, with the same coal capacity, she will have from 10 to 20 per cent. greater steaming radius. The average price paid in the navy for coal (including stations in all parts of the world) is probably at least \$7 per ton. There is, therefore, in the case assumed a direct saving in running expense of \$315 per day for coal alone. It may be argued that a vessel in port does not use her auxiliaries to the same extent that she does at sea, and that, therefore, the comparisons made are misleading. This may be true as to actual savings in pounds of coal and water or in dollars and cents, but the percentage differences hold true in any case. Furthermore, a ship is built to keep the sea, and her efficiency and usefulness are measured by her performance at sea and not when incidentally or accidentally in port. Her weights are distributed and apportioned, and her power, speed and "steaming radius" are designed for sea conditions, and it is these conditions alone which should be considered.

The weight and space required for plant are important matters, for a modern steamship, and particularly a war vessel, has every available inch of space and pound of weight carefully allotted; and it is sometimes difficult for the designers to adjust the conflicting elements (which may be equally important) so as to provide for all and still keep within the prescribed limits. The present weight of steam auxiliaries of a first-class battleship, assuming a total capacity at full load of 2,000 horse power, as before, is about 200,000 pounds or 100 tons. If the electric drive is used we must add the weight of the generating plant. The navy specifications limit this weight at present to one-third of a pound per watt of rated capacity. With 1,050 kilowatts capacity (six units of 150 kilowatts for service and one for spare) the weight would be 350,000 pounds or 175 tons. The electric auxiliaries would weigh about the same as steam, or 100 tons, a total of 275 tons, as against 100 tons for steam drive. There would be some saving in the wiring, as against steam and exhaust pipes, so that it may be assumed that the electric plant, with the generating sets described, will weigh between two and one-half and three times the steam drive. As an offset, however, we have the saving of 10 to 20 per cent. in coal required for a given steaming radius, which in a ship of this class would amount to between 200 and 400 tons. Furthermore, in the future a satisfactory steam turbine comparable in economy with the compound engine is developed for marine work, as now seems probable, the weight of the generating plant will be reduced to 50 per cent., and then the electric drive will prove favorably in the respect with steam, and there will still be the saving in weight of coal required for a given endurance.

The space necessary for plant must be considered as one of the vital parts of the ship, and as such it should be located below the protective deck. At first it may be said that it will be difficult to find space for such a large plant, but it must be remembered that the space required for 200 to 400 tons of coal is available in addition to the space at present allotted

for dynamo room, and these combined will certainly be more than sufficient.

The application of the electric drive to the various ship auxiliaries must be carefully studied in each case. The problems involved, however, are not more difficult than many special applications on shore, nor is there anything about them which a competent electrical engineer, with a proper knowledge of sea conditions, is unable to solve. The first cost will undoubtedly be greater than with the steam drive, but the savings in "operating expense," if capitalized, will much more than offset this difference in first cost.

The problem is purely an engineering one, and should be approached in a business-like way. Will the electric drive be equally safe, simple and reliable, and will it be more efficient than the present system of steam drive? This is the question in a nutshell, and I believe that the figures and data which I have presented enable us to answer it most emphatically in the affirmative. Other nations, particularly England, Germany and France, have already introduced the electric drive extensively on their ships, both in the navy and in the merchant marine; and it is earnestly to be hoped that our own navy, with its magnificent ships, officers and men, of whose record we are justly proud, will not lag behind in this important respect. Once provided the proper tools, and there need be no fear in this country that the necessary men to handle them properly will not be found.

I have not touched upon some of the minor electrical applications which have been made aboard ship, such as searchlights, range finders, engine-room telegraphs, speed and helm indicators, signal sets, telephones, etc., etc. Some of them, such as the signal sets and searchlights, are of considerable importance both from the military standpoint and for navigation purposes, and have stood the test of service admirably. Others, like the range finder and telephones, while of great utility, have not yet demonstrated that they can be relied upon at all times; while others still may be considered as luxuries (sometimes of doubtful utility) rather than necessities. All of them come within the province of the electrical specialist, rather than the electrical engineer, and have no direct bearing on the main problem discussed in this paper.

Some General Observations on Electric Traction.¹

By HORACE F. PARSHALL.

A general paper on electric traction must be to some extent discursive, and, from the standpoint of those looking for specific facts, superficial.

It is a natural thing for engineers to reason from experience with electric-lighting plant, as to how best to design plants suitable for electric-traction purposes. Such reasoning, however, is likely to be defective and lead to wrong results. A primary difference between electric lighting and electric traction, so far as the station is concerned, relates to the difference in the nature of the load—one being approximately constant from moment to moment, and the other varying between wide limits, and at such a rate that many engineers liken the strains upon traction apparatus to those upon rolling-mill engines. Another difference of great importance is that in a plant of given nominal horse power from three to five times the quantity of electricity would be generated for traction as for lighting purposes; consequently, a greater capital investment, greater refinement in the machinery and greater margins in the individual machines, or in the number of spare machines, are commercially permissible in the case of electric traction. In general, lighting machinery is called upon to work at full load for a few hours in the day, whereas traction machinery is generally called upon to work at approximately full load for many hours in the day.

The steam-generating plant for either lighting or traction of the same capacity need not differ in character to be equally efficient. Having reference, however, to the better load factor of the traction plant, and consequently a greater consumption of coal and a lesser ratio of cost of labor to that of material, better arrangements as to coal-handling machinery and coal storage are justified. More elaborate arrangements of steam-piping are also justified, since the loss, due to condensation in steam pipes, is determined by the number of hours the pipes are under pressure rather than by the quantity of steam carried by them.

Steam engines have been the subject of frequent discussions. It has been a much-debated point as to whether or not an engine should have a heavy fly-wheel. This question resolves itself into the most economical way, average loads considered, of getting the maximum effort from the steam engine to take care of the temporary overloading incident to traction work.

The dimensions of the cylinders of engines for good economy are determined with reference to average loads. For best economy, then, at good regulation, heavy fly-wheels are necessary to assist in overloads in traction work. The question of governing has also been frequently discussed. I do not understand why this question should be discussed, since nobody is of the opinion that an engine that governs closely is at a disadvantage. Such

¹ Read before the Northern Society of Electrical Engineers (English), January 21, 1899.

engines do not cost appreciably more, and are now generally manufactured. In reading such discussions, I have frequently wondered why the electrical conditions met with in parallel running have not been taken into consideration. The necessity of close regulation of steam engines was first demonstrated in the case of generators running in parallel, where the load did not properly divide with rapidly varying loads unless the engines governed with fair accuracy.

Another matter frequently discussed is that in respect to the speed of engines. Here, also, the electrician is entitled to some voice, since experience has clearly demonstrated that each size of dynamo has a range of speed through which its performance, either as to efficiency, regulation or sparking, is best, and dynamos built outside of this range of speed are made at the expense of efficiency, regulation or commutation.

The speed of the 1,500 kilowatts dynamos which I designed some years ago was limited to 75 revolutions per minute. Experience since then has not demonstrated the advisability of increasing the speed beyond this for this size of machine. My own experience justifies the statement that the mechanical and electrical conditions in the case of the larger direct-connected generators generally coincide in the matter of speed.

The system of transmitting mains for distribution, on account of the better load factor in traction installations, should be designed, for most economical working, with a greater cross-section than in the case of lighting with its smaller load factor. This is obvious from Lord Kelvin's law, in which the interest that goes on perpetually is balanced against the cost of the energy wasted in the mains. Clearly then, as the cost of energy does not vary in the simple ratio of load factor if mains are to be utilized three or four times as many hours in the year at rated capacity in one case as in another, a large cross-section cable is required if the cost of the wasted energy is to balance the interest account.

Apart from the proper designing of a given system of transmission and distribution, there remains the broad question as to what will be the nature of the transmission; that is, whether continuous currents shall be used or whether the distribution shall be multiphase, with sub-stations. The solution is to be determined in respect to the amount of power and the distance to which it is to be transmitted, and in particular cases to the conditions of distribution. Thus, where a very small voltage drop is permissible in the consumer's circuits, as in the case of earth returns, multiphase transmission with frequent sub-stations becomes a necessity, where under less restricted conditions continuous-current transmission would be more economical.

For comparison between continuous-current high-tension transmission and multiphase transmission, see *Proceedings Institution Civil Engineers*, Vol. cxxxiii., Paper No. 3,090.

It appears from this that the distance at which multiphase currents become efficient, as compared with continuous currents at 500 volts, is somewhat less than has been frequently anticipated.

The fixed losses in a multiphase system for the distribution of power for traction work are determined largely by the maximum momentary load which may come upon the sub-stations. When the ratio of the average to the maximum temporary load is comparatively large, the distance at which continuous currents become more efficient than multiphase currents is increased. In very large traction installations, in which the ratio of the average to the maximum approaches unity for average working, the distance at which high-tension currents are more advantageous is lessened. What method of transmission will be most efficient in a particular case cannot be determined without knowledge as to the nature of the load. In the Dublin installation, which I have recently designed for 250 cars, the power station is approximately in the center of the system. The average distance of transmission is about 2½ miles. I have used 500 volts continuous current with so-called "boosting machines," taking the current out of the rails at certain points so as to restrict the maximum drop in the earth to two or three volts. For two lines, extending some eight miles from the power station, I have, at a distance of about six miles, planned to install a rotary-converter station. The multiphase load, however, being such a small fraction of the whole, I have not installed multiphase generating machines in the station, but have used a special design of rotary converter run from the continuous-current machines. Such rotaries have to be very specially designed, since, in the case of the current becoming displaced in phase, they are apt to race dangerously. This is a particular case, designed after determining the average current consumption in any part of the system, when the ratio between the average and the maximum is approximately known from experience, so as to impose the minimum fixed losses, or, in other words, to insure, under average conditions, maximum efficiency. Were the number of cars doubled I would locate sub-stations approximately at the feeding-in points, and would use multiphase transmission.

An advantage in the use of rotary-converter stations is that at constant speeds such machines will give constant voltage regardless of the load or the drop in the lines (provided this be limited to an economical amount) or the regulation in the transformers, so that such machines can be made to supply simultaneously and satisfactorily both traction and

lighting installations. To justify this statement I instance tests recently made on some 900-kilowatt rotary converters from which full load could be thrown on or off from one to the other machine without any perceptible variation of the continuous current voltage.

In the designing of a multiphase system selection has to be made between quarter and three-phase. The three-phase system has the important advantage that but three-quarters of the weight of copper is required, as with either single or quarter-phase transmission. Considered, therefore, with the energy factors common in multiphase working, the three-phase system gives better transmission efficiency with the same section of copper in the average case as continuous current.

Another advantage is gained when the transformers are delta-connected. Any one of the three can fail, and the other two will deliver phase currents to the rotaries. There is practically no difference as to efficiency or working between tri-phase and quarter-phase rotary converters. In installations making general use of rotary converters feeding into a network at constant voltage, it is necessary to observe some care in selecting the high-tension mains, and in securing engines with approximately constant angular velocity. An engine, to be entirely satisfactory, should not produce by variable velocity a phase displacement of more than five degrees per half cycle from that of constant velocity. The transmitting mains should be designed with comparatively small drop, so that the rotary converters work properly in parallel in different stations, and so that the rotary converters can generate constant voltage with a varying load, without too great phase displacement. If proper precautions are not taken in these matters, rotary converters will not operate satisfactorily in parallel, and are likely to give a great amount of trouble from sparking and irregular variation of voltage.

For working with "rotaries," I would also point out the necessity of arranging the mains so that the current in each phase is delivered approximately at the same voltage. I have recently been conducting some tests on "rotaries" working on triple-concentric mains. At first the current in the different phases varied by about 10 per cent., and the rotaries worked unsatisfactorily; when, however, the electromotive forces were equalized the rotaries worked with entire satisfaction. The conclusion to be drawn from this, for three-phase working, is that the cables should have equal inductance, equal capacity and equal resistance in each circuit.

In installations which I have designed I have used cables drawn in conduits, and with manholes approximately 100 yards apart, so that the cables can be readily replaced or supplemented to meet the demands of the service. Armored cables laid in a common trench are objectionable, in that the burning out of one is quite likely to destroy its neighbor.

By far the most difficult problem to solve at the present moment in large multiphase stations is in connection with the switching apparatus. Circuit-breakers have been devised for continuous currents that will open at any current to be met with in practice. In the case of alternating currents the same perfection has not been made. I recently examined the plans of a 70,000 horse power station, and could not but feel that the success of the whole installation was dependent upon the switching arrangements.

In this discussion I have assumed that the distribution in a traction system would be by continuous currents. I have seen nothing that would lead me to believe that any other system will come into general use.

The next point for consideration is as to what form of apparatus should be used for conducting the electricity from the distributing mains to the car—whether it should be the single-wire overhead-trolley system with earth return, the two-wire system with return overhead, or with this last connected up as a three-wire system with the middle pair of trolley wires acting as a neutral, or whether a conduit system should be used. The valid objection to the single overhead-trolley system, neglecting the aesthetic one, is in the use of the earth as a return circuit. Troubles from electrolysis have been frequent in the United States, where the electromotive-force drop in the earth return is not limited by legislation. Owing to the stringent regulations of the Board of Trade, little trouble has yet been experienced in England or on the Continent, where similar regulations are in force. I pointed out, in a paper which I read before the Institution of Electrical Engineers, that with even very small electromotive forces a certain percentage of the current in all cases leaves the rails. With amounts of copper commercially permissible, either sub-stations at frequent intervals or boosting machines, such as have already been described by Major Cardew and myself at the Institution of Electrical Engineers, are necessary to bring the electromotive-force drop down to two or three volts, which in most cases of municipal working is the safe limit. If the electromotive force exceeds this limit trouble from electrolysis will probably occur at some date more or less remote, according to the local conditions as to the location of the earth return in respect to the gas and water pipes and the nature of the soil.

The double overhead-trolley system eliminates the possibility of trouble from electrolysis. In the case, however, of most cities, where numerous lines converge at certain points, the double overhead con-

struction would be complicated and objectionable in appearance. The same applies to the double overhead three-wire system. This last system has great advantages, however, and when used in connection with rotary converters, which act both as converters and equalizers, it is possible to operate tramways over very long distances from a single generating station.

The conduit system has been used in various American and continental cities with a considerable degree of success. The advantage of this system is that it can be a doubly insulated system, avoiding danger from electrolysis, and that there are no overhead wires. An additional rail at the side, or pair of rails between the tracks along the slot, has to be set off against the overhead wires on making comparison between the two systems as to appearance in the street.

In general, corporations are in a better position to install conduit systems than private companies, since corporations can borrow money at low rates of interest, and have not so great amortization to consider. Further, corporations, frequently having the control of gas and water pipes, can arrange matters so that the conduits can be put in at a less first cost. In some cities I believe the installation of conduits under a dual management would be impracticable, since the conduits would interfere with the gas and water pipes to such an extent that the conduits could not be installed, except by such general rearrangement that local consent could not be obtained. Undoubtedly, in the case of heavy storms, the conduit system is more troublesome than the overhead system. I had some examples of this in my recent visit to the United States. In New York it has been found necessary to employ an elaborate system of double-throw switches, so that if a part of the positive side of the system goes to earth, it can be put

greater economy in working, it would seem that in many cases to sacrifice somewhat in electrical efficiency at the beginning and provide for a possibility for practically unlimited growth, either as to capacity of power or area of district supplied from a central power station.

Storage Batteries and Railway Power Stations.

By ROBERT MCA LLOYD

PART I.

A difficulty confronting us is that very few operators of railway power stations have any data showing what they are doing. Electric light managers seem to take more interest in the output of their stations, and in many cases maintain a system of records of work done, but the manager of a trolley road is usually contented with superficial observations of the switchboard and the comforting fact that the cars are running.

We always find these managers greatly surprised when the actual state of affairs is shown to them on paper, and I believe that this Institute would be astonished at the results of a thorough research into the load curves of the railway plants of the entire country. You are, of course, prepared for the statement that the average load on a railway power station for a given period is much less than the maximum load occurring during that period and much more than the minimum, but it is not generally understood that the maximum load for the same period is apt to be far below the capacity of the generating plant in operation. As an illustration of this fact I show in Fig. 1 some data on a typical railway plant when 35 cars were running. We have not discovered any railway plant where this is not

FIG. 1. STORAGE BATTERIES AND RAILWAY POWER STATIONS.—CURVES SHOWING VARIATIONS OF LOAD

on the negative side and the negative on the positive side.

The Dublin station has been designed to work all the cars in the city of Dublin and its suburbs. It is centrally located, and at the same time has exceptional facilities for coal and water supply. The coal is handled automatically from the ship to bunkers over the boilers, and from thence it is weighed separately into each boiler. The boilers are of the water-tube type, and the piping is on a system devised by myself, which I have termed the "by-pass" system, since each pair of boilers normally supplies its corresponding engine, but can, by means of the "by-pass," supply any other engine. The engines are of the vertical cross-compound type, 20 inches and 40 inches cylinders, 42 inches stroke and 90 revolutions.

In conclusion I would point out that the mistake most frequently made has been in underestimating the amount of power that may ultimately be required in a traction system. Both the size and type of machinery in a generating station should be determined in respect to the maximum output of the station. Having regard to the present regulations of the Board of Trade and to economy in transmission and distribution, the limit for a 500-volt continuous-current station is usually reached at 5,000 kilowatts' output. Beyond this, a multiphase system of transmission with rotary transformers for continuous-current distribution becomes necessary for most economical working, since experience has fully demonstrated the greater economy of working from a single central power station. The "universal" station is the multiphase station, since it can meet every condition with a single type of generating machinery. As pointed out in the paper, however, the distance of transmission, amount of power and the nature of the load are the factors determining whether a continuous-current or a multiphase system is best in particular cases.

Having regard to lighting experience in the large American cities in which the three-wire system was originally installed, and which is now being replaced by a three-phase system with sub-stations to secure

true, and I believe that the data on most of the railway plants of this country will confirm my statement. The first explanation of this would be that such a surplus capacity is necessary for reserve to meet emergencies, but I do not find it to be a useful reserve, and shall refer particularly to Fig. 1, taking this station because, from the standpoint of the manager, engineers and attendants, it is dangerously overloaded and has no reserve. In fact, it was necessary to add to the capacity at once to make it safely operative.

I obtained these data on the day of heaviest travel in the whole year. It will be noticed that the highest point reached was within the capacity of the main station, and yet it was necessary to start up an auxiliary station. The central solid line shows the average load, and the upper and lower lines show the limits of the fluctuations occurring from moment to moment. The method pursued in getting these curves was to divide the day into half hours, and during the first five minutes of each half hour take the highest and lowest ammeter reading in each minute; these readings are plotted in the upper and lower curves; also to take ammeter readings every five seconds, and obtain the average of these readings as the point in the curve of averages. Another convenient method of obtaining the curve of averages is by wattmeter readings. Among some of the interesting features in this diagram may be noticed the fact that the nominal capacity of the generating apparatus was about 400 kilowatts in excess of its maximum output occurring at about eight o'clock in the evening, and that the average output at this time was about two-thirds of the maximum. The excess of nominal capacity was not so great at seven o'clock in the morning, but two in the afternoon, when other high points occurred, but as it was known that the morning peak would be of short duration, the engineer decided to run through it without the auxiliary station, and in the afternoon the load increased more rapidly than was expected, and the auxiliary was not ready

¹ Read before the American Institute of Electrical Engineers, New York and Chicago, February 15, 1899.

to go into operation on short notice, consequently obliging the main station to groan under a dangerous load for an hour or so.

It will doubtless occur to some that this station apparatus has been overrated, or that the engineer was incapable or overcautious, but the fact remains that similar data are obtained in very many stations, and that in many cases the apparatus has been subjected to satisfactory tests before acceptance by the purchasers. It may be possible to build engines which regulate at all conditions of load, and at the same time use steam satisfactorily at maximum load, but I do not find such engines commonly in use. Further than this, there are many very good engines in use which cannot be safely operated at anything like maximum load if that load is liable to sudden variations. I realize that you may suggest all sorts of schemes for getting a better output from the plant illustrated by this curve, and you may wish to ask some questions about this apparatus, but experience convinces me that the men who are most likely to be consulted about such a station will recommend more generating plant, and the truth is that there are so many good salesmen pushing engines and dynamos that station managers frequently fail to get full duty from the machinery which they are operating already. It is not merely that the storage battery has been neglected, but any of us can see in railway power houses throughout the country, where the managers have been persuaded to increase their generating plant, that attention to a few details, such as steam piping, would have brought their output up to requirements. Assuming, however, a station equipped with the best obtainable apparatus, and operated under the most advanced laws of station practice, in the absence of a storage battery, there would still be much more apparatus running than would appear necessary from the load diagrams.

The generator salesman says in reply to this proposition that his apparatus is cheap, and that it is good to have plenty of it, but one generally finds that where there is plenty of apparatus available the engineer is tempted to keep too much of it running, and therefore running at low efficiency.

Of course, railway power stations have individual characteristics, and it will not do to assume that they all need storage batteries, but there are certain features of railway power requirement which are common to the problem everywhere, and which invite consideration for the storage battery.

The curve characteristics of electric-light supply are well known, and much information about electric lighting has been brought out in the committee reports of the National Electric Light association for 1896 and 1897 and by Mr. Hammond in his paper before the British Institution of Electrical Engineers in March, 1898, but the possibilities are more varied in railway work, and, as far as I know, there has yet been no systematic research into the economy of railway power stations, the only published data on the subject being contained in the paper read before the American Street Railway association at Boston last September by R. W. Conant.

In my endeavor to point out some of the uses for a storage battery, I shall take as a typical station that shown in Fig. 1. It is located in a Pennsylvania town of 50,000 inhabitants. The railways radiate from the center of the town to distances of three to nine miles. There are six branches, and the power station is located two miles out on the longest branch. It has railroad and water frontage. The small auxiliary power house is the result of a recent consolidation and is close to the main house. There are three distinct ways of using a storage battery with this power plant. Taking up the figure, we find first the great fluctuation between night and day load; second, the fluctuations occurring from hour to hour; and, lastly, the superimposed fluctuations occurring from moment to moment. We shall call a battery of sufficient capacity to level off the night and day fluctuations "large;" a battery for leveling the hour to hour fluctuations "medium," and a battery to level the momentary fluctuations "small." It will be seen at a glance that the small battery will reduce the requirements of the generating plant to a capacity sufficient to meet the demands of the average load shown in curve A.

The battery must be able to discharge at 650 amperes for momentary periods, but its capacity in ampere-hours is unimportant. It will cost less than generating capacity for the same work, and a large part of the excess of capacity over requirements shown in the diagram will be saved. It will save some depreciation on the generating apparatus, and its own depreciation will not cost more than the depreciation of generating apparatus of similar capacity. It will have sufficient storage capacity to run a few night cars and lights when the engines are shut down. If located at a point nearer the center of feeder distribution than the location of the generating station, a saving in copper will be effected. Inasmuch as the investment will not be increased by including such a battery in this railway outfit, all the saving in fuel due to a steadier load and the operation of less generating machinery will be clear gain to the credit of the battery.

Line B at 815 amperes show the average load for 24 hours of the day, and a "medium" battery to reduce the load to this straight line would have a capacity of 1,300 ampere-hours. It will cost about twice as much as a "small" battery, but will not add enough to the cost of the installation to bring the investment up to the total now in generating appa-

ratus alone, and presumably necessary if no battery is used. This battery will have all the advantages of the small plant, with wider limits of operation. The station circuit-breakers may be set 650 amperes higher, and there will be greater convenience throughout the station in operating at a fixed load. There will be a marked effect on the efficiency of all departments of the station, and all the apparatus will yield a higher output in proportion to investment and cost of operation.

Line C at 650 amperes shows the average load for 24 hours, and a "large" battery capable of leveling off this load will have a capacity of 3,000 ampere-hours. It will cost approximately twice as much as the "medium" battery, and will have all of its advantages. It will cost as much as the generating machinery displaced by it. It will add largely to the flexibility of the station. This battery could be discharged momentarily at 3,000 amperes, which will put the circuit-breaker limit of the station at about 3,600 amperes, instead of 2,300, with all the present apparatus. It may be discharged at 1,500 amperes for one hour, which will be sufficient to cover load peaks that would stall the 1,150-kilowatt generating plant completely.

In cases of extreme necessity the entire system might be carried by this battery for several hours. The ability to carry sharp peaks is a distinct addition to the earning power of the system. Such peaks often signify the collection of fares which would be lost if the system were not flexible, and some managers keep up enough station capacity to carry a few holiday crowds, while for 99 per cent. of the whole year it is earning nothing. Other managers do not attempt to carry special crowds. The large battery will give the manager an opportunity to get all the money that can be made out of such business without feeling that he has made any investment for the purpose. Of course, the capacity of the system is limited also by the investment in copper, but in many cases the battery may be located so as to facilitate the distribution of power.

There is no reason why a railway power station of this capacity, running night and day at a constant load, should not attain a fuel economy as high as that of the well-known Chestnut Hill pumping station at Boston, which would be equivalent in electrical work to 557 watt-hours per pound of coal. Curve A, Fig. 1, shows for one day's work 7,800,000 watt-hours, which required at the above rate seven tons of coal, and, assuming that the battery would only have 75 per cent. efficiency, and that 25 per cent. of the entire day's work would go through the battery, one-half ton of coal would be added to this consumption, making 7½ tons of coal a day for this plant running with a large battery.

The battery efficiency in such service as this has been found in most cases much higher than 75 per cent., and in some cases over 90 per cent., so my estimate is clearly on the safe side.

On the day when these data were obtained 15 tons of coal was burned, or twice as much as would be necessary with the battery outfit. The battery would therefore save, at \$2 a ton, \$5,474 per annum in coal alone.

The number of men in the station is now the same night and day, and there would certainly be no increase in the labor item, whereas it is probable that one man on each shift might be dispensed with if the plant were reduced by the battery, in which case there would be another saving of \$1,200 per annum. The battery would also save water, oil, waste, etc., and there would be minor advantages, such as more constant potential on the line, less annoyance from circuit-breakers, no fear of sudden demands on the generating apparatus and the disagreeable possibilities incident thereto.

In the following table some figures are tabulated for the purpose of comparing four different layouts to meet the requirements of the railway system referred to in Fig. 1:

TABLE REFERRING TO FIG. 1.

Lay out with	Cost of generating apparatus.	Cost of storage battery.	Total cost of station plant.	Cost of coal per day.	Cost of coal per annum.	Saving in coal.	Sav. in coal and sav. in int., 5 p. c.
1. No battery..	\$115,000	\$115,000	\$30	\$10,950
2. Small battery	60,000	20,000	80,000	25	9,125	1,825	3,575
3. Medium "	50,000	35,000	85,000	20	7,300	3,650	5,150
4. Large "	40,000	70,000	110,000	15	5,475	5,475	5,525

CONTINUATION OF TABLE.

Cost of real estate and buildings.	Repairs and depreciation.	Saving in labor per annum.	Saving in water, oil, waste, etc.	Total saving.	Estimated addition to receipts.	Net advantage in operation.
1. All the same.
2. All the same.	191	3,675	3,675
3. All the same.	200	5,350	1,000	6,350
4. All the same.	1,200	7,025	5,000	12,025

I have assumed \$100 per kilowatt as the cost of complete station apparatus without batteries. This figure might have seemed high a year ago, but in view of the rising prices of such material I think it is only conservative.

It is rumored that an electric car line is projected from Oelwein, Ia., to Strawberry Point, Elkader, Monona and Watkon, Ia.

CORRESPONDENCE.

New York Notes.

NEW YORK, February 20.—There has been a slight delay in the sale of the stock of the Edison company to the New York Gas and Electric Light, Heat and Power company. Spencer Trask & Co. and Vermilye & Co. have issued a circular letter to the stockholders of the old company, stating that "owing to the illness of one of the counsel, the completion of the deposit agreement for the deposit of the stock of the company with the Central Trust company has been delayed, and therefore the time has been extended from February 15th to March 5th." The circular further said that the "deposit agreement will, it is expected, be issued this [last] week, and the Trust company be ready to issue its certificates in exchange for the deposit of stock."

Aaron De Grauw of Jamaica has brought an action in the Supreme Court against the Long Island Electric Railroad company, the Brooklyn Heights Railroad company and the Brooklyn, Queens County and Suburban Railroad company, and Johnston Livingston, president of the National Express company, with the idea of securing an interpretation of the law with reference to the right of surface railroads to carry freight and express matter on their lines in this state. The action is brought to restrain the defendants from operating trolley express cars along Washington street in the village of Jamaica, on which the plaintiff is an abutting property owner. The plaintiff alleges in his complaint that the Brooklyn Heights and other defendant companies have entered into an agreement with the National Express company providing for the running of box and freight cars over the trolley lines in violation of the laws of the state. Justice Marean reserved decision.

At the request of the counsel for the Astoria Light, Heat and Power company, the hearing at Albany on the measure to distribute light and heat, manufactured at Astoria, in New York city, which was set down for last Thursday, was adjourned until Thursday afternoon of this week. Assistant Corporation Counsel Thomas J. Creamer of New York appeared and stated that some method should be adopted of requiring companies securing such franchises as that contemplated in the Astoria bill to pay the city a fair sum for the franchises granted.

Our legislators at Albany—or some of them, at any rate—thinking that corporations doing business in public streets do not pay enough for the privilege, are considering a new scheme. Senator Ford has introduced a bill which proposes to tax as real estate the franchises and rights of street surface railroad companies, gas, electric and telephone companies, and other transportation corporations. This bill was discussed last week before the Senate committee on taxation and retrenchment. Another hearing will be given on March 2d. Mr. W. K. Bronk, representing the Mutual Gas Light company of New York city, declared that such a law would compel the gas companies to pay taxes twice on the same property, as they now pay a franchise or real-estate tax. Judge Charles F. Brown, representing the Metropolitan Street Railway company, said that the measure was not only uncalled for, but unequal in its operation. He asserted that the Metropolitan company now paid more taxes than any other corporation in New York city. The idea that the railroad companies were escaping just taxation was an erroneous one. He advised the committee to continue the present method of taxing gross receipts of street-railroad companies, and said that this was the only fair method of taxing them. Mr. Francis B. Thurber, president of the United States Exporters' association and a member of the New York Chamber of Commerce, declared that the enactment of the Ford bill would but accentuate the present legislative policy in this state touching corporations, which has driven millions of dollars of capital to other states. He presented resolutions of the Chamber of Commerce in opposition to the measure. John H. Crosby and R. A. Cooney of the Knights of Labor favored the bill. They declared there would be no trouble in getting at the equitable value of the franchises. E. M. Daly, a delegate from the Central Labor Union of New York city, in urging a favorable report upon the bill, declared that the workmen approved it, that it would tend to simplify the tax laws and would make property which cannot escape into New Jersey pay its just share of taxation. Ernest H. Crosby of the Social Reform Club of New York city favored the bill as the first step in the direction of freeing New York city and the local political leaders and courts from the control of the corporations.

A curious complaint comes from Westchester County. It is asserted that the introduction of the electric railway with cheap fares to New York is giving the police of that county no end of trouble and annoyance. For to cents passengers are now carried from the Battery to Yonkers, Mount Vernon, Pelham Manor and New Rochelle. The low fare, the police say, has proved an inducement to thieves, pickpockets and mendicants to pay frequent visits to the suburbs, where the number of policemen is limited and they have less risk of detection than in this city. Since the trolley line has been opened between Mount Vernon and New Rochelle there have been almost a dozen burglaries, while beggars annoy people on the streets, requiring the constant attention of the police. Formerly, the police say, they were able to watch the railroad stations and catch many of the thieves

as they were coming into or leaving town, but now crimes are committed and the offenders jump into a trolley car and escape. It is likely that if the influx continues the appropriations will be increased in order to put an additional patrolmen, which seems to be the simple remedy required. The people of Larchmont Manor, influenced by the experience of other communities, have declined to entertain the application of a company which desired to build a line in the Manor, and thus the trolley is cut off from reaching the northern part of the county. The trolley agitation in Westchester County was begun several years ago to help the local merchants, but as soon as a town or hamlet became connected with New York the shoppers have immediately gone to the city to patronize the larger stores. As a result many of the merchants and property owners who once favored trolley lines are now complaining at the turn affairs have taken.

Among recent New York state incorporations I notice the Horseless Vehicle company of this city. The capital is placed at \$150,000 and the directors are Frederick W. Danton of Hollis, John H. Eldert and H. G. Fleck of Richmond, and Abraham Both and Harold D. Bernstein of New York. M. S.

PERSONAL.

The well-known Daniel C. Hemingray of the Hemingray Glass company, Covington, Ky., made a flying trip to Chicago the early part of this week.

F. C. Phillips, president of the Elwell-Parker Electric company of Cleveland, was in Chicago last week, looking after the interests of his company.

E. S. Carpenter has succeeded F. W. Ferguson as treasurer of the Walker company. It is believed that the office and shops of this company in Cleveland will be continued by the Westinghouse interests.

Mrs. McCumber, wife of the senator-elect from South Dakota, was, it is said, formerly a resident of Fargo, where she was employed as assistant manager of the Western Union telegraph office. While still Miss Jennie Schorning, she was transferred from Fargo to the Wahpeton office. Mr. McCumber met her in the latter town.

Mr. E. B. Ellicott, city electrician of Chicago, addressed the Chicago Electrical association on February 17th on "Police and Fire-alarm Systems of Chicago." His paper was illustrated by apparatus. Mr. Ellicott also gave an illustrated address on "Present Underground Electric Trolley Systems and Their Applicability to Chicago Street Railways," before the Engineers' Club of Chicago on February 21st.

Mr. William E. Baker, for several years superintendent of the Metropolitan West Side Elevated Railway company of Chicago, has accepted the position of general superintendent and chief electrical engineer of the Manhattan Railway company of New York. As Mr. Baker has probably had more experience in the actual operation of elevated electric railways than any other man in the country, it looks as though the last remaining doubt of the electrical equipment of Manhattan had been removed. He had charge of the construction of the Intramural road at the World's Fair and afterward became connected with the Metropolitan company.

The best in the world in the line of telephone and telegraph improvements is none too good for Australia, according to Timothy Howard, superintendent of the government-owned telegraph and telephone systems in the colony of Victoria. Mr. Howard arrived in Chicago on February 20th, says the *Chicago Record*, and registered at the Palmer House. He is touring the principal cities of America and Europe for the purpose of observing the various systems of telegraphing and telephoning, and upon his return to Australia he will incorporate the advanced ideas with which he has come in contact on his travels into the conduct of the plants of which he is in charge. Mr. Howard bears a letter from Sir George Turner, premier of the Australian colony, to Mayor Harrison, and he will make a special study of Chicago's fire-alarm telegraph system.

The firm of Barton & Brown (George P. Barton and Charles A. Brown), patent lawyers, Chicago, has been dissolved by mutual consent. Both Mr. Barton and Mr. Brown will continue the practice of patent law, dividing the offices which they have heretofore occupied in common. Mr. Brown has formed a partnership with Mr. George L. Cragg, who has been with the firm of Barton & Brown ever since it was organized, and prior to that time had a thorough technical and scientific training. The firm

name will be Charles A. Brown & Cragg, and its suite of offices will be at 1450 Monadnock building. Both Mr. Barton and Mr. Brown are widely known and highly esteemed by the members of the electrical fraternity in the West. Collectively, they have upheld the best traditions of the patent bar, and individually they cannot fail to pursue the same line of honorable conduct.

S. M. Hamill of the Brush company has been interviewed for the *New York Sun*. He announced himself to be an out-and-out expansionist and said: "I meet a great many people in various parts of the country connected with the electrical industry, and, with few exceptions, they are all for expansion. I do not mean that they believe in the acquisition of foreign territories, making them into states, and having them represented in our government, but they are in favor of the development and expansion of our foreign commerce. So far as China and Japan are concerned, the prospect for a large business in the electrical field is enormous, and if we are going to ship millions of dollars' worth of apparatus to these countries, we most assuredly will need a powerful fleet to protect our interests and make our merchants respected. Those who are against the retention of the Philippines as a base for our navy in the East Indies and Chinese and Japanese waters simply know nothing of a manufacturing company doing business in a foreign country."

ELECTRIC RAILWAYS.

The McGowan syndicate's purchase of the Citizens' Street Railroad company's franchise and plant has stirred up much opposition in Indianapolis. The combine is regarded with suspicion, there being a feeling that the deal is a cover for a scheme to secure some undue advantage from the city. The new company offers the city about \$45,000 a year for the life of the franchise.

ELECTRICAL SECURITIES.

A deed of trust has been filed with the county recorder at Los Angeles, Cal., from the Los Angeles Railway company to the Union Trust company of San Francisco, for \$5,000,000, as security for a bond issue of a similar amount on the principal street railways of Los Angeles.

MISCELLANEOUS.

An "open discussion of the electrical business" as affording a career for young men is announced by the Y. M. C. A. Electrical Club of Chicago for the evening of February 24th at Association parlors, 153 La Salle street.

The authorities who have charge of the Philadelphia public buildings do not hesitate to express themselves in very forcible language against the depredations committed by women visitors and others who are supposed to do the stealing under the guise of souvenir hunting. The particular object of these polite thieves is the taking away of the incandescent electric-light bulbs. So many have been taken of late—in fact, nearly every one in the building that could be conveniently reached—that the commissioners are seriously thinking of making an example of the first offender that is caught, no matter who he is.

TRADE NEWS.

The Chicago office of the Sprague Electric company has been removed from the Marquette building to suite 609 Fisher building.

It is announced that the death of Mr. Bunnell will not interfere with the business of J. H. Bunnell & Co. of New York, which will be carried on as usual.

The Ohio Brass company of Mansfield, O., has a new building, very much larger than the old one, and, with new machinery, is prepared for a greatly increased output.

Eugene Munsell & Co. of New York and Chicago report a gratifying demand for their India and amber mica, of which they make a specialty for electrical insulation. Some exceptionally large orders have been received at both their Chicago and New York addresses.

The Mercer Electric Machine company of Dawson, Ga., manufacturers' agent and dealer in electrical specialties, will discontinue business soon. Mr.

Walter A. Mercer, who has been connected with the firm as manager, will make Indianapolis, Ind. his headquarters after March 1st.

BUSINESS.

The Leschen-Macomber-Whyte company, 19 and 21 South Canal street, Chicago, describes guys in an interesting manner in a little folder that will doubtless be sent to anyone on application.

The American Impulse Wheel company of New York reports some very large electrical-transmission work in hand and most favorable results from all its installations. The company is building up a large home and export trade.

The Electric Appliance company is calling attention to the fact that it is not too early for the alert station manager to make his preparations for protection from lightning during the early spring storms. It is pointed out that we frequently have quite heavy lightning in March, and to be safe lightning arresters should be installed early in that month.

The factory of the Peerless Rubber Manufacturing company is said to be running day and night in order to fill orders on time, the demand for the company's special line of packings constantly increasing. The celebrated Rainbow packing, Eclipse sectional Rainbow gaskets, Peerless piston and valve rod packing, Hercules combination metallic stop-valve packing and "Honest John" hydraulic Rainbow core packing are extensively used by all classes of engineers. There were over 1,500 tons of Rainbow packing sold during 1898.

The Western Electrical Supply company of St. Louis, Mo., has recently secured a large amount of weatherproof wire, which it is offering to the trade at a greatly reduced price. This wire, although not new, has not seen sufficient service to damage it to any extent, and is all put up on reels, in first-class condition. The sale of this wire, however, does not in any way interfere with the sale of the company's large and well-assorted stock of new wire of the Roebling make, for which it is agent, and always prepared to meet the market price.

In a recent interview with a representative of the *WESTERN ELECTRICIAN*, C. W. Price of the Montauk Multiphase Cable company, New York, stated that his company would make a most complete and comprehensive exhibit at the coming September meeting of the National Association of Municipal Electricians, to show the multitudinous uses to which multiphase cables are put. Displays will be made of the Montauk cable in connection with all interior adaptations. Telephones, district call boxes, watchmen's time-detector service, electric lights and Game-well auxiliary fire-alarm boxes in circuit therewith, will be shown. Altogether, the company will leave no stone unturned to show the many remarkable features of this novel cable.

Electrical engineers who are not already familiar with the value of micaite as an insulator for commutator segments and rings are requested to write the Mica Insulator company of New York and Chicago. The company makes a specialty of furnishing segments for any style or type of machine and has manufactured some segments recently as long as 36½ inches and four inches in height. It reports a heavy business, both in this country and in Europe. The Mica Insulator company's sheet-insulation manual and data book not only gives the breakdown tests of its insulations, but contains samples of the goods it manufactures. A large stock of micaite plates, cloth, tubes, paper and Empire and M. I. C. compound insulations is carried at New York and Chicago, and also at the sales agencies in Cincinnati, St. Louis, San Francisco and Cleveland.

Charles H. Besly & Co., 10 and 12 North Canal street, Chicago, report numerous large orders for their Helmet oil and Perfection and Bonanza oil cups. Shipments have been made to the J. I. Case Threshing Machine company, Pullman's Palace Car company, Charles Parker company, Crane Elevator company, Brown Hoisting and Conveying company, Cleveland Machine Screw company, Gormully & Jeffery Manufacturing company and Pope Manufacturing company. The last two customers use the oil for assembling wheels and coating steel balls as well as ball bearings and other wearing parts. The Pope people have adopted this oil for use on their chainless wheels. The McCormick Harvesting Machine company, Otis Elevator company and American Steel and Wire company are ordering Bonanza cups for use on their machinery.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued February 14, 1899.

619,269. Electrical Transmission of Sound. Frank M. Bell, New York, N. Y. Application filed October 12, 1896.

A balanced beam is arranged in operative relation with the sound receiver and carries a resistance; a point makes contact with the resistance; a lamp is in circuit with the resistance, and a receiving circuit is provided with a resistance variable by light.

619,276. Signal-recording Apparatus. Willard L. Candee, New York, N. Y., and Richard Varley, Englewood, N. J. Application filed June 4, 1898.

In the claim the combination is described of a lever pivoted on a universal joint, a recording point fixed thereto, a finger piece on the lever whereby it may be moved by hand into either of four positions, springs normally

holding the lever in a central position, a spring to depress the recording point and a motor-driven recording surface therefor.

619,287. Electric Railway. Justus B. Eitz, Philadelphia, Pa. Application filed January 5, 1898.

Means are provided for operating motor circuits at each end of a train which comprise a common motor circuit, a system, and identical controllers, so each motor can pro-

vided respectively with devices for arranging the motors and train-conductor circuit or system in fixed combination on the rear car, and with devices for cutting out the train-conductor circuit or system and reversing the motors on the front car.

619,203. Prepayment Electric-fan Motor. Walter C. Fish and Frank P. Cox, Lynn, Mass. Application filed August 17, 1897.

A coin-carrier is geared to the motor and has a number of coin holders which are adapted to receive and discharge one coin or token after another successively, and means are provided for closing the motor circuit and setting the coin-carrier in motion whenever a coin is present in the carrier and in contact with the terminals of a break in the motor circuit.

619,206. Dynamo-electric Machine. Samuel S. Forster, Schenectady, N. Y. Application filed November 14, 1898.

This invention is a horizontal dynamo with a split-hub spider, a collector fixed to one side of the spider with a space between the other side of the spider and the collector, means for securing the hub to a shaft, a supporting bearing, and means for adjusting the position of the spider without disturbing the collector when for any reason, as by wear of the bearing, the spider is out of its proper position.

No. 619,206.

619,209. Retaining-band for Commutators. John R. Grindrod, Lynn, Mass. Application filed November 5, 1898.

A wire band is employed for retaining the segments in place; a clamp composed of a single piece of wire bent so as to have two rounded ends or loops is situated between the segments and the band, one of the ends being arranged to take most of the strain of one of the ends of the retaining band, and also to receive the opposite end of the band and thereby prevent the wires forming the band from separating.

619,302. Two-rate Meter. Caryl D. Haskins, Newton, Mass. Application filed July 14, 1897.

The current in the field coil is dependent upon that in the work circuit; an armature is permanently connected across the supply mains and moves within the influence of the field coil, and means are provided for varying the current flowing through the armature independent of that flowing in the field coil, the regulating means being local in its action, in that it regulates only the particular meter with which it is connected.

619,307. Electric Motor. Thomas D. Hollick and Frederick W. Hollick, London, England. Application filed December 22, 1897.

One claim is given: In electromotors and in combination, an armature shaft, two separate armatures, the main armature, having a greater length than diameter, mounted thereon, and a field magnet movable with relation to the armatures to surround one or a portion of both armatures.

619,314. Electrical Heater. Charles W. Jones, North Temescal, Cal. Application filed February 10, 1898.

An electric heater comprising a bottom plate, a bottomless box secured centrally to the bottom plate, whereby portions of the plate project laterally beyond the box on the four sides thereof, a casing of greater horizontal and vertical dimensions than the box surrounding the box and secured to the bottom plate, whereby a space is left between the box and casing at the sides and top of the box; a non-heat-conducting material is provided in the space between the box and casing; electric heating devices in the box are provided with electrical connections, and insulating means are included between the box and bottom plate.

619,316. Trolley Catcher and Retainer. William B. King, Willoughby, Ohio. Application filed November 26, 1897.

A catching and retaining device is secured to the base or stand directly beneath the trolley pole. It is adapted to embrace and hold the trolley pole and move with the base or stand in a horizontal direction.

619,320. Trolley. Carl W. Larson, Schenectady, N. Y. Application filed October 31, 1898.

The invention comprises a plurality of trolley poles adapted to engage the same trolley wire, with means for controlling the movement of the contact devices.

619,324. Battery Switch. Roderick Macrae, Jersey City, N. J. Application filed August 18, 1897. Renewed July 25, 1898.

Features enumerated are a row of battery cells, a track arranged alongside or adjacent thereto of substantially the same length as the row of cells, a traveling contact device moving on the track, a series of contacts insulated from each other corresponding to the series of cells and respectively connected with the latter, each contact and its corresponding insulating space equalling in length the distance between the centers of the cells opposite which they are placed, and means for moving the traveling contact device along the track.

619,349. Process of and Apparatus for Extracting Precious Metals from Ores or Slimes. Hugo Klocken, London, England. Application filed April 12, 1898.

The process of extracting precious metal from ores or slimes by electrolysis which consists in agitating a mixture of the ore or lime and an electrolyte in the presence of an anode causing a stream of mercury to descend in a thin film over a metallic surface forming a cathode, passing current through the pulp to the cathode and thereby amalgamating the precious metal, and depositing thereon in an adjacent layer upon the cathode collecting the dissolved mercury and reconveying it to the top of the metallic surface.

619,360. Insulating Alternating-current Circuits. Charles P. Steinmetz, Schenectady, N. Y. Application filed July 15, 1898.

The art of eliminating air from an insulating compound or dielectric consists in substituting a vaporizable compound for the occluded air, and then vaporizing the

compound so that the air is carried away by the change of tension.

619,410. Telegraph-key Attachment. Arthur J. Hendricks, Crockett, N. Y. Application filed August 30, 1898.

With a telegraphic key there is combined a circuit-closing leaf spring connected at one end with the anvil contact of the instrument, and provided at the free end with an up-turned terminal normally exerting a pressure against the operating end of the key lever, a fixedly positioned guide bushing, a pull connection for the free end of the spring passing through the guide bushing, and a controlling lever connected with the pull connection.

619,440. Duplex Faradic Battery. James H. Robertson, New York, N. Y. Application filed April 9, 1898.

In a faradic battery an induction coil differentially wound is placed in combination with an armature influenced by two electromagnets, and adapted to make alternate contact with two points, each of which is in circuit, at intervals, with an electromagnet and a primary wire of an induction coil.

619,448. Electric Burglar-alarm. James Tomney, New York, N. Y. Application filed October 4, 1897.

A plurality of electrical connections forms a plurality of circuits between an indicating point and a guarded structure; a number of variable resistances are located in the connections, and means for changing the resistances and the path of the circuit between the guarded structure and the indicating point are provided.

619,449. Electric Protective System. James Tomney, New York, N. Y. Application filed June 24, 1898.

A system for electrically protecting structures from a central office or indicating point comprising a circuit between a guarded structure and the central office in which a circuit an indicating device is placed, the circuit comprising a plurality of paths, a source of electricity in the circuit and with which the paths are connected so as to contain more or less current, resistances in the paths to compensate for the differences of current in them, whereby the indicating device will be unaffected on a change of circuit from one path to another, and a device in the circuit for changing the current from one path to another.

619,465. Electrical Switch. Arthur Brier, Manchester, England. Application filed December 13, 1898.

This switch has a resistance comprising a movable part, operating means therefor, including a worm spindle, the movable bearings therefor and operating connections leading from the switch to move the bearings.

619,471. Electric Branding Device. Birney Fellowes and Henry Van Hovenbergh, New York, N. Y. Application filed August 2, 1894.

An apparatus for branding a variable design upon a surface or fabric, comprising a series of characters formed of metal and provided with connections for cutting them into an electric circuit, and means for adjusting them into various relations to vary the design to be branded.

619,476. Mechanical Time Switch for Two-rate Electric Meters. James H. Gerry, New York, N. Y. Application filed May 5, 1898.

The non-electrical mechanism of a two-rate meter is described.

619,493. Telephone Attachment. Frederick Lind, Jr., Paterson, N. J. Application filed September 20, 1898.

The combination with the receiver, a fulcrumed transmitter arm and the switch hook or hanger of a telephone, of an extension secured to, and movable with, the transmitter arm, a longitudinally adjustable support for the receiver swiveled to the end of the extension and means operatively connecting the extension to the switch hook or hanger.

619,519. Electric Branding Device. Henry Van Hovenbergh, New York, N. Y. Application filed August 2, 1894.

The device is provided with a rotatable disk carrying a series of circularly arranged branding characters, a supporting frame, means for holding the characters normally out of engagement with the surface upon which the frame rests, a guide roller mounted on the frame and bearing upon the contact surface, and means for turning the roller axially so as to shift the apparatus when the handle is operated, whereby a repeated operation of the handle will burn upon the fabric a series of characters side by side.

No. 619,527.

619,527. Motor-vehicle. Clinton E. Woods, Chicago, Ill. Application filed March 5, 1898.

The first claim is: In a motorcycle or vehicle, the combination with a vehicle body of a flexible support therefor, composed in part of an elliptic spring interposed between the vehicle body and the driving wheels, and a motor in engagement with the running-gear of the vehicle and flexibly supported by a movable part of said elliptic spring.

619,555. Telegraph Insulator. Isaac B. Frantz, Allentown, Pa. Application filed August 4, 1898.

An interiorly screw-threaded securing cap is adapted to be mounted upon the cross-arm fastening pin to securely hold the wire and positioning plate in position.

619,618. Ship's or Similar Compass. Ludwig Reil-stahl, Kiel, Germany. Application filed March 20, 1897.

A compass having an electromagnet mounted to swing with the needle thereof, the magnet having its poles placed

in positions respectively on the sides of the compass needle, and means for controlling the circuit of the magnet, whereby to return the needle from deflection upon the energization of the electromagnet.

619,620. Electric Motor. Conrad L. Rosenqvist, New York, N. Y. Application filed April 4, 1891.

An alternating or pulsating current motor having two field-magnet circuits mounted upon a common core, and means for rectifying the current in one circuit to maintain a constant field magnetism, only one circuit being active at a time.

619,621. Alternating-current Electric Motor. Conrad L. Rosenqvist, New York, N. Y. Application filed June 19, 1893.

The combination with a synchronous single-phase alternating-current motor organized to operate as a starting or non-synchronous motor, wherein the current flows through both the armature and field coils, of a magnet in a circuit-carrying current responsive to or varying with the speed of the motor, and a circuit-closer in the synchronous motor coils adjusted to be closed by the magnet when the critical or desired synchronous speed is reached.

No. 619,299.

619,622. Secondary Battery. Alexander Schan-schieff, London, England. Application filed September 20, 1895.

The process of manufacturing active material for electrodes for secondary batteries which consists in carbonizing a carbohydrate such as a saccharose by treatment with sulphuric acid, mixing with the carbon compound thus obtained a conductive agent, as a lead salt, and converting the mixture into a paste by addition of sulphuric acid in solution.

619,632. Indicating and Recording Mechanism for Measuring Fluids in Motors, etc. John E. Thebaud, Buffalo, N. Y. Application filed February 28, 1898.

One claim is as follows: In an indicating and recording mechanism for measurement of fluids in conduits or motors, the combination with a rack or gear wheel and their respective cams of a pivoted lever provided with separate pawls for giving to the rack bar or gear wheel movements in opposite directions, an intermediate arm on the pivoted lever tripping levers pivoted to the intermediate arm, locking levers pivoted to the frame independent of the intermediate arm and adapted for engagement with the rack bar or gear wheel and the tripping levers, armatures upon the pivoted lever, magnets for operation with the armatures, an electric transmitter connected to the magnets and conduit or motor and means connected with the pivoted lever and the magnets for introducing a local or stronger circuit through the magnets.

619,636. Apparatus for Separating Magnetic Materials. Otto A. P. Trüstedt, Stockholm, Sweden. Application filed July 31, 1895.

The combination with the electromagnet of a magnetic separator, of a generator for multiphase alternating currents, from which each current is led around different poles in the electromagnet so as to cause a wandering field of force to be created in the magnet, which field of force carries away the magnetic particles in a direction different to that in which the non-magnetic particles move.

619,662. Telephone-signaling System. Donald M. Bliss, Brookline, Mass. Application filed April 11, 1898.

A telephone signaling system comprising a local circuit at each station permanently disconnected from the main circuit, electromagnetic signaling mechanism in each local circuit and a transformer at each station, the transformer having one of its coils in series with the local circuit and its other coil bridging the main circuit.

619,667. Electric Printing-machine. George L. Campbell, Dushore, Pa. Application filed October 30, 1897.

The first claim: An electric bulletin, comprising a frame having paper-carrying rollers mounted thereon and means for traversing the frame, positive means acting upon one of the paper-carrying rollers to rotate it, a spring-held locking means acting upon the other roller, and a lever adapted to engage the latter roller to give it a partial rotation.

619,679. Galvanometer. Allen A. Dittmar, Jersey City, N. J. Application filed August 27, 1898.

Invention is allowed for a compound disk of magnetic and non-magnetic balancing metal, the magnetic portion of the disk being in the spiral or snail form while the non-magnetic material fills the remainder of the area comprised within the periphery of the disk so as to produce a disk which is balanced in all positions.

619,687. Electrical Sign. William A. Harvey, Scranton, Pa. Application filed February 23, 1898.

Lamp holders having grooved edges are adapted to engage any one of a series of parallel conductors.

DESIGNS.

30,206. Portable Electric Lamp. Clinton E. Whitney, New York, N. Y. Application filed January 16, 1899. Term of patent, seven years.

30,207. Terminal for Electric Circuits. William H. Baker, Central Falls, R. I., and Frederic E. Kip, Montclair, N. J. Application filed November 8, 1898. Term of patent, 14 years.

New Apparatus at Lewis Institute.

During the 2½ years that has elapsed since the Lewis Institute was opened to students it has demonstrated its usefulness as a school of practical technology. It has shown a healthy growth and has done good work, with the promise of doing still better. The scope of the institution is well adapted to the needs of many boys and girls in a work-a-day community like Chicago, who seek practical instruction or training that can be turned to bread-winning account immediately after acquiring a common-school English education. In general, the Institute is intended to fill the gap between the public school and the university. It takes children below the usual high-school age and carries them to about the first or second year of work ordinarily demanded in American colleges. During that time the latent bent of

rotary transformer shown in the lower left-hand corner of the picture. This is a sort of combination machine built by the Fort Wayne Electric corporation on the Wood and Churchward patents. It consists of an alternating-current synchronous motor and a direct-current generator. It is a six-pole machine and has a commutator and four brushes on the direct-current side and six collector rings on the alternating-current side. The direct-current generator is of five kilowatts' capacity and with a voltage of 110. The machine is so designed that by altering the leads on the collector rings it can be run on single-phase, two-phase or three-phase current. It is provided with a pulley and can be run by mechanical power as an alternating-current or direct-current dynamo. In fact, the machine seems capable of demonstrating the working of almost any kind of

horse power—drives a blower used to produce forced draft for an Economic tubular boiler, which is set up in the laboratory for testing purposes in the students' instruction.

The electrical apparatus in the engineering laboratory is used under the direction of Fred A. Rogers, the instructor in electrical engineering.

Death of Baron Reuter.

Paul Julius de Reuter, a baron of the Duchy of Saxe-Coburg and Gotha, died at Nice on February 25th. He founded Reuter's Telegram company, which is known the world over as an agency for the collection of news by telegraph. Baron Reuter was born at Cassel, Prussia, in 1816. From the opening of the first telegraph line in Europe between Aix-la-

NEW APPARATUS AT LEWIS INSTITUTE.

the youth toward science, technology or commerce is discovered and encouraged, that he may intelligently fit himself for his work in life. It is not designed to graduate finished mechanical and electrical engineers. The institution is regarded as a preparatory school. However, it offers a six-years' course, and is designed to thoroughly fit the student to enter the junior year of the best universities and technical institutions. But it is intended to aid the young man who must go directly into practical work as an electrician rather than enter an institution for the completion of a technical course. Evening classes have been arranged for the benefit of those who are unable to devote their time to study during the day, and are popular and well attended.

To accomplish its object stress is laid on laboratory work by the students, and the resources and opportunities of the laboratories are being constantly extended. In the engineering laboratory the four new dynamos which are herewith illustrated have been lately added. This laboratory is still far from finished, but the boys make temporary connections of belt or wire and obtain practical experience in it.

Of the new dynamos the most interesting is the

alternating or direct-current dynamo or motor. The normal speed is 1,200 revolutions per minute.

Beyond and above the rotary transformer in the picture is a two-phase Wood-Churchward alternator of the new type. The machine has four poles, and at 1,800 revolutions is rated at five kilowatts and 100 volts. To the right of it is a Wood arc machine, built to supply 35 lamps of 1,200 nominal candle power each. Farther to the right, under the bank of lamps, is a five-kilowatt, 110-volt Wenstrom compound-wound dynamo, with four poles and two field coils. It is driven at 800 revolutions per minute. All of this apparatus is installed for experimental purposes and is quite distinct from the house plant, which is in another room. The four dynamos are arranged to be driven from an overhead shaft to be belted to a five horse power Sprague motor. At present a Straight Line simple engine, turning at 280 revolutions and of about 15 horse power, drives the shafting. This engine is arranged to be run condensing or non-condensing.

The Olsen testing machine, shown on the platform back of the arc machine, is belted driven by a three horse power Northern motor enclosed and bolted to the ceiling. Another motor—a Lundell of three

Chapelle and Berlin, in 1840, he became interested in the electric-telegraph system. He acquired an interest in the different lines as they were opened, and in 1851, when the cable between Dover and Calais was laid, he opened his chief office in London. He had before this been naturalized as a British subject. Mr. Reuter immediately began to establish agencies in different parts of the world and to supply the British press with news. Similar organizations were established by him in America, India, China, Australia and all the continental states. In 1865 he turned over his business to a limited liability company. He retained the position of manager, and in the same year he obtained a concession for the construction of a submarine cable between England and Germany. Mr. Reuter also obtained a concession from the French government for the laying of a cable between France and the United States. This was laid in 1869 and is operated in conjunction with the Anglo-American Telegraph company. The position of baron was conferred on him by the Duke of Saxe-Coburg and Gotha in 1871. In 1878 Baron Reuter retired from the managing directorship of Reuter's Telegram company, but still retained a permanent member of the board of directors.

Some Recent Developments in the Gas-engine Field.¹

By EDWIN RUUD.

Gas-engine engineering is a peculiar and difficult line, probably one of the hardest branches in the entire mechanical field of to-day. This you will understand when you stop to consider that the temperature in the cylinder during the explosion periods is a dazzling white heat, and that many parts are exposed to this high temperature. Add to this the different behavior of the various kinds of gases, and that the whole process is going on within closed doors, so to speak, where you have very little chance to see what is taking place, and you can imagine the difficulties of the problem. It is a wonder that an engine can be made to run satisfactorily under such conditions. It requires a constant association with the subject in order to fully understand and to be able to overcome the numerous difficulties which present themselves. The difficulties increase with the size of the engine, due to the fact that the heat problem becomes more and more troublesome to solve. It is for this reason that the gas engine has not made much headway in the larger sizes. Also, few men have been willing to experiment in large sizes of gas engines, in view of the uncertainty and the abnormally heavy expense connected with the development of, say, a 1,000 horse power gas engine. I shall later on say a few words touching upon large-size gas engines.

I shall in the course of this short talk confine myself to two classes of engines now in use, and shall endeavor to explain or make clear to you the workings of these two kinds of prime movers. This classification is made with regard to the mode of regulation, the cycle being the same in both the "Otto" or "Beau de Rochas"; in fact, this cycle is about the only one used to-day commercially. I shall try to point out the advantages and the disadvantages of these two classes in order. But before I do this, I shall explain the working or principle of the gas engine in general for the benefit of the members who may not be familiar with the underlying principle. [Here the lecturer made some sketches on the blackboard and explained the first principles of design in the gas engine.] The so-called "hit-and-miss" gas engine has been made exclusively until recently, and I shall therefore describe this style first.

The phrase "hit-and-miss" is admirably well adapted for this type, as you will see.

Figs. 1 and 2 illustrate the principles involved in this mode of governing.

The cam shaft *A*, Fig. 1, which operates the exhaust valve *J* and other parts, runs only half the number of turns that the engine does. On this shaft is fastened the cam *B*, which moves the gas valve *G* when the roller *C* is brought in the proper position so as to ride on the cam. The governor *D* controls the position of this roller by the aid of the bell crank lever *E*. Thus, if the speed of the engine is too low, the gov-

valve *J* is opened, and on the return stroke the products of combustion are expelled.

You will see that by this mode of governing one or more charges may be cut out and that the engine either takes in a full charge of gas and air or omits the gas altogether, as the gas-valve stem is only in position to be operated by cam *B* when the engine is running at or below normal speed.

Thus you will readily understand why the "hit-and-

omits one or more charges a momentary variation in speed is the result, and fluctuation is apparent in the lights.

This introduction of two extra belts, shafting and masses to move causes quite a loss in power. The power absorbed by the two belts will be approximately seven per cent. and by the jack-shaft about three per cent., making a total of about ten per cent. taken up by the extra machinery. Even with this

FIG. 4. SOME RECENT DEVELOPMENTS IN THE GAS-ENGINE FIELD.

miss" type of engine is not suitable where a uniform speed is required, and but few of this type are running in connection with dynamos for lighting purposes. Where they are driving dynamos it is generally done as indicated in Fig. 3.

As Fig. 3 shows, the gas engine is belted to the pulley on the jack shaft and from this in turn to the dynamo.

The "hit-and-miss" gas engine must have heavy fly-wheels, and a heavy balance wheel is usually mounted on the jack-shaft in order to obtain an ap-

proximate steady speed. I have even seen some outfits of this kind having a small fly-wheel on the armature shaft. This arrangement, as you will see, takes up a great deal of floor space. The flapping of the engine belt, due to the irregular motion of the gas engine, together with the ordinary hissing sound from the two belts, makes the plant a very noisy one. The variation in the voltage on a 100-volt circuit is generally $3\frac{1}{2}$ to 4 volts during the cycle. That is, when the engine may take in a few charges successively the voltage is steady and rising, but when the engine

auxiliary machinery the speed of the dynamo is unstable and the service unsatisfactory. This type of engine is, therefore, limited to do work where steady speed is not necessary or required. This type of engine has one advantageous feature, namely, that the charge is always ignited under the same pressure, and hence the actual work done by the exploding gases in a given cycle is practically the same for full load as for no load.

Recent developments have proved that the modern type of gas engine is admirably adapted for electric lighting, as its economy is very high, and its speed regulation in a type to which I shall refer has been made as good as that of a first-class steam engine. It is the electric business which has stimulated the experiments in the direction of producing a gas engine which would be suitable for incandescent-lighting work. It is in contrast to the "hit-and-miss" type that I show you illustrations (Figs 2 and 4) of gas engines having the armature on the crank shaft, direct-coupled, or directly belted, precisely as its brother, the steam engine.

Fig. 2 illustrates a gas-engine cylinder and mixing valve of the type which proportions the charge in accordance with the load. The gas and air are mixed in the cylindrical mixing valve *A* in the proper proportions at which the same is set. This ingenious device is in reality a proportional meter, and preserves the proportions between the gas and air whether the engine runs at no load or full load. Thus the governor *B*, in connection with this valve, has absolute control over the amount of explosive mixture to be taken into the cylinder through channel *C* and inlet valve *D*. The charges are ignited by an electric igniter, located at *F*. This igniter, which is fully patented by the Westinghouse Machine company, differs from all other igniters in the respect that it is duplex and the bonnet covers two separate mechanisms. This construction makes it possible to change the connections of the wire from the battery to either set of terminals while the engine is running. If desired, both sets of terminals can be used at one time, thus insuring absolute certainty of ignition. This is often done in large electric-station work.

From this you will see that the last-described mode of governing is similar to that of the steam engine and that for picking up a heavy load it is even in a better position. All charges being proportioned to the load, if the load is suddenly thrown off there is one heavy charge already locked in, which cannot be removed, although the governor acts instantly, and there may be another under way which may be partially reduced by the action of the governor. This tends to speed up the engine a trifle above the normal, but because of the fly-wheels this tendency is so slight that it can be ignored in practice; besides there are very few plants subjected to throwing off the entire load at one. Having described both classes, I shall now dwell upon the gas consumption, and what I say in this respect is applicable only to the Westinghouse gas engine.

GAS CONSUMPTION.

The gas consumption in all engines varies with the

FIG. 6. SOME RECENT DEVELOPMENTS IN THE GAS-ENGINE FIELD —LARGEST GAS ENGINE IN COMMERCIAL OPERATION.

governor will ride closer to the spindle, and this will move the governor lever *F*, thus operating the lever, which moves the roller *C* on its spindle to a position where the cam will strike it, raising gas valve *G* and admitting the gas to be drawn to the inlet valve *H*, where it mixes with the air as it enters the cylinder of the engine. On the return stroke of the piston the charge is compressed and ignited at dead center. Now on the expansion stroke and then the exhaust

stroke will ride closer to the spindle, and this will move the governor lever *F*, thus operating the lever, which moves the roller *C* on its spindle to a position where the cam will strike it, raising gas valve *G* and admitting the gas to be drawn to the inlet valve *H*, where it mixes with the air as it enters the cylinder of the engine. On the return stroke of the piston the charge is compressed and ignited at dead center. Now on the expansion stroke and then the exhaust

¹ Address before the Technischer Verein (Technical Society) of Pittsburgh, Pa.

kind of gas used and also with the size of engine up to certain limits. The average performance of the Westinghouse gas engine, say from 20 horse power upward, is 10.5 to 12 cubic feet of natural gas per brake horse power hour. According to numerous tests with the Junker calorimeter, I have found that the average heat value of natural gas is 1,000 British thermal units per cubic foot. That is, the engine requires 10,500 to 12,000 British thermal units for each brake horse power hour, giving a heat efficiency at the shaft of 25.4 per cent, and 21.3 per cent, respectively. The above are not fancy figures, but represent the everyday performance of the engines while in the hands of the customer.

The indicator cards taken from a Westinghouse gas engine will give the reader an excellent idea of the governing action under overload, rated load, half load and no load. (See Fig. 5.)

Some special engines have been built which have given much better results than the above mentioned, and I have in mind a special 125 brake horse power gas engine which, when tested, gave the phenomenal economy of nine cubic feet per brake horse power. This would give an efficiency at the shaft of 28.7 per cent.

These are good results, but they are not as good as may be expected, and I firmly believe that the everyday performance of a gas engine will within a short time reach 33 1-3 per cent. Some experiments are being made along this line now, and with reasonable show of success. In comparison with this result I quote the gas consumption of the Lenoir engine of 1861, which was practically 90 cubic feet of about 700 heat unit gas per brake horse power hour. This engine was really the first commercial engine offered to the public. The next step was the Otto-Langen free-piston engine, which in reality was the invention of Barsanti and Matteucci, brought out in or about 1867. According to Tresca, the gas consumption per brake horse power was 44 cubic feet per hour. In 1876 Otto brought out the so-called "Otto Silent" gas engine. This engine was a compression engine, and in principle not very different from the "hit-and-miss" engine of to-day. This cycle is called Beau de Rochas, or the Otto cycle, although Gustav Schmidt is probably the originator of it. The consumption of gas was about 30 cubic feet per brake horse power hour. Thus we can see that the efficiency of gas engines has been notably improved.

WATER CONSUMPTION.

It is necessary in a gas engine to have the cylinders and all the parts exposed to the heated gases water-cooled, in order to prevent over-heating of the different parts. This is generally done by letting a stream of water flow through cylinder jackets. As the public at large seems to be ignorant as to the water consumed per brake horse power hour, I shall here state the amount of water required. In winter the consumption of water may be put down at about 30 pounds, and in summer 38 to 40 pounds per brake horse power. In places where water is expensive, this need not be wasted, as by putting up a tank or tanks, according to the size of the engine, the loss of water need not be more than a few gallons per week, or just as much as the evaporation of water from the surfaces of the tanks would amount to. Another way of cooling is by the use of a cooling tower. The water is pumped from a well through the water jackets of the gas-engine cylinder, where it becomes heated, and from there over to the top of the cooling tower, to again return to the well at about atmospheric temperature, to be used over and over. This mode of cooling produces a greater loss of water than that of the tank system, but it is almost always used in connection with large-sized engines. Not long ago I made some tests for the purpose of determining the amount of water necessary for cooling and to determine the heat lost through the same. It was found that 5,121 British thermal units went out in the cooling water, 2,922 British thermal units was converted into work, and 2,957 British thermal units must then be the approximate amount of heat which went out through the exhaust and was lost by radiation. From this you will see that there is still room for improvement toward efficiency. The bulk of the loss is in the cooling water.

THE FUTURE OF THE GAS ENGINE.

Until recently the gas engine has been made in comparatively small sizes only, and, as I have before stated, only for what you may call rough work, that is, where steadiness of speed was not essential. The largest engine in this country, made commercially, was only 100 horse power, having two cylinders and of the "hit-and-miss" type. The public looked upon the gas engine as a sort of "freak," and did not take very kindly to it. The hard times, however, which we have experienced during the last five years or so have done much toward introducing the gas engine. The keen competition and the small margin of profit caused manufacturers and business men to look around for some spot where a saving could be effected in their establishments. An investigation followed which was favorable to the gas engine. The introduction of electricity, calling for prime movers, also stimulated the demand for a cheap and convenient motor, and this, more than anything else, has brought the gas engine forward. When Mr. Westinghouse, about five years ago, commenced experiments in the gas-engine field, he did so because he foresaw a large future demand for the gas engine in the electrical field, if it could be made to give the service that its brother, the steam engine, was doing.

Experiments on a fairly large scale followed, both on compound and single expansion engines. The work was hard and trying, as the obstacles to overcome were numerous, but the results have been gratifying. In the early part of the spring of 1898 an engine of about 650 brake horse power was completed in the works of the Westinghouse Machine company. [Fig. 6 illustrates this engine operating a direct-current 500-volt engine-type generator.] This engine is of the three-cylinder type and has a speed of 150 revolutions per minute. After it was thoroughly tested on the testing foundation, it was erected in the power house of the Westinghouse Electric and Manufacturing company, where it is running in regular commercial service of a severe character.

The engine is direct-connected to a suitable generator and runs in conjunction with one or two steam engines, according to the call on these units for electric current. This engine is by far the largest gas engine in the world, and it is pleasing to record that this large gas engine was built in Pittsburgh. But this engine will not long enjoy the distinction of being the largest one. The Westinghouse Machine company is making drawings and patterns for a 1,500 brake horse power gas engine. This engine is also of the three-cylinder type, and it is designed to run at 100 revolutions per minute. Remarkable economy is expected from this engine, as every possible care is being taken to make it a model of modern gas-engine engineering. It would not be surprising if this engine developed a brake horse power for every 8 1/2 cubic feet of natural gas consumed per

Fig. 1.

Fig. 5.

SOME RECENT DEVELOPMENTS IN THE GAS-ENGINE FIELD.

hour, or 8,500 British thermal units per brake horse power hour. This would give a heat efficiency of 25.64

— or 30 per cent. at the shaft. When gas engines can be made of such efficiency in large units, they will undoubtedly compete successfully with the most modern steam engine.

A gas engine of such size and efficiency will run day in and day out on less than one pound of coal burned in a good produce gas plant per brake horse power hour. This includes banking of fires and the like losses. It would have to be a high-grade steam engine and boiler plant if it should regularly be able to produce a brake horse power for two pounds of coal per brake horse power hour, twice the amount of fuel required by the gas engine under similar conditions. From the foregoing you will see that the gas engine is no longer limited to special power purposes. It can hold its own as a prime mover, and can be used for almost all purposes for which the steam engine can be used. But all this has not been accomplished in a day. It is now 108 years since the first patent on an explosive motor was taken out by John Barber, and from that time on it may be seen that great improvements have been made.

Receivers for the Fort Wayne Corporation.

On the application of eastern creditors, Judge Baker of the United States Court at Indianapolis has appointed C. H. Worden and Samuel L. Morris of Fort Wayne, Ind., temporary receivers of the Fort Wayne Electric corporation. As soon as possible a trustee will be selected by the creditors and appointed by the court. Local capitalists have subscribed \$500,000 to purchase, reorganize and continue the business at Fort Wayne, and there is but little doubt that the business will in fact be continued without serious interruption. C. S. Knight, for years vice-president and general manager of the company, has resigned. F. S. Hunting has been appointed general manager to succeed him.

Pacific Cable Project.

On February 20th the Senate committee on foreign relations reported favorably for incorporation in the sundry civil bill an amendment authorizing a contract with an American company for transmitting government cablegrams to Hawaii, Manila and Japan for twenty years. The compensation is not to exceed \$175,000 a year, and provision is made that the contract be awarded the lowest responsible bidder who will deposit a \$400,000 bond to fulfill the conditions. At the end of the contract period the rate for government messages is to be one-third that for commercial messages, which are fixed at 25 cents per word to Hawaii and \$1 to Manila, the right being reserved to revise these rates at the end of ten years. The subsidy payments are not to be paid as dividends, but are to form a special fund for renewal and repair of cables.

Information gathered by the Navy Department, in anticipation of action by Congress authorizing the construction of a telegraph cable connecting this country with the new American possessions in the Pacific, has resulted in the suggestion of three routes and the practical abandonment of the route heretofore considered the most practicable. Reports from the Naval Hydrographic Office show that Wake Island, a detached coral formation to the north of the Marshall group, is entirely submerged occasionally, and cannot therefore be used as a landing and relay station. The information on which the Hydrographic Office based its reports is so meager, however, that the department has concluded to await the result

Fig. 2.

Fig. 3.

of surveys to be made. The gunboat Bennington started recently from Honolulu for Manila, with orders to stop at Wake Island and leave there a notice that the island was a possession of the United States. One of the naval colliers, the Nero, is now being fitted up for making deep-sea soundings in the Pacific to ascertain feasible cable routes.

Being practically convinced, however, that the reports of the Hydrographic Office will be verified, the officials are considering three other routes from San Francisco to Manila. All of these contemplate the Hawaiian Islands as the first landing place. One of the routes is from Honolulu to Johnston Island, thence to Guam, and thence to Manila. Johnston Island is detached from the Hawaiian group, but has been considered as a geographical part of it. A few years ago it was visited by a British gunboat, which proclaimed it a British possession. No apprehension that this will prevent the use of the island for a cable landing station is felt here.

Another route is from Honolulu to Midway Island, northwest of Hawaii and not quite half the distance between Hawaii and Guam, thence to Guam, and from Guam to Manila. Midway Island is one of the detached dots on the map of the Pacific. The third route is from Honolulu to Marcus Island, thence to Yokohama, and from Yokohama to Manila, Guam being taken in by a loop connecting Manila with Marcus Island. By adopting this route it is believed that a great deal of private business would be secured. Marcus Island is another detached formation. It stands sixty feet above the water, is in no danger of submersion, and contains trees and plants, thus making it a not undesirable place of residence for the cable operators. It is situated to the northeast of Guam and about 1,200 miles southeast of Yokohama. Geographically it is not attached to any particular group. Its nearest neighbor is Marshall Island, to the south, which must not be conflicted with the Marshall group, far to the southeast.

Advices from England indicate that the preparations of the British government are not as far advanced as those of the American government. In

the House of Commons recently Mr. Hogan asked the secretary of state for the colonies whether any decision had yet been arrived at by the imperial government, in co-operation with the governments of Canada, Australia and New Zealand, in reference to the construction of a Pacific cable, having regard to recent important international developments in that ocean. Mr. Chamberlain replied that no decision has yet been arrived at.

Storage Batteries and Railway Power Stations.

By ROBERT McA. LLOYD.

PART II.

In regard to the "small" battery, there is no doubt of its advantages in many cases, but for new installations it is not always the most economical battery. I understand that Mr. Leslie Carter, the president of the South Side Elevated Railroad company in Chicago, said recently that, as far as he knew, their battery did not save anything in the cost of operating the road, but that they could not run without it, and I take the liberty of making the following extract from his annual report to the stockholders, which has since been published:

STORAGE BATTERIES.

While the amount of current used per car-mile is low, and has produced gratifying results in all tests and comparisons made, the fluctuations of power above the average requirements are large, and the sudden demands on the power house compelled us to prepare promptly for the heavier business of the winter, which, with increased number of cars in service, heat and light loads, would have been beyond the capacity of the power house. Additional engine capacity could not be obtained in the time at our disposal, would have cost more money and have been expensive to operate. We accordingly installed two batteries of 750 kilowatts each, equidistant from the power house, at Twelfth and Sixty-first streets respectively. These batteries have greatly reduced the fluctuations and the maximum load at the power house. While the output at the power house is the same, the batteries charge at times of light traffic and discharge at times of heavy traffic, thus equalizing the work at the power house, and relieving the engines and generators. This is certainly an economy, and it is further claimed, with what correctness I am not yet convinced, that they cheapen the cost of production. But I do know that they keep up the voltage at the ends of the line, enable your road to operate more cars, furnish increased facilities to patrons, and prevent damage to power house machinery in case of sudden demand for increased power.

That battery was, of course, put in for regulating purposes only, and the load curves, some of which are shown in the following figures, give one the impression that the battery must certainly be useful. It seems to me hardly worth while in laying out a new station to put in a battery for the purpose of reducing the railway-power curve to the characteristics of electric-light practice, when by going a few steps further it may be refined to a practice comparable with marine engineering.

It might appear at first thought that a battery of sufficient capacity to insure a full load for the generating units at all times would save as much fuel as a battery large enough to level off the 24-hour service, but it is very difficult to follow the power requirements from hour to hour in such a way as to make ideal use of a battery, whereas, with a "large" battery, it would be possible for the ordinary station engineer to adjust his load so as to operate all of his apparatus to the best advantage all the time.

I have carefully analyzed the figures in Mr. Conant's very interesting paper, before referred to, and am compelled to differ from him at some points, and refer to them in order to meet in advance any criticism of my paper which may be based on his tables. In the first place, he assumes that his standard station can be worked all the year round with a load factor of 33 1/3 per cent., which is entirely too high; 20 per cent. or 25 per cent. would be more normal. I suspect that Mr. Conant's load factors have been obtained by indicator cards, instead of wattmeters. In Mr. Conant's table none of the stations shows a better figure for coal than three pounds per kilowatt-hour, while his standard station is put down for 2.2 pounds, without any intimation of the process for attaining such a good result. The question as to how the cost of repairs and depreciation of the entire plant would be affected by a large battery is particularly debatable ground. Mr. Conant allows two per cent. for depreciation beyond the normal running repairs. He estimates the entire plant including buildings, to last 50 years. His statement that the machinery now being installed will last much longer than that with which we have been familiar in the last decade has nothing to back it up except faith in the promises of the builders.

I propose to allow 10 per cent. per annum for repairs and depreciation on the entire station apparatus, including batteries. I have not seen any boilers that are likely to last 50 years, and there is plenty of evidence that all the best engines and boilers in this class of service to-day will go to pieces in a life of from 10 to 20 years. The particularly hard usage to which most of them are subject is not only steadily wearing them out, but producing a state of constant danger and not infrequent accidents. I am sure this is becoming well understood among railway men, and some of the best managers are writing off to depreciation 10 per cent. per annum. Moreover, who can say that improvements will not be made in the next 10 years, as in the past, and that engines and boiler may not be out of date before they are used up?

It is of course well known that whatever the rate of depreciation may be without batteries, it will be lowered by giving the generating apparatus a constant load, say half load, therefore, that the storage battery will not increase the rate of deprecia-

tion for the entire plant. If it can be shown that interest and depreciation for a plant of given load dimensions are practically equal, with or without a large battery, it is evident that the great saving in fuel alone will determine the superiority of the battery system.

I have so far considered the battery only at the central generating station, so that all the advantages due to locating it at proper points in the distribution system are additional arguments in its favor. In many cases the saving in copper may be greater than the sum invested in the battery, and the flexibility of the system improved in places where it would not pay to install sufficient copper to meet the irregular demands of travel.

The reserve qualities of the storage battery are unique. It might be supposed that a mere reservoir which is quickly drained would be of little value compared to a lot of extra generating apparatus standing idle, but experience is demonstrating every day, in existing plants, that the reserve which is needed most is the reserve which is not only ready for emergencies, but actually alive to any demand without the direction of a human mind.

Most of what has been said of the storage battery, as applied to the power station illustrated by

FIG. 3. Curves showing fluctuation of load, May 2, 1898, at power station of South Side Elevated Railroad company, Chicago, Ill.

FIG. 9. Curves showing regulating effects of batteries at the Twelfth street and Sixty-first street stations of the South Side Elevated Railroad company, Chicago, September 20, 1898.

FIG. 6. Tests made at the Woonsocket Electric Machine and Power company. Battery carries the whole load of station.

STORAGE BATTERIES AND RAILWAY POWER STATIONS.

the curves in Fig. 1, is true of its application to railway-power stations in general. The use of water power introduces a factor in the problem more variable than fuel, and I shall not attempt the discussion of it. Alternating currents lend themselves readily to the development of storage-battery applications on account of the mutually helpful combination of battery and rotary at sub-stations. Up to the present time, each of the large batteries installed for railway work has been obliged to meet different conditions and requirements, but they are all serving their respective purposes well, and showing many different fields of usefulness. I shall not refer to these plants, because Mr. Appleton, in a recent lecture to the New York Electrical society, has ably described those of most importance.

Most of us feel that the electric railway and electric-lighting interests are destined to get into closer relations, and the generating station of the future may be required to furnish all the electricity used within large areas for every purpose.

Coming, finally, to a problem which has been the subject of some newspaper discussion of late, I trust you will pardon me for treating of work with which I have no connection. Electricity has so many advantages over any other medium for transmission and storage of energy that I assume its use to be firmly established, and cannot conceive of any lasting rivalry by the other contestants now in the same field. Further than this, without saying anything for or against monopolies, I believe that all the energy supplied by means of electric currents to consumers of every nature in the Greater New York

should radiate from two or three central stations, and that these should be electrically tied together. The sub-stations would naturally consist of rotaries and storage batteries. It may not be possible to lay out each sub-station, so that the rotaries would run at a constant load for 24 hours a day, but it seems to me quite probable that such an arrangement would eventually be reached, and this would, of course, give the generating stations a constant load.

At the present time the load curves of the electric railways are very uncertain, and peaks are likely to occur at almost any time of day, while the addition of the peak due to electric lighting in the early evening would not add in large proportion to the railway peak, but electric lighting is capable of more general application, and it is possible that within a few years the distribution in the borough of Manhattan may reach from three to five hundred thousand kilowatts at the highest part of the lighting curve, which will probably be as great as the railway load when the elevated railway and the underground rapid transit are included. These peaks will often occur at the same time of day, and so there is no possibility of improving the load factor of either system by splicing the two together. It follows, therefore, that what is true of the relation

FIG. 8. Curves showing generator load at the power station of the South Side Elevated Railroad company, Chicago, Ill.

FIG. 5. Tests made at the Woonsocket Electric Machine and Power company. Generator carries the whole load of station. Rather regulation.

FIG. 7. Test made at the Woonsocket Electric Machine and Power company. Generator and battery in operation.

of a storage battery to the economy of the generating station for power or light separately will be true of the resultant of their combination.

The railway and light people recognize the importance of leveling up some portions of their load curves, but I estimate that the greatest saving is to be obtained by operating for a constant load 24 hours per day. However high would be the economy of such large stations, I am sure it would be higher with large batteries than without. Certainly the economy of the Boston pumping station as to fuel consumption should be surpassed. It must not be assumed that a high load factor for the system is an advantage. It is all right for the generating plant and for the copper feeders, but the kilowatt-hours that bring in the most money may spoil the looks of the load diagrams and kill the load factor. What is required to earn dividends is a profitable load factor outside of the stations, whether high or low, and the highest possible load factor at the dynamo terminals. The large storage battery meets these two requirements perfectly. A load factor of 100 per cent. may be maintained at the dynamo and current may be sold to the consumer regardless of the time of day.

With a million kilowatts in view for the borough of Manhattan, it would be necessary to generate an approximately constant force of 300,000 kilowatts.

A million kilowatts in station plant, without the battery factor, would cost \$100,000,000.

The same capacity, including the proportion of battery now deemed advantageous by some of the engineers in touch with these problems, would be di-

vided as to cost into \$70,000,000 of generating plant and \$30,000,000 of battery plant.

Finally, the same capacity, if divided in the proportions which seem to me most productive for the investment, would cost \$30,000,000 in generating plant and \$70,000,000 in battery.

This is quite a large battery plant, and as there would be more than two parts battery to one part generator, I am fearful of the jealousy which such a reversal of engineering practice would create.

In conclusion, I wish to state that nothing in this paper should be regarded as emanating, officially or unofficially, from the company with which I am connected.

The accompanying diagrams, Figs. 3 to 9, inclusive, show railway power curves, with and without batteries. If they do not indicate attainment of perfect results by the battery, it is not because perfect regulation is impossible, but because the engineer is well pleased with what he has, and does not strive for greater refinement. Fig. 2 shows the application of storage batteries to a large railway installation, in which part of the power is generated at a waterfall. It shows what may be done by what I have called a "medium" battery.

British Admiral in Electric Cab.

A New York correspondent relates the following incident of Rear-Admiral Beresford's visit to the

Fig. 4. Curves showing Regulating Effect of Storage Battery at Power Plant of the Barre-Montpelier Traction Company.

Fig. 2. Storage Battery on Large Railway Installation. STORAGE BATTERIES AND RAILWAY POWER STATIONS.

Brooklyn navy yard during the distinguished Irishman's sojourn in New York.

"When Lord Charles Beresford returns to England he will be equipped with material for a rattling good story about how he fooled the alert marines at the Brooklyn navy yard, with the assistance of an electric cab. It was thoroughly enjoyed by the distinguished Englishman.

"Lord Charles had an engagement to visit the navy yard, and Commodore Philip telephoned instructions to the Sands street gate to admit Lord Charles and his carriage without question. He ordered, further, that the marines on duty at the gate should line up and stand at attention as the rear-admiral of the English navy rode in.

"The marines burnished their buttons and their guns, put on extra polishes on their shoes, and prepared to make a front that would dazzle Lord Charles Beresford or anybody else.

"Down through the mud puddles of Sands street came bowling along a common-looking horseless cab. The sharp-eyed sentry had been expecting that so distinguished a personage as Lord Charles Beresford would doubtless come over in a coach and four, preceded by a brass band and an escort of police, so he paid no attention whatever to the auto-cab, which audaciously switched around, ran through the gate, and was several yards into the grounds before the sergeant of marines ran out and stopped it.

"The man on the cab was asked where he was going. He said to the house of Commodore Philip. He was then asked why he was going, who sent him, what his business was, why he came on Sunday.

"Back up," ordered the sergeant of marines. "There's never been a horseless carriage in this navy yard and there won't be while I'm here."

"So the man on the cab, with no small display of profanity, backed up to the gate and was maneuver-

ing to back out the gate when a large, good-natured face protruded from the cab window.

"I guess you don't know me," said the owner of the face, smiling; "I'm Beresford."

"The sergeant of marines retained presence of mind enough to refrain from fainting, the guard poured out and stood at attention, and the triumphant man on the cab steered his buzzing vehicle into the yard, where Commodore Philip met his guest."

Thawing Ice in Buried Pipes by Electric Heat.

The exceptionally cold weather of the greater part of February all over the northern portion of the United States, east of the Rocky Mountains, caused the freezing of the water in the buried service pipes leading from street mains to house in numberless instances. The usual method of plumbers in thawing out the pipes is tedious and expensive, costing anywhere from \$25 to \$150, while—in Chicago, at any rate—a deposit of money has to be made at the city hall to insure the proper restoration of the pavement if an excavation in the street is necessary. The plumber's assistant first thaws the frozen ground by building a fire of wood or coke, and a hole is dug to the pipe. Sometimes the ground is frozen so hard and so deep that after an opening has been made in the ground a second fire in the hole is necessary to soften the ground farther. When the service pipe is uncovered it is cut from the main and low-pressure steam, or sometimes hot water, from generators or heaters on the street is forced or pumped into it, and gradually the ice in the small pipe is thawed. This method is effective for a distance of about 15 feet, and it is often necessary to dig several holes, either because the service pipe is a long one, or because the frozen section was not encountered in the first instance.

Several persons have used electricity as an improved method of thawing the ice in buried water pipes, but Mr. Francis H. Soden, an electrical engineer of Chicago, claims to have been the first to give practical demonstration of the success of the new system. Mr. Soden has used electricity for this purpose in several instances and always with success. The diagram given herewith shows the essential features of his method. Excavating streets or the grounds outside of buildings is not necessary.

The operation consists in uncovering the service pipe after entering the basement of a building and cutting the pipe in two, so that electrically the water-pipe system of building is cut out of circuit; thus there is no danger of leakage of electric current to the numerous pipes and conductors usually about buildings. Alternating current has been employed. One wire of the secondary main of a transformer is connected to the end of the pipe to be thawed where it is exposed indoors, and the other wire is connected to any convenient point of the water-pipe system that is exposed on the street, such as a fire hydrant or the next building's street-hose attachment, or in the next building to the nearest faucet. The current should be regulated to a safe carrying capacity of the pipe's least conductive point. The service pipe, if of the same carrying capacity throughout, will be uniformly heated. The primary of the transformer should be equipped with a reactive coil so that the current can be regulated to suit the conditions of the secondary circuit.

The current should heat the lead pipe so that it is perceptibly warm to the hand; approximately 50 degrees Fahr. is sufficient, while 100 degrees Fahr. will not be injurious, and the work will be hastened. Care should be taken in operating not to heat to the fusing point of the metal, especially on lead pipe, which fuses at 617 degrees Fahr.

As the ice becomes sufficiently loosened the water from the main, being under pressure, forces a passage between the ice and the pipe and helps to clear its own way.

Mr. Soden says that there is no injurious effect causing electrolysis, as if single-phase high-frequency alternating current is used such effect is practically nil; and in any case the current is not in use a sufficient length of time to cause appreciable effect, especially as the ground surrounding the pipe is frozen and is consequently a poor conductor of electricity.

The current naturally follows the path of least resistance. In this case the path is metallic, and the current will practically return all its power in useful work. The power needed will vary slightly in somewhat similar cases, according generally to the amount of ice contained in the pipe.

Two cases in which Mr. Soden's plan was used are of particular interest. One was that of St. James Methodist Episcopal church, on February 18th. Here there were 80 feet of one-inch lead pipe, 45 feet of six-inch iron pipe and 30 feet of one-inch lead pipe in series with a copper wire of .01 ohm resistance to make the circuit through which passed a current of 155 amperes at 25 volts, or 3,775 watts. The water began to flow in seven minutes, with a full head of water at 12 minutes.

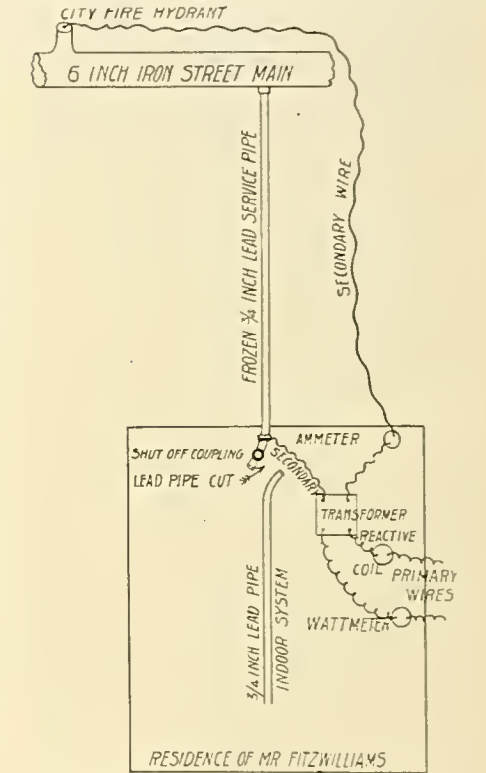

At the residence of Mr. Fitz Williams, 3824 Vincennes avenue, the circuit consisted of 85 feet of 3/4-inch lead pipe and 22 feet of six-inch iron pipe, with a copper wire of .02 ohm in series, through which flowed a current of 100 amperes at 30 volts, or 5,700 watts. Here the water started to flow in 12 minutes, and there was a full head of water in 30 minutes

The pipe here showed more ice than at the church. If necessary the time between the starting of the water and the resumption of full pressure could have been shortened.

The apparatus used in both cases was a laboratory transformer connected to the 125 cycle 1,100 volt alternating lighting mains of the Commonwealth Electric company of Chicago. The transformer was equipped with a reactive coil in series with the primary circuit. The secondary coil was so wound that by changing connections at terminals of windings either five volts or multiples of five volts up to 50 volts could be secured, independent of reactive coil regulation, so that large amperage was possible with this apparatus at small voltage. Fine regulation could be had by the use of the reactive coil when desired.

Mr. Soden has been 29 years in the electrical profession, having been connected with Mr. Edison's laboratory in Menlo Park, in 1879, and the early Edison electric lighting in New York. He was the first electrical engineer to install wires for Edison lamps in Chicago when business opened here. Mr. Soden has lately obtained valuable patents on the purification of refractory ores as found in nature.

Reports from other places indicate that the plan of electrically thawing the ice in buried water pipes

THAWING ICE IN BURIED PIPES BY ELECTRIC HEAT.

was adopted elsewhere with success. Prof. R. W. Wood and Prof. D. C. Jackson of the University of Wisconsin at Madison, Wis., appear to have accomplished the same result as Mr. Soden in Chicago without knowing of his work, for one newspaper dispatch credits Professor Wood with the statement that so far as he knew the idea was wholly original with him. The method seems to be much the same as that of Mr. Soden, except that a somewhat higher voltage was used, and no mention is made of cutting off the house piping.

Successful tests were also made in Beloit, Wis., and Des Moines, Iowa, the latter by E. G. Pratt, manager of the Capital City Electric Light company. An amusing instance was reported from Plymouth, Ind. An Associated Press dispatch from that place says: "Hardly had the heavy arc wires been connected with the mains and a circuit established, when every telephone bell in town began to ring. Most of the ground connections to the telephone system are made by attaching the wire to water pipes. The mains could soon be thawed if the people could stand the noise of the bell-ringing."

J. M. Johnson, in a letter to the *Chicago Record*, gives a note of warning. He says: "I have used electricity for several years to thaw frozen pipes and heat water passing through the same for warm-water purposes. This system is not practicable, as electrolysis takes place and is liable to destroy all the pipe in the circuit. When the water liberates the hydrogen which unites with the carbonic oxide of the iron the temperature rises and condensation takes place in the electric current and unites with the hydrogen and oxide, thereby forming sulphuro-pholena. This will dissolve iron very quickly. I have a sample of pipe ruined in about forty minutes that was over 200 feet long and 1 1/2 inches in diameter." Mr. Johnson's phraseology and reasoning are not very clear, and Mr. Soden, as stated above, thinks that the danger from electrolysis is not great.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the entire contents of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, \$3.00 for a full year of 52 numbers; in clubs of four or more, \$2.50, with free extra copy for eight subscriptions; foreign countries, \$5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—the only general electrical paper published in the West—thoroughly covers a territory exclusively its own. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers desiring western trade will appreciate the UNEQUALLED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

American electrical manufacturers who are seeking a market abroad will have plenty of opportunities during the next two years, through the Paris and Pan-American expositions, to show their products to foreign buyers in the most advantageous manner.

In the case of the Paris Exposition, American manufacturers will place their apparatus in direct competition with that made abroad, and those who are familiar with both classes, have no fear that the reputation of Americans will suffer by this comparison.

upon a building, and the architects, George B. Post of New York and Mr. Coolidge of Chicago, are now conferring with Mr. Peck and the supervising architect about the plans.

In this connection it is interesting to note that the American Chamber of Commerce of Paris, an organization formed for the purpose of facilitating commercial intercourse between France and the United States, and protecting and promoting the interests of those engaged therein, which embraces among its membership nearly all the important houses established in Paris or represented there which are engaged in such commerce, has strongly urged upon Congress the necessity of a liberal appropriation for the American section of the Paris Exposition.

In spite of the vigorous protests of the electrical interests of the country, the Navy Department has seen fit to take a step backward in the matter of mechanical equipment for its new vessels. The further use of electricity on warships for certain purposes for which steam may be employed is to be abandoned in accordance with an opinion of the assistant secretary of the navy, to whom the question was referred when the naval board of bureau chiefs was unable to decide the matter satisfactorily.

The question which Mr. Allen has decided was raised two months ago, when the power that should be used on boat cranes, winches on deck and other auxiliaries on the five new battleships was being considered. The effect of his decision will be to go back to steam power for auxiliaries where electricity has been generally used.

Lord Beresford, the British admiral who has been visiting this country, pronounces unqualifiedly in favor of electric cabs and declares his intention of never again riding behind a horse when he can procure an electric vehicle; at least, that is what he is reported as saying in New York by the enterprising reporters who accompanied him in his trips about the city.

ference of opinion as to the best practice. The manager of the London Electrical Cab company contends that the experience of that corporation sustains the claim he has made in favor of heavier carriages than are now being introduced.

I note it is stated that the "new motors weigh 16 hundredweight, whereas an electric cab weighs two tons." The writer of the article has evidently been misinformed, as the weight of the London electrical cabs does not exceed 3,200 pounds complete, and they are supplied with power sufficient to propel the cab 40 miles with each charge of the accumulators, at a speed of about nine miles per hour.

The tendency toward reducing the weight of these conveyances should not be developed to the extent of sacrificing strength and durability of carriage or the driving mechanism, but there is no doubt that experience will indicate changes in design and construction of the old carriages that will effect a marked improvement in them and at the same time bring about the desired reduction in weight.

Some things there are that are done better in the United States than in England beyond question or cavil. And one of these is the making of proper compensation for electrical engineers in municipal employment.

It is true that the remuneration of the electrical engineers formed the topic of a rather heated discussion at a late meeting of the vestry. While the salary of the chief electrical engineer, Mr. George H. Cottam, was increased from £450 to £550 practically unanimously, the recommendation of the committee that that of the three assistant engineers should be augmented met with much opposition.

An Open Discussion on "The Electrical Business."

The Young Men's Christian Association Electrical Club is composed of about sixty young men who are anxious to make a success in electrical work. This club has been organized for two years and now owns considerable laboratory equipment and conducts four classes in connection with the Association college. At the last regular meeting of the club on February 24th, in the association parlors, about 150 young men were present, and the programme was an open discussion on "The Electrical Business—Does it Pay and Where Are the Chances?"

One of the features of the evening was the reading by George A. Damon, the director of the club, of a paper which was a symposium of the answers to a circular letter which had been sent to a large number of men prominent in several electrical lines. In this letter the question was asked what opportunities the business offered, and what salaries were paid, what were the qualifications necessary to both a start and success; whether the business or the technical end was paid better and the benefit of a college education.

It was generally conceded that the newest developments offered the largest opportunities. These were variously indicated as water-power development, alternating-current transmission, storage-battery work, electric interurban railway construction, electro-metallurgy, automobile work and the application of electricity to steam lines. Patent law and the rapidly growing telephone field were also advocated.

It was quite unanimously agreed that the business end paid better than the strictly technical branches, though the value of a combination of business and technical training was brought out.

The salaries connected with a large variety of occupations were given in connection with considerable information in regard to the relative chances for advancement in each line.

Following the reading of the paper, Mr. H. H. Cutler, general manager of the Cutler-Hammer Manufacturing company, answered the question of "How Should a Young Man Get a Start in Electrical Work?" Mr. Cutler, referring to his own experience as a boy, told how he had tried to learn chemistry, because it was his father's business; how he had tried architecture because his mother thought it would be nice, and how finally he went to work in a machine shop for 8½ cents an hour, because of his own inclination to "make things." His start in the electrical business was secured by a careful study of the electrical exhibit of the Franklin Institute in 1884, after which he applied for a position with one of the electrical manufacturers, and went to work for \$1 per day. Mr. Cutler pointed out that the secret in getting a good job was to pick out a class of useful work which you liked, learn to excel in that one particular line, find a man who could use your peculiar abilities and impress him with your desire to work for him. "Learn to excel in some one particular, useful work and you'll never have any trouble to find and hold a job."

City Electrician Edward B. Ellicott spoke of "The Chances in the Municipal Electrical Service," and brought out the fact that of 170 men employed in the electrical department of the city of Chicago, not one was a college graduate. There were three divisions in his department—electric lighting, fire-alarm telegraph and inspection. The best chances for obtaining a start were in the lighting department, as a man could begin at the bottom and work up, learning all the details as he advanced. He instanced a case where a man had worked up from \$40 to \$75 per month within a year. The fire-alarm service required men of peculiar ability and long experience, and was a hard department to get into. The inspection department contained the best class of young men, and for this department his experience had been that practical electricians passed better examinations than young college graduates. Every position in the city electrical service, except those of the heads of departments, was under the civil-service law, and Mr. Ellicott was sure that the examinations made it possible for every applicant to be judged on his merits without political influence entering into the selection. He deplored the fact that a higher grade of applicants did not take the examinations, and believed that there were first-class chances in the city service for bright young technical graduates with a year or so of practical experience.

Mr. Bion J. Arnold spoke of the "Qualifications for Success." The chief requisites, he said, were a high ideal, a firm determination to succeed and a strong will. It was absolutely essential for a young man to aim high and after setting a mark to be determined to accomplish his purpose. He should develop the quality of decision and know how to say "yes" to the right thing and "no" to the wrong thing, and he should always keep his reputation clean and free from compromising decisions. He told the story of a boy whom he had employed at one time, who "didn't want to make blue-prints, but wanted to become a consulting electrical engineer at once," and brought out forcibly the point that a young man should not expect success too soon, but should make progress slowly and surely. A young man should start with the purpose not so much to make money at the beginning, but to secure a broad ground-work of knowledge and a working proficiency in his chosen vocation, and a reasonable compensation would surely come in time. He had learned that a great many men could stand success, but that few could stand

defeat. It was when a man was down that his best efforts were called for. If a young man can get out of difficulties by his own efforts he is sure of success. He believed that it was true that "genius was nothing but the ability for hard work."

Mr. Scheible of the Cutter company spoke briefly of the chances in the supply business, and showed that the successful manufacturer was the one who made goods not only "to sell, but to excel."

Mr. H. A. Seward of the Edison company, the president of the club, brought out the point that a young man should be loyal to his employer. He told the story of a young man who, after working for four years for \$7 per week, demanded more pay. When his employer told him he wasn't worth any more, he replied, "Well, you just give me more money and I'll show you I can earn it. I can work just as hard as any man in the shop, if I only get paid for it." The moral was apparent.

Mr. Floyd Marshall of the *Street Railway Review*, who was chairman of the evening, closed the discussion by giving some statistics showing the vast investments in electrical enterprises, and pointed out the chances for technical men by quoting the figures recently gathered by Prof. Goldsborough, which showed that after five years' experience the salary of the Purdue graduates averaged \$1,500 per year.

Death of John Kruesi.

John Kruesi, the chief mechanical engineer of the General Electric company, died on February 22d, at his home in Schenectady. His death, which resulted from an attack of grip, occurred quite suddenly, after an illness of only three or four days.

The funeral services, which were held on Saturday, February 25th, were attended by thousands of the

JOHN KRUESI

officials and employees of the General Electric company and of his neighbors in Schenectady. Many of Mr. Kruesi's old associates in the early Edison days were present as a last mark of respect to their old friend and comrade.

Among those who came especially from long distances were Thomas A. Edison; C. A. Coffin, president of the General Electric company; Samuel Insull, president of the Chicago Edison company; F. P. Fish, general counsel of the General Electric company; Charles A. Batchelor of New York city; S. Bergmann of New York city; J. W. Lieb, general manager of the Edison Illuminating company of New York; John Langton of New York city; W. S. Barstow, general manager of the Edison Illuminating company of Brooklyn; F. R. Upton of New Jersey; Wilson Howell of Harrison, N. J.; Martin Insull of Chicago; W. E. Gilmore of Orange, N. J.; C. T. Hughes, manager of the New York office of General Electric company, and many others.

The pall-bearers were A. G. Pitkins, vice-president of the Schenectady Locomotive Works; John De Remer of Schenectady; E. W. Rice, third vice-president of the General Electric company; G. E. Emmons, general manager of the General Electric company; Charles A. Batchelor and Samuel Insull.

John Kruesi was born in Spercher, Canton Appenzel, Switzerland, in 1843, and went to work in a machine shop at an early age. He found his way to Paris in 1867, the year of the exposition, and remained there, working in various mechanical industries until the outbreak of the Franco-German war in 1870. He then went to London, where he remained until he finally resolved to make his home in the United States, which he reached in December, 1870.

An old acquaintance and fellow-countryman, August Weber, whom he had met at the Paris Exposition, was then working for the Singer Sewing Machine company at Elizabeth, N. J., and it was with the same company that Mr. Kruesi first found employment in this country. During the two years that he stayed in Elizabeth he showed that he had a firm grasp of mechanical problems, and in 1872 he was given full charge of a new automatic machine for making needles.

At this time Mr. Thomas A. Edison, in partner-

ship with Mr. Unger, was manufacturing stock exchange tickers and telegraph instruments, in Ward street, Newark, and in June, 1872, Mr. Kruesi began to work for him. The panic of 1873 seriously disturbed Mr. Edison's plans, and he and his employees found it hard work at times to make a living between 1873 and 1875, but in the latter year Mr. Edison felt strong enough financially to open a second shop for purely experimental work in Green street, Newark. One of the first men whose services he was able to utilize in this field was John Kruesi, and for the next five or six years, either in the Green street shop or at Menlo Park, Mr. Kruesi was practically Mr. Edison's machine foreman, not only designing and making special apparatus to fit the conditions which Mr. Edison required, but also often making the special tools necessary for newly invented apparatus.

During this five years—from 1876 to 1881—Mr. Edison was busy with the phonograph, improvements on the Bell telephone, incandescent electric lighting, electric-railway experiments, and, above all, the subdivision of the electric current necessary to make incandescent lighting successful as a commercial venture. During this period Mr. Edison's power of doing without sleep and of working day and night for several days in succession tried the endurance of the strongest of his associates. Mr. Charles A. Batchelor, who was closely connected with Mr. Edison at this time, says that of all the group of men who worked at Menlo Park Mr. Kruesi was the most tireless, as well as being one of the most fertile in suggestions to overcome the difficult obstacles to success which were constantly arising. The first phonograph ever constructed was made by Mr. Kruesi from Mr. Edison's rough sketch, and this instrument is now in the Patent Department of the South Kensington Museum at London.

In 1881 incandescent electric lighting had passed beyond the stage of experiment, and the Electrical Tube company was formed, with Mr. Edison as president, Mr. Samuel Insull as secretary and Mr. Kruesi as treasurer and general manager, to make and lay down underground electric conduits in New York city and elsewhere. The first shops of this company were in Washington street, New York, and there Mr. Kruesi, often with his own hands, turned out the early conduits which were laid down in the lower part of New York city—the first two-wire conduits for lighting or power to be placed in service in any part of the world. Nearly all the early patents for improvements in underground conduits bear Mr. Kruesi's name as inventor.

The Electrical Tube company, after moving its shops to Bridge street, Brooklyn, for a short time, was finally absorbed by the Edison Machine Works, whose shops were then in Goerck street, New York, in 1883. Mr. Charles A. Batchelor was then general manager of these works, and Mr. Kruesi became his assistant. In 1886 the Edison Machine Works were removed to Schenectady, Mr. Samuel Insull becoming the general manager and Mr. Kruesi retaining his place as assistant general manager. Mr. Insull himself gives Mr. Kruesi credit for having designed and constructed all the shops which were erected while he was general manager—that is, from 1886 to 1892. "When we went to Schenectady," said Mr. Insull, "we had only 200 employees, and in 1892, when the General Electric company was formed by the union of the Edison and Thomson-Houston companies, we had 4,000 employees, so that Mr. Kruesi had to make provision for this large increase in the comparatively short space of six years." In fact, the works, as they now stand, are Mr. Kruesi's monument.

In 1892 Mr. Kruesi succeeded Mr. Insull as general manager, and in this capacity had charge of the Schenectady works until 1896, when he was appointed chief mechanical engineer to the company. During his long connection with Mr. Edison and the various companies which were his successors, Mr. Kruesi made many important improvements and inventions in machine tools. He was also, from his thorough understanding of the strong and weak points of apparatus, a salesman of more than average ability, when his services were wanted in this capacity. He had a large and varied electrical knowledge, particularly in his keen recollection of numerous experiments which had turned out failures, and of the reason why success along some particular line could not be achieved. Most of all he was prized for the absolute honesty of every side of his character.

Mr. Kruesi was a regular attendant at the meetings of the Association of Edison Illuminating Companies, and his advice was always received with respectful consideration. While attending the last convention a snap-shot photograph from which the accompanying portrait is made was secured by Mr. King, the mechanical engineer of the Chicago Edison company, and it is needless to say that he prizes it highly.

Mr. Kruesi was a widower, his wife having died in January, 1897. He leaves a family of eight children, the eldest of whom is now in England.

The will was read after the funeral, and it was found that the executors were Mr. Thomas A. Edison, Mr. Samuel Insull and Mr. Charles A. Batchelor.

A local telephone system is to be installed at Fremont, Ia.

DEVELOPMENT OF THE TELEPHONE FIELD.

Michigan Telephone War.

[From the Detroit correspondent of the WESTERN ELECTRICIAN.]

A meeting was held recently in Lansing by those who are interested in the independent telephone movement in this state. There were representatives from the independent exchanges of Detroit, Grand Rapids, Kalamazoo, Battle Creek, Lansing and other cities. The meeting was not open to the public, and the only news given out for publication was the fact that a concerted movement among the independent telephone companies to fight the Bell interests will soon be under way. One of the important subjects under consideration was the regulation of tariff rates on the state lines. These, it is believed, will be somewhat lowered and made more uniform. They will be regulated according to distance and the time used.

The men who were present admitted that most of the afternoon and evening was taken up in discussing the new rates made by the Michigan Telephone company. They declare that the intelligence of the public would not permit the independent companies to be driven out of the field, as the Bell interests would immediately raise rates to the old scale.

Said an officer of the Detroit Telephone company: "We are in a peculiar position in Detroit, as well as in other places. For instance, in Detroit, our franchise expressly stipulates that we cannot charge more than \$25 for residence telephones and \$40 for business places. Naturally, we have the right to lower, but not to raise them.

"Now if the Bell company manages (I don't think they can) to drive our companies out of the state, it will be able to raise its prices and thus recoup itself.

"And then, again, we have our investment to look after. Last year we paid six per cent. clear to our stockholders. We cannot afford to go into a rate war which might in the end wipe out not only the interest but the principal as well.

"The Bell company offers to make 10-year contracts for its telephones at \$24 and \$36 per year. To explain how they do this I will tell you something of our own experience.

"When the Detroit Telephone company was first in good running order there was a continual buzzing sound on the wire. We had some expert electricians in our employ, and they said it was caused by electric-light wires falling across our wires. After two weeks of tracing it was discovered in an alley under the eaves of a barn. We had it fixed immediately and the buzzing stopped. We have had trouble since then, and the same electric-lighting company has always been to blame.

"Wouldn't it be an easy matter to have one of those wires interfere with the operation of the cheap-rate Bell instruments? And wouldn't it be easy for an agent of the company to say, 'Well, that is the best we can give you on this contract. If you pay, say, \$75 a year for one of our new long-distance telephones, the buzzing will cease.' And with a poor telephone on his hands, and only one company to deal with, the subscriber would have to cancel his old contract and put in a new instrument.

"But I have always said that we must rely on the intelligence of the public. We are giving a first-class service; we are adding improvements in equipment and methods of operating, and we believe the public, because they form the majority of our stockholders, will stay with us."

Independent Interests in Baltimore.

By a decree of the Circuit Court at Baltimore, February 20th, the property and franchises of the Home Telegraph and Telephone company were sold at auction for \$175,000. The purchase includes a thoroughly equipped central telephone office and upward of 1,200 subscribers. The franchise of the company was granted in 1892 by the state Legislature, and included the privilege of using the city's conduits. The property will at once be reorganized.

The syndicate which recently bought up the street and suburban railway lines and the electric-lighting and power companies is negotiating for the purchase of the Home Telephone plant, with a view to consolidating the telephone and electric-light companies and amalgamating them with the United Railways company.

The representatives of the United Railways company are said to have proposed to exchange one share of that company's stock, the par value of which is \$50, for four shares of stock of the Home Telephone company, the par value of which is \$20. This is equivalent to \$125.00 a share for Home Telephone stock. There are 5,000 shares of Home Telephone stock, aggregating \$100,000, and the total purchase price would be \$62,500 in the common stock of the United Railways and Electric company. The total issue of United Railways common stock is \$24,000,000, of which \$2,000,000 will be issued this month and distributed among the subscribers to the underwriting syndicate in the shape of a bonus of 25 per cent. upon their subscriptions for the bonds and cumulative preferred stock. There will be \$11,000,000 retained in the treasury for betterments, extensions, acquisitions, etc., and a portion of this amount will be used for the purpose indicated.

The new Continental Trust company, in which Senator Hanna is interested, will finance the combined electric-lighting and telephone companies.

Independent Telephone System for Chicago.

Chicago is now assured of an independent telephone system, so far as the granting of franchises is concerned, the ordinance finally adopted by the City Council on February 20th, granting the Illinois Telephone and Telegraph company a franchise, having become a law by limitation. The mayor promised, however, to sign the ordinance. When the City Council met Alderman Novak moved the minutes of the previous meeting be amended so as to show the passage of an amendment at the previous meeting binding the company to keep in repair for one year all streets it may tear up. This was agreed to, and, the mayor having no further changes to suggest, the ordinance became a law by virtue of the fact that the time had gone by when he could interpose any more vetoes. The ordinance has not yet been accepted by the company, but it is anticipated that it will be formally accepted as submitted by the city.

Edward Wellington Hurst.

Each year the independent telephone movement brings new faces into prominence in the electrical field. Among the latest to win special recognition for contributions of unusual value is the subject of this sketch, Edward Wellington Hurst, chief electrician and general manager for the Farr Telephone and Construction Supply company of Chicago. Mr. Hurst was born in Courtright, Ont., in 1865, and after completing his education he entered the electrical field at Detroit, Mich., in 1885, where he

EDWARD WELLINGTON HURST.

quickly took a prominent place among the electrical workers in that field.

Mr. Hurst engaged with the Farr company at the time of its organization, soon after becoming a partner in the concern. Mr. Hurst is a bright, pushing young man, and it is a pleasure to do business with him. Mr. Hurst is entitled to a considerable share of the credit for building up the splendid business which the Farr company now enjoys.

Comic Opera by Telephone.

The Chicago Telephone company treated some of its subscribers last week to the opera, "The Charlatan," which De Wolf Hopper was singing at the Columbia. One 10-inch transmitter and two small transmitters were set in the footlights, one on each side of the proscenium, and two large ones in the wings. Different exchanges were favored each night during the week, and many subscribers took advantage of the innovation.

Should this experiment be successful the telephone company says it may continue the service, furnishing subscribers not only with the musical events by telephone, but comedy, drama, and vaudeville as well. And even sermons by prominent preachers may be added to the list, transmitting the church musical service as well. During the experimental period the telephone company has put as many as a dozen receivers on one instrument in residences, so that this number of people may hear the opera in a home party.

General Manager A. S. Hibbard of the Chicago Telephone company, speaking of the introduction of the theater service, said:

Experiments in the way of transmitting music by telephone have been tried from time to time in various parts of the world. In this country perhaps the most extended success of transmission of music has been made in Milwaukee, where music from the Palm Garden is transmitted by telephone and may be heard in the evening. Little has been done in the way of attempts to transmit music and dialogue as an opera, as it involves greater difficulties than the ordinary transmission of music. Instruments which are adjusted properly for music transmission will not in all cases transmit the spoken words or dialogue.

Then, again, the actors move from place to place on the stage and get out of focus with the transmitters.

In the experiments which have been tried this week at the Columbia Theater three transmitters have been used, which are under the control of a switchman seated at one side of the stage. As the act is moved about from place to place or the work changes from music to dialogue he throws on or off the different transmitters best adapted to the work and gets, perhaps, better results in these respects than have been obtained elsewhere.

Roosevelt Patent Litigation.

The opinion of Judge Woods in the case of the Western Electric company, appellant, against the Western Telephone Construction company and others, appellees, on appeal from the Circuit Court of the United States for the Northern District of Illinois, has been handed down in the United States Circuit Court of Appeals for the Seventh Circuit, Judges Woods, Jenkins and Showalter being present. The suit was brought to obtain an accounting and injunction against infringement of United States patent 215,837, issued on May 27, 1879, to Hilborne L. Roosevelt of New York for an "improvement in telephone switches." The case has excited great interest in the independent telephone field, and the successful defense of the Western Telephone Construction company is a matter of common gratification to all engaged in the independent business. Judge Woods' opinion is appended:

"The Roosevelt patent is for a mechanism purely. It is designed for use in connection with telephones, but its essential character is no more affected by that fact than the character of a device for opening and closing the gate in a head-race would be affected by the fact of its use for turning off and on and regulating a current of water on its way to a mill-wheel. The electric currents, whether carried upon the wires of a telephone or a telegraph, were not new and by no pretense can be brought within or made to affect the scope of this patent. Switches employed in telegraphic and telephonic devices to shift the electric current from one wire to another were not new. Such a switch, connected permanently at one end with a current-conducting wire—X in the patent—and capable of being shifted at its other end from one point of contact to another—as from P to A in the patent—was a matter of common knowledge, and the problem for the solution of which Roosevelt obtained a patent was to effect that shifting automatically. That problem was not a whit different mechanically because the purpose was to shift and direct the passage of electricity over wires than it would have been if the wires had been tubes through which the passage of a liquid was to be determined by the opening and closing of valves by means of a shifting switch or lever. It was, of course, no problem at all to mechanics of ordinary skill, after the telephone was invented, with a switch in position, to devise means of shifting the movable end from the point of normal contact to the other point prepared for it; but if the like had never been done before, it would doubtless have been an inventive achievement to provide for an automatic movement of the switch which should be effected by the mere use of the telephone in the ordinary way in the hand of an unskilled operator. The like had been done, however, by Cushman when he devised a signal box for fire alarms with a switch mechanism so constructed and arranged that the shutting of the outer door of the signal box switches the electromagnets out of the telegraphic circuit.' That switch, as a mechanism, is not to be distinguished from this of the patent because the particular results to be accomplished are not the same and are not brought about exactly in the same way. The shifting of currents by a switch is one thing; the subsequent course of the currents and what they do or what is done with them are different things, unaffected by and without effect upon the character of the switch. So, too, the idea and a form of automatic switch are illustrated in the hurglar alarm of Fontaine. It is, therefore, impossible, even without looking for automatic switches in the mechanic arts outside of electrical devices, to concede to this patent the character of a pioneer invention. It need not be said that there was no degree of invention in so connecting the transmitting instrument with the spring-switch that the unskilled operator, without intending or understanding the result, should accomplish the necessary movement of the switch merely by lifting the instrument, and, on quitting, should involuntarily and with equal want of understanding restore the switch to its normal position simply by releasing his hold of the instrument. This, the specification puts beyond doubt, was what the patentee supposed he had accomplished, and, the invention being from necessity very narrow, there is no good reason for giving a wider scope to the claims of the patent, even if by their terms they are not so limited. In the second, third and seventh claims the transmitting instrument is described as suspended to the switch, and the same meaning is made evident in the first claim, by the terms of which the switches 'to be placed in contact with one screw point through the influence of the telephone when not being used,' and 'is freed from the influence of the telephone, substantially as described.'

"No claim of the patent can fairly be given a construction which would include either form of apparatus manufactured by the appellees.

"The decree below is therefore affirmed."

Judge Showalter did not participate in this decision.

Signal-current Generators for Telephone Exchanges.

By H. P. CLAUSEN.

When the capacity of a telephone-exchange system rises above several hundred subscribers the need is felt for labor-saving appliances, chiefly in the work that must be performed by the switchboard operator. This may be divided into several operations, namely, answering calls, calling subscribers, interconnecting subscribers, supervising such interconnections and dissolving the interconnections. However, the limited scope of this article covers only such apparatus as is required for the second or calling operation.

As a rule, the switchboard operator is apprised of a subscriber's desire for a communication by the falling of an annunciator shutter or lighting of a lamp. The signal is then responded to by the operator, either by inserting a plug, pressing a button or other means that may have been provided in the switchboard equipment. Upon learning the subscriber's needs the operator's next duty is to learn whether the desired correspondent's line is free for allowing his signal-receiving apparatus to be sounded. If, on testing or by observation, it is found that the called-for subscriber's line is not already in use the operator's next duty will be to project a signaling current over the circuit. This brings us to the operation which it is the purpose of this article to describe.

The signaling current for sending out over the line may be (as is the case in the smaller exchange systems) generated by the switchboard operator, while driving an electric generator; however, this operation consumes so much of the switchboard operator's time that it soon becomes a burdensome duty for the operator. In the smaller exchange systems the hand-driven magneto-generator can be employed with good results; in the larger systems, however, where the time consumed while interconnecting the subscribers must necessarily be less, the necessity arises for providing some other means for ringing the subscribers' telephone bells; in other words, the electric generator must be driven by some external source of power, such as an electric, gas, water or oil motor. Whichever type of driving engine may be employed, it is essential that its speed should be fairly constant; moreover, its power should be such that even with three or four operators ringing out at the same time its speed shall not be seriously affected. Another important feature provided should be that its internal resistance should be comparatively low, depending, of course, somewhat on the size of the generator armature and field magnets.

In the telephone exchange the magneto-generator is installed as an adjunct to the hand generator placed at every operator's position on the switchboard; and during the busy hours, at least, the power generator is kept in motion. The operator's ringing cam is so constructed that whenever it is depressed or drawn in a certain direction, the current generated by the constantly driven power generator flows over the connected subscriber's line and performs its functions. When a large number of operators must be supplied with current from one common power generator, the wires may be connected direct to every operator's ringing keys. There is this objection, however. The power generator may on a short-circuit produce a current of at least one or two amperes. Such a current, if allowed to act directly on a delicate spring, would rapidly destroy its usefulness by reason of the heating effect; moreover, the contacts in an operator's circuit-changer would soon become seriously burned if used while conducting current to a line which may be of a very low resistance, or even short-circuited. In order to avoid this and still allow the operator to ring out on the subscriber's lines it is the usual practice to insert a non-inductive resistance between the generator and the operator's ringing keys. This resistance might be, for example, 300 ohms, and a substance of like resistance would be inserted between the power-generator mains and ringing cams at every operator's position; thus, no two operators would be drawing current from the mains through a common non-inductive resistance, nor would the power generator's electromotive force be high enough for forcing a very large current through the 300 ohms resistance.

The speed at which power generators should be driven depends chiefly on the construction of the magneto-bells employed at the subscribers' stations. As a rule, 800 or 900 revolutions per minute will answer, the exact rate of revolutions being determined by an actual trial. Fig. 1 shows a magneto-generator driven by an external source of power. It also shows how the operator's positions, *A, B, C, D, E, F*, and *G*, are connected to the power-generator mains by means of the wires, *A', B', C', etc.* Fig. 2 shows an electric motor whose armature has two windings, the primary to suit whatever current may be available for driving the motor and the secondary for producing an alternating current at about 75 volts pressure. The current is taken from the machine by a pair of collecting rings and brushes.

Another plan which may be used is shown by Fig. 3. It consists of a comparatively large number of batteries connected to several properly disposed contacts of a pendulum pole-changing arrangement, which, alternately and reversely, connects the battery terminals to the power-generator mains. Referring to the figure, a series of 25 batteries is shown at *P, B*, with their opposite poles connected to the terminals *P* and *P'*. One of the power-generator mains connects to the armature *A* and the contact piece

AP, which is fastened to the pendulum rod. The remaining power-generator wire connects to a stationary contact *PC*. Thus it will be observed that when the pendulum is in the position shown the power-generator mains are fed by the battery as follows: *PG, M, A, AP, P', P, B, P, B', P, PC* and *PG'*. When the pendulum swings to the opposite side the circuits are exactly similar, with the exception that the contact piece *AP* forces itself against the spring *P*, causing it to break contact with its stationary contact *PC*. Now it will be seen that

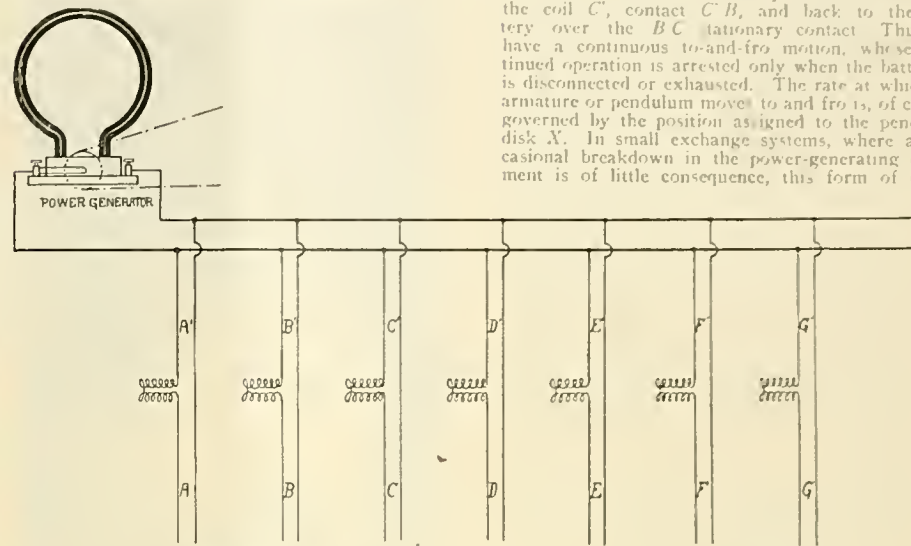

Fig. 1.

Fig. 2.

Fig. 4.

Fig. 6.

traversed by a current as follows: *B, C, CB, BC* and back to *B*. In this position the electromagnet *C* is drawing the armature *A* toward itself, which in effect, tends to allow the *P* spring to make connection with the *PC* stationary contact, and further allows the *P* spring to make connection with the *AP* contact piece on the pendulum rod. At the same time the *CB* spring makes connection with the *BC* stationary contact, while the *CB* spring is being forced away from it. Thus, in effect, causes the current from the battery *B* to flow through the coil *C*, contact *CB*, and back to the battery over the *BC* stationary contact. Thus we have a continuous to-and-fro motion, whose continued operation is arrested only when the battery *B* is disconnected or exhausted. The rate at which the armature or pendulum moves to and fro is, of course, governed by the position assigned to the pendulum disk *X*. In small exchange systems, where an occasional breakdown in the power-generating equipment is of little consequence, this form of equip-

SIGNAL-CURRENT GENERATORS FOR TELEPHONE EXCHANGES.

instead of the *P'* terminal, we have the *P* terminal connected to the *PG* wire, this giving the required reversal of polarity for sounding magneto or polarized electric bells. In order to allow the pendulum pole-changing equipment to give practical service it is necessary that the pendulum shall keep up a constant to-and-fro motion, with a certain predetermined number of oscillations per minute, which is accomplished in the following manner: The armature, it will be observed, is pivoted or hung from a pivot at *M*, which, at the same time, is used as a polarizing magnet for polarizing the armature *A*, as also the electromagnets *C* and *C'*. Near the extreme bottom of the armature rod the pendulum disk *X* is placed, it being adjustable either up or down. Somewhat above the *AP* contact piece, which is fastened to the armature rod, there is another contact piece, marked *AB*, which may be of a non-conducting substance. At *CB* and *C'B* we have two springs operating in conjunction with the stationary contact *BC*; there is also the battery *B* and the electromagnet coils *C* and *C'*, which are connected in such a manner that whenever the battery current passes through the windings a strong pull is exerted upon the armature *A*, as shown in the cut, the coil *C* being

ment is capable of giving a very satisfactory service. However, there are comparatively few in use giving an every-day service.

Fig. 4 represents a plan which is being used to some extent in towns where economy must be practiced in every direction. As shown, two lamps *R, R'* are connected on one side to a direct-current 110-volt lighting main and on the opposite side to a segment *C* of the pole-changing commutator *PC*. The segment *C* is then connected to the remaining wire of the lighting mains. The commutator *PC* is driven at the proper source of speed by an external source of power, which need not be very large, for it is necessary only to overcome a small amount of friction created by the brushes *BC* and *B'C'* bearing upon the commutator. The lamps should be of the 10 candle power, 110-volt type. With this form of equipment and, in fact, also with the equipment shown in Fig. 3, it is necessary to connect a condenser *K* across the power-generator wires in order to obliterate the effects of a disturbing inductive current (principally in common-return systems) which is set up in wires running quite near and in parallel to a wire being traversed by alternating currents whose potential is almost at its maximum height in every stage of its

flow. In other words, we have a complete break in the flow of current with every change in direction, whereas there is a gradual rise and fall in the current when a magneto-electric generator is employed.

Fig. 5 shows another arrangement where we have the same pole-changing commutator arrangement *PC* as shown in the preceding figure. We also have the brushes *BC* and *BC'*, but, instead of the 110-volt lighting mains, we have a number of batteries *PB* connected to the commutator segments *C* and *C'*. As observed in Figs. 3 and 4, the condenser *K* should also be connected across the power-generator mains. Fig. 6 represents a form of power-generating equipment where the batteries *PB* are connected for giving a large quantity of current. Batteries are connected to the segments of the pole-changer *PC*. The brushes *BC* and *BC'* are connected to the primary winding *TB* of a static transformer, whose secondary *SP* is connected to the power-generator mains, bridged by the condenser *K*. Now when the commutator is in operation the battery current is made to flow through the primary winding, first in one and then in another direction, thereby producing an induced current in the secondary winding *SP*, having the proper difference of potential. The condenser *K* may or may not be connected across the mains, depending somewhat on the transformer construction and character of the line to be rung over.

Thus far we have dealt only with such power-generating arrangements as require the generator or pole-changing apparatus to be kept in constant motion. It may, however, be desirable to describe a system in which the power-generating equipment is in action only when required for transmitting a signal.

Fig. 7 does not represent what might be considered an effective piece of apparatus for ringing more than one subscriber's bell at a time. It does, however, suggest something which should appeal to the superintendent's practical sense immediately, namely, an arrangement with which the forgetful subscriber, who makes a practice of leaving his telephone off the hook-switch, may be called.

The ordinary alternating-current telephone generator, it is well understood, produces about 1,000 cycles of current per minute, these impulses of current, while flowing through a magneto-bell, causing its armature to strike alternately first one and then the other gong for the required signal. However, with the receiver removed from the switch-hook and the magneto-bell cut out of circuit, the subscriber could not be called to the telephone, the receiver alone being left in circuit. Under favorable conditions the ringing currents in passing through the telephone receiver might cause the diaphragm to emit a cracking noise sufficiently loud to attract attention. As a rule, however, this form of signal cannot be relied upon, the alternations being far too slow for producing anything but a dull sound from the rigidly clamped diaphragm. Referring then to the cut, it will be observed that we have a static transformer *T*, whose secondary *TS* connects to the plug *CP*. The primary winding of the transformer connects to the set of batteries *PB* through a normally open make-and-break contact *BB*, which is controlled by the push-button *CC*, electromagnets *PC*, armature *A* and battery *PB*, operating in conjunction, as follows: The button *CC* on being pressed causes the current from two cells of the *PB* battery to flow into the armature *A*, over the resting contact *VB* and through the electromagnet coils *PC*, energizing the magnet cores. This results in the armature *A* being successively drawn upward and again released, by reason of a break in the battery circuit at *VB*. As long as the button *CC* remains closed, the make-and-break movement continues at the rate of, say, 40 breaks per second, or 2,400 breaks per minute. While the armature is vibrating the *PB* battery interruptedly completes its circuit at *BB* and sends impulses of current through the primary transformer winding, which, in the well-known manner, causes an alternating current to flow from the secondary winding, one cycle for each make-and-break, that is, 2,400 cycles or 4,800 alternations of current per minute. Now if such currents are sent through a telephone receiver its diaphragm produces a very sharp and piercing sound, which frequently possesses a greater penetrating power than the vibration of telephone bells.

EXTENSIONS AND IMPROVEMENTS.

The Lee County Telephone company of Dixon, Ill., claims to be one of the most successful enterprises of this kind in the country. Beginning in October, 1896, the company made a complete circuit of the county, putting in no less than 14 exchanges, at Amboy, Harmon, Shaw, Sublette, West Brooklyn, Compton, Eldena, Paw Paw, Lee, Lee Center, Steward, Ashton, Franklin Grove and Dixon. At the last-named point it now has 310 subscribers, although it is in direct competition with the Central Union Telephone company, which had 150 subscribers. The Lee County company now has all of these old Bell subscribers with the exception of about 25. The system is all paid for and the company has money in the treasury. The entire management, from securing lines, setting poles, buying material and tools, and paying employees, and getting subscribers, has been done by the president and general manager, L. D. Parker, to the great satisfaction of all concerned.

Matchless Electric Lighter.

The accompanying cut (Fig. 1) shows the "ever-ready" portable stand lighter made by Stanley & Patterson, 32 and 34 Frankfort street, New York. It is designed to furnish a light by electricity where otherwise a match, burning gas jet or other flame would be required. It is made in wall-bracket form as well as in the portable pattern, and is especially adapted for use in smoking-rooms, hotels, cigar

FIG. 1. MATCHLESS ELECTRIC LIGHTER.

stores, marine work, palace cars, apartment houses, office buildings, private residences, and, in fact, in all places where cleanliness and freedom from danger from discarded matches are desired. The advantages of the device are safety, cleanliness and attractiveness, and it is said that the cost of maintenance is about a cent a month. The body of the lighters is of white china. The lighter may be attached to electric-light sockets by plug and cord, or may be operated by two cells of dry battery and an ordinary gas-lighting spark coil. On electric-light circuits it requires no attention from one year to another, save moistening the asbestos packing in the torch, which is said to be necessary usually about twice a month,

Fig. 1.

A NEW CIRCUIT BREAKER.

with ordinary usage. The diagram of connections is given in Fig. 2.

Statistics of fire-insurance companies, the manufacturers say, demonstrate that two-thirds of all fire losses are caused by discarded matches. The Matchless electric lighter renders the use of matches in any building unnecessary, and with their discarding, is eliminated the greatest source of danger from fire. Its adaptability to marine work is demonstrated by the satisfaction which the installation of lighters on Mr. Howard Gould's steam yacht Niagara has given. Thirty-eight of the lighters were placed on one circuit on this yacht and have never, it is said, given a moment's trouble. It is also pointed out that in hotels and private dwellings the lighter prevents the

marring of fine furniture and polished woodwork by the careless scratching of matches, as well as the damage often done to a polished table or desk by the dropping of a heated match-tip upon its surface. Stanley & Patterson add: "If the torch of the Matchless electric lighter should accidentally drop to the floor, the flame can do no damage, as it is always an inch above the surface upon which the torch may rest, and within a minute will, of its own accord, become extinguished. Inverting the torch by replacing it in the lighter will, however, render it operative after a moment's rest. The packing of the torch is fireproof asbestos, and no liquid is present at any time in any part of the lighter. Contact points are of cold rolled steel."

A New Circuit Breaker.

McCarthy Bros. & Ford of Buffalo, N. Y., have placed upon the market the Buffalo expansion circuit-breaker, for which they claim the advantages of simplicity, reliability and low cost.

This breaker is an attachment placed on an ordi-

FIG. 2. MATCHLESS ELECTRIC LIGHTER.

nary knife switch, and in this way the complete instrument performs the service of a knife switch and a circuit breaker. The switch can be used the same as an ordinary knife switch without reference whatever to the breaker attachment, thus doing away with the necessity of a switch separate from the circuit breaker.

As the name implies, this breaker is operated on the expansion principle, the current being conducted over a thermal rod having large expansive properties. This rod actuates the tripping device which holds the opening spring in a closed position. Upon the passage of an excessive current over this rod, the latter expands and, releasing the spring, opens the switch. The switch, when opened by the breaker attachment, can be again closed the same as an ordinary switch and is immediately ready for service again. The thermal rod will open the switch before

Fig. 2.

heating to such an extent as to be unbearable to the hand.

This circuit breaker is said to be equal in every respect to magnetic circuit breakers and superior for some classes of work, especially for motors, as the time value may be made as large or small as desired. The magnetic circuit breaker has to be set at a current which is considerably above the normal current capacity of the motor, in order that the circuit be not opened with the first rush of the current to the motor in starting. The expansion breaker will take care of the first rush of current, while a continuous flowing current will open the circuit in five or 10 seconds, or one minute, according to adjustment.

All the Buffalo expansion circuit breakers are

furnished with fuse terminals as an extra precaution against accidental disablement of the breaker attachment. If anything should happen to the latter a set of ordinary fuses could be inserted in the circuit until necessary repairs could be made. These breakers are made single, double and triple-pole, single or double throw, with switches either single or double-break and for any voltage and alternating or direct current. Front or back connections, with or without carbon breaks, may be made. Sizes range from 25 to 200 amperes. Fig. 1 shows a 25 ampere single-break, double-pole circuit breaker of this type open, while Fig. 2 represents the device closed.

Argentine Electrical News.

[From the Buenos Aires correspondent of the WESTERN ELECTRICIAN.]

The letter written by the representative of the Metropolitana Tramway company to one of the daily papers here shows how some of the companies are held by the municipality. This company was authorized by councils to change the old horse-car system to electric traction, and now after considerable delay the mayor, or "Intendente," has vetoed the concession, as councils did not insist on the clause in relation to the free lighting of the streets. The representative in his letter shows that the company has already contributed \$450,000 toward the cost of paving the streets through which its system runs and that its annual receipts are only \$80,000. He further states that the street lighting as insisted on by the mayor means the establishing and maintaining of 400 arc lamps, which would require an outlay of \$242,476, and a yearly cost of \$92,070 for supplying current, etc., which is greatly above the gross revenue of the company. Further, he states that the change of the system from horse to electric traction will cost the company about one and a quarter million dollars—gold. If all of these statements are correct, and it is presumed that they are, it can readily be seen that these companies are working at a disadvantage, as compared with those in cities in the United States. It would seem extremely burdensome to force traction companies to give public lighting in addition to the 6 per cent. tax which they are all forced to pay, but the mayor of Buenos Aires thinks that even with these exacting conditions attached the transportation lines must still have a "wee bit" of the receipts left at the end of the year for distribution as dividends to the stockholders, in view of the avidity with which concession for car lines and electric-lighting companies are purchased from the concessionaires by English and German companies. Practically all of the traction and electric companies in this republic are almost wholly controlled by English, German and French capital.

Two new companies were registered in London lately for the purpose of acquiring, building and working rail and tram lines, telegraph and telephone systems; to carry on mercantile, commercial, trading and financial operations; as stock and share dealers, electricians and electrical engineers, engineers and iron founders, etc. The South American Electric company, limited, with a capital of \$500,000, has as its main object to adopt and carry into effect an agreement between the General Electric company of New York and Charles Bright. The other company is "Charles Bright & Co., limited," with a capital of \$1,000,000 in \$100 shares.

During the past week the City Council imposed a tax of 5 per cent. on the gross revenue of the electric-light companies of Buenos Ayres, instead of 3 per cent., as at present, for the use of the subsoil in which their mains are laid. It is rumored that the General Electric company of New York will shortly open a branch office in Buenos Aires for the supply of all the material it manufactures. It is to be hoped that the rumor is true, as it will be a great convenience to the trade and save several months in obtaining goods. C. P. R.

Electric Vehicle Business.

Articles of incorporation were filed in New Jersey last week by the New York Electric Vehicle Transportation company, with an authorized capital of \$25,000,000. The company is empowered to acquire and manufacture, buy and sell vehicles of all kinds to be operated by electricity, compressed air, gas, oil and other means of motive power; also to acquire franchises for operating these vehicles to carry passengers and freight of all descriptions. The incorporators are James E. Hayes, Camden, and C. F. Graetz and Augustus Treadwell of New York. Mr. Treadwell is employed by the Electric Storage Battery company, which is behind the new company. President Isaac L. Rice of the Storage Battery company said to a New York *Sun* reporter that the new company was but an enlargement of the Electric Vehicle company, which for some time has been operating electric cabs in that city. The business of the Electric Vehicle company, of which Mr. Rice is also president, has been increasing largely. It is pointed out that this company may be a possible competitor to Richard Croker's Auto-truck company.

From Philadelphia comes the news that articles have been filed with the Secretary of State of New Jersey changing the name of the Philadelphia Motor-wagon company to the Pennsylvania Electric Vehicle company, and increasing the authorized capital

stock from \$3,000,000 to \$6,000,000. The company is authorized to make and deal in self-propelled vehicles. The incorporators are Cornelius W. Woodward and William J. Jackson of Philadelphia and Josiah S. Dubois of Camden. This is also an evident offshoot of the Electric Storage Battery company.

Burglars in a Power House.

A dispatch from Rutherford, N. J., to the New York *Tribune* relates that three burglars made a bold attempt at robbery at the power house of the Union Traction company, in East Rutherford, a short time since. It was about 2:30 a. m., and one man stood guard outside, while two others, wearing masks, entered the power house, made the employes hold up their hands at the point of loaded pistols and shot one man who declined to obey. The robbers escaped without any booty.

Charles H. Tyler of Rutherford, night foreman, was washing out a closed car in the shed, using a mop on a long handle, when a masked man suddenly appeared at the car entrance, pointed a pistol at him and commanded him to hold up his hands. Tyler thought some of the employes were attempting to play a practical joke, and he threw the mop at the man with considerable force, striking him in the face. With an exclamation of anger the burglar rushed forward, and Tyler, seeing that he was in earnest, darted for the engine room, closely followed by the masked man, who shot at him, wounding him in the leg. Tyler flung open the engine-room door, but found another masked burglar in control.

Wallace Jones, the night engineer, had been reading when the door from the fire-room opened. A masked man pointed a pistol at him and ordered him to throw up his hands. The two men placed Tyler and Jones with their faces to the wall, and then found Harry Watson, the night fireman, asleep on the floor. He was put with them, and one robber, with a pistol in each hand, stood guard.

As the other robber went out into the carshed a door opened and John A. Bainton, a motorman, and one of East Rutherford's marshals, put out his head. A pistol was shoved in his face. He slammed the door, and getting out of a side door, ran away. In the same room James Malone, a motorman, was asleep. He says the burglar came into the room, looked around and then went away. As soon as it was known that Bainton had escaped the burglars backed down the carshed, with their pistols pointing at the three men in the engine room, went out one of the front doors, joined their sentinel outside and escaped.

The robbers entered the carhouse by forcing a window in the fire-room. Their object was probably to break open the small safe in which conductors drop the envelopes with their receipts. This is in the carshed, fastened to the wall, but it had only one day's receipts inside, and, owing to a storm, the amount was not more than \$50. There is a large safe in the office. After the robbers went away Tyler was taken to a Rutherford drug store and his wound was dressed, the pistol ball having gone through his leg.

Cloth Pressing by Electricity.¹

By W. P. ATWELL.

At a recent meeting of the Industrial society of Elbeuf a report was made by Mr. C. Mouchel, on a new process invented by Mr. Chedville, which is known as the "electro-calidor" process, and consists of pressing cloth by means of boards heated by electricity.

A special committee appointed for the purpose examined the manufacture and operation of the press boards. The result is declared to be most satisfactory, and the report is as follows:

The body of the press board is composed of asbestos paste covered by a coating of German silver. This is again covered by paper pulp, which gives a pliable surface without materially increasing the thickness of the press board, which measures from two to four millimeters (0.078 to 0.157 inch). The first experiments were made by applying the electric current through holes pierced in the portion of the board projecting beyond the cloth. Experience, however, has led to the adoption of press boards with a trapezoid projection, of which the two obtuse angles are covered with copper. Spring clips, provided with a metal connection and attached to a pliable conductor, serve to transmit the electric current to the copper-covered corners of the boards when the press is arranged for work.

The electric press boards are used in the following manner: On a plate of sheet-iron is placed a piece of cloth, between the folds of which are placed at equal distances three electric press boards; then there is another plate of sheet-iron, another piece of cloth, and so on until the press is full. An ordinary press holds six pieces, the folds of the cloth being one meter (1.09 yards) wide.

The Messrs. Blin employ a system of hollow presses, and an iron track sufficiently long to accommodate ten communicators with each one of their hydraulic presses. Against the ceiling and parallel with this track are arranged two conductors, one positive and one negative. They are placed on either side and a little beyond the line of the track. Large clips for transmitting the electric current are attached by pliable wires to these conductors. The hollow press is then placed between two of these clips, each of which communicates with a movable vertical distributor.

The distributor is a simple grooved rod, the conductor being placed in the groove. Thirty pliable wires, each terminating in a spring clip, hang at equal distances from this distributor.

The clips are readily adjusted to the metal corners of the electric press boards, the positive on one side and the negative on the other. The circuit is thus established and the proper degree of heat generated, the time necessary varying from three fourths of an hour to one hour and a half.

The required current for a press board measuring one meter (1.09 yards) by 70 centimeters (27.5 inches) is two amperes under a pressure of 10 volts. A press of eight pieces, with 21 press boards, demands a current of 48 amperes to heat the press, and the amount of electric force ex-

pendent in one hour and a half is as follows: $48 \times 110 \times 1.5 \times 750$ watts per hour. The mechanical force, given a dynamo of 90 per cent. working capacity is $\frac{48 \times 110 \times 750}{1000}$ horse power. The labor expended in one hour and a half is as follows: $12.5 \times 1.5 \times 1875$ horse power per hour.

Supposing a consumption of 1.5 kilograms of coal per horse power per hour, the quantity of coal necessary to heat a press may be estimated at about 30 kilograms (66 pounds). Estimating coal at 25 francs (81.5 cent.) per ton, the maximum cost of heating a press would then be 75 centimes (24 cents).

Comparison being made between the amount of coal required by the new system of pressing and the coal for direct heating in a special oven by means of sheet iron plates interposed between the folds of the cloth, it is found that the old method is six times dearer than the new, as the Messrs. Blin have used the old system with all little waste as possible and had no pressure per day, state that they used at least a ton of coal a day for the heating of their plates, which involve an expenditure of 25 francs (81.5 cent.) for the press, as used, by 1.10 francs (21 cents) per press.

There is thus an economy of fuel both the new system rather and more important point of superiority.

The first is the perfection of the work. The heating of each press, and even of each piece, can be regulated mathematically, either by varying the number of press boards or by increasing or diminishing the length of the heating. The cloth is heated slowly and without the inequalities resulting from the old system, under which the two ends of each piece were almost in contact with a plate heated to 550°. All manufacturers who have employed the new system speak of this point as a great advantage.

A second advantage is the extreme cleanliness with which the pressing can be effected. The old style of plates heated in an oven often resulted in soiling the cloth, which is now entirely avoided.

Another advantage is the economy in laborious handling necessitated by heating and transporting heavy cast-iron plates. The workshops can also be kept at a lower temperature, more favorable to the health of operators.

The heat generated in the folds of the cloth is completely utilized by the new process, and a fraction less is lost by radiation than under the old system of heating by plates.

If there is already an electric plant in the establishment (and few modern houses devoted to commerce or manufacture are without one), the expense is reduced. The boards are not costly, and with proper care will last several years.

Mr. Mouchel thinks that the process above described is, from all points of view, a most important invention and should be generally adopted.

COMMUNICATION.

Taxation, Trusts and Natural Monopolies.

To the Editor of the WESTERN ELECTRICIAN:

I was delighted with the article in a recent issue of your journal by Franklin H. Wentworth on "Aluminum as an Economic Factor." The writer in a most forceful and expressive style sets forth the true situation, not only in the copper field, but in the entire field of industry to-day.

Monopoly has come to be the dreaded corsair upon the perilous main of competition, and we are all (outside of the trusts) desiring a remedy. More than 900 trusts and combins are now clutching at the throat of the American people, and it is not surprising that the sleeping giant is at last coming to realize that he is being bound down by the cords of monopoly and special privileges, and I predict that in the very near future he will snap these cords as though they were paper strings, for monopoly always overreaches itself, and in many cases has already done so.

As I have said, Mr. Wentworth has ably set forth the serious phase of the copper monopoly as it affects electrical trade interests to-day. But what shall be said of his conclusions. I quote his closing words:

"If the holdings of the copper trust were assessed at their true value by the states in which they lie, it would not be necessary for the electrical industries to turn to aluminum for relief. We would have plenty of copper at a reasonable price." Just preceding this paragraph the writer quotes these words from Thomas G. Shearman's "Natural Taxation": "The trust, in so far as it is purely an economizer in production, is legitimate. Monopoly of natural resources is another matter. Monopolies of this sort are built up by unjust systems of taxation, and they can be easily destroyed by just systems of taxation."

To show the fallacy of the conclusions of both these writers let me briefly illustrate: Suppose a tax of 25 cents a gallon was levied on petroleum, in order "to tax out of existence" the Standard Oil trust; would this accomplish the purpose? Could not the monopoly simply raise the price of oil by the amount of the tax and thereby shift the tax onto the consumers of oil and still make its profit of "one hundred millions a year"? Or, suppose a tax were levied on copper to 2 cents a pound by the state of Michigan, could not the copper trust simply raise the price of copper the amount of the tax and still make the same profit?

Certainly it could and would. Any trust that has the exclusive monopoly of any natural product is complete master of the situation under competition. If some substitute is found for the product then it ceases to be a monopoly. But no form of taxation can reach the public evil which every private monopoly necessarily is.

I see but one remedy and I believe there is but one remedy, and that is public ownership of all natural monopolies. Legislation cannot and never has controlled private monopoly under competition, and as Mr. Wentworth well says, such attacks are "wrong in principle."

May I briefly call attention to another phase of this question?

I know of considerable capital now being held back from investment in electric-lighting machinery

¹ From advance United States consular report, February 23, 1899.

through fear that calcium carbide will soon be made so cheaply that it will largely drive out the electric-lighting industry. The installation of such machinery comes so high and the public is becoming so suspicious of profitable franchises that acetylene gas is coming in for a large measure of attention.

I am pleased to see so able a trade journal as the WESTERN ELECTRICIAN take up these questions, and I believe it behooves every business man to study the trade conditions of to-day with great care—even then he may be caught and swallowed up.

HENRY E. ALLEN.

Kingfisher, Okla.

American Institute of Electrical Engineers.

The nominations for officers for the American Institute of Electrical Engineers is now occupying the attention of members of the Institute. From the returns of nominating blanks filled out by members the council will select candidates for the official ticket at its meeting on March 22d.

CORRESPONDENCE.

New York Notes.

NEW YORK, February 27.—Everybody knows of the bitter attack that Tammany, with Richard Croker at its head, is making on the Manhattan Railway company. People are asking themselves the cause of it. The Manhattan company has been doing business a long time, but Tammany seems to have just awakened to the iniquity of its methods. One explanation advanced is that Mr. Croker and his associates were "short" on Manhattan stock and wanted to cause the price to drop to a point, said to be 90, where they could buy at a handsome profit. If this assumption is true the Tammany braves made a great miscalculation, for the stock has steadfastly remained steady at from 111 to 114. Another reason given is that Mr. Croker is seeking revenge for Mr. Gould's refusal to adopt compressed air rather than electricity for the new system of motive power on the elevated roads, while a third cause for Mr. Croker's anger is stated to be Mr. Gould's refusal to give the Tammany man's compressed-air company permission to attach its pipes to the elevated structures throughout the city.

Whatever the cause, all sorts of demands have been made on the company by various departments of the city government—some with some show of reason, but most of them unfair and unreasonable. The company says that it will not comply with any municipal regulation which is merely a tyrannical abuse of authority and will seek the protection of the courts. The most menacing of the Tammany demonstrations against Manhattan was the notice served by the Park Department on February 17th, revoking the right-of-way and license granted to the company for Battery Park, and ordering the removal of the elevated structure from that park within the next six months. This did not strike consternation in the Manhattan camp, however, and on February 20th Mr. Gould issued a statement to the stockholders, saying that a change to the electrical system of train operation was desired. The electrical project will be considered by the stockholders at their meeting to-morrow.

The Municipal Assembly passed two ordinances relating to the Manhattan road, one compelling the company to run trains on all its lines on not less than five minutes' headway during the 24 hours of each day, and the other ordering the placing of drip-pans under the entire length of the structures. It is said the latter ordinance, if enforced, would cost the company \$1,500,000, and it is further pointed out that with electrical operation there will be no use for drip-pans. Mayor Van Wyck has not signed the ordinances as yet and has appointed a hearing on the matter for Wednesday, March 1st, at 10:30 a. m.

There has been some talk of compromise between Tammany and Manhattan yesterday and to-day, but the fight is still on. Mr. Croker says that he is conducting a "holy war" on an unrighteous corporation. This is his declaration: "We want all corporate interests to do justice to the people who put us in office. Financiers may call this persecution, if they will. I don't care. It isn't persecution. It's a desire on our part to see that justice is done. We want these corporations to obey the law made by the people's representatives; not to make laws for themselves and override the will of the people." On the other hand, Mr. Dillon, counsel for the Manhattan company, asserts that the municipal "raid" is "the most pronounced Populistic attack upon vested interests that I have ever known. There has been nothing in the legislative or legal history of Texas, South Carolina, North Carolina or Kansas that approaches it. By Populistic attacks I mean attacks on vested rights under the form of law, and that is just what is attempted here. It out-herods anything ever done at any time in the worst Populistic state in the Union, and if it were possible to imagine that it could be successful, it would be the most serious blow ever dealt to property and vested interests in the country. It would discredit the city of New York and cover the state with shame." M. S.

Canadian Intelligence.

OTTAWA, February 25.—A movement is on foot in the city of Toronto to have all the ambulances of the city fitted out with electric motors and do away with horses altogether. This proposition is advanced on the ground that the ambulances could be worked with greater expedition.

By a vote of 399 to 61, the town of Orillia, Ont., passed a by-law authorizing the issue of debentures for \$75,000 for the purpose of installing an electrical-transmission power plant. With this sum it is proposed to bring 800 horse power from the Ragged Rapids on the Severn River, a distance of 19 miles overland. The contract has already been awarded to the Central Construction company of Buffalo, whose tender of \$67,200 for the complete plant, electrical and hydraulic, was the most satisfactory of those submitted. The power will be transmitted at 20,000 volts. It will be used for running the electric-light and waterworks plants, which are owned by the town, and for supplying private power users. This town will be the first municipality, it is said, on this continent to install an electric plant of its own for the purposes mentioned. It will be able to sell electrical power as low as \$13.50 per horse power per annum, it is claimed.

The Court of Appeal in Montreal has rendered an important judgment in the case of the Hull Electric company against the Ottawa Electric company. The result of the judgment is that the Ottawa company will be compelled to remove its poles from the streets of Hull, Que. The plaintiff company, by virtue of a by-law of the city of Hull, claimed a monopoly of erecting poles and conducting the electrical business in that city. Judgment was given in favor of the Hull company, and the Ottawa company was ordered to remove its poles from the streets of Hull. The exclusive franchise of the latter company is thus declared legal.

The Lake Megantic Pulp company of Quebec is asking power from the provincial Legislature to locate, construct and operate a branch or branches of railway from points on the Quebec Central railway and on the Canadian Pacific railway to any industrial establishments of the company in the townships of Whitton and Spalding.

Among other power asked by the Chateaugay and Northern Railway company of Quebec province is that to construct and operate a railway from any point in the boundary between the province and the state of New York, thence to a point in Soulanges County, to connect with the Montreal Island Belt Line railway, through Montreal and Hochelaga to a point on the Great Northern railway in the county of Joliette. The company also seeks permission to construct and operate an extension of its main line to and through the town of Berthier, and to construct and operate, by electricity, circuit lines of railways in towns, villages and parishes along its main line and branches.

The Montreal and Southern Counties Railway company has a charter which gives it a most extensive franchise on the south shore of the St. Lawrence River. It has the right to traverse some 17 different counties, connecting them with the city of Montreal. It is not known by which bridge the company proposes to cross the river, but arrangements will doubtless be made with either the Grand Trunk railway or the Canadian Pacific railway to do so. It is reported that the company counts upon doing a very large business in farm produce for the Montreal market, and members of the company pretend that arrangements for handling this produce and delivering it in good shape without trans-shipment in Montreal are so indifferent that various points in Ontario can supply the Montreal market better than the farmers of Quebec province.

It is currently reported that four prominent bar-riers of Ottawa will seek incorporation, at the next session of Dominion Parliament, as the Royal Telegraph company, with a capital of \$1,000,000. It is proposed to construct and operate telegraph and telephone lines throughout the Dominion.

There is an arrangement between the Dominion government and the electric-railway companies operating in most of the large cities of Canada, by which letter-carriers use the street cars in the performance of their duties. For this consideration the Montreal Street Railway company has been paid \$200 per month, but the postmaster-general was notified some time ago that the service would be discontinued on that basis. The railway company claims that a record of the work performed shows that at regular fares the sum to be charged would amount to over \$1,000 per month, and hence the refusal to renew the contract on the former terms. In Toronto the price paid is said to be \$400 per month.

Professor V. L. Emerson has perfected a process for the conversion of sawdust into smelting gases. The acetylene gas manufactured from sawdust has had great illuminating power, but it has not been useful for smelting purposes. Mr. Emerson undertook to perfect a process for the manufacture of smelting gas, and he is supported financially by a bank at Ottawa. This gas will be used to smelt iron, and the mines at Ironsides, near Ottawa, will be the first to use it.

At Ottawa capitalist, who has been negotiating for the purchase of automobile carriages for service in the capital of the Dominion has been notified that a Toronto agency for the manufacture of the carriages has been opened there. The agency is a

branch of a leading American firm, and carriages of all kinds will be built this year. The carriages which will be brought to Ottawa will be simple in construction and suitable for use on any street. The radius of operation will only be limited by the facilities for recharging the batteries.

It is understood that a company is being organized with a capital of about \$1,000,000, in Montreal, Boston and Paris, France, for the purpose of manufacturing calcium carbide on a large scale. The company will operate at the Shawinigan Falls, on the St. Maurice River, Quebec, utilizing part of the power being developed at that point by the Shawinigan Water and Power company. The company claims that it will operate under such great advantages at this location that it will be able to sell calcium carbide at greatly reduced prices.

The plant of the newly incorporated Metropolitan Electric company of Ottawa will cost in the neighborhood of \$300,000. It will have a capacity of 5,000 horse power, but only 2,000 of this power will be utilized at present. The power will be brought in from Britannia, about eight miles from the city, to a transforming station, at 10,000 volts, for transmission over the wires in the city, where it will be transformed to 2,000 volts. The power cost the company a short time ago \$20,000, but the company has since been offered \$80,000 for it.

The Toronto Electric Street Railway company's statement for the last year shows the net earnings to have been \$360,000. After paying four per cent. dividend the company carries forward to the rest account the sum of \$100,000, and thus swelling this account to nearly \$1,000,000. A. V. W.

PERSONAL.

Dr. H. S. Carhart of the University of Michigan was in Chicago early in the week. He lectured to the students of Lewis Institute on transformer design on Monday evening.

In a recent press dispatch from New York it was stated that Thomas A. Edison, Jr., and Miss Marie Louise Tuohy, an actress at the Casino Theater, were married last November. Because of troubles at the theater, it is stated, the lady announced the fact of her marriage two weeks ago.

Professor John B. Johnson, formerly of Washington University, St. Louis, has accepted the position of dean of the engineering faculty of the University of Wisconsin at Madison. Professor Johnson is a graduate of the University of Michigan and the author of engineering text-books.

Mr. I. N. Simpson, superintendent of the department of exhibits at the forthcoming exposition in Omaha, was in Chicago last week in the interest of the exhibition. Mr. Simpson was on his way east for the purpose of interesting manufacturers whose co-operation is desired by the Omaha exhibition.

Edwin Stanton Carpenter, assistant treasurer of the Westinghouse Electric and Manufacturing company and treasurer of the Walker company, died suddenly of heart disease in New York on February 16th. Mr. Carpenter was but 37 years old. His associates of the Westinghouse company held him in high esteem.

Lewis Miller of Akron, O., father-in-law of Thomas A. Edison, died in a New York hospital, after an operation, on February 17th. Mr. Miller was 70 years of age and a prominent manufacturer of agricultural machinery. He took a deep interest in Sunday-school work and founded the famous Chautauqua Assembly in 1874.

George B. M. Harvey, the new proprietor of the *North American Review*, has had much to do with the development of the electric railways of Staten Island and the Jersey Shore. He is 35 years old and began his career as a reporter on the *New York World*. He secured the friendship of William C. Whitney, with whom he formed a business connection in 1893. It is reported that he paid \$225,000 for the *Review*.

Bradner P. Holmes, manager of the Youngstown (Ohio) Electric Light company, died on February 13th at his home in Youngstown. Pneumonia was the cause of death. Mr. Holmes was well known and highly esteemed by a large number of friends and acquaintances in the electric-lighting business. He took an active interest in the affairs of the National Electric Light association and was president of the Ohio Gas Lighting association at the time of his death.

ELECTRIC LIGHTING.

The Greenville Light and Car company of Greenville, Miss., has secured the contract to light the city of Greenville with 60 or more arc lights of 2,000 candle power each for the term of 10 years, and has issued \$40,000 of bonds for the purpose of adding to its present electric-light business a small system of electric street railway, the construction of which it hopes to finish before July 1st. J. A. Gaboury is president of the company.

The mayor and aldermen of Sweetwater, Tenn., have granted a 20-year franchise with contract to the Sweetwater Telephone and Improvement company, for the erection of an electric-light plant. The company is to furnish the city 15 or more 2,000

candle power arc lights, and will also furnish 400 to 600 16 candle power incandescents for commercial and private use. It is in the market for an alternating-current dynamo, boilers, engine (75 to 100 horse power), wire fixtures and all material, except poles, for the complete construction of the plant, the plant to be completed by June 20th. D. L. Smith is the manager of the company.

The Singapore *Free Press* contains the following announcement: The Bangkok electric-light syndicate has disposed of its share of the plant and business to Capt. Anderson and Admiral de Richelieu, probably on behalf of a company. The government share of the business is to be acquired by the same interests. It is understood that the promoters of the new company will put new capital into the concern and install more machinery and dynamos, possibly with a view to combining with the tramway company." The same authority announces that "the preliminary operations in connection with the lighting for the fort at Colombo by electricity have been taken in hand by Mr. W. Simm, an engineer, who was specially got out for the purposes from the Insulated Wire company of Prescott, Lancashire. Thirty arc lamps are to be put up."

ELECTRIC RAILWAYS.

The capacity of the generating station of the South Side Elevated Railroad company of Chicago will be doubled this year. Contracts have been let for Allis engines and Westinghouse generators for two new units of 1,500 kilowatts each. This will bring the capacity of the plant up to 6,200 kilowatts, exclusive of the storage batteries.

According to the *Chicago Record* of February 28th Corporation Counsel Thornton has decided to begin damage suits against the three principal surface street-railway companies of Chicago for injury to the city's water-pipe system through electrolysis. A declaration in the case is being drawn by Assistant Corporation Counsel Jandus, and a large quantity of evidence has been collected by City Electrician Ellicott, to be used in the prosecution. The amount of the damages to be asked has not been decided upon. The basis of the contention will be that, owing to the neglect of the railway companies to properly provide for conducting their electric currents from the points where they leave the rails to the power house, damage to the city mains has resulted.

The final step in the consolidation of the Yerkes North, Northwest and West Side lines was taken a few days ago, when deeds were filed in the recorder's office conveying the property and franchises of the Chicago and Jefferson Urban Transit company, the North Chicago Electric Railway company, the Chicago Electric Transit company, the Cicero and Proviso Street Railway company, the Ogden Street Railway company, the North Side Electric Street Railway company and the Evanston Electric Railway company to the Chicago Traction company in consideration of \$1. The articles for the incorporation of the Chicago Traction company were filed at Springfield some time ago. The lines listed in the transfer are feeders to the main lines of Yerkes. The incorporators of the Chicago Traction company were directors and officers in the feeders. The main trunk line had guaranteed the interest on the bonds of the feeder companies and practically owned them.

POWER TRANSMISSION.

Mr. W. T. Baker's application for a franchise to enable the Snoqualmie Falls Power company to distribute electricity for manufacturing purposes in the streets of Tacoma, Wash., is still pending in the City Council. The *Tacoma Ledger* interviewed a large number of influential citizens on the subject, and the opinion was almost unanimous that the franchise, guarded by reasonable restrictions, should be granted immediately.

MISCELLANEOUS.

The Columbian Electric Car Lighting and Brake company, incorporated some time ago with an authorized capital stock of \$2,000, has filed papers at Trenton, N. J., increasing its stock to \$10,000,000.

The trustees of Michael Reese Hospital, Twenty-ninth street and Groveland avenue, Chicago, have decided to improve the hospital at an expense of \$50,-

000, and work on the improvements will be begun in the spring. Among the improvements to be put in is a new and complete electric plant, which will include all the latest inventions in the way of hospital lighting. A new heating plant will also be put in. Isaac Greensfelder is the president of the board of trustees.

The secretary of the navy has transmitted to Congress, to be included in the general deficiency bill, the following estimates of appropriations required by the Bureau of Yards and Docks, to restore the steam engineering buildings at the New York navy yard, and to replace the necessary power plant, tools and experimental implements and outfit connected with those buildings, which were destroyed by fire on February 15th: Power plant, with steam, electric and pneumatic installation, \$95,000; machine tools, traveling cranes and lifts, with installation of new machine shop, \$535,000. The expenditure of this amount will necessarily extend over the next twelve months, the purchase and installation of the outfit proceeding as buildings and floor space are prepared.

TRADE NEWS.

The Garton-Daniels Electric company of Keokuk, Iowa, has just appointed Mayer & England of 10 South Tenth street, Philadelphia, its representatives in the middle states territory for its line of railway lightning arresters.

A recent fire forced the removal of the Hartley Electrical Works of Chicago to 53 South Jefferson street. Bernard Hartley says that he has now more space and better facilities than before, and is in position to fill all orders for new or repair work promptly.

Mr. W. N. Matthews, formerly with the St. Louis Electrical Supply company, has undertaken the sale of a large amount of second-hand machinery, wire, shafting, pulleys and general supplies for one of the electric-lighting companies of St. Louis. He will be pleased to answer inquiries addressed to him at 312 Commercial Building, St. Louis.

The management of the Technical Agency, 1365 Monadnock Block, Chicago, states that for a month past it has been crowded with requisitions for draughtsmen, salesmen, electrical engineers and men for almost every class of engineering work. The agency's system for keeping in touch with a large number of the available technical men of the country has enabled it to supply the majority of these requisitions promptly and satisfactorily to both employer and employed.

On the morning of February 23d Roth Bros. & Co. of Chicago sustained a severe fire loss, their manufacturing plant being entirely destroyed. They will, however, resume business at once in a new location, which they are unable to name at present. Within a few weeks they will be ready to accept orders and make prompt shipments as usual. Their temporary address is 236½ East Madison street. Many friends and customers of this enterprising firm will extend sympathy in this misfortune.

All students of the Electrical Engineer Institute of Correspondence Instruction, as well as others connected with the electrical profession, will be interested to learn that this enterprising institution has secured the services of Mr. Alfred E. Wiener, the well-known author and electrical engineer, who assumes charge of the instruction department as chief instructor of the institute. Mr. Wiener is an exceptionally well-informed engineer and also possesses the rare gift of imparting knowledge to others. The students of the institute will be greatly benefited by this arrangement. Among the corps of authors and instructors which the institute has gathered around it are now numbered many of the most prominent electrical engineers of the country, so that the student enters upon his studies with the satisfying conviction of having intrusted his electrical education to an institution the good faith, trustworthiness and technical reliability of which stand unquestioned. Students and those who are desirous of becoming such are cordially invited to call at or write to the home offices of the institute, 120 Liberty street, New York city, where Mr. Herman A. Strauss, the general manager, will be at all times pleased to discuss or correspond in detail with them as to their individual needs and assist them in selecting the most suitable course.

BUSINESS.

The Electric Appliance company has thoroughly established in its new quarters, and a tour of its new building proves conclusively its superior facilities for successfully handling a large electrical supply business.

The American Electrical Heater company of Detroit is manufacturing an electric soldering iron especially suited for telephone work. These irons are already in use among switchboard manufacturers and by telephone exchanges in all parts of the country, and are stated to be giving excellent satisfaction.

Charles A. Cooper & Co. of St. Louis are doing a large and increasing business, and desire to call special attention to the Imperial double-fluorant incandescent lamp, which is meeting with considerable success at their hands. They are also offering a special four candle power sign lamp which consumes only 16 watts. Their fan motors and ceiling fans are said to be the "coldest members" in the land, and it is claimed that their lines of electrical supplies are the most complete in the West.

The Western Electrical Supply company of St. Louis, Mo., through its engineering department, reports the outlook for a large spring business as most encouraging. The numerous Warren alternating-current machines which this company has sold during the last season are more than pleasing to customers, and henceforth the company expects a rapid increase in its business in this line. It is now busy working on several large contracts for Warren alternating equipment. The Western Electrical Supply company believes that prospective purchasers of electrical machinery will consult their best interest by communicating with it before purchasing elsewhere.

The Warren Electric Manufacturing company of Sandusky, Ohio, did a large business through the month of January. During February it also secured many contracts. Among the more important ones were the following: One hundred and twenty kilowatts at Reno, Nevada; 30 kilowatts at San Francisco, Cal.; 75 kilowatts at Spokane, Wash.; 75 kilowatts at Torreon, Mexico; 120 kilowatts, Chambersburg, Pa.; 60 kilowatts, Woodfield, Ohio; 60 kilowatts, Rockford, Ohio; 75 kilowatts, Wallaceburg, Ontario; 30 kilowatts, Royal Oak, Mich.; 75 kilowatts, Holly, Mich.; 180 kilowatts, Denison, Texas; 120 kilowatts, Bonham, Texas; 45 kilowatts, Hillsboro, Tex. With the large amount of prospective business that is sure to fall to this active company within the next few weeks, the factory will keep up its operation with night and day force probably during the entire year.

The Shelby Electric company of Shelby, Ohio, manufacturer of the well-known Shelby and Y-ray incandescent lamps, has opened a permanent office in New York city in the Fidelity and Casualty building 97-103 Cedar street, with Mr. John F. Outwater in charge. Mr. Outwater's numerous friends in the trade will no doubt be surprised to learn that he has made the change from buyer to seller. For the past ten years Mr. Outwater has been connected with the Brooklyn Edison company, in various responsible positions, lately as purchasing agent, and the numerous friends whom he has made as a buyer will no doubt be glad to reciprocate when in position to do so, now that he is on the other side of the counter. Mr. Outwater states that he is in position to furnish the trade with any and all types of lamps, ranging from 1-5 to 50 candle power, and from two to 250 volts.

Users of belts will be interested in the claims of the Crescent Chemical company, sole manufacturer of "never-slip" pulley covering, 185 Dearborn street, Chicago. This company makes strong claims for its pulley covering, which is said to be used in thousands of plants throughout the country. By the use of this product machinery may be run with sagging belts and cool journals without the use of idlers or tighteners, saving lost motion, requiring less power and only about half the amount of oil. It is also said to increase the life of belts and machinery one-third. The special claim made for the pulley covering is that by its use belts will not slip. The pulley covering, which is a liquid, is applied with a brush and is always ready for use. It is guaranteed. The Crescent company is ready to send samples on 30-day tests. The company takes pride in showing its hundreds of testimonials. Many of these are from prominent electric-lighting companies.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued February 21, 1899.

619,733. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed May 16, 1898.

In an electric meter there is the combination of the series energizing coil, the U-shaped iron core, the secondary energizing coil, the shunted energizing coil and the revoluble disk armature.

619,734. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed June 2, 1898.

In a retarding device the combination is described of a winged fan, a liquid opposing the revolutions or motion of the winged fan and consisting of pure paraffin oil, a detachable receiver having a screw-threaded joint for securing it

to a suitable support and containing the winged fan and paraffin oil, and a combination cover and support.

619,735. Multiple-rate Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed June 11, 1898.

In the operation of the registering mechanism there are employed a right-hand worm, a right-hand worm wheel, a left-hand worm, a left-hand worm wheel, a movable lever carrying the right and left hand worm wheels and means for meshing separately either the right-hand worm wheel with the right-hand worm or the left-hand worm wheel with the left-hand worm.

619,700. Electrical Apparatus. Thomas B. Kinraid, Boston, Mass. Application filed May 5, 1898.

Claim is made for a body producing a magnetic field, a winding within the influence of the body, means to maintain high-potential and low-potential regions respectively in opposite parts of the magnetic field and means to cause fluctuations of the field, the winding being wound to present conditions of electrical potential related inversely to the magnetic potential of the field, and having decreasing potential throughout its entire length from its high-potential region to its low-potential region.

- 619,761. Dynamo-electric Machine. Thomas B. Kinraide, Boston, Mass. Application filed September 29, 1898.

An electromagnet is employed for producing a magnetic field, and means are provided for polarizing or converging the lines of magnetic force of the magnet from a large area thereof to a smaller area or pole, these means including a winding spread out co-extensively with the large area and immediately adjacent to the surface of the magnet.

- 619,771. Secondary Electric Clock. James O. Lyman, Waterbury, Conn. Application filed August 10, 1898.

An electric-clock movement is described comprising a plate provided with means for attachment to the cooperating parts of the movement, a pair of magnets, a forked lever, having attached to one end an armature and having one branch of its other forked end bent in the form of a V, the other branch thereof being bent at right angles near its extremity and provided with a set screw, a detent having one end thereof formed to engage the teeth of a main wheel, its outer end opposite end being so formed as to engage the end of a lever, a pawl pivoted to a lever and having one end formed to engage the teeth of the main wheel, the other end thereof being formed to engage a pin, a main wheel provided with cogs or teeth around its outer circumference, and a spring provided with means of attachment to a lever and a plate.

NO. 619,735.

- 619,829. Protective Device for Incandescent Electric Lamps. Richard Kaes, Vienna, Austria-Hungary. Application filed August 11, 1898.

This is a protective cover for an electric lamp, to which is attached a supporting device adapted to be depressed by the fracture or depression of the cover, while a circuit making and breaking device is operated by a part or attachment of the supporting device, whereby the depression of the supporting device will break the circuit.

- 619,868. Coin Controlled and Registering Telephone Apparatus. Robert D. Cranston and Sylvester M. Williams, San Francisco, Cal. Application filed November 11, 1897.

A coin-controlled telephone apparatus, including a normally locked mechanism, means whereby it is released by a current from a central station to open a circuit, and a coin-controlled means for restoring the broken circuit.

- 619,885. Voltaic Battery. Hugh de C. Hamilton, New York, N. Y. Application filed March 17, 1896.

A hanger of insulating material comprising a bridge is adapted to rest on the top of a cell or jar, with an elongated or oblong extension underneath the bridge and having substantially parallel vertical sides, against which anode plates may be secured, an elongated flange below the extension, the flange being thicker than the extension and being located centrally longitudinally with respect thereto and adapted to form an abutment for the depolarizer carrier or plate, and two vertically disposed perforations in the hanger for receiving a bladder or fastener for the depolarizer, whereby short-circuiting through collecting escaped depolarizing material will be avoided.

NO. 619,845.

- 619,866. Railway-signal System. Thaddeus B. Keeler, Rahway, N. J. Application filed July 21, 1898.

Electromagnets of different resistances and a source of electric energy common to the electromagnets are included in the track circuit, independent signal circuits, signal operating means and a source of electric energy are included in each of the signal circuits, the armatures of the electromagnets being of different resistances, each forming a part of one of the signal circuits.

- 619,866. Insulating Caster. Harry S. Lee, Tecumseh, Mich. Application filed December 27, 1898.

The caster has opposite openings formed in the fork thereof, and a cross or other electrically non-conducting member, while an approximately U-shaped bail is

formed from a single length of wire, having the free ends of its side arms bent inward forming pivots, adapted to be engaged with the respective openings in the forks of the caster, whereby the bail is pivotally mounted upon the caster and embraces the caster wheel.

- 619,900. Electric Switch. Andrew H. Miller, Central City, Colo. Application filed (month omitted from official report) 9, 1897.

A switch for controlling two electric-lamp circuits, comprising a switchboard, contacts thereon, switch arms for closing the circuit through the contacts, lamp circuits leading from the contacts, and a link connection between the switch arms, consisting of a bar having a pivotal connection with one of the switch arms and a sliding engagement with the other of the switch arms.

- 619,927. Electric-railway Trolley. Edward M. Bentley, New York, N. Y. Application filed May 16, 1896.

The combination is described with a pivoted trolley arm and a spring pressing the outer end of the arm upward, of a transverse guide on which the arm may travel and a similar transverse guide for the outer end of the spring.

- 619,942. Annunciator for Telephone Exchanges. William R. Cole, Detroit, Mich. Application filed August 25, 1897.

In an annunciator there is the combination of a movable signal wing, means for moving the wing into view, two axially aligned electromagnets in rear of the wing, a latch located between the wing and the first magnet for holding the wing in its normally retracted position and controlled by the first magnet, an armature for the other magnet and in rear thereof, and means actuated by the armature for returning the signal wing to its normal position.

- 619,965. Route-indicating Lamp for Street Cars. James A. Lakin, Westfield, Mass. Application filed April 19, 1898.

This device consists of a frame plate, a vertically adjustable base secured to the lower end of the plate, an arm on the base, incandescent electric-lamp sockets secured on the arm, a globe cap pivotally secured to the top of the frame plate, globes supported between the cap and the base, a spring on the frame plate engaging the cap for holding it against the globes, and a cushioned globe-pivoting ring between the adjoining ends of the globes.

NO. 619,965.

- 619,974. Rail Insulator. Charles B. Martin, New York, N. Y. Application filed November 8, 1898.

In a third-rail electric-railway system, it is proposed to use contact rail and insulators therefor comprising supports attached to the cross ties, and insulating bodies interposed between the contact rail and the support and supporting the contact rail loosely, to allow the cross tie and attached supports to move vertically relatively to the contact rail, but prevent lateral movement of the rail.

- 620,002. Switchboard-connecting Cord Circuit. George K. Thompson, Malden, Mass. Application filed July 16, 1898.

A cord circuit for linking together sub-station circuits of diverse character divided by a repeating coil into two independent plug circuits, each plug having three contact surfaces, the tip and sleeve being in circuit with each other and normally including in series two helices of the coil, a condenser, and a disconnecting signal and the test-contact surface being in circuit with a relay and battery, whereby when the plugs are inserted into sub-station circuits of the same or of dissimilar type, each plug circuit is adapted to repeat into the other.

- 620,004. Telephone-switchboard Circuit. Thomas C. Wales, Jr., Newton, Mass. Application filed October 31, 1898.

A special cord circuit is provided with one plug only, normally resting in a grounding plug-seat switch, the line-conductor terminals of the plug being in series with each other and with a retardation coil; a battery and a relay, and the test-conductor terminal of the plug being in series with each other and with a retardation coil, a battery and a relay and the test-conductor terminal of the plug being in series with a second relay and a battery, the battery having two normally open independent branches to the plug-seat switch, each having in series a supervisory signal and a resistance coil, the respective armatures of the relays being each adapted to short-circuit one of the signals.

- 620,009. Electric Railway. William R. Woodward, New York, N. Y., and Frederick S. Woodward, Graniteville, Mo. Application filed March 29, 1898.

In an electric-railway system there is the combination with a main conductor and a series of stationary insulated

third-rail sections, of switches controlling the connection between such sections and the main conductor, mechanical operating devices located beyond each end of each section and reversely connected to such switches, and an electrically propelled vehicle having means for taking current from the third-rail sections and provided with means such as a shoe for engaging with the switch-operating devices, to close the switch before the vehicle passes onto the section from either direction, and to open the section after the vehicle passes off of the section in either direction.

- 620,027. Induction Coil. Manes E. Fuld, Baltimore, Md. Application filed December 7, 1898.

An induction coil has insulated iron wrapped upon the bobbin tube and the primary and secondary coils wound upon the insulated iron.

NO. 618,974.

- 620,031. Constructing and Bonding Rails of Electric Railways. Samuel H. Harrington, New York, N. Y. Application filed June 17, 1897. Renewed July 18, 1898.

A rail for electric railways having a heading of the same metal as the rail extending out from and incorporated with it and a bond-receiving perforation formed through the heading and the adjacent metal of the rail proper.

- 620,042. Telephone-call Register. Bruno Krausse, Wilmersdorf, Germany. Application filed August 1, 1898.

One claim is given: In a telephone system, a registering device, a device for normally locking the same, an electrically operated releasing mechanism for said locking device, electric generators, such as batteries located at the subscribers' stations, and current-switching devices in connection with said batteries and with the releasing mechanism, said current-switching devices being controlled by the establishment and interruption of the speaking circuit and serving to normally connect like poles of said batteries so as to render the batteries inactive, while the establishment of connections for conversation will so affect the current-switching devices as to change the connection of the batteries and send an operating current into the releasing mechanism, and mechanism for operating the locking device at the end of a conversation.

- 620,056. Process of Tanning Hides or Skins. Samuel P. Sadler, Philadelphia, Pa. Application filed October 21, 1897.

The method described of tanning or tawing hides or skins consists in impregnating the hides or skins with a metallic salt which is capable of yielding, under the action of hydrogen, a metal, metallic oxide or compound, which will unite with the fiber of the hide to form leather, and then subjecting the hides or skins to the reducing action of nascent hydrogen electrolytically produced.

- 620,086. Electric Heater. Louis Casper, Chicago, Ill. Application filed November 15, 1897.

In an electric heating device there is the combination of a fluid chamber, a heating chamber arranged within the fluid chamber to provide a surrounding space, insulated supports in the heating chamber, a series of resistance rods mounted in the supports, coupling conductors connecting the rods at opposite end portions in convoluted series, a removable cover closing the outer end of the heating chamber, electric circuit posts on the cover, and fingers on the first and last rods in contact with the posts.

NO. 620,056.

REISSUES.

- 11,718. Electrical Controlling Apparatus. Oscar H. Pieper and Alphonse F. Pieper, Rochester, N. Y. Application filed January 17, 1899. Original No. 575,573, dated January 19, 1897.

The last claim is reproduced: In an electric controlling apparatus, an oscillating spindle, a fixed switch bar on said spindle, connected brushes and an insulated brush on said switch bar, a series of contact plates surrounding the spindle, and a lever for operating the spindle, so that when the lever is approaching its central or neutral position the field magnets remain at full strength.

- 11,719. Telephone. John T. Gent, Alwyn W. Staveley and Isaac H. Parsons, Leicester, England. Application filed October 26, 1897. Original No. 584,868, dated June 22, 1897.

In a telephone there is the combination with the diaphragm of a variable resistance device consisting of suitable conducting material in a granulated or comminuted state, a movable containing or holding receptacle for the material, and means connecting the receptacle with a normal movable instrumentality of the telephone apparatus, whereby the receptacle is automatically actuated whenever the instrumentality is operated in effectuating the service of the telephone.

LEADERS IN THE INDEPENDENT

Western Electrician

1. Milo G Keilogg, President Kellogg Switchboard and Supply Company, Chicago.

Western Electrician

EVERY SATURDAY.

Vol. XXIV.

CHICAGO, MARCH 11, 1899.

No. 10

Hopkins J. Hanford.

The subject of this sketch has been introduced to electrical interests through his connection with the independent telephone industry, in which he has been a conspicuous figure for several years. Hopkins J. Hanford is not an electrical engineer, and he makes no pretensions to scientific attainments. Without the advantage of technical training, he has succeeded in building up an admirable system, and the secret of his success lies in his willingness to leave all technical matters to the men he employs to design, build and operate his exchanges, devoting his entire attention to the management of the property. He is a business man, and he has introduced business methods in all the independent telephone enterprises with which he has been identified.

The first work of this character in which Mr. Hanford engaged was in Ohio, 15 years ago. A small town in which he was interested, because it was the home of his childhood, desired a telephone service, but could not satisfy the exorbitant demands of the old company. Mr. Hanford accordingly started out to build an independent exchange, and he succeeded so well that he determined to build another.

This was a small undertaking, viewed in the light of present experience, but at the time of its inception it was regarded as a big enterprise, and it involved considerable risk.

However, the field was not ripe for the general establishment of anti-Bell exchanges, and Mr. Hanford devoted his attention to other matters. He has built railroads, reclaimed waste lands, executed government contracts and engaged in the government service since then, thus enjoying an exceptionally wide experience and gaining valuable acquaintance among public men, capitalists and promoters. Mr. Hanford was connected with the United States Treasury Department for several years as chief of the inspectors of national banks. Upon his retirement from this position he engaged in banking in New York city.

About the time of the expiration of the Bell patents Mr. Hanford's business called him to Detroit, where he found great dissatisfaction everywhere manifested against the old monopoly. Seizing the opportunity thus afforded, Mr. Hanford offered to organize a company and build an exchange if a favorable franchise could be secured. This was done, and the work of establishing a competing telephone system in Detroit was at once launched. Mr. Hanford procured the necessary financial backing, but he was not able to make the arrangements he desired for the equipment of the exchange, and he proceeded to form a construction company to take up the work. A switchboard was built and the exchange was soon in running order, forming one of the largest and most successful independent telephone exchanges in the country.

Mr. Hanford's greatest achievement was the formation and exploitation of the Kinloch Telephone company at St. Louis. He was the organizer, financier, builder and operator of this exchange, which is to-day unquestionably the most successful anti-Bell enterprise in the country. At present it is giving regular commercial service to 5,000 paid subscribers, which largely exceeds the entire list of Bell patrons in St. Louis. The company is still busily engaged in adding new patrons and extending lines in all directions. An addition to the exchange equipment that will give it capacity for more than 8,000 connections is now being built.

Mr. Hanford is also general manager of the St. Louis Electric Construction company and he holds the same office in the Citizens' Electric Lighting and Power company of St. Louis.

At present Mr. Hanford is giving considerable time to the affairs of the Illinois Telephone and Telegraph company, which has just received a franchise from the city of Chicago for an independent telephone exchange, to compete with the old Bell system. It will therefore be seen that Mr. Hanford represents large interests in the independent telephone industry, and that he is bound to play a conspicuous part in the development of that field.

Mr. Hanford is a resident of Evanston, Chicago's fashionable North Shore suburb.

Independent Telephone System for Chicago.

The preliminaries in the formation of the Illinois Telephone and Telegraph company are now being completed; the selection of directors and officers and the settlement of the policy of the company are being made. Charles H. Aldrich, the legal adviser of the promoters, is authority for the statement that some of the most prominent business men of Chicago are identified with the project and that the directory when announced will be thoroughly satisfactory to the people.

Mayor Harrison formally approved the ordinance passed by the Chicago City Council granting the company a franchise for a telephone-exchange system in this city. The new concern starts with friendly interest of the city administration as well as the public generally. Actual work upon the plans for the exchange and in canvassing for subscribers

HOPKINS J. HANFORD.

will be begun as soon as the formal organization is perfected.

Independent Telephone Interests in Cleveland.

The Cuyahoga Telephone company, which was recently organized, has purchased the franchise and plant of the Home Telephone company of Cleveland, an independent organization, and has entered into very extensive plans for the construction during this season of an exchange, at Cleveland, of very large size and on the most approved lines of construction.

The company is composed of men of large financial means, who are also largely interested in street railroads and other interests in Cleveland. Mr. H. A. Everett is the president of the company, and the interest is practically the same as that locally known as the Everett syndicate.

The company has contracted with the Kellogg Switchboard and Supply company of Chicago for its switchboard and telephone apparatus, and the system will be in complete operation before the end of the year. The switchboard will have a capacity, when installed, for 5,760 lines, and its ultimate capacity will be about 20,000 lines.

The Everett syndicate is now constructing an

eight-story, fireproof building in Cleveland for the use of its telephone exchange and street-railroad interests. The upper floor of the building will be devoted entirely to the switchboard plant, and will be of the size to allow a switchboard for the ultimate capacity of 20,000 lines.

The same interest will also construct, during the coming season, a very extensive system of toll lines throughout Ohio, to be known as the United States Telephone company of Cleveland. The officers of this corporation are the following-named gentlemen: President, H. A. Everett; vice-president, E. W. Moore; secretary, James B. Hoge; treasurer, John Sherwin; superintendent, Fred Storm; counsel, H. D. Chitchfield; consulting engineers, Ledlie & Reber.

Independent Telephony in New England.

[From the Boston correspondent of the WESTERN ELECTRICIAN.]

The plans of the promoters of the Massachusetts Telephone and Telegraph company are beginning to emerge from the obscurity which enveloped them when the company first brought forward its propositions. It is conceded by the people interested, represented by Z. S. Holbrook of Cambridge, Mass., that they contemplate establishing a long-distance line for New England, and it may eventually reach out beyond New York and Philadelphia, which are their present objective points outside of this section.

Since they obtained franchises in Boston, and applied for a charter under the name of the New York and Boston Telephone company in New Jersey, the promoters have obtained a franchise in Portland, Me., and control rights to build and operate lines in other parts of the state of Maine. Early in the present month they applied in Connecticut for a charter to do business in that state also. Their latest move is an application for a franchise in Providence, R. I. With large independent exchanges in Boston, New York, Philadelphia and many of the other important cities en route between Portland and Philadelphia, they expect to do a rushing business.

Haverhill, which has a fight on hand between an independent company and the New England Telephone and Telegraph company, might be utilized as a connecting link on the way to Portland from Boston, while Providence and New Haven would come in handy on the road to New York. Worcester and Springfield are also said to be objective points.

President Charles E. Adams of the Massachusetts State Board of Trade has accepted the presidency of the company. He is a Lowell man.

In Boston and in Providence the company's representatives, in asking for special privileges, have pledged themselves not to sell out to any other corporation. It is believed that the enterprise is a legitimate one, and means business, with millions ready to be invested whenever they are wanted and called for.

The New England Telephone and Telegraph company, the Bell institution here, is aroused to effort to forestall the newcomer in this city, and is said to have sent out 50 canvassers during the last month to obtain new subscribers in the local and suburban districts.

Independent System for Columbus.

The Ohio Telephone company has applied to the Columbus City Council for a franchise. The terms offered by the new company provide for a rental of \$2 per month for residence telephones and \$36 per year for business telephones, with full metallic circuit; or, with long-distance equipment, \$5 per month for residences and \$48 per year for business houses and offices "at any place within the present or future corporation lines of the city." Should the lines be required to go underground after five years, an increase of the rentals may be made, not to exceed \$1 per month per instrument. The company agrees to pay the city two per cent. on the first \$50,000 of its gross receipts, with a sliding scale.

The proposition has been received with general favor, and it is anticipated that the franchise will be granted.

Independent Toll-line Service in Michigan.

By W. C. STERLING, JR.

Michigan has gained distinction in the independent telephone field, not only on account of its successful anti-Bell exchanges in large places, but particularly through the network of toll lines that covers the state and connect the independent exchanges in large and small points.

The New State Telephone company of Michigan is said to be the largest independent telephone system in this country. It was organized immediately after the Detroit Telephone company began business and has rapidly enlarged and extended its system until it now owns its own lines across the state and has established exchanges in all cities within a radius of 150 miles from Detroit.

W. L. Holmes is president of both the Detroit Telephone company and New State Telephone company, and the directors of both companies include A. I. McLeod, E. H. Parker, Charles Flowers, T. F. Ahern, Hugh O'Connor, W. C. Sterling, Jr., John T. Holmes and the president. Mr. Hart of Lapeer is a director in the New State Telephone company and Julius Stroh of the Detroit Telephone company.

The New State Telephone company is strong, because it has been established on a popular basis. All the stock is held in Michigan and is distributed wherever the lines extend. Enough stock is usually sold in each city in which an exchange is to be established to build the exchange. In this way the com-

panies working, with which the New State Telephone company connects.

There are over 26,000 independent telephones in Michigan, and these two companies operate nearly 10,000 of them through their exchanges and 150 toll stations.

From all appearances the Michigan (Bell) Telephone company made a failure in its efforts to crush the New State Telephone company, and finally sold out a controlling interest to the Erie Telegraph and Telephone company, but the reorganized company has made no advance toward regaining the confidence of the people of the state.

The New State Telephone company's largest exchanges are located at Jackson, Ann Arbor, Mount Clemens, Port Huron, Monroe, Ypsilanti, Pontiac, Howell, St. Clair, Lapeer, Rochester, Flushing and Marine City. The company has toll connections with Grand Rapids, Bay City, Saginaw, Lansing, Kalamazoo, Battle Creek and many other important cities of Michigan.

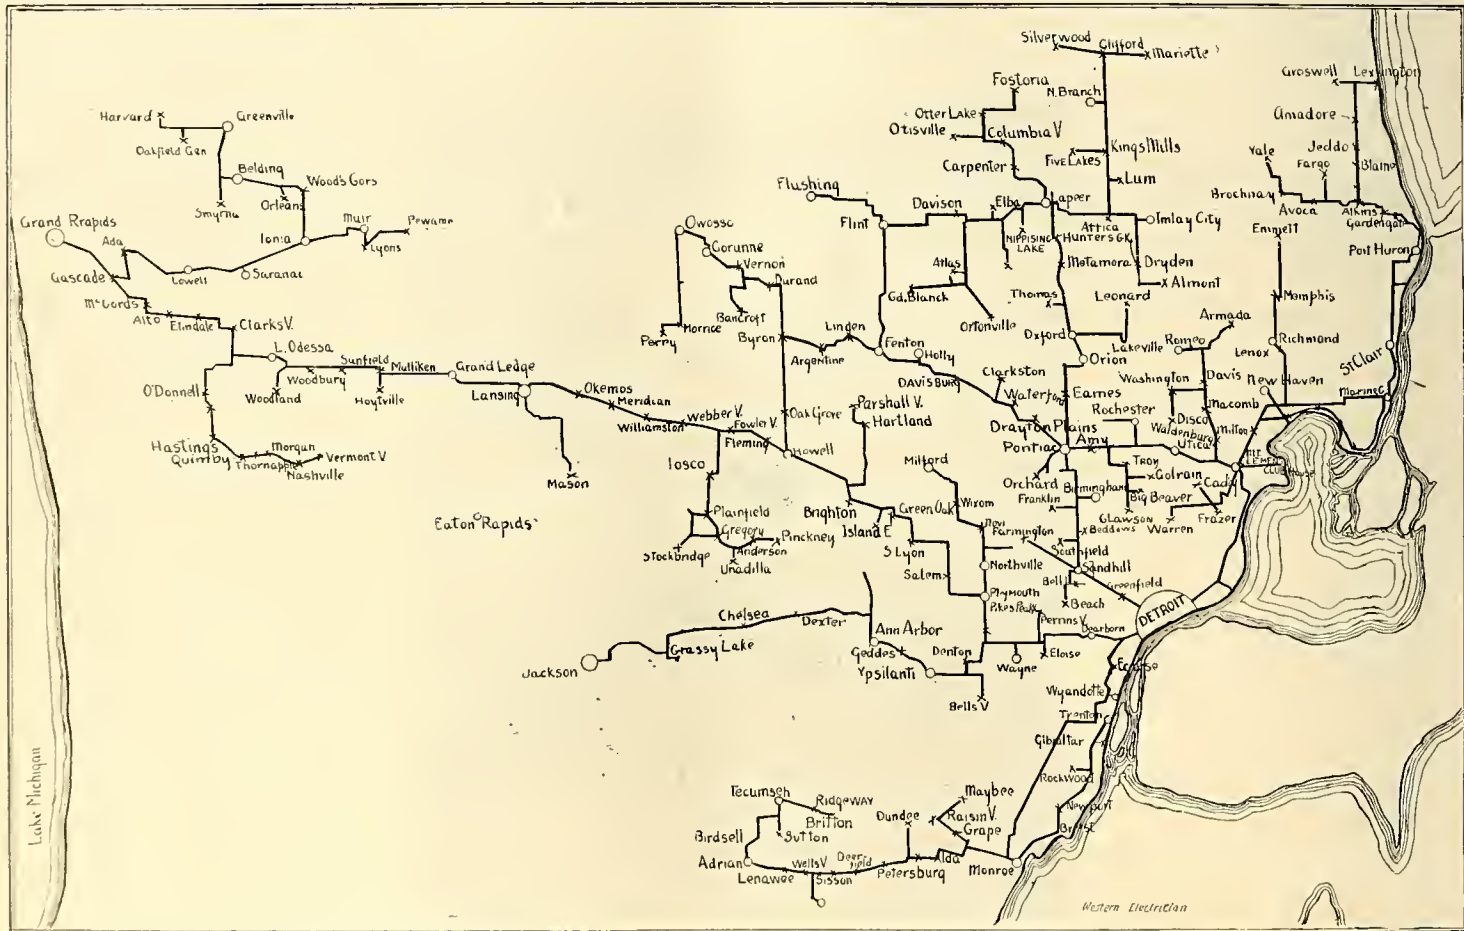

The company makes its own equipment, including long-distance telephones and the latest drop and signal multiple switchboards. Its long-distance toll lines are copper wires throughout, and the construction has been planned with a view of making the system a permanent investment.

Lower Rates for New York Telephones.

[From the New York Tribune.]

It can hardly be doubted that a great majority of the users of telephones believe that the charges in

while they aim to secure some relief for the public. They are not working in favor of an arbitrary-rate bill, nor do they wish to cut down the profits of the companies to an extent which will bring serious trouble upon the systems now in use; but this bill, while it fixes rates, provides a simple means of changing them to higher or lower figures if these rates are found on trial to be unjust to the companies or to the public. It is proposed that three state officers shall act as arbitrators, and that these arbitrators shall investigate the complaints of subscribers if prices are too high and the complaints of the companies if prices are too low. No investigation expenses are to be paid by the state. This plan requires that the companies shall have an opportunity to pay profits of 10 per cent. upon the actual investments in addition to the interest upon bonded indebtedness. Might it not be prudent and wise for the telephone companies to abandon opposition to this Marshall-Henry bill lest a worse thing should befall them? It is certain that no bill which seeks to confiscate property or to take away from the companies an equitable rate of profit can obtain the sanction of the Legislature and the governor. The Merchants and Manufacturers' Board of Trade, which has been supporting a bill much more radical and revolutionary than the Marshall-Henry bill, has announced that it is willing in the public interest to withdraw the measure which it has been supporting, lest the Legislature might decline to afford any relief to the public if legislation too sweeping and drastic were demanded. No convincing arguments have been presented by the companies for their hostility

INDEPENDENT TOLL-LINE SERVICE IN MICHIGAN.—MAP OF NEW STATE TELEPHONE COMPANY'S SYSTEM.

pany has its local stockholders to stand by it if a hard fight is made by the Bell company. Moreover, a great many farmers in the territory through which the toll lines extend are stockholders. The company is free of bonded indebtedness and is paying two per cent. quarterly dividends. In some cities the Bell company has been almost entirely superseded. Monroe, Mich., may be cited as an example. The New State Telephone company has 200 telephones working, while the Bell company has about a dozen, and these are not all paying subscribers.

The large Jackson exchange of this company is almost completed. This will greatly assist the income-earning capacity of the toll lines.

The company has recently completed arrangements with all independent telephone companies of Michigan to connect their lines, and is now furnishing toll service to the Central Telephone company of Kalamazoo and the Citizens' Telephone company of Grand Rapids. By connecting with these two companies, points in Indiana and Ohio are reached by New State Telephone company subscribers. The Valley Telephone company of Saginaw connects on the north. The company is constantly improving and extending its system.

At present the New State Telephone company has about 1,500 telephones working and over 2,500 miles of telephone lines, and the Detroit Telephone company, the parent company, has over 5,000 tele-

this city are excessive. It is a matter of common knowledge that the profits of the parent company, whose main offices are in Boston, have been great for many years, and have now reached totals that are actually prodigious. New Yorkers who pay telephone bills are convinced as a rule that the gains of the local organizations are handsome, and that the management ought to be willing now to grant reductions. The growth of the telephone business on and about Manhattan Island has been remarkable, and there is a general feeling that the companies ought to be satisfied with more moderate rates than those which they are now exacting. It is not only the regular rentals of telephones with which fault is found, but also the condition of things by which the renter of a telephone in the borough of Manhattan is compelled to pay an extra charge whenever he calls up the renter of a telephone in Brooklyn or in the boroughs of Richmond and Queens. No person deserving attention desires to deprive the owners of the telephone patents and the telephone properties of a proper return on the capital actually invested; but some measure of relief from the present telephone schedules ought to be adopted by the Legislature.

The Marshall-Henry bill, which has been introduced at Albany again this session, appears to be discreet and judicious, and its supporters declare that they intend to do no injustice to the companies,

to a rational adjustment of rates. No public-spirited person who has considered the subject with care can dispute the evident fact that the present rates are too high, and that the users of the telephone are entitled to reasonable relief.

Telephoned for the Minister.

[From the Cleveland Plain Dealer.]

A local clergyman was downtown one of the recent ultra-zero mornings, and, desiring to call upon a parishioner whose place of business is on Water street, he stepped into the office of another parishioner on the avenue near Erie street, with the intention of calling up the Water street man by telephone and finding out how long he would be in his office, the pastor not relishing the idea of the long walk in the piercing cold.

The avenue parishioner was not in. His office-boy had the big room all to himself.

"My lad," said the pastor, "I wish you would call up Mr. Dash, main 'steen-naught, and ask how long he will be in his office, and if he isn't there find out when he will be in. My fingers are so cold I don't think I could hold the receiver."

"Yes, sir," said the polite boy. "Who shall I say wants to know?"

"Rcv. Mr. Blank," replied the pastor, as he drew up a chair beside the steam radiator.

Pretty soon he heard the boy say:
 "Is this main 'steen-naught?"
 There was a brief silence. Then the boy went on:
 "Yes, yes, I've got 'em—Iullo! Is the boss in?—
 what's that?—Who's this talking? Why, it's the
 Rev. Mr. Blank. No, Blank—Blank, Blank, Blank—

FIG. 2. AMERICAN EQUIPMENT FOR BRITISH COLUMBIA EXCHANGE—CONSTRUCTION OF SWITCHBOARD.

What's the matter with you, Lizzie? This is the Rev. Mister Blank! Got it? Don't get funny, girlie. What do I want to know? Say, I asked you that half an hour ago. Is the old man in? Who is it talking? Well, I'll be jiggered! Now, take off your earmuffs, Mabel, an' do a little listenin' act. This is the Rev. Mister Blank! Oh, you've got it now,

have you, birdie? So kind of you—yes, yes, I'll forgive you this once. Now agitate your Cinderellas into the old man's office an' see if he's there. Yes, tell him the Rev. Mister Blank is at the 'phone an' wants to know if he's out. Don't be idlin' round when there's souls to save. Get a hustle on you."

At this point the pastor got so fidgety that he walked over to the telephone.

"Just hold on a minute, my boy," he beseechingly cried.

But the boy waved him aside.

"I'm getting him," he said.

Then he turned back to the telephone.

"Who's this?" he cried. "Who? Mr. Bunner? I don't want you—yes, this is the Rev. Mister Blank. Blank, Blank. Who's swearing? Don't get fresh, Bunny. Yes, Rev. Mister Blank. Yes, Reverend. Preacher, you know; be good—go to church—Friday evenin' prayer-meetin's. Got it? Yes, this is him. Is old Dash in? There, don't get gay. What's that? Won't be back for three months? You ain't kiddin'?" Well, that's all. Yes, it's quite enough. Funny Bunny. By-by."

And the boy slammed the receiver into its hooks. Then he turned to the perspiring clergyman and deferentially remarked:

"Mr. Dash has just stepped out, sir, an' won't be back for three months!"

After this the worthy pastor will endeavor, whenever possible, to do his own telephoning.

American Equipment for British Columbia Exchange.

It will be a source of considerable gratification to independent telephone interests to learn that the principal exchange in British Columbia has been equipped throughout with apparatus manufactured and installed by an independent telephone company of this country, especially in view of the fact that the present equipment is to replace the Bell system originally installed. The Victoria and Esquimalt Telephone company has thoroughly rebuilt its lines and exchange plant and has now a capacity of 1,000 numbers. The change in construction and apparatus has greatly improved the service and added materially to the popularity of the company.

An excellent view of the switchboard in the company's central exchange at Victoria, B. C., is presented in Fig. 1. This equipment is the standard express switchboard of the American Electric Telephone company of Chicago and has capacity for 1,000 connections. Fig. 2 shows the back of several sections of the board, and gives a fair idea of the construction and wiring system employed. The cross-connection board is illustrated in Fig. 3.

The construction of the switchboard is along the lines followed in the standard equipment of this type, and can be enlarged at will without requiring any change in the plans of the system further than that immediately needed for the new business. The entire plant is laid out with the view of securing a thoroughly flexible system, that can be increased from time to time as the demands upon it require.

The special features of this type of board may be summarized as follows: Each drop and jack is mounted in a separate case. The back of the board consists of a series of hardwood strips extending horizontally across the board, and each strip is of the same width as the height of the shell from top to bottom. There are 10 of these wood strips to each section, and each strip is made for the insertion

of to drops. Along the front of each wood strip are run four strips of german silver. Two of these represent the generator circuits and two the night-alarm circuits. Four german-silver springs are mounted on the back of each of the drop cases. These represent the generator and night-alarm terminals of the drop. Extending out from back of each drop shell are also two substantial machine screws. In inserting these screws through holes bored in the wood strips the drop is brought into its proper position in the switchboard. The machine screws running through the board are provided with

FIG. 3. AMERICAN EQUIPMENT FOR BRITISH COLUMBIA EXCHANGE.—CROSS-CONNECTION BOARD.

thumb-screws or nuts. When these nuts are tightened the drop is fastened securely in position in the frame, and at the same time connection is positively and reliably made between the german-silver bands or strips on the front of the wood strip on which the drop is mounted, and hence night-alarm and generator connections are made between drop and the strip circuits. Each 100-number section, whether equipped with full 100 drops or not, is wired for the full 100 lines, with operator's instruments mounted and all circuits run ready to connect the board to line terminals and be put into operation without inconvenience or delay.

FIG. 1. AMERICAN EQUIPMENT FOR BRITISH COLUMBIA EXCHANGE.—1,000 LINE EXPRESS SWITCHBOARD OF VICTORIA AND ESQUIMALT TELEPHONE COMPANY AT VICTORIA, B. C.

Central-office System of the Newark Telephone Company.

The central-office system recently built and installed by the Western Telephone Construction company of Chicago, Ill., for the Newark Telephone company at Newark, N. J., includes a main exchange, arranged for an ultimate capacity for 2,100 subscribers, and four sub-offices—at Belmont, with 300 capacity; Belleville, 200; Roseville, 200, and Harrison, 100.

Referring to the cuts, Fig. 1 is a view of the main exchange, in which 17 operators are engaged at their respective stations, including the chief and trunking operator. Fig. 2 shows a back view of the switchboard. It will be observed that sliding doors completely protect the drop cases, connecting rack and wiring against the entrance of dust or other interfering agencies. At the far end of the switchboard the relay cabinet is shown, and at the right a part of the distributing board. Fig. 3 presents a view of the test side of the 2,100-capacity distributing board and a side view of the power board at the right. A back view of the distributing board showing the arrester side is presented in Fig. 4. The underground cables are equipped with tubular ter-

3. Lamp-signal circuits, 20 volts direct or alternating current.

4. Subscriber's calling circuit, 75 volts alternating current.

The operator's transmitter circuits are supplied with current by two cells of storage batteries of 300 ampere-hours capacity, one cell being charged while the other is delivering current to the transmitters. The same batteries are used for charging the relay circuits.

The lamp-signal circuit is normally supplied with current by the secondary winding of a motor-generator whose primary is wound for 500 volts direct current. As the signal current must be supplied at all times, even while the motor-generator is cut off, a set of 10-40 ampere-hour storage batteries is kept in readiness for instant use. As a matter of fact, the storage batteries are usually cut in during the night and Sunday service.

The subscriber's calling (power generator) circuit is supplied from the 20-volt secondary winding of the motor-generator, and the current is raised to 75 volts by means of a static transformer. In case of a breakdown an auxiliary motor-generator may be cut in. This machine has a 110-volt direct-current primary and a 75-volt alternating-current secondary.

ators, transmitters and receivers. In responding to a call (announced by the exposure of an annunciator shutter) the operator inserts an answering plug into the spring-jack, thus restoring the shutter, and inquires as to the caller's needs. If this be a request for connection with a subscriber's line within the operator's direct reach, the connection is completed without any additional operation other than that of inserting the calling plug into the desired subscriber's line-jack and projecting a calling signal over the circuit. In case the request had been for a connection with a subscriber's line outside of the operator's reach, although terminating in the same office, the Western multiple-plug system is employed. If, however, the circuit is required to be extended to either of the sub-exchanges, the calling plug is inserted into a transfer-jack terminating in a regular annunciator drop and spring-jack on the trunk board (shown by Fig. 1), and then by means of visual signals the main operator informs the trunk operator which sub-office the circuit should be connected with. The trunk operator complies with the request by selecting a plug whose circuit is permanently extended to the desired sub-office and inserts it into the spring-jack of the trunk selected by the main operator. This completes the connection be-

FIG. 1. CENTRAL-OFFICE SYSTEM OF THE NEWARK TELEPHONE COMPANY.—OPERATING ROOM IN NEWARK EXCHANGE.

miral heads, as shown by Fig. 5. Fig. 6 shows the power board, the storage batteries being placed in a closet at the left.

The subscribers' stations are equipped with Western apparatus, consisting of granular carbon transmitters, long-distance induction coils, double-pole receivers and the usual magneto-electric signaling arrangements.

As mentioned before, the underground cables terminate in head, as shown in Fig. 5. The cable circuit are then extended to their respective arrester terminals (Fig. 4) by means of specially formed office cables laid in ducts under the center of the distributing board. From the arrester terminals the circuits are extended to the test side of the distributing board by means of twisted pairs of rubber-covered jumper wires threaded through the distributing frame in their proper order. The test jacks (Fig. 3) are connected to the switchboard line terminal by cable, as shown in Fig. 2.

Before describing the operation of the complete system, it is essential to understand the purpose and location of the power board equipment, which was designed particularly for this plant. After laying out the exchange system it was found necessary to supply the following currents for the purposes mentioned:

1. Operator's transmitter circuit, two volt direct current.
2. Relay circuit, 100 volt direct current.

The machine is connected in such a manner that the 75-volt current may be reduced to 20 volts for use on the lamp-signal circuits. This feature is of special value in case of a serious accident to the larger machine.

The two-volt transmitter battery and 20-volt signal battery are charged by a double dynamo whose shaft is coupled directly with that of the 500-volt motor-generator. Referring to Fig. 6, in which the machine to the left is the 500-volt motor-generator with the double dynamo somewhat to the right. At the extreme right the 110-volt motor-generator is placed. Immediately behind the machines is the polished slate switchboard, upon which numerous switches have been mounted, together with the voltmeter, ammeter, resistance lamps, transformer and the double dynamo field-regulating rheostat.

Returning to the switchboard equipment, it should be explained that each operator is required to attend to 100 subscribers' lines. The lines terminate in a combination spring-jack and annunciator drop, which are so placed in relation to each other that after a shutter has assumed its tripped or "incoming-call announcing" position, the operator's answering plug cannot enter the spring-jack without restoring the shutter to its normally hidden position. The operator's section is further supplied with the usual equipment of interconnecting cords, listening and ringing cams, hand-driven calling-current gener-

tween the sub and main-office operators and permits the latter to make a direct request upon the former for connection with the desired subscriber. After completing the conversation either subscriber, by sending a ring-off current over the line, actuates a clearing signal on the sub, trunk and main switchboards.

The installation is furnishing satisfactory service, and the equipment is pronounced by experts one of the most complete in the country.

Southern Telephone Association.

[From the Memphis correspondent of the WESTERN ELECTRICIAN.]

Managers of independent telephone exchange systems in Tennessee held a meeting at Memphis recently, at which an association was formed and a movement inaugurated for the purpose of making arrangements to hold conventions at some convenient place and at regular intervals of all persons in the South interested in the independent telephone business. At the meeting the Southern Telephone association was adopted as the name under which the organization would operate. James D. Randall of Memphis was elected president, C. W. Bolton of Pontotoc, Miss., secretary, and George W. Scheuing of Memphis, treasurer. The first formal convention will be held on July 5th, and telephone manufacturers will be invited to display their apparatus and participate in the meeting.

Independent Telephone Movement in Indiana.

By S. P. SHEERIN.

The development of the independent telephone business in Indiana within the last three years, and notably within the last 12 months, has been a most remarkable accomplishment.

The telephone business of the state, under exclusively Bell management, had been rather dwarfed and unsatisfactory. In 1883 the Legislature passed a law fixing the maximum price for telephones at

FIG. 2. CENTRAL OFFICE SYSTEM OF THE NEWARK TELEPHONE COMPANY.—BACK OF MAIN SWITCHBOARD.

\$3 per month. At that time the Central Union Telephone company, which is a Bell licensee, pulled out a dozen or more of the smaller exchanges in the state. When the company removed these exchanges, it took with it every vestige of good-will which it had previously enjoyed in the several localities. The management of the business in the remaining cities, while in the main in the hands of capable men, was so hampered by exacting conditions and red tape that the service was never popular, and was confined almost exclusively to people who could not well get along without telephones.

When the basic patents expired a few years ago, the active independent telephone manufacturers found a most inviting field in Indiana. Exchanges sprang up all over the state and grew to full vigor, like mining towns, in a few months. It is a singular thing that not one of the projectors of Indiana independent telephone exchanges realized how rapid the growth of the business was going to be. The result has been that a great many exchanges have had to be rebuilt entirely, and fitted up to a capacity, in many instances, five times greater than that first arranged for to meet the expectations of the promoters.

The Indiana independent telephone owners are not people who run away from a prospective fight. There is now not a large city in the state that has not either an independent telephone plant in active

FIG. 3. CENTRAL OFFICE SYSTEM OF THE NEWARK TELEPHONE COMPANY.—DISTRIBUTING BOARD, TEST SIDE.

operation in competition with the Central Union, or one in process of construction. The number of Central Union plants of the state, as given officially in a \$6,000,000 mortgage recently filed by that company, is 41, while the independent exchanges of the state number 147.

The building of independent plants was the forerunner of the construction of several thousand miles of independent telephone lines. Some of these are copper metallic of the very best construction and fully equal to the Bell and Central Union lines.

Others are iron metallic, fairly good lines—indeed, very good for purely local purposes—and the balance are grounded lines, which answer the purpose for short-distance work fairly well. It is proper to say that of these latter, however, 70 per cent. will be rebuilt with either copper or iron and made complete metallic circuits within the next year. They are not things of beauty to look upon, and perhaps not always the most satisfactory in operation, but they have been great educators of the people in the use and necessity of the telephone, and from that point alone have been worth all they cost and more, too. Then, too, the users of them have the satisfaction, which the owner of the log cabin felt, in the reflection that while he might be temporarily inconvenienced, the thing was all his own, and he could enjoy it without any man's interference. There are now over 4,000 miles of independent toll lines in the state.

Telephone movements, like revolutions, never go backward. No man or woman who has ever had a telephone is ever again entirely happy without one. This is the case in country districts as well as in crowded cities. There are in Indiana to-day, in farm-houses alone—by this I mean the houses of actual farmers, engaged in the cultivation of their own land—over 5,000 telephones, and the number is growing daily. In many places in this state co-operative lines, extending for 10 or 20 miles, have been built by farmers for the sole benefit of connection with one another and the village railway station. The thrifty farmer, at a nominal cost, can now walk into his comfortable sitting room, ring up his county town, and have his ear to the markets of the world at every hour of the day. If his machinery breaks down in the seeding or harvest field, he can order a duplicate of the broken part to be sent him on the next train without leaving his home. In case of sickness, he is in immediate touch with the doctor, and if the angel of death shall descend upon his home, he is in close and sympathetic communication with his minister. The boys and girls of the country find the telephone a great addition to the joys

FIG. 4. CENTRAL OFFICE SYSTEM OF THE NEWARK TELEPHONE COMPANY.—DISTRIBUTING BOARD, ARRESTER SIDE.

of life. The young woman who, having been dressed and waiting for three-quarters of an hour, begins to fear that she will be late for the opening of the dance, can learn at once whether her expected attendant, who lives four miles away, has yet driven from his home in her direction.

The telephone, to the Indiana farmer, is the sort of stock which he has satisfied himself, in his short experience, he can afford to improve at all necessary cost. Therefore, the replacement of rickety and indifferently constructed grounded lines by good substantially built metallic lines is only a matter of very short time, and is just as sure to come as the magnificent gravel roads of the state have succeeded the mud and corduroy roads of a few years ago; just as sure to come as the magnificent school-houses, which dot the state from one end to the other at intervals of a mile or two, followed the hewed log school-houses of the early settler, which were many miles apart.

The most notable development of the telephone in Indiana within the last year has been made in and about Indianapolis. The New Telephone company of Indianapolis, a purely local institution, broke ground for its exchange the latter part of last June, since which time it has put in 53 miles of conduit space in the central part of the city and has covered the remainder with the very best pole construction that it is possible to obtain at this time. In fact, the Indianapolis plant has attracted the attention of the entire country. The company bought property in the center of the city and erected its own building at a large cost, and has an exchange room which is said by experts to be a model.

The company started out to procure 2,000 five-year contracts as evidence that the people desired to support a competing telephone company. The 2,000 contracts were quickly obtained, and in a little while the number swelled to 3,000, and now upon the eve of opening the exchange the company is obliged to contract for an additional 500 section of switch-board. The plant provides for complete metallic circuits of copper throughout. The switchboard is a full multiple manufactured by the Kellogg Switchboard company of Chicago, and the cables are the work of the Standard Underground Cable company of Pittsburg. The switchboard is now upon the ground and is being wired up. The cable

is practically all installed, and the plant will be ready for operation by the first of April.

It may be well to remark here that the citizens of Indiana have solved for themselves the problem of the inconvenience of two telephones to their entire satisfaction. It has been the red-ribbon argument of the Bell people that two telephones are a nuisance; that when there are two exchanges, every subscriber has to have both telephones, thereby largely increasing the worry and expense; that the telephone is a natural monopoly, and therefore the company in possession ought not to be disturbed, etc.

There is not a city in Indiana having an inde-

FIG. 5. CENTRAL OFFICE SYSTEM OF THE NEWARK TELEPHONE COMPANY.—UNDERGROUND CABLE TERMINALS.

pendent plant that would retrace its steps and go back for good to the condition it was in before the independent plant was started. Competition has increased the value of the telephone to the individual user in every instance. It has induced better service, more courteous treatment and greater familiarity with the great advantages of the telephone. It has forever settled and put at rest any danger, come what may, of the telephone being the luxury of the favored few. The policy of the Bell people in the lifetime of their patents was to select the most favorable territory and sell their service at a price that only the people most highly favored by fortune could afford to pay. The independent people have proceeded upon the theory directly opposite. They have sought to cover the whole field, at prices within the reach of all the people, relying for their profits on the enlarged use of the telephone. How well they have succeeded every one of your readers can determine for himself by a comparison of the situation in his neighborhood to-day with that which existed four years ago. They have succeeded so well that the Bell people themselves are now making laudable efforts to follow their righteous example.

In addition to the work done by the New Telephone company, the work of the New Long-distance Telephone company, a corporation with a million dollars of capital, composed exclusively of Indiana people, with headquarters at Indianapolis, organized for the purpose of supplying the entire state with

FIG. 6. CENTRAL OFFICE SYSTEM OF THE NEWARK TELEPHONE COMPANY.—POWER BOARD EQUIPMENT.

long-distance service, connecting up the county seats of the state with Indianapolis and with each other, has been doing an immense amount of construction, and will be able to put the New Telephone company in connection with 70 state exchanges and innumerable toll-station points, immediately upon the completion of the plant in Indianapolis.

The New Long-distance company confines itself solely to the building of toll lines, and proceeds upon the theory that local exchanges succeed better when entirely under control of local people. The New Long-distance company makes long-time contracts with county-seat exchanges for toll-line busi-

ness, leaving to the county-seat exchanges the exclusive control of the toll business within the county, and takes to itself all the business going out of the county. The arrangement is highly satisfactory to both parties and makes a very strong combination. In addition to this contract with local exchanges, the Long-distance company has also contracted with all the independent metallic toll lines of the state

Central-energy System at Henderson, Ky.

The telephone exchange recently installed by the Henderson Telephone and Telegraph company at Henderson, Ky., is particularly interesting, because of the standing of the men interested, the character of the service required and the type of equipment employed.

The company was formed by H. K. Cole of Owensboro and J. W. Walker of Morganfield, Ky., who secured as the principal stockholders the most prominent business men in Henderson and Morganfield. The present officers of the company are: President, A. Waller; vice-president, O. W. Rash; secretary and treasurer, O. P. Dyer.

The constructing of the exchange and the selecting of the system was entrusted to Messrs. Cole and Walker, who have had considerable experience in the telephone business; they have large interests in other exchanges and are thoroughly familiar with the best class of construction and equipment.

FIG. 2. CENTRAL ENERGY SYSTEM AT HENDERSON, KY.—LIGHTNING-ARRESTER AND CROSS-CONNECTING BOARD.

for interchange of business along their respective lines, and has also contracted for business along several hundred miles of independent lines, not now metallic, upon condition that the same be made metallic within a given time.

The independent telephone companies of Indiana have a state organization known as the Indiana Mutual Telephone association, of which Mr. E. H. Andress of Lafayette is president and Mr. H. B. Gates, secretary of the New Telephone company of Indianapolis, is secretary. This organization has done magnificent work for the furtherance of the independent telephone movement, and may be relied upon at all times to give needed aid and advice to newcomers into the independent telephone field.

In a paper necessarily as brief as this it would be impossible to give full credit to the independent telephone movement of Indiana and the individual efforts of the bright men in the several cities of the state who are devoting their energies to the business. It may be said in a general way that the movement is in good hands and that our independent friends, the country over, may always expect without fear of disappointment to hear good reports from Indiana.

Weather Service.

[From the Washington correspondent of the WESTERN ELECTRICIAN.]

The sundry civil bill has been amended by Congress so as to include a provision for the purpose of

FIG. 3. CENTRAL ENERGY SYSTEM AT HENDERSON, KY.—RINGING AND BATTERY CHARGING EQUIPMENT.

The exchange was built as a permanent investment, and knowing that the enterprise would meet sharp competition from the old company, no expense was spared in putting in a high-class plant. In the line construction copper wire is employed and complete metallic circuits are used throughout, with paper-covered cable on the principal leads. The central-energy system manufactured by the Stromberg-Carlson Telephone Manufacturing company of Chicago was adopted.

Fig. 1 shows four sections of 100 connections each of the central-office switchboard, the original equipment installed to serve 400 subscribers, with which number the exchange started. The board, in appearance, is similar to that company's individual gen-

erately underneath the lightning-arrester board, from which they are run through the combination fuse and carbon lightning arrester to the switchboard.

Fig. 3 shows the ringing and battery-charging equipment. The motor-generator is run by the trolley line circuit and supplies the energy for the sub-

FIG. 4. CENTRAL ENERGY SYSTEM AT HENDERSON, KY.—BATTERY EQUIPMENT AT EXCHANGE.

scribers' ringing the central office and also the current used for charging the storage batteries. Power for operating the generator employed in calling subscribers from the central office is secured from the same source. At the top of the board is a 500-volt double-pole knife switch for throwing on the trolley current, also a switch for throwing on the electric-light circuit. The center of the board is occupied by the C. H. starting-box and the power-generator transformer, and also switchboard power-generator circuit switch and battery-charging switch.

Fig. 4 shows the subscribers and operators' telephone-talking battery in duplicate, also the subscribers' ringing battery for emergency use.

Fig. 5 shows the type of telephone used in central-energy exchanges.

With all batteries of the entire system placed at the central office, they are under the direct super-

FIG. 5. CENTRAL ENERGY SYSTEM AT HENDERSON, KY.—SUBSCRIBER'S EQUIPMENT.

vision of the manager of the exchange, and can be maintained at a very small expense. With the batteries and generators taken away from the subscriber's station, it leaves practically nothing requiring attention, and the subscribers are saved the annoyance of inspectors' visits, which are necessary in local-battery systems.

In this system the subscriber signals the central office by pressing the push-button at the lower end of the instrument, while the "disconnect" signal is automatically given by placing the receiver on the hook when through. In this way it is impossible to fail giving the "disconnect" signal.

Toll lines are now being constructed by the company for connecting with the interstate toll-line systems, and when completed direct connection can be made from any of the subscribers in this system, over any of the toll lines.

FIG. 1. CENTRAL ENERGY SYSTEM AT HENDERSON, KY.—400-LINE BOARD.

erator call-system boards, but is wired for the central energy system, and is provided with a hand generator for emergency use. The board has a trunking capacity for 1,000 subscribers.

Fig. 2 shows the lightning-arrester board and cross-connecting board. The leads enter the office in 10 100 pair cables and terminate in pot-heads immedi-

ately underneath the lightning-arrester board, from which they are run through the combination fuse and carbon lightning arrester to the switchboard.

Largest Independent Exchange in Iowa.

The largest independent telephone exchange in the state of Iowa, and one of the largest in the United States, is that of the Mutual Telephone company, which was established in January, 1897, upon the mutual or co-operative plan, with 800 stockholders. As an inducement to the public, the promoters of this company named a basis of rates so that the stockholders paid an annual rental of \$24 for their business telephones and \$18 for their residence telephones, while subscribers who were not stockholders paid an annual rental of \$36 for their business telephones and \$24 for the residence.

The company commenced operation in October, 1897, with 500 subscribers. After operating the ex-

FIG. 2. LARGEST INDEPENDENT EXCHANGE IN IOWA.—CHIEF OPERATOR'S DESK AT DES MOINES.

change upward of a year, it was discovered that the original plans upon which the installation had been made were not adapted to the situation, and the company was unable to increase as fast and as extensively as the demand required.

In the fall of 1898 the management thoroughly investigated the field of telephone equipment, and as a result of its investigation placed a contract with the Sterling Electric company of Chicago for a 1,200 drop metallic-circuit switchboard and complete exchange equipment, consisting of distributing board, cable terminals, toll boards and monitor's desk. On January 1st the installation was completed and the company was serving 1,200 stations, of which 800 were residence and 400 business telephones.

At the time of the organization of this exchange the Bell company was serving 735 patrons, but the old concern has been losing ground steadily, and now a large percentage of the telephones are fur-

The Mutual Telephone company is recognized as being one of the most prosperous and profitable enterprises in the city of Des Moines. The company has invested over \$100,000 in plant, and furnishes employment to 30 construction men and to 24 exchange operators. Since its organization, the company has built over 600 miles of toll line, and its

board of 1,200 drops, while Fig. 2 shows the chief operator's desk and monitor, and Fig. 3 is a view of the distributing board of 1,200 wires' capacity. Fig. 4 gives a view of the line equipment with the Sterling pole-top terminal in use. The entire equipment was built and installed by the Sterling Electric company of Chicago. The Mutual Telephone company of De

FIG. 1. LARGEST INDEPENDENT EXCHANGE IN IOWA.—1,200 LINE SWITCHBOARD NOW IN USE.

system is connected with over 300 of the leading towns in the state of Iowa. The growth of this company is so rapid and constant that before the close of this year it expects to be serving 3,000 patrons. It now has with the Sterling Electric company of Chicago an order for additional equipment, which will greatly increase the facilities and improve the service. The officers of the company are J. W. Hill, president; D. F. Witter, vice-pres-

Moines is living evidence of the possibilities of an independent telephone company when properly equipped and properly managed.

Independent System for Minneapolis.

A Minneapolis paper published an alleged prospectus of the J. C. Hubinger company, which proposes to establish telephone exchanges in Minneapolis

FIG. 3. LARGEST INDEPENDENT EXCHANGE IN IOWA.—DISTRIBUTING BOARD FOR 1,200 CONNECTIONS.

nished free of charge. Prior to the incorporation of the Mutual company the Bell company's rates ranged from \$36 to \$72 for residence and \$60 to \$72 for business houses. The rates now range from \$12 to \$36. The city administration in Des Moines, during the last year, has revoked the franchise of the Bell company and ordered it to remove its poles and wires from the street, as they were a nuisance and a menace to life and property. This order is now being bitterly contested in the courts of that city.

dent; H. E. Teachout, secretary, and A. C. Miller, treasurer. The company has secured as general manager Mr. Paul M. Krahnner, who has been closely identified with the telephone field for years. Mr. Krahnner resigned his position with the Chicago Telephone company to accept his present engagement at Des Moines. He has had wide experience and is acknowledged to be one of the most competent experts in the country.

The present equipment is illustrated herewith. In Fig. 1 is shown the Sterling Electric company's

FIG. 4. LARGEST INDEPENDENT EXCHANGE IN IOWA.—LINE EQUIPMENT WITH POLE-TOP TERMINALS.

and St. Paul. This company has secured a four-story building at 414-416 Third avenue south, Minneapolis, for its exchange. It adjoins the exchange of the Northwestern company. Switchboards of the Stromberg-Carlson pattern have already been ordered and are expected to be in place by April 1st. The building will be wired at once and the cables brought into the basement. Over \$100,000 will be spent in putting the offices and exchange in shape. The company expects to have 500 instruments in operation by April 15th and 1,200 by July.

the campaign by denouncing the political managers who foisted him on the public two years ago and then lacked the courage to repeat the dose. Possibly they realized that the public would not stand any more nonsense of that kind.

Permission to land a cable in Cuba has been sought by the Commercial Cable company, but as the Western Union claims exclusive privileges under grants from the United States and Spain, the subject has been referred to the law department, and the attorney-general will give an opinion. The fact that the government has decided not to grant any long-time franchises in Cuba under existing conditions is taken as an indication of its policy in all matters affecting the island.

The bill repealing the much-discussed "Allen law" has passed both houses of the Illinois Legislature by a practically unanimous vote, and has been signed by the governor.

The law related to street-railway companies, and authorized municipalities to extend the franchises of existing companies for 50 years, and also gave the companies of every city in the state the right to charge a fare of five cents for a period of 20 years. It aroused a storm of popular disapproval, the Chicago daily newspapers being particularly active in opposition to it; and in repealing it the state senators and representatives executed the will of the people.

Legislation affecting street-railway companies of other states is occupying considerable attention at this time. In Wisconsin particularly is this noticeable. Organized labor throughout that state is urging the passage at Madison of the bills of the Citizens' League to regulate the business of street-railway corporations. The Federated Trades' Council of Milwaukee has indorsed the measures and the State Federation of Labor will send a representative to Madison in behalf of both organizations to use vigorous efforts to secure the passage of the bills. The proposed bill provides that street railways shall keep open accounts with the state, so that their actual earnings may be apparent to everyone, and also empowering city councils to fix the rates of fare. A resolution favoring the measure was signed by 50 union-labor organizations.

In such a serious professional paper as the Lancet of London is published Dr. Julius Althaus' recommendation of electrical treatment to make old men, if not exactly young again, at least much younger in appearance, disposition and action. Dr. Althaus describes old age as a disease and believes in applying a current of electricity to the brain to improve the nutrition of the nerve cells. This sounds a good deal like the claims of the electric-hairbrush, electric-belt and electric-sole men, who have been denounced and derided for years by physicians and electrical engineers. But Dr. Althaus, whoever he may be, seems to promulgate his startling theory with the gravity of a sage. It is said that in some cases this treatment has made old men five or 10 years younger in a few weeks. Any physician can apply the treatment, but the doctor's readers are warned that it must be used with care. Says Dr. Althaus:

"It is notorious that electricity is frequently applied in the most careless and haphazard manner, and this explains why so many persons are skeptical concerning its curative effects. An application of the constant current to the brain during which not the slightest fault has been committed is in a certain sense an artistic performance, which requires not only knowledge, but also much practice and some talent, like a good musical performance. How often does one hear a sonata by Beethoven or a polonaise by Chopin actually murdered? The same applies to electrical treatment. A man who labors with love and care, and has the discrimination to select one of the methods described by me or several of them which may be particularly appropriate for a given case, will, in the nature of things, obtain better results than another whose heart is not in his work, who acts by mere routine, and who is devoid of the elements of an artistic disposition or true clinical instinct."

Still there are some who will remain unconvinced by the reasoning of this artist in electrical manipu-

lation. The proposition is much like Sir William Crookes' plan to enrich the wheat-fields of the earth with nitrogen taken from the atmosphere by electrical means—one is apt to cogitate upon it for some time before accepting it as a verity.

By failing to make provision for beginning the work of constructing the Pacific cable Congress has again seriously delayed that important public improvement. The failure of the bill providing for the necessary appropriation is attributed to Speaker Reed, whose hostility to the administration's policy on expansion has been shown in many ways. It is admitted that the administration keenly feels the defeat of this measure, and it is evident from published expressions of opinion that the business interests of the country do not relish the idea of the speaker venting his spite in such a manner. There was a general demand for the establishment of telegraphic communication between this country and its newly acquired possessions in the Pacific, and President McKinley sent a special message to Congress in which he pointed out the importance of providing for a cable, but Speaker Reed, who has antagonized everything which had any bearing on the policy of expansion decreed that a cable should not be constructed at this time, and he succeeded in stifling all legislation of this character.

As a result of this failure by Congress to make suitable provision for a cable it will be inconvenient to communicate with the Pacific possessions of this government, and as all correspondence will have to be carried on by mail it will take more than a month to send a communication from Washington to Hawaii and get a reply. Happily, existing conditions do not give any concern, but President McKinley would like to have had cable connection with the islands so as to shorten the time to Manila. He will have to wait until the convening of the Fifty-sixth Congress before that question will be again considered, and, in the meantime, the danger of a foreign government building a cable continues.

This number of the WESTERN ELECTRICIAN is devoted almost entirely to the independent telephone field. Marked advancement is everywhere apparent in this branch of the industry and its expansion during the last year has been on a scale far surpassing the most sanguine expectations of the gentlemen who have been engaged in its development. It is particularly noteworthy that the telephone business has attracted a much more influential class of investors in the last 12 months than those who engaged in the earlier struggles, and this has enabled the promoters of more ambitious schemes to invade the larger cities and enter actively into competition with the Bell interests in the strongholds of the old concern. The experience at Detroit has been repeated in many other places, notably St. Louis, and during the coming year Cleveland and Indianapolis will likewise be scenes of commercial warfare. By far the most important acquisition, however, has been the addition of Chicago to the list of cities which have granted franchises to anti-Bell companies.

In the present number it has been the aim of the WESTERN ELECTRICIAN to convey some idea of the magnitude of the independent movement, the advancement that has been made in the organization of exchange systems, the improvements and refinements that have been introduced in the apparatus and service of the independent companies and to introduce to all who are interested in this subject the gentlemen who have been most prominently engaged in bringing about the present advanced condition of the independent industry. The WESTERN ELECTRICIAN takes pleasure in presenting portraits of the leading independent telephone men of the country in the supplement which accompanies this number. The groups contain representatives of all branches of the telephone industry—inventors and manufacturers, dealers and salesmen, engineers and managers. They have all gained some prominence in their respective branches, and many of them are already known to readers of this journal.

The WESTERN ELECTRICIAN congratulates all engaged in this field upon the prosperity which they have enjoyed during the last year. For its part, it pledges the same earnest support to the independent telephone industry that it has freely accorded since the field was opened to competition.

It looks very much as if Sam Jones was going to lose his job. The "powers of darkness," as he describes the predominating influences in the Republican party, prevailed against him, and he failed to secure a re-nomination for mayor of Toledo. But Mayor Jones is not to be gotten rid of so easily. He will run on an independent ticket and enliven

Proposed Combination of Independent Manufacturing Companies.

The plans of the promoters of a combination or consolidation of independent telephone manufacturing companies have been published in the daily papers and discussed by the trade. The project was started in Chicago, but has not received the unqualified approval of the strongest western companies, and, at present, serious disagreements among those originally interested threaten the success of the movement. Representatives of the proposed "trust" are endeavoring to secure the co-operation of eastern manufacturers, but, according to reliable information from New York, Boston and Baltimore, the promoters have met with less encouragement than they anticipated.

One of the shrewdest men in the business, whose company will probably not join the trust, admitted that he regarded the formation of the trust as possibly the first step in the direction of transferring the independent factories to the Bell company. The stock of the consolidated companies will be listed and therefore easy of acquirement by the Bell interest. This feature of the situation is likely to appeal in the most emphatic manner to the independent exchange owner, and if he should take a decided stand with the object in view of not patronizing a concern that was soon to become the property of the Bell company, competing manufacturing concerns would undoubtedly soon appear in the field to supply his wants.

On the other hand, those manufacturers who favor the trust claim that some plan is necessary for improving the conditions now existing, as excessive competition is resulting in much needless expense.

We present the two sides of the case for the information of our many telephone readers.

Pioneer in Independent Long-distance Service.

In November, 1895, the Western Telephone and Telegraph company was organized, with George W. Beers of Fort Wayne, Ind., as president; C. H. Cory of Lima, Ohio, vice-president; D. J. Cable, secretary; W. H. Duffield, treasurer; and the intention of the incorporators being to connect a few of the independent telephone exchanges in and about Lima, Ohio, in which the incorporators themselves were interested.

The demand for such service, as reflected in the use of the lines, was so much greater than had been anticipated, that immediately the plan was enlarged so as to reach the Indiana exchanges in which Mr. Beers had become interested, as well as other exchanges in the immediate vicinity.

The authorized capital of the Western Telephone and Telegraph company having been fully absorbed, a reorganization was effected on August 18, 1897, under the name of the National Telephone and Telegraph company, with an authorized capital of \$1,000,000, with the same officers as those of the company which it succeeded.

The new organization, with that energy and push that characterize Mr. Beers' undertakings, has thoroughly covered the northwestern portion of Ohio and the northeastern portion of Indiana, giving the users of independent telephones a better service in that district than is furnished to the subscribers of the Central Union Telephone company by the Bell long-distance telephone system, because the National Telephone and Telegraph company's lines reach all the people in the small communities as well as in the towns and cities. The telephone is no longer a luxury in Indiana, enjoyed by the few, but has come to be a necessity employed by the masses in their every-day business and social relations; indeed, it has been said that one can telephone to points in that state where the United States mail does not go.

Together with the New Long-distance Telephone company of Indianapolis, whose lines are now being rapidly constructed in all directions from that city, the National Telephone and Telegraph company will reach all of the 127 independent telephone exchanges in Indiana. Arrangements have been made to connect at Toledo with the Ohio lines of the United States Telephone company, and connections have already been made at Sturgis, just beyond the Michigan line, with the great independent system of that state.

Thus are the citizens of three great states, using more than 50,000 telephones, put into every-day and easy communication with each other. The appreciation of those citizens now having access to these existing facilities has been manifested by a patronage which has compelled a duplication of most of the circuits in the system, and the managers believe that the increased use of the lines that will come with the inauguration of the greater system will call for additional circuits, for the erection of which plans are now being made.

Valley Telephone Company of Michigan.

From a point of connections per operator, or calls per subscriber, the Valley Telephone company, doing business in East Saginaw, West Saginaw, Bay City, West Bay City and Flint, Mich., claims to be in the lead. The construction and equipment of these plants were undertaken by the Sterling Electric company of Chicago. The work is of the highest

grade and enables the company to give a service superior to that of the Bell company. In view of this fact the public gives the Valley company the preference. Added to this is the advantage of a large and constantly increasing number of subscribers and the fact that a free-trunking service is furnished between the several exchanges. To meet the demands upon it the Valley company has placed an order with the Sterling Electric company of Chicago for special equipment that, when installed, will furnish such additional facilities as will enable it to meet the demands for some time to come. The Valley company believes in anticipating the wants of the public, and being a home institution, has the interests of its patrons at heart.

Telephone News from the Northwest.

[From the Minneapolis correspondence of the WESTERN ELECTRICIAN.]

The Northwestern Telephone Exchange company is securing a right-of-way for a toll line from Winnipeg Junction, Minn., to Red Lake Falls, Thief River Falls and St. Hilare.

The citizens of Mount Hope, Wash., are so anxious for telephone connection that they are setting poles and distributing them.

The council of Des Moines, Ia., finds it a hard problem to assess telephone and telegraph lines under the new law, requiring an entirely new system.

John Gallagher, the lineman who fell from a telephone pole in St. Paul, died of concussion of the brain.

The Inland Telephone company of Spokane, Wash., will erect a \$75,000 fireproof building there at once.

The Rushford Telephone company of Rushford, Minn., has placed a new switchboard in its office.

A local stock company in Ponda, Ia., has been granted a franchise for a telephone exchange, and it is expected to have the system in operation in 60 days.

The local telephone company at Hancock, Ia., is to be reorganized and made a joint stock affair.

The town of Pomeroy, Ia., will vote March 27th on granting a franchise to the Central Telephone company.

The telephone company at Sigourney, Ia., will extend a toll line to What Cheer, Ia., in the spring.

The town of Ida Grove, Ia., will vote March 27th on granting a franchise to the Iowa Telephone company.

The Home Telephone company of Fort Dodge, Ia., has placed another switchboard in place with 100 drops.

A new telephone company is projected at Nevada, Iowa.

Omer Smith of North English, Ia., has bought the Green Valley-Wellman telephone line from E. Hess.

Arrangements have been completed for the Perry Telephone company to connect its toll lines with Adair, Ia.

The Chamber of Commerce of St. Paul has passed resolutions favoring granting a franchise to the American Telephone and Telegraph company and favoring a law declaring telephone companies common carriers. It also voted to request the council to investigate the status of the Mississippi Valley Telephone company and ascertain whether it has not forfeited its franchise.

A bill has been introduced in the Minnesota House directing the state auditor to ascertain the total value of all properties belonging to telephone and other companies, and to levy an excise or license tax equal to the average rate of taxation.

Monroe, Ia., will vote March 27th on granting a telephone franchise to the Iowa Telephone company and also to the Central company.

A local telephone exchange is projected at Union, Iowa.

Ackley, Ia., has voted to grant the Iowa Telephone company a franchise.

George Merrill is figuring on a local telephone exchange for Verndale, Minn.

The Howard (S. D.) Telephone company has been incorporated, with \$2,000 capital stock.

The druggists of Minneapolis are considering an agreement to put in nickel-in-the-slot instruments. The company offers a rebate of 20 per cent. to them, and some figure that they would reduce their own bills materially by such an arrangement.

The City Council of St. Paul has demanded a more explicit statement from the Mississippi Valley Telephone company of its expenditures, in compliance with the terms of the charter of the company, which require that at least \$50,000 shall be expended in the city within six months.

George Vosbeck of Mankato, Minn., secured a verdict of \$3,500 for damages received by his son, Walter Vosbeck, from the property of the telephone company. The judgment is against the contractor who was constructing the system of the Mankato Telephone company.

The Pipestone (Minn.) Telephone company has secured new quarters for its central office, and will move into them soon.

The Luce-Vietch Telephone company at Galesville, Wis., has been sold to Perry Vietch. Mr. Luce retires.

The Ripon Telephone company of Ripon, Wis., will connect with the toll lines of the Little Wolf River Telephone company.

John Cochrane has bought all the stock of the

People's Telephone company in Waupun, Wis., and will hereafter be sole manager and proprietor.

A move is on foot to establish a telephone exchange at Aitkin, Minn.,

A local telephone company has been incorporated at Vinton, Ia., to be known as the Vinton Telephone company.

A long-distance telephone connection from M. d. forl, Wis., to Westboro, Wis., is projected.

The Wisconsin District Telephone and Telegraph company, which was granted a franchise in Superior, Wis., more than a year ago, will not abandon the project, but will build a long-distance line to Minneapolis. The mayor threatens to have the franchise abrogated, because it grants no rights or privileges to the city as compensation for the use of the streets.

The Chequamagon Telephone company of Ashland, Wis., announces that it will connect with Superior and Duluth as soon as independent telephone exchanges are established there.

The Story County Mutual Telephone company of Nevada, Ia., will undertake to establish an exchange in Nevada and toll lines over the county, to connect with the Boone and Marshalltown mutual companies.

The Northwestern Telephone Exchange company, in Minneapolis, gave a dinner at the Commercial Club, to the members of the canvassing department, as a reward for the excellent work the department has done. The local exchange now holds the record for the highest number of subscribers secured in any one month. For January the record of 425 was thought to be very good, but February exceeded it with 550. The company has tried the experiment during the winter of running a restaurant in its building to furnish food for its employees, and finds it very successful.

William Adams has bought a half interest in the Logan, Ia., telephone exchange.

Herman Moorck has secured sufficient subscribers at Aitkin, Minn., to assure the success of his proposed telephone exchange.

The Western Electric Telephone company has made a reduction in toll rates over its lines.

An electric-light wire fell across several telephone wires in Charles City, Ia., and burned out the telephones connected to them.

The Mutual Telephone company of Des Moines is working hard to get its instruments into the state-house. The Iowa Telephone company has 11 instruments there to the Mutual's one, and the latter thinks that as it forced the low rates and has as large a list of subscribers as the former, it is entitled to better patronage from the state.

Charter Oak and Prairie City, Ia., will vote on March 27th upon the proposition to grant the Iowa Telephone company franchises, and the Chariton and Newburn Telephone company's application for a franchise at Milo, Ia., will be determined the same day.

The Ottumwa Long-distance Telephone company of Ottumwa, Ia., has been granted a franchise by the council. The company has its system in, but takes this move as a precautionary measure. The city will vote on the franchise at the spring election.

At Winona, Minn., the Northwestern Telephone Exchange company is charged with placing poles without permission and doing considerable work without consulting the city engineer, as required by the ordinance. The city officials will look into the matter.

The new telephone exchange at North Branch, Minn., is about completed.

The Wisconsin Telephone company has made toll connection with Tomah, Wis.

Complaint is made at Detroit, Minn., that the Northwestern Telephone Exchange company is setting its poles in the country in reckless disregard to the rights of the public. It is charged that the poles are set in many instances in the public highway so as to require teams to turn out to avoid them.

The Lenora and Amherst Farmers' Mutual Telephone company has been organized near Lanesboro, Minn., to connect Soland, Amherst and Lenora with Lanesboro. Later the line may be extended to Canton, Newberg and Mabel.

F. H. Juergens and others have formed a partnership at Jordan, Minn., to build a telephone line to Lydia. The line is to be in operation by May 1st.

The telephone exchange at Rush City, Minn., is about completed. It will start with 26 connections.

Business men of Faulkton, S. D., have made arrangements to secure long-distance connection.

The Overland Telephone company's petition for a franchise at Melrose, Ia., will be voted on by the people of that town March 27th.

A number of improvements will be added to the telephone system at Wabasha, Minn., in the spring. Heavier and taller poles will be put in and other changes made.

The Hillsboro, Duane, Caledonia and Shelly Telephone company of Hillsboro, N. D., has made arrangements with the Northwestern Telephone Exchange company for a traffic exchange.

The Sauk Center (Minn.) Telephone company has been formed and will proceed to purchase and install an exchange at once.

The bill which has been pending before the Minnesota Legislature, providing for placing the telephone companies under the Railroad Commission, has been killed in committee.

The Dwelle Telephone company proposes a number of improvements to its system at Lake City, Minn., in the spring. Toll connections will be made with the Northwestern Telephone Exchange company.

Combined Police-signal and Telephone System.

The police-signal and telephone system recently installed in the central station of the Chicago Police Department by the Municipal Police Signal company of Chicago is said to be the only one in which the circuit apparatus is not used for signaling. The signaling equipment is used on regular metallic or common-return telephone wiring in connection with the telephone system. This saves the running of a separate circuit for the signaling in large cities, where it is impossible to operate a telephone system on a circuit line. The direct-line system also prevents confusion in indicating at central office, as no other number than the one from which the signal is given can be turned in.

If any line becomes broken it disables only the station to which it extends, and not a whole district, as in a circuit system.

Fig. 1 shows a board for 30 main lines for police

office lines call, the drop falls and closes the (local) circuit, starting the night-bell or buzzer, which continues until the shutter is restored. In this way, at the regular time for reporting by the patrolman, if there is a citizen's or patrolman's call for a wagon it makes separate and distinct indications on the switchboard; the wagon call can be answered at once, and need not be delayed until all the officers in the district have reported, as is necessary where circuit systems are employed.

In the lower part of this section is located a spring-

JACK CORRESPONDING WITH EACH LINE. On the table, in front of the indicating board, are shown a number of ringing and listening plugs provided with proper connecting conductor cord.

When a wagon call is given a ringing plug is inserted in the jack corresponding in number with the bell indicating, and the power-generator key, shown at the right of the plugs on the table, is pressed, or the hand generator is operated, which rings the bell in the patrol box and denotes that the call has been received. When a reporting signal is given, an answering plug is inserted in the proper jack and the call answered by telephone.

The plugs can also be used for connecting patrol boxes in the same district, or with any other district, through the trunk lines, or with any of the officers or other lines that may be connected with the police-telephone system.

In cities where independent exchanges are established the patrol-box telephone or other police-system line can be connected direct with any of the subscribers in the local exchange, or for long-distance work, if necessary.

This is especially desirable late at night, when public telephone offices are closed, and the patrolman detects anything unusual about a place of business and desires to call the owner regarding the matter.

At the left of the drops and jacks a galvanometer and strap keys used for testing lines, etc., are shown; also a switch for throwing off or on the night circuit.

The board is provided with two portable telephones

At the lower end of the box is the regular reporting generator, used by the patrolman when reporting or when telephone connection is desired. When operated, it throws the drop, but does not ring the bells at the board.

In the center of the box is placed a telephone receiver, transmitter, etc. The telephone apparatus is so arranged that the battery is supplied from the central office. This is a long-distance instrument, and can be used on any length of line.

The patrol station is also provided with a "recall" bell, which is placed at the top of the patrol booth, and is a special extension bell with compound magnets and large gongs. It is used for calling patrolmen to the box. With this system once well understood by the public, any person hearing the bell would

Fig. 1. Bell Complete.

Fig. 2. Armature.

HOLTZER-CABOT MAGNETO BELLS.

Fig. 3. Gearing.

at once inform the nearest patrolman, should the latter be too far away from the box to hear the call during the busy part of the day in streets where there is considerable traffic.

Where desired, the citizen's or wagon-call instrument can be used as a fire alarm, and the equipment used as a combined police, fire-alarm and telephone system. No batteries are required in the signaling system, and the central-energy telephone system is used, providing for the transmitter battery at the central office, leaving no batteries at the local stations to freeze or get out of order. This system requires no delicate apparatus in its operation. It is being introduced for use with park-police systems and large private institutions, as well as in municipal service.

Central Telephone and Electric Company's New Home.

Among the companies that have enjoyed uninterrupted prosperity since their formation the Central Telephone and Electric company of St. Louis occupies a conspicuous place. A view of a portion of the office and salesrooms in the new quarters is presented in the accompanying illustration. The company's new offices, salesrooms and factory at 909 Market street contain 8,500 feet of floor space. The company has been doing business some time, but with the increase in the equipment it was found desirable to make some changes. Accordingly it was incorporated January 16th with James S. Cuming as president and general manager, and it is now prepared to manufacture everything in the telephone line.

Holtzer-Cabot Magneto Bells.

In several important details the magneto bells manufactured by the Holtzer-Cabot Electric company of Boston differ from other types on the market. The magnets are held on by means of short bolts, which enter into projections in the field pieces. They can therefore be firmly secured without any danger of springing the fields. This construction admits of the generator being taken from the box without removing the hook, or even taking the magneto from the wall.

The generators are equipped with gears or chain and sprocket. The latter method of driving is very popular. The connections between the driving wheel and pinion are made adjustable, and a special hard-steel chain is used, which is guaranteed not to stretch or wear. The gears are finely cut, have an extra wide face, and are practically noiseless in operation.

FIG. 2. COMBINED POLICE-SIGNAL AND TELEPHONE SYSTEM.—PATROL BOX EQUIPMENT.

boxes, and one each for the chief of detectives, desk sergeant, captain and inspector, with necessary capacity for trunking lines to other stations and other offices. In the top section of the board are arranged the wagon-call indicators, consisting of a polarized bell, each with a small shutter made of thin sheet aluminum, held up by a catch over the bell-hammer pin.

Under the shutter, on the face of the board, is

FIG. 1. COMBINED POLICE-SIGNAL AND TELEPHONE SYSTEM.—30-LINE BOARD FOR POLICE SERVICE.

The number corresponding to the patrol box connected to this line. When a wagon call is given by a citizen or patrolman, the bell will ring and the bell-hammer pin release the light aluminum shutter, which will fall and show the number of the box from which a call is made. A wagon can be dispatched at once without any farther notification.

In the top of the lower center section are the patrolman's regular supporting signals. These consist of drops with shutters, the same as used on telephone switchboards, and provided with a night circuit. On the inside of the shutter is marked the location of the station with which it is connected. If a regular reporting signal is given from any of the patrol boxes, or if any of the other district trunking or

for attendant's use. These instruments are provided with a plug and connected with the board at a spring-jack at the bottom of the jack-plate.

The patrol box is shown in Fig. 2. At the upper end, on the outside of the box, will be seen a crank, which is connected with a generator in the inside. This is for a citizen's call, or when a patrolman has made an arrest and calls for a wagon. When the generator is operated it rings the polarized bell in the office.

At the upper end of the box, inside of the door, is a polarized bell, mounted on a heavily japanned iron box, which is the "answer-back" bell, operated from the central office to denote that the wagon call is being answered.

The flexible method by which the pinion is attached to the shaft assures a steady and uniform movement of the armature while passing through the varying magnetic field. The appearance of the completed bell is shown in Fig. 1, while Fig. 2 represents the generator and Fig. 3 the method of gearing.

Kusel Long-line Switchboard.

The cut shows the new, compact and neatly designed long-line switchboard recently put on the

KUSEL LONG-LINE SWITCHBOARD.

market by the D. A. Kusel Telephone and Electric Manufacturing company of St. Louis. This switchboard possesses many valuable improvements and is thoroughly reliable. It is simple, positive and quick, and, like all instruments manufactured by this company, is practical and perfect in mechanism. This is only one of the many improvements in telephony

shows a lever switchboard for connecting the several divisions of toll lines. It is also used in several stations that have from three to 10 private telephones, as there is nothing to get out of order. It is arranged so that the extension bells are between the board and ground, and when the telephones are in use the extension bells are cut out.

Ericsson Breastplate Transmitter with Head-gear Receiver.

The arrangement illustrated herewith will be found convenient for busy central-station work, where it is desirable for the operator to have both hands free. The key for the primary circuit is placed beneath the transmitter, and by moving the small arm to either side two positions and different modes of connections are obtained. In one the key has to be depressed to make the primary circuit, and in the

ERICSSON BREASTPLATE TRANSMITTER WITH HEAD-GEAR RECEIVER.

other the key is kept down, thus securing a constant connection and saving the battery. When the operator is not too busy, she releases the key and only keeps it down while speaking.

The plate, transmitter and receiver are all made of aluminum, which somewhat reduces the weight.

The transmitter can be turned and the mouth-piece adjusted to any suitable distance. The mouth-piece is removable. Where the operators are very busy the primary key is replaced by a spring arranged so that the current is connected when the mouthpiece is in the ordinary speaking position, but disconnected when the transmitter is turned back.

furnished with automatic self-registering attachment, especially designed for this purpose.

Mianus "98" Telephone.

The accompanying illustration shows a telephone subscriber's instrument that is now being exploited most energetically by the Mianus Electric company of Mianus, Conn.

This is a strictly high-class telephone. The outfit is provided with the "98" transmitter two-cell battery box. Its size at the bottom is 13 inches by 31 inches, complete with 10,000-ohm bell receiver and

FIG. 1. AMERICAN COMPANY'S SPECIALTIES.—NEW TYPE OF RECEIVER.

cord, as shown in cut, with an oak or walnut finish. The Mianus Electric company's factory is running full blast, as business is excellent.

American Company's Specialties.

The American Electric Telephone company has several attractive novelties which it is introducing to the attention of independent telephone managers.

Chief among these is the handsome receiver which is illustrated in Fig. 1. The cut shows the instrument complete and the component parts when it is dismantled. It is a graceful device and is handsomely finished and highly polished, presenting a very attractive appearance. By removing the cap which is screwed on the top, the shell may be removed for examination, adjustment or repair, all the working parts being secured so as to form practically one piece.

Another attractive novelty is the "kitchen telephone." This is the Burns one-way telephone and is particularly handy for domestic service, permitting a housekeeper to call up the gro-

LEVER SWITCHBOARD FOR TOLL LINES.

made in the last year by the company, which manufactures only high-grade instruments.

Lever Switchboard for Toll Lines.

The Western Illinois Telephone company of Augusta, Ill., has exchanges at Macomb, Rushville and Carthage and operates 700 miles of toll lines, con-

KEYSTONE CABINET SET.

necting the principal towns in Adams, Hancock, Brown, Schuyler, McDonough and Fulton counties. The company's lines cross the Illinois River at Beardstown and the Mississippi River at Warsaw, submarine cables being used. It has toll stations in 59 towns and furnishes connection through other lines with 21 additional points.

The peculiar character of the service has created a demand for a special switchboard, which has been met by the equipment herewith illustrated. The cut

MIANUS "98" TELEPHONE.

The frame is thus completely insulated and does not, as in the other, serve as conductor.

The Ericsson Telephone company of 20 Warren street, New York, reports that this class of equipment has proved highly satisfactory. The growth of the business is gratifying, and the demand for these high-class goods is encouraging, because it shows that the people appreciate goods of genuine merit, and are not backward in adopting such goods when they find by actual experience their real worth.

Keystone Cabinet Set.

A special equipment for office and pay-station service is offered by the Keystone Electric Telephone company of Pittsburg in the form of an attractive cabinet set, illustrated in the accompanying cut. This set is furnished with a complete equipment of the Keystone company's high-grade apparatus, and the desk is attractively finished and durably constructed. When desired for pay stations this set is

FIG. 2.—AMERICAN COMPANY'S SPECIALTIES —IMPROVED BELL-TYPE SWITCH BOARD.

cer, butcher or other trader, but not affording facilities for receiving calls from other subscribers. These instruments are compactly made and contain a compartment back of the transmitting mechanism for holding a couple of cells of dry battery. One-way telephones have been very generally adopted in San Francisco, where they received the name of "kitchen telephones." They are also being introduced into Grand Rapids on an extensive scale by the local independent company operating in that city, which has placed an order for 1,000 instruments with the American company.

Probably the most important addition to the Amer-

ican company's line of equipment is the new metallic switchboard, which is illustrated in Fig. 2. This board contains all the desirable features of the Bell type, it is declared, and many additional advantages are included. The drop is of the well-known tubular type, and a soft-iron tube incloses the coil, connections for which are made by means of two insulated pins passing through the removable back strap, enabling a defective or injured coil to be removed without disturbing the adjustment of drop or shutter. The armature lever is short, reducing the weight or friction on the shutter to a minimum. The drops are arranged in rows of 10, with a restoring rod for each row, and mounted horizontally on metal strips. Only as many banks of drops need be installed as the service requires. Below the drops the jacks are located in rows corresponding to the shutters. The plugs and combined listening and ringing keys are mounted in the usual manner on a shelf, which is covered with heavy leather to prevent noise and reduce wear on plug handles. Below the subscriber's jacks a blank panel is provided for adding trunking facilities, should the increase in service demand it. Space for clearing-out drops is also provided, and the usual plug test for cord circuits is placed in the center of the board.

Eureka Equipment.

The Eureka Electric company of Chicago has already found its quarters too small and has just

FIG. 1. EUREKA EQUIPMENT.

taken the adjoining building, which will give to this company the largest floor space on the ground floor of any telephone company in the world. This company, while one of the youngest in the field, is already securing its share of the telephone business. It is making a specialty of a new high-grade magneto bell (Fig. 1), for which claims of superior construction are made. The switch is self-contained and the magneto-generator is of heavy tungsten steel, with ringers of the well-known bell pattern. It is full-nickel and furnished with platinum contacts when desired. The company's transmitters are of the solid-back type and are powerful and efficient. The receivers are double-pole, and the construction work throughout is of a high grade. The switchboard of this company, known as the Eureka metallic express (Fig. 2), is giving satisfaction wherever used and is in great demand. The company is placing upon the market a new intercommunicating system, known as the Eureka auto-inter system, which does not require any plugging or lever switches. By simply pushing the button on the station desired connection is secured, and it is impossible to leave one station cut in upon another, as the act of placing the receiver upon the hook cuts out the station automatically.

The management of the company is in the hands of Messrs. Kusel and Stein. The company is represented upon the road by Messrs. Kusel, Platt, Miller and Wood. It is comfortably located at 157 and 159 South Canal street, Chicago, where it has sales-rooms and offices, in which switchboards, cross-connecting boards, cable heads and telephones are displayed. The company also furnishes catalogues on application, and pay-station signs are distributed among exchange managers.

NEW COMPANIES.

The Constableville and West Leyden Telephone company of West Leyden, Lewis County, N. Y., has been incorporated to operate a telephone system connecting Rome, Martinsburg, Houseville, Constableville, Mohawk Hill, West Leyden, West Branch, Boonville and Highmarket. The capital is \$3,000, and the directors are Benedict Cantier, S. C. Capron and J. Capron of Leyden, Frederick Myers and Elizabeth Myers of West Leyden, and J. J. Dourner of Lewis.

The Kurtz National Telephone company has been incorporated for \$20,000 at Belleville, Ill. The company is named after its president, W. J. Kurtz, and will use his new instrument and tower system. The Hon. W. De Bolt of St. Louis is secretary and treasurer; Victor H. Adams, electrician for the L. M. Purney Manufacturing company, will be vice-president. These officers, together with L. M. Purney and Joseph M. Duffy, constitute the directory. Over 200 five-year contracts have been secured at Belleville for service, and a model exchange with St. Louis connection will be built.

Williams Electric Company's Transmitter and Receiver.

Figs. 1 and 2 illustrate respectively a sectional elevation and a plan view, with the diaphragm removed, of the new Williams solid-back microphone. The patents covering this microphone are owned and controlled by the Williams Electric company of Cleveland, which has the exclusive right to manufacture and sell these instruments in the United States and Canada.

It is claimed for these microphones by those who

FIGS. 3 AND 4. WILLIAMS ELECTRIC COMPANY'S DOUBLE-POLE RECEIVER.

have used them that they are not only the most sensitive, but also the most powerful instruments that have ever been used in the independent telephone field. These instruments talk well with one cell of battery, but at the same time they will stand without sputtering as many as three bichromate batteries for heavy long-distance work.

Referring to Fig. 1, *b* is the carbon back-plate, which is ground around the periphery so as to make it perfectly cylindrical and of a uniform diameter. This carbon back-plate is then fitted into a brass receptacle *r*. This brass receptacle is itself mounted upon a disk *f* and *f'*, through which the adjusting screw *a* passes that butts against a brass disk *m*. Upon turning the adjusting screw *a*, the carbon back-plate is carried toward the diaphragm, and the face of it is at the same time maintained perfectly horizontal and in exact alignment with the face of the diaphragm. When the proper or desired amount of adjustment is reached the carbon back-plate *b* is locked in position by means of a double split clamp *c*. This forces the carbon into intimate contact with the brass receptacle *r*, and the brass disk *m*, which is between the carbon plate and the adjusting screw *a*, forces additional contact surface. This method of gripping and retaining the carbon plate gives an electrical contact of a very low possible resistance.

The diaphragm *d*, which is of either carbon or

FIGS. 1 AND 2. WILLIAMS ELECTRIC COMPANY'S TRANSMITTER.

gold-plated ferotype, is clamped and held rigidly and perfectly in its position between the cap-plate of the microphone and the metal receptacle by four machine screws, thus affording a very perfect electrical contact between the diaphragm and the other metal parts of the transmitter.

The granule-retaining ring *p* is made especially for the company from silk fibers, and while it is sufficiently rigid to maintain the carbon granules in their proper position, it is still extremely flexible and resilient, so as not to impede the amplitude of the vibrations of the diaphragm. This in a large measure accounts for the volume of sound as well as the sensitiveness of this instrument. The carbon

granules are made by a new and secret process, which makes them extremely hard and yet at the same time very light. It will be noticed by referring to the drawings that the diaphragm is situated very closely to the back-plate, so that there is scarcely any room for carbon granules between the points of the serrations in the carbon back-plate and the diaphragm. This leaves the support of the carbon granules almost entirely to the back-plate itself, the diaphragm not having the weight of the granules directly against it. With this arrangement it is impossible for the granules to wedge or pack between the diaphragm and the back-plate and thus deaden the transmitter.

Figs. 3 and 4 are exterior and interior views of the new Williams double-pole receiver, the latter showing the horseshoe magnet, which is composed of the very highest grade of magnet steel, and

FIG. 2. EUREKA EQUIPMENT.

is of a semi-circular cross-section, so as to fit snugly into the receiver shell and use all of the available space in the shell. The bobbins for this receiver are supported in a brass disk, which in turn is supported by three screws which thread into the hard-rubber receiver shell near the diaphragm end. The horseshoe magnet is supported at its neutral axis or the binding-post end of the receiver, and it straddles or grips the bobbin cores, imparting to them its magnetism. The permanent horseshoe magnet is so powerful that it will lift six pounds of iron while its own weight is but 4 1/2 ounces. The weight of this receiver complete is 12 1/2 ounces.

The binding posts of this receiver, as will be seen from Fig. 3 are novel in construction, in fact being the only spring-lock binding post that has ever been used on a telephone receiver. This form of binding post is said to be rapidly replacing the old style lock-

nut binding post, as a loose contact is simply out of the question, there being a continuous spring tension exerted against the receiver-cord tip at all times.

The Williams Electric company of Cleveland, Ohio, was incorporated April 12, 1898, and began the manufacture of magneto bells three months later. The demand for magneto bells of this company's make became so great that it had to enlarge its quarters and place additional machinery. On the first of this year the company began the manufacture of double-pole receivers and long-distance telephone transmitters. It is now manufacturing everything that enters into the complete equipment of the subscriber's end of a telephone exchange.

New Automatic Lightning Arrester.

The illustrations represent a practical and ingenious lightning arrester, or rather an abnormal current arrester, guaranteed to take care of all abnormal currents of high or low tension on telephone circuits. The principal features of this device are stated to be these: It is purely automatic in its operations, requiring no attention whatever after being installed; there are no fuses to burn out to interrupt the service, and there is practically no resistance in the magnets on the talking circuit.

The operation of the device is as follows: The

FIG. 2. NEW AUTOMATIC LIGHTNING ARRESTER.

protector stands in its normal position only so long as the ordinary working currents are on the line. In this position all currents pass through the electromagnets, which are made very sensitive without interposing much resistance on the line (from 1 to 5 ohms only). If for any reason the line receives an overcharge, such as lightning or through accidental contact with trolley wires or electric conductors, the arms are instantly drawn in, shunting the current around the magnets, making direct connection to ground. The abnormal currents will take the path of least resistance, passing to the ground, leaving the telephone, switchboard or other instrument connected with the magnets unharmed. As soon as the line is relieved of the overcharge the moving parts automatically resume their normal position without the necessity of adjustment or repairs.

During the entire year's trial at the exchanges and on the toll lines of the Kent and Ravenna system, there were no cases of lightning or trolley crosses too severe for the arrester to take care of perfectly.

This automatic lightning arrester (shown in Fig. 1) is made for either grounded or metallic circuits, for use at the telephone instrument or put up in sections for switchboards (Fig. 2), requiring floor space much less than required by the ordinary fuse board. The metal parts are nicked, and, together with the magnets, mounted upon polished rubber, black fiber or porcelain base. As now constructed the contacts to ground are carbon, readily taking care of sneak currents as well as those of greater volume. This arrester is manufactured by the Butler-Taylor company at Ravenna, Ohio.

Lundquist Automatic Telephone System.

There has been inquiry for years for an effective automatic-telephone system, the advantages of which are obvious. Mr. F. A. Lundquist, the superintendent of the National Automatic Telephone company of Chicago, is the inventor of the apparatus herewith illustrated, and he claims that his company has the only practical automatic telephone system in existence. The patents are owned and controlled by the

FIGS. 1 AND 2. LUNDQUIST AUTOMATIC TELEPHONE SYSTEM.

company mentioned, which manufactures and sells the instruments direct to local companies or communities.

It is said that by this system a subscriber having an automatic telephone can almost instantly connect himself with any other subscriber without the assistance of anyone, and any number of conversations can be carried on without interfering with one an-

other. The switchboard (Fig. 1) is very simple in construction, and therefore durable. There is not a point or coil that will not, it is claimed, carry fully 20 times the amount of current of an ordinary drop board, making possible the use of one or 1 1/2 or even two-ampere fuses. The working parts of the automatic board are substantial, and will not get out of adjustment easily. It would seem that there necessarily would be more complication in an automatic switchboard than in a manual board, but the company asserts that this is not the case. Many of the exchanges using the automatic board have men in charge who are inexperienced in telephones and switchboards. Still all of these exchanges are said to be giving entire satisfaction to the users. It is also claimed that the automatic system gives perfect and economical toll-line service. A great advantage is that the service is the same in small exchanges as in large ones, and the service is the same at night as during the day. The only difference in expense between installing an automatic system and any other system is the first cost of instruments.

It is asserted that the owners of automatic exchanges can furnish patrons with cheaper service than those who use any other kind, and still the profit on the investment is greater by at least 20 per cent. Another point emphasized is that an exchange can be extended at any time without any extra cost

FIG. 1. NEW AUTOMATIC LIGHTNING ARRESTER.

other than the cost of the new telephones ordered. Fig. 2 shows the Lundquist telephone. Some 30 exchanges are now using the National automatic system, it is said. The first system was installed in Sterling, Kan., in April, 1897, and is said to be giving perfect service.

The National Automatic Telephone company also manufactures an interior-telephone system which is wholly automatic.

Telephone Legislation in Delaware.

Representative Donahue has introduced a bill in the Delaware Legislature which provides that all per-

sons, companies or corporations engaged in furnishing telephone service shall be permitted to make three classes of subscribers, and thereby charge one rate for the use of telephones in hotels, another for places of business and a lower rate for private residences, but the charges for the services to the three classes named shall always conform to the provisions of the present regulations.

New Apparatus of the Western Telephone Construction Company.

The Western Telephone Construction company, Chicago, is busily engaged in meeting the great demand for its newest type of "Keelyn A" telephones. The new telephone is a remarkably complete piece of mechanical and electrical apparatus. The magneto-generators are equipped with the best material obtainable. The pole-pieces and armature are made of a special grade of iron prepared exclusively for the use of the Western Telephone Construction com-

FIGS. 1 AND 2. NEW APPARATUS OF THE WESTERN TELEPHONE CONSTRUCTION COMPANY.

pany. In addition to using a superior grade of material, the several parts have been designed with a view toward meeting the most exacting demands of telephone engineers. The permanent magnets are made from the best magnet steel thoroughly aged after magnetization. This aging process was adopted by the company after many expensive experiments, and it destroys every chance of building up a compound permanent magnet with anything but the highest grade of material. Another point for careful consideration is the magnet cores used in building up the magneto-bell magnet system, which consist of the finest Norway iron drawn to the proper thickness. The generator armature, ringer magnets and induction coils are wound with the best grade of copper wire carefully insulated with silk.

Another improvement has been made in the automatic hook switch (Fig. 2), a long lever taking the place of the old-style, short-lever receiver-supporting prongs. The main springs, however, with their platinum contact points, have been retained, not being susceptible of further improvements. The telephone is equipped with the well-known Keelyn receiver, which, it may be mentioned, is the only one of its kind having no exposed metallic contacts, thus in-

FIGS. 3 AND 4. NEW APPARATUS OF THE WESTERN TELEPHONE CONSTRUCTION COMPANY.

sure complete immunity from dangerous accidental electric shocks.

Another invention of merit is the new "Keelyn A" transmitter. This transmitter is not only a solid back but a solid front as well, which is a feature not found in other types, adding, no doubt, a great deal toward making the "Keelyn A" telephone one of the most elegant, efficient and desirable pieces of apparatus on the market.

Figs. 3 and 4 show respectively a front view and an open back view of the Western express switchboard. The Western Telephone Construction company desires to make the announcement that the Western express switchboard has been meeting with a success unparalleled by any switchboard ever produced, both in efficiency and unsolicited praise from the independent telephone engineers, and justly so, it appears, for wherever this apparatus is placed on a

competitive test the company asserts that it rarely fails to "win out."

The cabinet work is of the best grade quartered oak. It is filled, rubbed and varnished before any apparatus is allowed to be installed, thus insuring a perfect and lasting finish. The back part of the switchboard is arranged with a pair of paneled interlocking doors, which protect the working parts against the entrance of dust and also the tampering tendencies of inquisitive operators or visitors. The

HOLYOKE SWITCHBOARD.

keeping the manufacturing department constantly "on the jump," so to speak, in order to keep pace with the ever-increasing demand.

Holyoke Switchboard.

The switchboard made by Holyoke & Holyoke of Chicago is in use in the island of Jamaica, Alaska, Mexico, Canada and nearly every state in the Union.

The drop is constructed on mechanical lines whereby through leverage the power is greatly increased. The ringing and listening cams are of new design. The board is well made of the best material with hard-rubber front and German-silver springs. It is quickly operated and gives general satisfaction.

The factory is at Clinton and Van Buren streets, where, with new machinery and increased force, the firm is prepared to fill all orders promptly. They also make a specialty of magnets, induction coils and special coils, and are equipped with dies for making them in variety.

Jones' Special Telephone Set.

The accompanying cut illustrates a new telephone set now being pushed by J. Jones & Son, dealers in supplies, at 640 Cortlandt street, New York. The set is called the "new standard \$5.00 set," and its simplicity and other excellent qualities make it an instrument of great desirability, especially for private-line service. Dr. Emile Hotzen took two of these telephones and fittings to Germany, and he recently stated in the presence of a representative of the WESTERN ELECTRICIAN that they were now installed on a three-mile iron-wire line from a farm to a village in Germany, and were giving excellent service. Such foreign appreciation, in a country, too, noted for its fine mechanical and electrical skill, speaks well for the workmanship of the Jones telephone set.

William Roche.

William Roche, the inventor of the New Standard dry battery, is receiving flattering orders from the United States navy and Europe for his cells,

WILLIAM ROCHE.

and some of the brightest managers of independent telephone stations have long since become aware of their durability and quality. The Standard Telephone and Electric company of Madison, Wis., is handling most of the western business for this cell, carries a full line in stock and fills all orders promptly. Owing to the extraordinary increase in price of most of the materials used, Mr. Roche has been compelled to advance his price somewhat, but assures his patrons that when materials come back to old lines of cost he will give them the full benefit of it. Absolute reliance can be placed in these cells, it is said, for telephone, electro-medical and cantry work, and in fact for all work that a regular open-circuit cell will do.

Schmidt & Bruckner Novelties.

The Schmidt & Bruckner Electrical company of New York is introducing several novelties which are attracting particular attention among western buyers. Prominent among these is an adjustable telephone arm for which no connection cord whatever is required. Two strong steel rods complete the circuit to the base connections through the side flanges at the socket. The No. 100 desk telephone has an automatic hook-switching device that will stand rough usage. The company's new combination microtelephone and stand has the switching connection in the base of the stand, like the regular desk type. There is no clip on the combination microtelephone to press in order to throw the battery on the transmitter. As the microtelephone is laid across the forks it pushes down a long hard-rubber button projecting from the upright tube, and thus operates the switch in the base.

Lamber Schmidt and Frederick C. Bruckner, who control this company, learned the art through many years of practical experience with the Western Electric, Bell and independent telephone manufacturing and construction companies. The company manufactures complete exchange telephone apparatus, as well as several types of automatic intercommunicating and private-line sets, transmitters, receivers and switchboard parts.

THE TELEPHONE TRADE.

C. P. Platt, representing the American Electric Telephone company of Chicago, is in Havana with the view of introducing the American equipment into the Cuban capital.

One of the signs of the present good times is the busy condition of the Okonite factory. Okonite is a wire that long ago won its position in the electric-light business, and its reputation stands it in good stead in the rapidly growing field of independent telephony, for the independents are now going gradually through the change to strictly high-class construction. It is in the remodeling of exchanges and the production of new ones along the conservative line that Okonite's merits tell.

Mathias Klein & Son of Chicago, manufacturers of climbers for telephone and telegraph linemen, report a gratifying increase in their business. It may not be generally known that this firm has built up an excellent trade and is now doing business in every part

SCHMIDT & BRUCKNER NOVELTIES.

of the United States. Although taxed to the utmost capacity the firm is still giving full value as in the past. The firm also handles construction tools, and those in need of goods of this character may find it to their advantage to get the firm's catalogue.

General Manager L. F. Requa of the Safety Insulated Wire and Cable company of New York is to be congratulated on a business that has continued remarkable in its growth up to the present time. The Safety telephone wires and cables have been for years standards in the general telephone field and so well appreciated in older telephone circles that the independent people have naturally followed with a great business. The Safety company refers to both independent and Bell companies as to the splendid service of its cables.

The Taber & Mayer company of Boston was started in the early part of 1895, or at the very beginning of the independent telephone business, as a partnership. While it has not grown as large as some concerns in the intervening time, it has, nevertheless, gained the reputation of producing goods of the very best quality only. In 1898 the business was incorporated as the Taber & Mayer company. The capacity for output as well as factory floor space was at the time trebled. The concern is strictly a manufacturing one, producing all the parts as well as complete instruments. V. A. Mayer is president and E. S. Taber is treasurer.

An increased spring demand for telephone material is very evident to the Central Electric company of Chicago. The prevailing higher prices on

line drops are of the Western self-restoring removable type. The line terminals connect at the back directly to the tip and sleeve springs of the spring-jack, either by a screw or soldered connection. The drop coils are wound with a large-sized wire, thus insuring complete protection against burn-outs, as the drop coil will carry enough current for a sufficiently long time to blow an ordinary one-fourth ampere fuse.

Another point not to be lost sight of is the self-restoring feature contained in the Western drop, the annunciator shutter when announcing a call being suspended before the corresponding line-jack in such a manner that it is returned to its normally horizontal position when the answering plug is introduced into the line-jack. This is said to be the only practical self-restoring drop yet produced, and it has been

JONES SPECIAL TELEPHONE SET.

identified with the Western company's switchboards for years.

The board is further equipped with Western platinum-contact circuit-changers, highly efficient tubular bridging clearing-out drops, double-pole triple-magnet head receiver, "Keely A" adjustable transmitter and supporting arm, double-conductor spiral-protected linen-braided connecting cords, Keely magneto-generator, buzzer, etc. The company's patrons express their appreciation of this board by

SCHMIDT & BRUCKNER NOVELTIES.

construction material to-day, compared with a year ago, seem rather to have stimulated business, than depressed it. Low rates of interest compel the seeking of new investments; hence, in any field where good profits are assured at nominal risks great activity will prevail. The telephone field is practically untouched in the smaller towns, and therefore the Central people look for a very large and profitable development in this line. This demand must be figured in addition to the regular needs of existing ex-

changes, and also after making due allowance for the requirements of the very strong independent movement.

E. J. Noblett of Chicago, manufacturer of special woodwork for telephone and electrical construction of every description, announces that he has secured the contract for 1899 for cross-arms, pins, brackets, etc., from the Central Union Telephone company. Mr. Noblett is to be congratulated in securing so excellent an order. The fact that this contract was awarded to Mr. Noblett in spite of close competition speaks volumes for the excellence of his products.

The Sterling Electric company of Chicago, which manufactures telephone-exchange equipment for independent companies similar to that used in Bell exchanges, passed its first year's milestone in February. It has doubled its machinery plant during the last month, being compelled to do so to handle the increasing business. The Sterling company has been working night and day for the last 30 days, and Manager Doolittle states that it will have to work night and day shifts for the next three months to fill the accepted orders now on hand. The independent telephone companies are showing their appreciation of apparatus that is standard, having the manifest advantage of the Bell company's experience.

The recent incorporation of the North Electric company of Cleveland and the removal of its plant to the spacious quarters at 61 to 71 Frankfort street suggest what enormous strides have been made in the independent telephone field alone during the last decade. The company was established on a small scale and has developed a full line of telephone apparatus. This company makes in its own factory every part that goes into the construction of a telephone system. The officers are: President and general manager, C. H. North; vice-president, D. B. Wick, president of the Wick Banking and Trust company of Cleveland; secretary and treasurer, George C. Steele, formerly secretary and manager of the Painesville (Ohio) Telephone company.

One of the most essential features of an up-to-date telephone system is a thoroughly reliable terminal and distributing box, which, if properly equipped, saves many hundred dollars of expense to a telephone exchange. The device affords the most satisfactory method of inclosing and protecting the ends of telephone cables, and gives means of testing the conductors. If properly fused, it also serves as an effective lightning arrester. The Western Electrical Supply company of St. Louis is offering to the trade, in connection with its excellent assortment of telephone supplies throughout, what is termed the Moon terminal head or distributing box, which is thoroughly equipped to satisfactorily overcome all of the objectionable features which have been experienced in some makes of distributing boxes. One of the principal features of this fused box is the arrangement of the fuse connection, which gives a fuse $3\frac{1}{2}$ inches long, although the distance between the terminals is only one inch. It is said that this terminal box has given excellent satisfaction wherever it has been used. The company has sold a large number of these terminal boxes throughout the West and Southwest.

In a recent and characteristic letter from Mr. J. J. Nate, the manager of the Standard Telephone and Electric company of Madison, Wis., these interesting passages occur: "Notwithstanding low prices, strong competition and the fact that we are not located in Chicago, we are doing a grand, good business. Our mail orders are phenomenal, and our goods seem to recommend themselves to prospective purchasers everywhere. The writer has just returned from an extended trip of two months throughout the South and East and reports some very flattering orders as a result. Our exchanges everywhere are in A1 condition, giving first-class service. It is pleasing to note that the apparatus which we put upon the market five years ago is still satisfactory to the people who have been our customers and friends from the beginning. Financially the company stands without blemish, and has discounted its bills almost from the first month of its existence. Prospects for this year's trade are even brighter than the outlook for preceding years, and we anticipate some excellent business in the coming months. We have introduced many new and worthy devices in the way of auxiliary apparatus and have recently put upon the market a new standard duplex switchboard, which is in every way an improvement over our product put out heretofore in the same line, and is meeting with favor everywhere. An exchange of 800 numbers, employing this board and our Standard Milde instrument, recently installed at Asheville, N. C., has been a revelation to the people in that part of the country. The subscribers at Asheville refer to the 'new telephone' as 'the instrument over which you can hear a watch tick clear across the town.' Our exchanges are growing and increasing in popularity with subscribers everywhere. It has not been our policy to sacrifice all our profit in an effort to put our goods upon the market, nor do we ever intend to do so. When that time comes, we shall be glad to invest our money in exchange plants, as the revenue there seems to be without question eminently satisfactory to investors."

The Harrison primary cell No. 1 is making itself felt, especially in the West, among those desiring a cell of the "very best." Large orders have been coming in of late to the Thermo-electric company, Times building, New York, and one for 500 cells for

regular supply trade has just been received. The features that seem to please users most are the extraordinarily high electromotive force of the cell and its capacity. This cell is practically a new departure in primary cells, for, while peroxide of lead has long been used in connection with storage batteries, it has, the company claims, never before been successfully used in a primary cell. "The combination of lead peroxide and zinc amalgam as elements," the manufacturers, Harrison Bros. & Co. of Philadelphia, claim, "with dilute sulphuric acid as the electrolyte, gives the highest electromotive force (2.45 volts) obtainable in a practical primary cell. The quick depolarization obtained by the use of specially prepared lead peroxide, along with the low resistance of the electrolyte and its high voltage, makes the Harrison cell the most powerful of the open-circuit type known. Its recuperative powers are phenomenal, and the amount of work it will do is extraordinary when its size is taken into consideration. The small dimensions of the cell—it is only five inches high by three inches square—is one of its commendable features. Where space is a consideration the Harrison cell is most suitable, as it occupies only a fraction of the room required for the usual type of open-circuit wet cell. The ratio is about one to six for the same output. Its high voltage reduces by more than one-half the number of units required for a given purpose, when compared with the usual type of open-circuit cell. The absence of creeping salts and corroded connections, its non-liability to destruction by short-circuiting and freedom from freezing in cold weather, along with the cheapness of its maintenance and renewals, are strong points in its favor." It is estimated that the cost of the electrical energy obtained from this cell is about one cent per watt-hour. This battery will, it is said, give on ordinary open-circuit work a discharge of 40 ampere-hours, or over 80 watt-hours.

One of the latest companies to enter the independent telephone field, and one that is likely to make itself strongly felt as a factor in this rapidly growing industry, is the United States Automatic Telephone company, which was recently incorporated under the laws of the state of New York, with a preliminary capital of \$1,000,000. This company has acquired the basic United States patent granted to the well-known electrical engineer, Mr. Elias E. Ries of New York city, upon a new automatic-telephone system of his invention, which evidently not only constitutes a radical departure in telephone work, but promises to greatly cheapen the art and practice of telephony by reason of its remarkable simplicity, low cost and convenience, and its unusual promptness and efficiency, as compared with the ordinary systems now in vogue. The distinguishing feature of the Ries automatic-telephone system is that it dispenses entirely with the hook switch, magneto-generator, drop switchboards and other complex and troublesome features of existing telephone systems. The subscriber's apparatus has been reduced to such a state of simplicity that nothing is left for him to do but listen and talk. The instrument does the rest. It is said that the new apparatus can be furnished at less cost than any apparatus of equal grade hitherto manufactured. The United States Automatic Telephone company, with offices in the New York Life building, 346 Broadway, New York city, proposes to enter into the manufacture of telephonic apparatus embodying the various features of its system, and to introduce the same under license arrangements through existing independent telephone companies, as well as through new sub-companies to be formed by it for the purpose in the various sections of the United States. The incorporators of the parent company and its temporary officers are Messrs. Elias E. Ries, Israel Steinhart, Martin Lowenstein, Henry J. Furlong and H. A. J. Wilkens, all of New York. The company will shortly elect permanent officers, and, it is believed, will add to its board of directors a number of prominent gentlemen who are largely interested in the telephone industry in addition to those already named.

EXTENSIONS AND IMPROVEMENTS.

A new telephone line is about to be built to Point Wilson from Port Townsend, Wash.

It is rumored that the Hughes Telephone company will put in an exchange at Hillsboro, Ore.

The Oregon Telephone company is putting in a local telephone service for Hood River, Ore.

The Sunset Telephone company is putting in a local telephone system at Cottage Grove, Ore.

D. C. Demarest has been granted a franchise to construct a telephone line from Altaville to Jamestown, Cal.

A franchise for a telephone line from San Diego, Cal., through Roseville, was granted to the United States government.

At San Andreas, Cal., an ordinance was passed granting D. C. Demarest a franchise to construct and operate a telegraph and telephone line along streets of the county.

The Inland Telephone company will erect a \$75,000 office building at Spokane, Wash. As soon as the new office is in operation all the old-style telephones over the city will be replaced with the express system.

H. F. Fiecher and the C. and E. have turned over their private telephone lines in Corvallis, Ore., to the Oregon Telephone company, which will connect those lines with its system. The company is at

present engaged in putting up a considerable amount of new wire.

Manager W. H. Dancy, local manager of the Oregon Telegraph and Telephone company at Salem, has been informed that the company will at once begin the construction of a line between Salem and Mount Angel.

A telephone system using the National Automatic Telephone company's instrument will be installed in Rankin, Ill. The National Automatic Telephone company is installing an interior automatic-telephone system for C. D. Heath & Co., 378 Wabash avenue, Chicago.

The managers of the Southside Telephone company, which operates a telephone service from Long Beach to Roslyn, have purchased the franchise and property of the defunct Long Island and New York Telegraph company, and it is proposed to extend the service of the Southside company through Long Island. The Long Island and New York Telegraph company conducted a telephone line between East New York and Far Rockaway and Rockville Center. At the latter place the wires of the Southside company will be connected with those of the other company, and it is said that in a short time Babylon and Patchogue will be on the line of the company. The Southside telephone service, on a limited basis, costs \$15 a year.

EXCHANGE MANAGERS.

Dr. I. A. Lumpkin of Mattoon, Ill., who has been ill for several weeks, has returned to his home completely recovered. Dr. Lumpkin reports that the independent interests throughout the state are becoming much better organized and are extending their lines in every direction. The Bell interests are endeavoring to secure control of certain points for the purpose of breaking the connections of toll lines, but thus far they have not succeeded in seriously affecting the service.

Simon P. Sheerin of Indianapolis, who is an active force in the onward march of independent telephony, is a self-made man a little over 50 years of age. He obtained his education in the public schools and the printing office. He dabbled in politics early in life, and when only a little beyond his majority was elected to a county office as a Democrat. He edited the *Logansport Indiana Pharos* for many years, served as a member of the state executive committee of his party, was elected clerk of the Supreme Court of Indiana and served acceptably for four years and declined a renomination. His motto as to political service is, "While it is a pleasant experience to be honored by one's fellows with public office, no man should be continuously in politics for a livelihood." Mr. Sheerin was the Indiana member for eight years on the Democratic National Committee, and was during the entire time the secretary of the committee. He has been largely identified with many important interests, notably the development of the great natural-gas interests, having been largely instrumental in the piping of gas to all the larger cities of his state.

George W. Beers is regarded as an old-timer by independent exchange managers. He was born in Ohio, in which state he continued his residence until six years ago, when, to be nearer the center of his business activities, he removed to Fort Wayne, Ind. His telephone experience began in 1880 with the Midland Telephone company, at that time the licensee of the American Bell Telephone company, having exchanges at several points in Ohio. The company was absorbed with other licensees of the American Bell, forming what is now the Central Union Telephone company, operating throughout Ohio, Indiana, Illinois and Iowa. Upon the organization of the Cincinnati, Van Wert and Michigan railroad, Mr. Beers left the telephone service to become the constructing engineer of that line. The road was built, and is now a part of the Cincinnati Northern railroad, between Cincinnati and Jackson, Mich. The telegraph lines along the Cincinnati, Van Wert and Michigan railroad in Ohio, Indiana and Michigan were constructed and operated by the Edison Mutual Telegraph company, an Ohio corporation, of which Mr. Beers was the secretary and treasurer up to the time the lines were acquired by the Western Union Telegraph company. About this time the basic telephone patents expired, and Mr. Beers engaged in independent telephone enterprises in 1894, organizing and putting into operation successively the exchanges at Decatur, Ind.; Van Wert, St. Mary's, Wapakoneta, Lima and Delphos, Ohio; Fort Wayne, Ind.; North Baltimore, Ohio; Auburn and Kendallville, Ind. He is now particularly interested in the exchange of the New Telephone company at Indianapolis, which he believes will be equal if not superior to any telephone exchange in the country. Mr. Beers was among the first to recognize the necessity of out-of-town connections for the local exchanges, and he quickly saw the utility of establishing connections upon the co-operative plan between exchanges; therefore, in 1895 he organized the National Telephone and Telegraph company, of which he is the president, and through the medium of that company's lines all of the exchanges, together with the small towns in Indiana lying north and east of Indianapolis, and those in Ohio lying south and west of Toledo, have been connected, comprising the most complete independent telephone system yet inaugurated.

MANUFACTURERS AND DEALERS.

William E. Sundberg, general manager of the Reliable Electric Manufacturing company, was born in Stockholm, Sweden, in 1871, and was graduated from the Polytechnic Institute of Stockholm in 1892. For six years he has been connected with telephone exchange and manufacturing work. He is the inventor of several mechanical and electrical devices.

William J. Murdock of the firm of William J. Murdock & Co. of Boston has been identified with the telephone business in the East for several years, having been connected with the Electric and Machine company of Boston from 1887 until 1895, when he began manufacturing telephones. The firm of William J. Murdock & Co. is the manufacturer of the "M" bipolar receiver.

Independent telephone men will be interested in the announcement that R. E. Weed has been recently appointed secretary and treasurer of the Victor Telephone Manufacturing company, Chicago. Mr. Weed is one of the many energetic young men in the telephone business, and has shown conspicuous ability in the discharge of the duties of his position. The Victor company has been exceptionally successful in the telephone field, and this is due in great measure to the abilities of the staff which Mr. Weed so worthily represents.

J. A. Williams is well known in the independent telephone field, having first engaged in the manufacture of magneto bells for the independent field five years ago, with the Williams-Abbott Electric company, which he founded. About one year ago Mr. Williams disposed of his interest in the company, and in connection with B. S. Chamberlin and other Cleveland capitalists formed the Williams Electric company for the purpose of manufacturing telephone apparatus for the independent field. The success of Mr. Williams in his new undertaking is attested by the fact of the enormous business that the Williams Electric company is now doing in the complete telephone apparatus.

F. J. Dowland of Ludington, Mich., has for many years been the secretary of the Pere Marquette Lumber company, and has held several terms as mayor of the city of Ludington. With the decadence of the lumbering interests of Northern Michigan, Mr. Dowland turned his attention to other lines of work, and accepted the presidency of the Mason Telephone Pay Station company. He has recently been re-elected president of the company, and is giving to it his ripe experience as a business man. This company has a very accurate and ingenious appliance for the automatic collection of tolls, invented by H. R. Mason of Ludington, and sold to this company by him. It is intended for use in hotels, depots, drug stores and public buildings.

Mr. A. M. Taylor, well-known inventor and telephone expert, has become associated with W. H. Butler in the Butler-Taylor company of Ravenna, Ohio. Mr. Taylor is one of the pioneers in the independent telephone movement, having built and managed some of the first independent exchanges in the country. Mr. Taylor has invented a number of useful devices that have been of great advantage to the independent telephone people. He is a thorough mechanic and an up-to-date construction man and telephone manager. He has derived his knowledge of telephone business by practical experience, and his judgment on construction work and general telephone business is to be relied upon. The Butler-Taylor company will manufacture lightning arresters and several other new inventions of Mr. Taylor. Mr. Butler is a business man of means and the success of the company is assured.

Elias E. Ries, who is exploiting the United States Automatic Telephone company of New York, was born in Germany in 1862 and was educated in the technical schools of New York and Baltimore. He took up the study of telegraphy in 1876, practicing as an operator with the Gold and Stock and Western Union Telegraph companies and making a number of valuable improvements, some since patented. In 1881 he entered the service of the United States Electric company, in the mechanical and lamp departments and in dynamo construction, and later engaged with the Fuller Electric Light company and with Bergmann & Co. in experimental work connected with the Edison system of electric lighting. Mr. Ries is an actively interested member of the American Institute of Electrical Engineers, the American Association for the Advancement of Science and the American Association of Inventors and Manufacturers.

The Stromberg-Carlson Telephone Manufacturing company of Chicago has recently added above \$5,000 worth of heavy machinery and improved tools and made arrangements for doubling its factory space to be in position to fill the orders it has on its books at the present time. Among the unfilled orders is the equipment for a 5,000-capacity, semi-multiple switchboard and central-energy telephones for Minneapolis and one of similar character for St. Paul; a 1,500-capacity strictly multiple switchboard and central-energy system for Waco, Texas; a 600-capacity trunking switchboard and central-energy telephones for Parkerburg, W. Va.; a 200-capacity central-energy equipment for North Vernon, Ind.; a 200-capacity central-energy equipment for Chicago, Mich.; a 100-capacity central-energy equipment for Milford, Ill.; besides many orders for the regular exchange apparatus and special toll-line

switchboards and toll-line telephones with new and improved generator.

The Farr Telephone and Construction Supply company of Chicago has enjoyed success from the beginning of its existence. Charles W. Farr, the president of the company, was born in Port Huron, Mich. He engaged with the Western Union Telegraph company in 1871, and served with that company as local manager until 1889, when he resigned his position. During the last ten years of service with that company he acted as local manager for the Bell Telephone company, filling two very responsible positions to the entire satisfaction of both companies. Thinking there was a greater prospect for advancement in the electrical field, he came to Chicago in 1892, and soon after founded the company which bears his name. Mr. Farr has had experience in telephone construction from climbing the poles and stringing wires to the finest switchboard work. The Farr company manufactures everything in the telephone line, and the excellence of its product has given it an enviable reputation. The principles of honesty and fair dealings, which Mr. Farr and his associates have always followed, have gained the confidence of their customers.

Among the telephone men who have gained distinction C. H. North occupies a conspicuous position. His education fitted him for mechanical and electrical work, and he has supplemented it by practical experience. He was engaged with the Akron, Canton and Massillon Telephone company in 1881, and later with the Cleveland Telephone company until the spring of 1887, at which time he withdrew in order to devote his energies to an enterprise he had started in 1885 for repairing and remodeling the switchboards, telephones and magneto bells of the Erie Telegraph and Telephone company. Mr. North invented a machine for cutting mechanically perfect gears, which enabled him to turn out a magneto-generator as noiseless and accurate in adjustment as a watch. His ringing and listening key, first used on the Bell switchboards, was an ingenious device. The first independent exchange built and installed by Mr. North was at Garrettsville, Ohio, in 1893. Among novel features of the North Electric company's new switchboards, the self-restoring drop is particularly praiseworthy. The company's protecting devices for switchboards offer new and valuable features.

Notwithstanding the fact that the Victor Telephone Manufacturing company has been in existence for less than a year, it has gained a position among the leaders. It has placed its apparatus in every section of the country. This is due almost entirely to the able management of its president, William T. Blaine, who has by hard work and perseverance piloted the company to its present state. The company has recently added to its list of apparatus a central-energy system. Ernest E. Yaxley, the superintendent and electrical engineer of the company, was born in 1860, in Hillsdale, Mich. Mr. Yaxley soon developed a tendency toward the mechanical arts, and in order to gratify his inclination, at the age of 16 years, he entered a machine shop as apprentice. His advancement has been rapid and continuous. Mr. Yaxley soon realized that the telephone field gave great opportunities to his abilities, and about 1891 became identified with the development of the Strowger automatic system. It was in the spring of 1898 that the Victor Telephone Manufacturing company was organized to promote Mr. Yaxley's valuable inventions in the way of telephone apparatus. Although in existence hardly a year, the company is already at the foremost rank of the independent manufacturers, which is undoubtedly due to the excellent quality of Mr. Yaxley's devices, coupled with the high executive ability of Mr. William T. Blaine, the company's president.

Maximum Telephone Rates for New Jersey.

The New Jersey Legislature is considering Assemblyman Murray's bill providing for the regulation of telephone rates throughout the state, the maximum figures being as follows: In cities of over 100,000 population, \$50 a year; in cities of from 20,000 to 100,000 population, \$40 a year; in places under 20,000 population, \$30 a year. The attorney-general, the controller and the secretary of state are constituted a board to hear appeals, with power to modify these rates where they prevent a company from earning 10 per cent. on its capital stock and bonds.

Assemblyman Murray declared that these rates were based upon the charges that obtain where competition has forced the Bell company to meet public demands. The Bell company has given service at a profit when charging only \$3 a month for a telephone in a business house and \$2 a month for service in a private house. In Trenton, Newark, Jersey City and Elizabeth rates had been reduced by such competition, but in Plainfield the charge is \$125 a year for a business place and \$60 a year for a private house, as against \$36 and \$25 respectively, in Newark and Trenton. Considerable data collected by a telephone manager who had had much experience in such matters was submitted for the consideration of the members.

A representative of the independent company operating an exchange in Jersey City and Bound Brook protested against the bill on the ground that it would drive the local companies out of business. They have never paid dividends on their stock, he said, but

paid the interest on their bonds and allowed a reduction of eight per cent. on the telephones used by stockholders. He said that Plainfield suffered from high prices because it would not grant a franchise to a competing company and so protected the Bell monopoly. The committee seemed inclined to think that competition sufficiently regulated prices. Further hearing will be given the conflicting interests before decision is reached.

Wolf River Telephone Lines.

A. L. Hutchinson, secretary and treasurer of the Little Wolf River Telephone company, is arranging to connect Fond du Lac, Wis., with Oshkosh, Ripon, Berlin and several other points in that part of the state. Mr. Hutchinson announces that the franchise in the city of Fond du Lac granted to F. H. Sweet and Waldo Sweet several years ago has been transferred to the Little Wolf River Telephone company of Weyauwega.

In March, 1895, the Wolf River Telephone company was incorporated with a capital stock of \$1,200 for the purpose of building a toll line to Tusten from Weyauwega, a distance of 17 miles. The company increased its capital stock to \$6,000, extended its lines from Weyauwega to New London, and put in a local exchange in New London.

In 1896, as some of the stockholders were opposed to further extensions, E. H. Jones, A. L. Hutchinson and H. E. Kepler, an electrical engineer from St. Louis, organized the Little Wolf River Telephone company, with a capital stock of \$6,000, built from Royalton to Symco, a distance of 10 miles, and put in a small exchange in Manawa. In January, 1898, E. H. Jones sold his interest in the Wolf River company to A. L. Hutchinson, who immediately commenced operations to extend the business of the lines and secure connection with the Oshkosh Northwestern company. E. H. Jones then transferred his interest in the Little Wolf River company to Mr. Hutchinson. In May, 1898, the capital stock of the Little Wolf River company was increased to \$15,000. The company on May 21st had Oshkosh and Omro connected. An exchange was built in Omro and the lines extended north to Weyauwega. Franchises were also secured in Winnecone, Hortonville, Clintonville, Tigerton and Wittenberg. Work has been continued without interruption to the present time; lines have been extended to Berlin, where connection is made with the local company; an exchange has been built to Clintonville, and by March 15th the toll lines will be complete to Wittenberg. A contract has also been made with the local company in Ripon, through which city the lines will be extended to Fond du Lac.

The Wolf River company and the Little Wolf River company are operated as one system, known as the Wolf River lines.

The lines are nearly all metallic circuits, and good service is given. The toll rates are about one-half those of the old company, while the time limit is raised from three minutes to five minutes. The rates for telephones in exchanges are also about one-half the rates of the old company. As an instance of what business these lines are doing, Mr. Hutchinson says: "When I contracted to connect with the Oshkosh company they demanded a guarantee of 500 messages per month, which I readily consented to give, as I had faith that the business would be far in excess of that number of messages. We did not complete connection with Weyauwega till about the first of December, and Berlin was added the first of January in the present year, and yet the reports show that in January the number of messages to and from Oshkosh amounted to 685 paid messages."

At its annual meeting the capital stock of the Little Wolf River company was increased to \$60,000 and that of the Wolf River company to \$8,000.

The Wolf River company paid a dividend of seven per cent. in 1897 and 12 per cent. in 1898. The Little Wolf River company paid a dividend of 10 per cent. for 1898, which was remarkable, as the lines were not completed for through business till late in the season.

New England Telephone News.

[FROM THE BOSTON CORRESPONDENT OF THE WESTERN ELECTRICIAN.]

The American Bell Telephone company has bought the estate on Oliver street, in Boston, adjoining the building in which its offices are located, paying \$85,000 for the property, which has a one-story building upon the land at present. It is stated that the purchase is made for the purpose of increasing the facilities of the New England Telephone company, the Bell's Boston branch, which has headquarters in the company's building, and a new building will soon go up on the site, connected with the present nine-story structure.

Much interest has been taken by the people of Boston in the bill now before the Legislature providing for supervision of telephone business in Massachusetts, in a manner similar to the oversight now exercised in relation to the gas and electric-light companies. At the hearings the committee rooms have been crowded, and the original place of meeting had to be changed to a larger one to accommodate the spectators. The only important opposition thus far developed has been voiced by the attorney for the Bell interests. At a meeting last week of the Massachusetts Associated Boards of Trade the project of state supervision was indorsed, and a committee was appointed to urge the passage of the bill. Lynn and

Brockton boards of trade have also requested the representatives in the Legislature from those cities to vote in favor of the measure.

Electricity at the Omaha Exposition.

[Special correspondence of the WESTERN ELECTRICIAN.]

OMAHA, March 6.—The electricity section at the Greater America Exposition at Omaha this year will present an array of attractions both varied and unique. The Electricity and Machinery building, which is now ready to receive exhibits, is a very large structure, affording ample floor and gallery space for exhibits in operation, as well as a display of finished products of manufacture. It is the purpose of the managers of the exposition to show the latest apparatus and multiplicity of devices of an electrical nature and give a practical demonstration of their application to manifold uses. The Electricity building at the Greater America Exposition at Omaha is bound to attract widespread attention, as it will embrace one grand array of operating machinery interspersed with countless novelties to hold the attention of curious visitors. Manufacturers of electrical goods whose trade is drawn largely from the Mid-west discern in the Omaha Exposition a rare opportunity for exploiting their wares.

Mr. I. N. Simpson, superintendent of exhibits, says he finds extraordinary interest manifested by prospective exhibitors. He offers them space for live exhibits free, not only in the domain of electricity, but in all other branches of industry. Large reservations of space have already been made. This wonderful attraction, along with that of the colonial exhibits, argues for a very large attendance at the Omaha exhibition, which will open July 1st and close November 1st. J. B. H.

Reported Transfer of the Electric Storage Battery Company.

The New York Gas and Electric Light, Heat and Power company has certified to an increase of capital stock from \$25,000,000 to \$36,000,000. The amount of capital actually paid in is \$50,600, and the debts and liabilities are \$36,150,956.50. The certificate is signed by Henry J. Hemmens, chairman, and Frank D. Allen, secretary of the meeting of stockholders. The *New York Tribune* says that it has been understood for some time that the control of the Electric Storage Battery company of Philadelphia has been acquired by the Whitney syndicate, two members of which, Thomas F. Ryan and Anthony N. Brady, were a day or two ago elected directors of the company; and it is supposed that the increase of \$11,000,000 in the capital stock of the New York Gas and Electric Light, Heat and Power company, which corporation also is owned by the Whitney syndicate, signifies that that company is about to absorb the storage-battery company. The latter has \$8,500,000 common and \$5,000,000 preferred stock and \$450,000 bonds.

"World" and "Engineer" Combined.

Announcement is made of the combination of the *Electrical World* and the *Electrical Engineer* of New York, the latter publication having lately been acquired by Mr. James H. McGraw, publisher of the *American Electrician* and *Street Railway Journal*. Mr. Johnston of the *World* will retire from the field of electrical journalism, and Mr. Wetzler of the *Engineer* will hereafter devote his entire attention to the *Electrical Engineer* Institute.

The new publication will be known as the *Electrical World and Electrical Engineer*, and its editorial policy will be intrusted to T. C. Martin and W. D. Weaver, which will be sufficient guarantee that a high standard will be maintained. The business management will be directed by James M. Wakeman and A. C. Shaw.

The combination, it is anticipated, will prove advantageous in every way for the publications interested and their patrons. Mr. McGraw and his associates are to be congratulated upon the arrangement.

Dinner to W. E. Baker.

On Monday evening, March 6th, Mr. William E. Baker, late superintendent of the Metropolitan West Side Elevated Railroad company of Chicago and now general superintendent and chief electrical engineer of the Manhattan Railway company of New York, was the guest at a quiet dinner given in his honor by some of his Chicago friends at the Union League Club. Besides Mr. Baker the gentlemen present were Messrs. B. E. Sunny, S. P. Wells, B. J. Arnold, Theodore P. Bailey, J. B. Allen, F. H. Clark, James R. Chapman, S. S. Neff and Frank Hedley. Everybody had something pleasant to say of Mr. Baker, in view of the important work he is to take up in New York, and he was wished the greatest measure of success. A few days ago the employes of the Metropolitan company gave Mr. Baker a handsome silver loving cup as a farewell souvenir, and this cup was used with discretion and admired without limit at the Union League dinner.

Chicago Electrical Association.

An interesting paper on "Patent Systems of the United States and Foreign Countries Compared" was presented before the Chicago Electrical associa-

tion by W. Clyde Jones on March 3d and was received with considerable attention. This organization has given more thought to patent regulations than any other association in the country that is not strictly of a legal character, and for that reason alone the paper commanded attention. Mr. Jones treated the subject in a masterful style, and his views will doubtless receive the consideration to which his experience and ability entitle him.

CORRESPONDENCE.

New York Notes.

NEW YORK, March 6.—After 16! these many years the Manhattan elevated railroad system in this city is to be equipped for the electrical operation of the trains. The matter was finally and officially settled at a stockholders' meeting held on February 28th, at which these resolutions were adopted without opposition:

Resolved, That the proposition to increase the capital stock of the Manhattan Railway company, contained in the notice pursuant to which this meeting is held, be and it hereby is sanctioned and approved, and that the capital stock of the Manhattan Railway company be increased from the present amount thereof, to wit, \$50,000,000, consisting of 500,000 shares of the par value of \$100 each, to \$115,000,000, to consist of 450,000 shares of the par value of \$100 each.

Resolved, That the stockholders of the Manhattan Railway company approve the proposed action of the board of directors, that the funds derived from the sale and distribution of the additional capital stock authorized at this meeting shall be expended and used primarily to substitute electricity in the place of steam as the motive power on the railways of the company, and to provide new plant and equipment, and for the enlargement and improvement of its system, and all other requisite facilities, to the end that the company may furnish the public a service of the greatest possible efficiency, speed and comfort; that such improvements be begun immediately, prosecuted with vigor and completed as soon as practicable, and that any surplus of said funds not needed, in the opinion of the board, for these purposes be used for any authorized corporate purpose.

It will thus be seen that the company will be amply supplied with funds to carry out the work which Mr. Baker has been imported from Chicago to supervise. Mr. Gould referred to the Tammany "raid" on the company at the stockholders' meeting and noted that it was begun at the time the Manhattan company failed "to comply with a demand made on behalf of the New York Auto-truck company to enter into a contract with that company to let it fasten its pipes on the entire railway structure of this company for a nominal consideration." Mr. Gould added that the company confidently relied upon the support of the public in its policy to make improvements, and that the stockholders could rest assured that the hostile demonstrations on the part of the city officials would not be allowed to delay the proposed improvements for a single day. It begins to look now as though the bottom had dropped out of Tammany's "holy war" on Manhattan. The drip-drip ordinance, to which I referred last week, has been withdrawn from the mayor by the Municipal Assembly and referred to a committee. The mayor has as yet taken no action on the ordinance to compel the company to run trains at intervals of five minutes or less through the 24 hours, although he gave a public hearing on the subject on March 1st. Most significant of all, Mr. Croker admitted to a *Sun* reporter on Friday that the Municipal Assembly has no authority over the Manhattan company. One interesting statement recently made by the Tammany chieftain was to the effect that he had been informed that Professor S. H. Short, now in Europe, had once examined the Manhattan structure and had reported that it was not strong enough to bear the weight of the electrical system.

There are persistent rumors of a consolidation of the Metropolitan and Third Avenue street-railway surface systems, but officers of both companies make positive denials. Mr. Whitney is reported to have said that "There is nothing in the story whatever. There have been no negotiations of any kind, nor has there been, nor will there be, any sort of agreement entered into."

Counsel for the Edison, Citizens' and Municipal Electric Light companies of Brooklyn have filed claims amounting to more than \$500,000 against the city of New York for lighting the borough of Brooklyn for part of 1897, 1898 and January of this year. It is said that the bills have been "held up" by the Municipal Assembly.

The announcement is again made that the negotiations for the consolidation of all the transportation companies in Brooklyn, including not only the surface trolley roads, but the two elevated roads, are progressing in a most satisfactory manner, and that within six months the consolidation will be effected.

M. S.

PERSONAL.

The will of Jesse H. Bunell, who died last month, was filed for probate in the office of the surrogate in Brooklyn. The estate, valued at \$300,000, is left to his widow and sons.

Mr. Samuel L. Naphtaly, the manager of the Central Light and Power company of San Francisco, was in Chicago for a few days last week in the interest of his company.

Francis H. Drake, director of the electricity and machinery department of the United States commission at the Paris Exposition, will sail for Paris to-day. He will return on April 15th.

F. S. Terry, now with the Weston Electrical Instrument company, has been in Chicago for a week

looking after his interests here. Mr. Terry, needless to say, was warmly welcomed by his old friends in the electrical fraternity of Chicago.

Mr. Albert Scheible will deliver a paper entitled, "Electric Street Lighting of Yesterday and To-day," before the Chicago Electrical Association in its rooms, 1736-1741 Monadnock building, on the evening of March 17th. Everyone interested in the subject is invited to attend the meeting. A general discussion upon the subject will be held after the reading of the paper.

Mr. William Hood, well known to the electrical fraternity of Chicago and the West, has become the representative in Chicago of the Oklahoma Cement and Plaster company of Cleveland, of which Mr. L. H. Rogers, formerly with the Brush, Adams-Bagnall and Fort Wayne Lamp companies, is treasurer. Mr. Hood has the cordial good wishes of his electrical friends in his new departure.

Mrs. Elizabeth Beach of Evanston, Ill., died in San Francisco on March 2d. Mrs. Beach was the widow of Franklin G. Beach, the pioneer telephone man of the West and general manager of the Central Union Telephone company of Chicago at the time of his death on April 28, 1897. The deceased lady left Evanston on February 20th to visit the family of John I. Sabin in San Francisco. Her only living relative is a sister, residing in New York.

Mr. H. F. J. Porter of the Bethlehem Iron company lectured to a large audience at the recent meeting of the Society of Arts, Massachusetts Institute of Technology, Boston. His subject was "Modern Forging," and he presented in a very interesting way, with numerous illustrations by the stereopticon, the methods in vogue at the Bethlehem works of forging such articles as hollow and solid shafts, dynamo field rings, guns and armor plate. Views were shown of the hollow shafts of the Oregon and of the Brooklyn, made at these works. Defects in the old methods of forging and the steps leading to the present methods were well explained.

ELECTRIC LIGHTING.

The city of Astoria, Ore., is contemplating the erection of an electric-light plant for the purpose of lighting the streets of the city.

The electric-light plant at Tampico, Mexico, has been purchased by T. C. Henry and associates, who will replace it with a first-class modern establishment.

The town of Williams, Ariz., will soon be lighted by electricity. The main owners of the plant are J. C. Boyce and J. C. Brown. The plant is almost completed.

J. Pierpont Morgan, the New York banker, has promised to contribute £5,000 to the cost of establishing an electric illuminating system in St. Paul's Cathedral of London.

The Jamestown (Cal.) Electric Light company has sold its system to the Tuolumne Electric Light and Power company, which will use it to furnish light and power for Jamestown, Quartz Mountain, Stent and vicinity.

W. S. Smith, an expert electrician, rendered report to the city authorities of Portland, Ore., furnishing estimates of cost of erecting and operating a plant of sufficient capacity to light the city. The total cost of the plant is estimated at \$174,425.

It is said that Anthony N. Brady, representing a syndicate of capitalists, has purchased the Equitable Gas and Electric company of Utica, N. Y. The company is capitalized at \$400,000, and it is said that the stock was sold to the new owners at above par.

Henry Vogel, a saloonkeeper at Clark and Michigan streets, Chicago, was convicted in Judge Waterman's court of stealing electricity from the Chicago Edison company by tapping the wires in the street and using the current to light his saloon. He was fined \$75.

The authorities of Springfield, Utah, have refused to grant an electric-light franchise to Davis Clarke, S. J. Norris and W. L. Harris, giving as their reason that they believe in municipal ownership, and that the council has already made some moves toward putting in an electric light plant.

A recent New York state incorporation is that of the Middleport Power company of Middleport, Niagara County, to manufacture electric light, heat and power. The capital is \$15,000 and the directors are Frank G. Lott and Thomas J. Wilcox of Niagara Falls, William J. Sterrett and George F. Thompson of Middleport and Byron C. Stanton of Sanborn.

Up in the Klondike the question of using electric lights is now to the front. The Skaguay *Askan* of January 12th says that a public meeting was held recently for the purpose of discussing the question of securing cheaper electric lights for Skaguay. Mr. Keelar, who represents those proposing to erect the new plant, says that a business combination with plenty of capital behind it will erect the plant, if the citizens will meet it half way and guarantee a certain percentage of the lights now used.

It is proposed by Mayor Harrison and City Electrician Elliott to extend the street arc lighting of Chicago by establishing additional stations in city

pumping plants now used by the Sewer Department exclusively. Some of these plants will be abandoned for pumping purposes when the new intercepting sewers are built and some will continue to serve their present purpose with electrical additions. If the plans are carried out in full 2,900 street lamps of 2,000 nominal candle power each will be added to the existing municipal equipment.

An ordinance will be introduced in the Evanston, Ill., Council to permit furnishing light and heat to residents of that city on a new plan. If the ordinance is accepted the Yaryan circulating hot water and heating system is the one that will be used. The pipes are to be laid underground with electric-light wires. Incandescent lights will be furnished at the rate of one-half cent an hour. The franchise asked is for 25 years, with no compensation except that are lights be furnished the city at a reduced rate. Homer C. Yaryan and H. M. Wisler are interested in the plan.

Senator Higgins has introduced a bill in the New York Legislature to provide for an electric-lighting plant to supply the public buildings in Albany. Ten years or so ago a lighting plant was set up in the capitol, but it was worn out when Governor Morton entered office in 1895, and had to be abandoned. A contract was entered into with the Municipal Gas company of Albany to supply the light. The political differences between William Barnes, Jr., and Anthony N. Brady in Albany last fall gave rise to a report that the lighting contract would be taken from Mr. Brady's company forthwith and a state plant set up. The bill now introduced fulfills this prediction, although it is based undoubtedly upon the more substantial reason that the state needs the plant. The superintendent of public buildings is directed to establish the plant, for which \$60,000 is appropriated. The buildings to be lighted are the capitol, state hall, geological hall and the buildings connected therewith.

William A. Linn of Hackensack, N. J., Cyrus O. Baker, Jr., of Newark and George H. Guy and Herbert B. Coho of New York city have filed articles of incorporation for the North Jersey Light, Heat and Power company, with a capital of \$100,000. They have purchased the old Red Mills property at Arcola, which has a valuable water power on the Saddle River. It is the purpose of the company to build a new dam and establish a plant for generating electricity by water power, it being understood that from 75 to 400 horse power can be obtained, according to the condition of the stream at different seasons. Arcola is on the Paramus Road, nearly midway between Hackensack, Paterson and Ridgewood, and on the route of proposed important trolley extensions. One purpose of the new company, it is said, will be to create a sentiment in favor of lighting country roads by electricity produced at low cost by water power. A steam plant will also be put in to supplement the water power when the stream is low.

ELECTRIC RAILWAYS.

An ordinance has been passed granting to George E. Leighton the right to construct and operate an electric street railway in Pasadena, Cal., for 23 months.

A Spokane paper says that the Lidgerwood electric line is to be extended from Hillyard to Cœur d'Alene Park. The proposed west extension will be 17 blocks long.

Survey of the Pacific Beach and La Jolla railroad at San Diego, Cal., has been completed, and Superintendent Flint is making up report on the work necessary to be done in electrically equipping the road.

The Los Angeles Railway company has given an order for the electrical equipment of 10 new cars. The work of cast-welding the joints of all the new rails laid by the company will be begun soon.

On February 6th the Kenosha Light and Power company was granted a 10 years' contract to light the city. The question of municipal ownership was thoroughly investigated before the order was passed. W. H. Schott, president of the company, feels elated over his success.

The Bergen County Traction company has opened its extension from Fort Lee to Bogota, N. J. The extension is five miles long, crossing the Northern and West Shore railroads above grade. During the coming summer the line will be carried across the river to Hackensack.

The Chicago, Wheaton and Aurora Railroad company has been incorporated with a capital of \$10,000, which, it is said, will be increased, to build an electric railroad from Aurora to Wheaton and from the latter place to Chicago. Andrew J. Hirschl is mentioned as an incorporator.

The February reports of the Brooklyn trolley roads show the disastrous effect of the recent blizzard on surface street-railway travel. The earnings of the Nassau Electric Railroad company were \$18,000 behind those of the corresponding month last year. This loss is directly due to the storm, which tied up many of the Nassau's lines for several days. The Brooklyn Rapid Transit company, which in January made a large increase in earnings over last year, showed for February an increase of only \$1,427 over the earnings for February, 1898. President

Rossiter says that the blizzard cost his company about \$50,000.

A bill has been introduced in Congress for the extension of the lines of the Maryland Suburban Railway company into the District of Columbia. Electrical equipment will be used, and both passengers and freight will be carried. The sub-extension is to be commenced within one year and completed within two years of the date of the passage of the act, under guarantee of \$1,000, which amount and charter are to be forfeited upon failure to complete the extension within the specified time.

Robert H. Derrah of the Boston Elevated Railway company has just completed a map showing all existing and projected street-railway lines in Massachusetts, Rhode Island and Connecticut, as well as the steam roads. There is 2,157 miles of electric roads in the three states, and during the year 1898 some 90,000,000 car-miles were run, carrying over 400,000,000 passengers.

Corporation Counsel Thornton, in the name of the city of Chicago, has sued the Chicago North Shore Street Railway company for \$500 damages because of injury alleged to have been done to the city water mains through electrolysis. The disintegrated main is in Evanston avenue, opposite the street-car company's power house, between Argyle and Winnemac avenues. The claim for damages is based upon the assertion that the return current of the company's trolley line in Evanston avenue affects the main and caused the disintegration of the iron pipe. The street-car officials, it is said, have determined to fight the suit, which was begun in the Circuit Court, to the court of last resort.

The City Council of Moscow, Russia, advises all contractors who are desirous of bidding for the construction of electric railroads in the city to make applications to the City Council not later than the 12th of April. The sum of 750 rubles (\$375) must accompany each application. The council will give all persons presenting applications the terms and conditions of the concessions, with all necessary drawings and statistics as to the working of the tramways in Moscow for the past five years, profits of the different localities, list of lines existing, and approximate prices for making out the estimates. For foreign bidders there will be issued copies of the contracts, printed in foreign languages, which will be sent on demand to all electrical companies. Copies will be sold to all applicants desiring particulars of the contract to be issued. The date of presenting the final tenders will be October 1, 1899.

Two companies, each capitalized for \$300,000, have been incorporated for the purpose of building electric railroads from Aurora and from Elgin to Chicago. They are to be known as the Aurora and Chicago Railway company and the Elgin and Chicago Railway company, and they will compete with the steam railroad companies in the carrying of passengers, mails and express. Elgin and Aurora are each about 40 miles from the center of Chicago, the former northwest and the latter southwest. The incorporators—B. Mahler, H. A. Everett, E. V. Moore, Elmer E. Barrett and Edward Dickinson—are all Cleveland (O.) men, with the exception of the last two, who reside in Chicago, and their experience with long-distance electric lines has been practical. They organized and still operate five lines, running between Cleveland, Lorain, Oberlin, Berea, Akron, Chagrin Falls, Painesville, Elyria and Bedford, O., with a maximum distance of 30 miles between terminal points.

POWER TRANSMISSION.

C. G. Baldwin proposes to use the water of Mill Creek to generate electric power, to be distributed to the farmers in the vicinity of San Jacinto, Cal., to pump water for irrigation purposes.

The aluminum transmission line between Blue Lakes and Stockton, Cal., is nearly finished. Electrical power generated at the former place will be sent over it for the first time about April 1st.

Alonzo Baily is at the head of a company which proposes to utilize the water of the Salt River for the purpose of transmitting power to Globe, Ariz., to furnish light. The electricity will be transmitted 20 miles.

The Washington Power Transmission company has been formed by New York and Boston capitalists. The capital stock is \$1,750,000, and the object to develop hydraulic and electrical power at Cedar River Falls, for use in Tacoma, Seattle and other cities of Puget Sound.

Fred T. Sterling, receiver of the Montana Power company, has filed a petition with the court asking that he be permitted to issue receiver's certificates for the amount of \$77,000, with which to purchase electrical machinery to place the plant in operative condition. Consent was secured.

J. Spaulding, W. H. Carlin, G. L. Hughes and others have appropriated water from the Yuba River at Marysville, Cal., to be used for generating light, heat and power. The intention is to furnish light and power to adjacent towns as far north as Chico and south to Wheatland and Lincoln.

The Clear Lake Electric Power company has asked the right to construct, maintain and operate

a system of electric-light and electric-power lines in Vallejo, Cal., for a period of 50 years. R. Raymond, secretary of the company, says that it is proposed to secure power from Cache Creek and furnish light and power for Calistoga, St. Helena, Napa, Vallejo, Benicia, Santa Rosa and Petaluma.

The Mendocino Electric company has taken the plant, lines, etc., of the Ukiah (Cal.) Electric company, the latter retiring from business. Lines connecting with the old plant will be at once shifted to connect with the new company's plant on Ackerman Creek. The new company will complete the dam. Frank Morse will continue as manager.

Contract for the construction of a Mount Whitney long-distance transmission electric-light and power line, consisting of 62 miles, has been let to G. S. Young and W. A. Burkholder of San Francisco. The company will furnish power and light to Visalia, Exeter, Tulare, Lindsay and Porterville, Cal. The cost of the plant will be over \$200,000, this amount having been supplied by J. H. Hammond of London, W. H. Hammond and A. G. Wishon, local capitalists, and others.

PUBLICATIONS.

A handsome engraving of Washington's mansion-house at Mount Vernon is distributed as a souvenir by the American Electrical Works of Providence. The picture, adorned with vignette portraits of George and Martha Washington, is really a work of art. A printed description of the mansion accompanies it.

The fan-motor catalogue of the Emerson Electric Manufacturing company of St. Louis is out in good season. The fans described are for alternating current and include desk, bracket and ceiling types. They are all guaranteed, and the desk and bracket designs have the improved fan blade of this company, which is of a new shape and is said to do away with all objectionable noise. The catalogue is clear and explicit, well illustrated, and should be a help to buyers.

Henry Raymond Rogers, M. D., of Dunkirk, N. Y., has issued two brochures—one entitled "The Universe; or, the Secrets of the Sun and Stars," and the other "Electricity, the Universal Force." The opening paragraph of the latter essay is the following: "But one force exists, and that universal force is demonstrably electrical. All physical phenomena, every form and manifestation of force without a single exception, may be traced to the mere transmutation of the electrical energy."

A neat booklet, issued "For Your Good and (Incidentally) Our Own," by the Montank Multiphase Cable company of 100 Broadway, New York, explains clearly in an interesting way the new principle of the heat-sensitive cable made by this company. Essentially this principle "consists in the making of all electric wires employed in every interior electric installation, and for whatever service to be rendered, capable of discovering dangerous heat or incipient fire from every infinitesimal point of its length, and giving warning thereof, locally and centrally." The little book is worth reading.

TELEGRAPH.

The Canadian Public Works Department is calling for tenders for the construction of a telegraph line from Spence's Bridge to Nicola, and also one from Kamloops to Nicola Lake.

A correspondent of the *Morning Post* of London points out that the greatest importance of Samoa to England is its connection with the proposed Pacific cable. The islands stand in the direct route of the cable, and it would be no doubt convenient to have one of the all-British stations at Samoa. For this purpose, of course, the absolute possession of one of the islands would be most useful, but even then the cutting of the cable by the enemy in time of war would not be difficult. As various colonial governments have come to a definite decision on the matter, the English technical press urges the English government to agree to the proposed division of cost, and to proceed at once with the design and execution of the work.

After eight years of litigation, including decrees, appeals and cross-bills, there is a prospect that steps will shortly be taken to enforce the decree of the federal court ordering the segregation of the telegraph properties of the Western Union and Union Pacific companies. Judge Munger of Omaha has entered an order striking from the report of Special Master Commissioner W. D. Cornish his recommendation that the parties be relieved from the provisions of the decree and characterizing the recommendation as "impertinent," because Cornish was an officer of the Union Pacific when he made his report. The court further dismisses the supplemental cross-bill of the Western Union Telegraph company, and the case is left as it came back from the United States Supreme Court, with the decree of segregation in full force.

At the South Foreland lighthouse in England trials were made on January 30th, under the supervision of Signor Marconi, of his system of telegraphing without conducting wires between the East Goodwin lightship, 12 miles out at sea, and the lighthouse. The system acted well, the messages being received

and recorded on the tape with absolute accuracy. Signor Marconi had with him two assistants at the lighthouse, Messrs. Kemp and Cohen, and one on the lightship, Mr. Richards, but several of the messages were sent by men on the vessel who had been instructed in the work. The height of the pole used for transmission was 130 feet, and Signor Marconi considered that by this that a message could be sent to the French coast. The receiving wire on the lightship was run 80 feet up the mast. During severe weather the system worked perfectly, and the men on the ship sent messages that were transmitted to Ramsgate. All present were impressed with the demonstration, and promises of support to a resolution urging the Board of Trade and the Admiralty to take up the system were given.

ELECTRICAL SECURITIES.

J. & W. Seligman & Co. offer for subscription at 102½ and accrued interest \$2,845,000 five per cent. consolidated-mortgage gold bonds of the Paterson and Passaic Gas and Electric company, due March 1, 1949. This company is the only one supplying gas or electricity to Paterson and Passaic and the surrounding territory and has a perpetual franchise. The United Gas Improvement company of Philadelphia owns a large majority of the capital stock and will supervise its operations.

Brown Bros. & Co. offer for subscription, at 107½, \$4,000,000 first mortgage and collateral trust 50-year, five per cent. gold bonds of the Philadelphia company, which controls the gas and electrical business of Pittsburgh. The bonds are part of a total authorized issue of \$6,500,000, of which \$1,000,000 is reserved to provide for maturing underlying bonds, and the remainder, \$1,500,000, is to be held under restrictions, for future improvements and extensions. The company has for many years supplied with natural gas the cities of Pittsburgh and Allegheny, Pa., and many adjacent towns. It recently acquired control of the Allegheny County Electric Light company and has contracted for the control of the Consolidated Illuminating Gas company of Pittsburgh. It proposes, by an increased issue of its common stock, to secure the United Traction company of Pittsburg. The bonds are secured by a first mortgage on all the properties of the Philadelphia company and by the deposit of securities in companies controlled or contracted for. By a report of certified public accountants the net income of the companies whose property or securities underlie the bond issue for the year ended December 31st last is shown to have been \$971,571, being \$771,571 in excess of the annual interest charge upon this issue of bonds, or more than 3½ times the amount required to pay the interest.

INDUSTRIAL COMBINATIONS.

Propos of the reported combination of New Jersey electric-lighting companies, the following dispatch from Philadelphia to the *Chicago Tribune*, dated March 5th, is of interest: "The United States [Gas] Improvement company of Philadelphia has assumed control of all the electric-lighting companies in northern New Jersey. The capital stock of the new company is \$20,000,000, and it will be called the Electric Company of New Jersey."

An important consolidation has just been perfected in the vicinity of Buffalo and Niagara Falls, whereby the entire street-railway system of the city of Buffalo, the electric roads of Niagara Falls, with the exception of the Gorge road, and the electric roads connecting Buffalo, Niagara Falls and Lockport have changed hands. The syndicate that has made the purchase has a capital stock of \$25,000,000, and all the interests affected by the change are to be consolidated under one management. The properties affected by the deal are the Buffalo Railway company, the Buffalo Traction company, the Buffalo, Bellevue and Lancaster Railway company, the Buffalo and Niagara Falls Electric Railway company, the Buffalo and Lockport Railway company, the Niagara

Falls and Suspension Bridge Railway company and the Niagara Falls Park and River Railway company. It is understood that the stockholders of the Buffalo Railway company will receive par for their stock; the stockholders of the Buffalo and Niagara Falls road about 75 cents, and the stockholders of the Buffalo and Lockport road about 50 cents. After consolidating all of the properties the new owners will retire all the stock with an issue of new bonds and later float a line of new preferred and common stock.

MISCELLANEOUS.

A dispatch from Redlands, Cal., states that while standing on the iron case of a transformer E. L. Crawford struck his head against a live copper wire carrying 30,000 volts to Los Angeles, making a short-circuit and blowing out the fuses at the power house in Santa Ana canyon. He received no further injury than a slight burn on the scalp and a stunning fall to the ground.

This is what the daily papers report Edison as saying he is doing now: "At present I am working on a device for sending photographs by wire. I am perfecting the machine now, and it will be a success. By this invention an artist can place his sketch in it and by attaching the same to a wire send in the picture to his paper. I am doing the work for Homer Davenport, the artist. This thing has been done before, but the machines have been too cumbersome. I intend to have this one made similar to a kodak."

TRADE NEWS.

John Buckley, Edward F. Davison and F. C. Kummell of Rochester, N. Y., have incorporated the Rochester Electric Motor company, with a capital of \$10,000.

The Standard Electric company of California has been incorporated for the purpose of building electric plants. The principal place of business will be San Francisco. The directors are J. S. Drum, F. H. Dam, M. F. Vendall and others. The capital stock is \$5,000,000.

The Corporation Court of Alexandria, Va., has granted a charter to the National Electrical Supply company, the object of which is to deal in general electrical supplies. The capital stock is placed at \$25,000. H. D. Merrick of Washington, D. C., is president of the company. A. W. Armstrong is named as the Alexandria agent.

The Western Electric company carries the only stock of interior conduit in Chicago. As is well known, the standard rubber-covered wires can be placed in these conduits without violating the Underwriters' rules. Contractors should get prices on conduit and wire from the Western Electric company before purchasing elsewhere.

The electrical supply business which has been conducted by J. A. Erner & Co. at 354 North High street, Columbus, O., will in the future be carried on under the firm name of Erner & Hopkins, Mr. W. A. Hopkins, Jr., having purchased an interest. Mr. Hopkins has been identified with Mr. Erner since the business was commenced. Construction work will be continued under the name of the J. A. Erner Construction company.

W. W. McChesney, Jr., representing Huebel & Manger of Brooklyn, has been in Chicago during the week in the interests of his house. Mr. McChesney is in high spirits, due to the large increase of the business he has secured. He announces that he personally has done more business during the last two months than he did all last year, and the prospects for a still greater increase are exceedingly bright. Mr. McChesney stated that the feeling among business men throughout the country could not be better. Huebel & Manger's products, of course, need no praise, as they have stood the test of time. The suc-

cess of Mr. McChesney, however, is due, in great measure, to his own efforts, as his abilities as a salesman are well known.

The Ward Leonard motor starters, with automatic release, have been lately reduced in price by a reduction varying from 30 to 50 per cent. This great reduction is due, the company says, to new inventions and the cheapening due to large volume of business. The Ward Leonard Electric company makes the claim that it has never yet had a single case of repairs upon its circuit-breakers. This, the company states, is due to the fact that the two independent switches, one upon each pole, make the circuit-breaker self-protecting. This feature in the Ward Leonard circuit-breaker is a strong point in its favor.

BUSINESS.

Eugene Munsell & Co. of New York and Chicago write that they are prepared to separate street-railway companies and electrical manufacturers from their money by giving them in return good India and amber mica for electrical insulation.

McLeod, Ward & Co., 27 Thames street, New York, call attention to the Kinsman desk lamp, for which they claim a large sale. Since its introduction in 1893, the sales of this lamp have steadily increased from year to year. The manufacturers will be pleased to send descriptive pocket catalogue on request.

The Electric Appliance company is inviting its customers and other friends to call and inspect its new building and equipment at 92 and 94 West Van Buren street, Chicago. The new location is easily reached by either the electric or cable surface lines or by elevated trains from any point on the elevated loop. It is only a few minutes' walk from the Monahan building, which is one of Chicago's electrical centers.

The Michigan Pipe company of Bay City, Mich., manufacturers of creosoted-wood conduits for underground wires, cross-arms, poles and railroad ties, has issued a neat pamphlet setting forth the advantages of its products. The company says that it installed a plant for treating timber by the Bethell process, because the experience of engineers in Europe and America has proved that timber treated with deadoil of coal-tar, or creosote, has withstood the effects of time and storm better than timber treated by any other process.

Users of cedar poles may not be aware of the fact that C. H. Worcester & Co., Koss, Mich., control the output of cedar on the line of the Wisconsin and Michigan railway, 55 miles in length, covering a territory of over 400 square miles of cedar forests. This enables the firm to furnish a choice assortment of poles, of which it has a large stock of all sizes on hand for prompt shipment. Worcester & Co. have furnished many of the poles used by some of the largest telephone and telegraph companies throughout the country. They think that it is doubtful whether any other concern is in a better position to fill orders.

The Ward Leonard Electric company of Bronxville, N. Y., not long ago entered the field of manufacturing enameled iron signs. There are, it is said, only five manufacturers of these goods in the United States, and they operate under closely guarded secret processes. The familiarity with enameling processes gained by the Ward Leonard company in the manufacture of its enameled rheostats enabled it to quickly overcome the difficulties attending the manufacture of enameled iron signs, and the company is now enjoying a handsome business in this line and is very much pleased with the prospects of this branch of its business. The Ward Leonard company issues a complete price-list for all sizes and quantities. The telephone and street-railway companies use many of these signs, and they are rapidly growing in favor for numbering and naming dynamos, feeders, circuits, etc.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued February 28, 1899.

- 620,110. Vehicle Lamp. John W. Eisenhuth, New York, N. Y. Application filed January 5, 1898.
This is a lamp for bicycles or other vehicles carrying an oil burner and an incandescent light, the construction being such that either oil or electricity may be employed.
- 620,111. Cut-out. Edward B. Ellicott, Chicago, Ill. Application filed December 30, 1897.
An electric line terminal consisting of a rounded lug adapted to be secured to an insulating base plate, a terminal portion provided with a receptacle for the connected conductor, and a sleeve rotatably fitting upon the lug and adapted to be secured in position thereon.
- 620,117. Arc Lamp for Electric Lighting. David Gertin, Corning, N. Y. Application filed September 15, 1898.
An inclosed arc lamp having the inner globe closed at the bottom and having a restricted orifice in its peripheral walls for the admission of air below the arc and a passage above the arc for the escape of the gaseous products.
- 620,144. Multiphase-current Transformer. Ernst L. K. F. Kahlenberg, Berlin, Germany. Application filed August 8, 1898.
The combination with a source of multiphase current of a transformer for supplying secondary circuits and having

- multiphase windings and switching apparatus for connecting the windings of the transformer either in star or triangle fashion.
- 620,172. Secondary Battery. Gustave Philippart, Paris, France. Application filed March 22, 1898.
An electrode comprising active material and surrounding washers superimposed and in contact with each other, forming a wall with minute pores or crevices between the washers through which the electrolyte may pass, the washers preventing the escape of the active material.
- 620,196. Electric Time Switch. Hans O. Swoboda, New York, N. Y. Application filed November 2, 1897.
There is a motor device and in combination with it a pair of contact arms and a movable dial adjustably mounted upon the spindle of the motor device and adapted to be driven at a constant speed, a pair of stationary contact pieces located in the path of movement of the arms, an electrically operated switch in the working circuit, comprising a switch blade, an electromagnet, a swinging armature oscillated by the energizing of the magnet and a loose connection between the armature and switch blade, which permits a movement of the armature prior to that of the switch blade in the direction of the common motion.
- 620,197. Coin-controlled Electrical Apparatus. Rob-

- ert W. Taylor, Sr., Chicago, Ill. Application filed February 14, 1898.
A slot machine for giving electric shocks is described. It includes a combination with a coin chute of an electric generator, stationary terminal strips in the chute in open circuit with the generator and positively actuated means for carrying a circuit-closer between the strips in a manner to close the circuit.
- 620,214. Carbon Holder for Electric Arc Lamps. Sigmund Bergmann, New York, N. Y. Application filed January 24, 1898.
This arc-lamp device is provided with a concave seat, a series of balls mounted on the seat and a weight mounted over the balls and tending to force the balls in contact with the seat and guiding tube.
- 620,230. Electric-motor Suspension. George Gibbs, Philadelphia, Pa. Application filed February 28, 1898.
A supporting frame for an electric motor of an electric vehicle consisting of a frame spring-supported at one end from the axle and spring-supported at the other end upon the opposite side of the axle upon the equalizing bars of the truck.

620,254. Four-tub Electric Bath. Carl E. Schnée, Carlsbad, Austria-Hungary. Application filed December 15, 1898.

Four absolutely separated tubs of non-conducting material (preferably porcelain) are described. Each tub receives one limb of a person and can be connected in different combinations for every kind of treatment of the body, combined with an adjustable bathing chair.

620,256. Means for Suspending Electric Motors. Sidney H. Short, Cleveland, Ohio. Application filed June 15, 1898.

A frame is journaled at one end upon the driven axle and spring-supported at the other end from an independent support, and a motor is attached thereto provided with means for adjusting the motor toward or from the driven axle.

620,257. Means for Suspending Motors. Sidney H. Short, Cleveland, Ohio. Application filed June 22, 1898.

A supporting frame is, at one end, journaled to the driven axle and at the other spring-supported from an independent support. A motor has trunnions journaled in the frame and springs limiting the movement of the motor relatively to the supporting frame.

NO. 620,256.

620,283. Regulating Transformer. Edward W. Cowan and Alfred Still, Bowdon, England. Application filed December 29, 1897.

A regulating transformer comprising a fixed portion forming part of an iron circuit and a movable portion forming the remaining part of the circuit; the secondary winding is carried partly by the fixed and partly by the movable part, the parts being so arranged that in one position of the movable part the two parts of the secondary winding shall act against each other, and in another position they shall act with each other.

620,302. Automatic Cut-out for Electrical Transformers. William J. Greene, Cedar Rapids, Iowa. Application filed October 11, 1897.

The first claim describes the combination with a suitable retaining case of an oscillating controller pivoted to a suitable standard, a low-resistance solenoid adapted to move the controller to close a switch, a switch closed thereby and connections thereof with secondary mains and a transformer in permanent connection therewith, a high-resistance solenoid in a shunt circuit through the controller, an intermittent transformer and a switch co-acting with the high-resistance solenoid to cut it in, the switch consisting essentially of cups containing mercury or the like conductor, double-pole contacts adapted to dip therein, a guide adapted to cause the contacts to move in a vertical plane, an oscillating gravity arm adapted to open the switch, a supporting standard therefor and for the controller and links connecting the gravity arm with the mercury-contact switches.

620,305. Leuring Iron. William S. Hadaway, Jr., New York, N. Y. Application filed January 26, 1898.

A hot press bag comprising a metallic body containing an electric resistance to heat the same, and provided with suitable electrical connections, a flexible covering attached to the margin of such metallic body, and a yielding filling of heat-conducting particles between such covering and body.

620,306. Electrically Heated Tool. William S. Hadaway, Jr., New York, N. Y. Application filed January 26, 1898.

The tool has a heater body and an electrode adjustable to and from the same to form an arc. A sleeve of refractory insulating material surrounds the electrode adjacent to the arc, such sleeve serving to insulate the electrode and support it movably adjacent to the heater body.

620,307. Process of Forming Magnesia Insulation upon Conductors. William S. Hadaway, Jr., New York, N. Y. Application filed January 26, 1898.

The process of coating electric wire with an insulation of magnesia for use in electric heaters, which consists in first coating the wire with metallic magnesium, and then applying an oxygen-bearing substance, as manganese oxide, to the coating of magnesium, and heating the whole to decompose the manganese oxide and oxidize the magnesium upon the wire.

NO. 620,306.

620,308. Incandescent Arc Light. William S. Hadaway, Jr., New York, N. Y. Application filed February 16, 1898.

Where the carbons of an arc lamp are of uniform cross-section a refractory sleeve is fitted close to them, about the arc and adapted when the light is in operation to be heated to incandescence in proximity to the arc. The sleeve may be made of fused magnesia.

620,309. Electric Fuse. William S. Hadaway, Jr., New York, N. Y. Application filed April 27, 1898.

A magnet wire or strip is employed to conduct and to break the current, and adapted to oxidize below the point of fusion, thus forming an infusible conductor under such conditions.

620,326. Electric Recording Apparatus. Charles L. Jaeger, New York, N. Y. Application filed April 19, 1898.

The combination of a series of contacts and a conductor arranged in series relatively to each other but not placed in direct contact, a recording device comprising a second series of contacts corresponding to the first series of con-

tacts and electrically connected with them, a conductor arranged adjacent to the second series of contacts, but not in actual contact with them, a spark-producing device, electrical connections between the device and the conductors and contacts, and means for feeding a record paper between the second series of contacts and the corresponding conductors—so constructed and arranged to form perforations in the record paper.

620,327. Electric Recording System. Charles L. Jaeger, Maywood, N. J. Application filed August 11, 1898.

In an electric recording apparatus the combination of a movable body made of non-conducting material and provided with an opening or slot permitting the passage of sparks, means for moving a strip or chart, means for producing sparks, and electrical connections.

620,333. Direct-current Motor and Method of Operating Same. Benjamin G. Lamme, Pittsburg, Pa. Application filed December 16, 1897.

A direct-current motor is provided with a commutator and with collecting rings and brushes, in combination with an external circuit having the brushes for its terminals and containing a transformer winding or windings; means for connecting one of the supply mains with one of the commutator brushes are provided and also means for connecting the other main with the other commutator brush or with a point in the external circuit at will, in order to operate the motor at different speeds.

620,334. Direct-current System of Electrical Distribution. Benjamin G. Lamme, Pittsburg, Pa. Application filed August 4, 1898.

The combination with a compound-wound direct-current generator of one or more pairs of feeding conductors connected in the usual manner to the generator, a shunt to the series winding of the generator and one or more pairs of feeding conductors connected to the armature terminal that is opposite the series-winding connection and to the shunt at a point intermediate its terminals.

620,335. Method of and Means for Varying Speed of Direct-current Motors. Benjamin G. Lamme, Pittsburg, Pa. Application filed September 3, 1898.

The method of operating direct-current electric motors at different rates of speed which consists in varying the phase relation between current and electromotive force in the armature circuit, whereby the armature reaction is varied.

620,336. System of Electrical Distribution and Regulation. Benjamin G. Lamme, Pittsburg, Pa. Application filed September 28, 1898.

A system of electrical distribution comprising a source of direct currents, a rotary transformer receiving current from that source and supplying alternating currents to translating devices and one or more chokes in series connected across the alternating-current circuit or circuits, these coils being so proportioned as to compensate for changes in inductive load in the work circuit, whereby the speed of the rotary transformer is kept approximately constant.

NO. 620,333.

620,343. Rotary-transformer Regulation. Ralph D. Mershon, New York, N. Y. Application filed October 31, 1896.

A system of electrical distribution comprising an alternating-current circuit containing inductive resistance and a rotary transformer provided with adjusting means variable at will, whereby the field charge may be varied in accordance with the voltage desired at the direct-current terminals.

620,365. Means for and Method of Electromotive-force Regulation. Norman Rowe, Wilkesburg, Pa. Application filed January 27, 1898.

The method of raising or lowering the electromotive force supplied by a transformer having a winding the active length of which is variable which consists in first inductively adjusting the electromotive force corresponding to one length of winding to that corresponding to a different length and then changing the circuit connections to correspond to the adjusted electromotive force.

620,404. Electric Railway. Louis M. Aspinwall, Pittsburg, Pa. Application filed February 25, 1898.

Features enumerated are a feeder, a single line of roadway contacts normally insulated from the feeder and from each other, and a series of electro-magnetically actuated circuit-making and breaking switches, each of which embodies a coil having a low-resistance connection at its respective ends with one of the roadway contacts and with one of the switch contacts and having a permanent high-resistance connection to ground.

620,440. Telephone Switch. William D. Gharky, Philadelphia, Pa. Application filed June 16, 1898.

Line wires extend to a subscriber's station; a subscriber's talking circuit is adapted to be connected thereto, and there is a switch for completing the connection, a signal included in the completed circuit and remaining unaffected as long as the circuit remains intact, a local circuit containing a subscriber's transmitter, a battery and the primary of an induction coil, means on the switch for closing the local circuit, a normally closed auxiliary switch in the circuit and means whereby the latter is automatically opened when use of the instrument is suspended.

620,466. Process of Utilizing Spent Battery Solutions. Joseph Lones, Smethwick, England. Application filed November 22, 1897.

This is a process for the recovery of residual products from the spent solution of voltaic batteries in which the positive metal is zinc and the exciting liquid is a solution of a caustic alkali. It consists in treating the spent solution with a sulphide to precipitate the zinc contained therein in the form of sulphide of zinc, separating the precipitate from the liquid and subsequently treating the filtrate with an oxidizing agent so as to convert any thiosulphate of the alkali into sulphate of the alkali, further treating the solution with steam of lime and afterward with barry's water so as to remove the sulphate contained therein, and finally separating the clear liquid from any

suspended matter and evaporating the clear liquid until it has acquired a strength sufficient to fit it for reuse as the exciting liquid of a voltaic battery.

620,473. Electrical Machine. George F. Martin, Corydon, Ind. Application filed July 18, 1898.

One claim describes a machine having stationary armature plates and movable motor plates, with supports for the armature plates, whereby the same may be adjusted, consisting of a pair of interengaged shafts, means for rotating the same in unison, and a sleeve of insulating material upon each of the shafts provided with grooves within which the edges of the armature plates fit, and a grooved insulating guide piece for the upper edges of the armature plates.

620,479. Sheet-metal Trolley Wheel. George E. Mittinger, Jr., Cleveland, Ohio. Original application filed August 30, 1898. Divided and this application filed December 6, 1898.

A grooved pulley composed of a pair of sheet-metal disks provided with flanges bent upwardly and outwardly in opposite directions, the flange of one of the disks being extended so as to form the outer grooved face of the pulley and embrace and interlock with the flange of the other disk.

NO. 620,473.

620,491. Telephone Switchboard. James M. Over-shiner, Elwood, Ind. Application filed January 24, 1898.

The combination with a jack and a drop of a plug to enter the jack and an engaging device on the plug adapted to co-operate with the drop to restore it as the plug is inserted into the jack and also while it is being withdrawn therefrom.

620,513. Combined Lighting and Alarm Device. John Thorsen, North Aurora, Ill. Application filed June 30, 1898.

The claim describes the combination with a movable floor section or trap of an angle lever, a wire or the like connected to one arm of the lever and to the floor section or trap, suitable guides for the wire, an adjustable support for the wire, an alarm mechanism having a turning post, a slotted device adapted to engage the post and normally prevent its turning, a connection between the device and the angle lever whereby the device is disengaged from the post when the lever is operated, an electric lamp having a lever connected to its switch key, and a connection between the lever and the angle lever.

620,514. Potential Regulator for Dynamos. Allen A. Tirrill, Whitefield, N. H. Application filed April 28, 1898.

The main supply wires of the dynamo are connected to a normally closed primary branch circuit and provided with one or more operating helices; a pair of contact terminals are arranged to be opened or closed upon each other by the action of the helices; a supplementary branch circuit is connected also to the supply wires and terminating in the pair of contacts mentioned; a relay is arranged in this supplementary circuit, a shunt circuit connecting with the dynamo and provided with a rheostat, the shunt circuit having two terminals extended to the armature of the relay and being opened or closed by it.

620,537. Coin-controlled Mechanism for Electric Meters. William F. Browne, New York, N. Y. Application filed December 28, 1897.

In a coin-controlled mechanism the yieldingly supported frame for the coin wheel, having a contact point, another contact point adjacent thereto, means for moving the frame to bring the points in contact, a movable contact section or switch in the main circuit, an electromagnet adjacent thereto, adapted to operate it, and electrical connections between the main circuit, the contact points and the magnet.

NO. 620,491.

620,547. Signal System. Edward L. Hail and George Hail, Providence, R. I. Application filed August 17, 1897.

One claim reads: A signal system for indicating the movements of an elevator car comprising an alarm, an electric circuit including said alarm, means rendered inoperative by the stoppage of the car at any point in the hatchway for closing the circuit to sound the alarm when the car is approaching a predetermined point and for breaking the circuit when the car has reached or passed said point.

620,549. Electric Railway. James F. Munsie, New York, N. Y. Application filed February 25, 1898.

A supply system for electric railways comprising a series of water-tight contact boxes mounted along the track and provided with an elastically yielding vertical plunger extending into the box through a water-tight joint, a circuit closer within each box adapted to co-operate with an insulated conductor traversing the system and extending from box to box, the plunger being provided with means for preventing it from turning on its axis and with a roller at its top projecting into a grooved guide rail for a collector carried by the car

Western Electrician

EVERY SATURDAY.

Vol. XXIV.

CHICAGO, MARCH 18, 1899.

No. 11

Transformer Station at Tonawanda, N. Y.

By ORRIN E. DUNLAP.

One of the fine new buildings that the Niagara power development and transmission have given to the Western New York section is the transformer station of the Tonawanda Cataract Power company on Robinson street, North Tonawanda, N. Y. This structure is of brick. Its dimensions at the foundations are about 80 by 60 feet, and it is a story and a half high. It is located very close to the Buffalo-Niagara power transmission line, from which it receives its supply of current. In every feature the construction of the building is most substantial; in fact, it is very characteristic of all that is done by the men connected with the generation and distribution of the Niagara

Buffalo and Niagara Falls road, which are used to Buffalo. The Buffalo and Lockport road is also supplied through a sub-station at the Lockport terminal of the trunk line, while the Buffalo and Niagara Falls road is supplied also at the Niagara Falls end from rotaries located in the central station of the Niagara Falls Power company. Thus both of these great electric-road trunk lines are now operated by Niagara power.

The lightning arresters and high-tension board are to be located on the second floor. The switch-board on the lower floor, Fig. 3, is of white marble and has eight panels fully equipped for controlling the various currents. A lighting plant is to be installed in the west half of the building.

In addition to the electric-road service, it is intended that this plant shall supply Niagara power

Steel Girders Burned by an Electric Arc.

An interesting useful application of electric-arc burning recently took place in Chicago in connection with reconstruction work in the New York Life building. The contractor for the building, the Moulton Starrett company of Chicago, was engaged in remodeling a portion of the building to suit a new tenant. To provide for two new stairways from the main floor of the building to the basement it was found that it would be necessary to cut through two sets of three steel I-beams. These six I-beams were each 15 inches high with a half-inch web and six-inch flange varying in thickness from a quarter-inch on the outside to one inch at the center. It will be appreciated that the section of metal to be cut through was considerable. The point at which the cut was to be

FIG. 1. TRANSFORMER STATION AT TONAWANDA, N. Y.—ROTARIES.

current. The lower floor has been left in a single room, and is provided with two 12-ton cranes. Granolithic pavement is laid throughout. The east side of the room is devoted to the present installation (shown in the picture on this page), and there have been placed two 500 horse power rotary converters and four static transformers, each oil-cooled and of 500 horse power. Room has also been provided for two additional rotaries. The current from the transmission line enters the building on the east side at a voltage of 11,000, three-phase, alternating. After passing through the high-tension circuit-breakers on the second floor it goes to the static transformers, one of which is shown in Fig. 2, where it is reduced to 375 volts, and is then fed to the rotaries, which convert it for the electric-railway system and commercial purposes. Current from this station is furnished to the Buffalo and Niagara Falls electric road for its operation from the car barns to the Buffalo line, and to the Buffalo and Lockport road from a point near Pendleton Center to the tracks of the

for industrial purposes through the locality where it is built. The Tonawanda Cataract Power company was organized for the purpose of distributing Niagara power in the town of Wheatfield and city of North Tonawanda, Niagara County, and the town of Tonawanda and village of Tonawanda, Erie County. Its officers are: President, Charles A. Sweet of Buffalo; secretary and treasurer, William B. Rankine of New York, and assistant secretary and treasurer, De Lancey Rankine of Niagara Falls, N. F. Irish is the superintendent in charge of the station.

Both Tonawanda and North Tonawanda are great lumber markets, and within their borders quite a little power is used. Both places have for some little time longed to be placed in touch with the Niagara power development, and the construction of this station gratifies their ambitions in this direction. The shipping facilities of the Tonawandas by rail and water are excellent, and the distribution of the Niagara energy may lead industries to locate there, many fine sites being available.

made was located in such a position that it would be necessary to have special saws made, and as three I beams of this size, side by side, would not cut very easily, it was estimated that in addition to the time required to make the special saws it would take two men at least two weeks at \$3.50 a day to saw them off. This loss of time in finishing the job and the expense involved were important considerations, and when it was suggested to Mr. Ralph Starrett, superintendent of the contracting company, that inasmuch as a smooth cut was not necessary, it might be feasible to get the girders burned off with the electric arc, he placed the matter in the hands of Clyde J. Coleman of the Coleman Laboratory of Experimental Engineering. Mr. Coleman has done considerable work in the line of electric-arc burning for the purpose of getting into safes and vaults with broken locks, and for cutting new doorways in vaults already in place, and also as an interesting experiment to demonstrate the possibilities of safe burglary by this method. Mr. Coleman pronounced the plan

of burning off the I-beams perfectly feasible, and undertook the task. The time actually required for electrically burning off the six girders was about 12 hours, and from four to five hours more was spent on mechanical work, such as removing girders to get at the remainder. The electric arc therefore did in two working days what would have required from two to three weeks by the usual method, resulting in a great gain of time for completing remainder of the job. The work was carried out by Clyde J. Coleman, Clarence W. Coleman and J. R. Cravath of the Coleman Laboratory of Experimental Engineering.

The plan of operation is very simple. Current was applied at 110 volts from one of the dynamos in the plant of the building. The current used was about 350 amperes. The positive side of the circuit was grounded on the structure of the building and the negative connected to a carbon holder containing a 1½-inch round carbon. The carbon holder had a wooden handle. The operator struck an arc between the spot on the iron to be melted and the carbon. The light and heat were intense, and the

Practical Applications of the Rotary Equalizer.

By CHARLES B. DAVEY.

The rotary equalizer is an appliance by means of which the potential between the two sides of a three-wire system is maintained at a balance.

In plants where current is generated at 220 volts and the load is divided between light and power, it would, in the writer's opinion, be good engineering to install an equalizer and distribute current for the lighting at 110 volts. The increased efficiency of the 110-volt over the 220-volt lamps and the speed control of the motors affected by the two-voltage method and commutated fields would make this one of the most efficient methods, involving the least amount of machinery. The losses of transmission or line loss would be more than offset by the increased all-round efficiency.

Another application of the equalizer, where it can be used to great advantage, is in isolated plants, where two sets of mains are brought in from a central station, the current being used in cases of

as will be described later, which would bring the losses to a minimum, they might almost be neglected. The better regulation at point of distribution, giving a higher life efficiency of the lamps, should further help to balance this loss. Where three-wire-system mains are brought in from a central station there is certain to be a difference of pressure between the two sides of the system, and further, the losses need not amount to very much even at full load; it would depend to an extent on the wiring. If the keeping of the system in balance had been properly worked out the lack of balance at any time should be very little; consequently, the capacity of the equalizer could be reduced, and with it, of course, the losses would be reduced. A fair estimate of capacity for an equalizer would be 10 per cent. of the plant capacity.

From the central-station point of view, what is the objection to the use of the equalizer across the power mains, in the case of the central station supplying current for lighting at one cent a lamp-hour? The central-station company certainly does replace the burnt-out lamps, provided they are returned intact; but this is a very small item, for, assuming that a lamp has an average life of 600 hours, which is a conservative estimate, at one cent a lamp-hour this would mean that for every \$6 paid for current one new lamp has to be supplied, which, estimating the price of the lamp at 20 cents, would be equal to but 3-3 per cent. of the cost of current. Then why such a difference between light and power rates? It may be argued that the power rates are low to insure a day load and so raise the plant efficiency of the station; but then power can be obtained at any time in the 24 hours at this price. Of course, it is a recognized fact that more current is consumed as power during the day, but there are plants consuming as much current at night as during the day, and

FIG. 3. TRANSFORMER STATION AT TONAWANDA, N. Y.—SWITCHBOARD.

effect was very disastrous to the eyes where proper precautions had not been taken. The arc is usually covered over with a muffle, consisting of an asbestos-lined iron box, with a hole in the back just large enough to admit the carbon used. The box is placed against the iron to be burned and the carbon thrust through the hole and the arc drawn. In places where there is not room for the box the carbon is simply thrust through a shield consisting of a sheet of heavy asbestos board. Some resistance has to be placed in the circuit, as is the case with any arc working on a constant-potential circuit. The resistance used in this case was simply a few turns of german-silver wire placed in a pail of water under a faucet, from which it was constantly replenished.

Municipal Ownership for St. Augustine.

An ordinance has passed its first reading in the City Council of St. Augustine, Fla., providing for the municipal ownership of an electric-lighting plant. There need not be no doubt that the ordinance will become a law, and that the question will be submitted to a vote of the people at the next municipal election to be held in June. There are three private lighting plants in the city, connected with the Ponce de Leon and Alcazar hotels and the railway station and office.

breakdowns, or at such times as the local plant may be shut down for overhauling. The equalizer could be placed across the power mains and current distributed at the lower voltage for lighting. The chief advantage derived from such a scheme is in obtaining the current for lighting at considerably reduced rates, such current being charged at one cent a 16 candle power lamp-hour and current for power at 10 cents a kilowatt-hour; but the difference in price is not so great in these figures as it is in the rates of discount.

To give an example where light and power are used, we will take the cost of 1,085,184 watt-hours at light rates. This would equal 16,956 16 candle power lamp-hours, and, assuming that a 16 candle power lamp consumes 64 watts of energy, which is a fair estimate of the average lamp used in an isolated plant, this, at one cent a lamp-hour, would amount to \$169.56, less 10 per cent. discount, which would make the net cost \$152.60. Now, taking the same amount of energy, but at power rates, it would be 1,085 kilowatt-hours, and at 10 cents a kilowatt-hour would equal \$108.50, less 42 per cent., or net \$62.93, thus showing a saving of the difference between \$152.60 and \$62.93, or \$89.67.

This saving would have been further augmented if power had been used also, for it would have increased the discount when the consumption of energy exceeds 2,000,000 watt-hours a month, this discount being 55 per cent. Of course the equalizer losses have to be deducted, but with such a machine

FIG. 2. TRANSFORMER STATION AT TONAWANDA, N. Y.—ONE OF THE STATIC TRANSFORMERS.

consequently they should have a different rate. In some cities a system of two-rate metering is adopted, whereby during certain hours of the day you can obtain current at very much reduced rates, and at night, when the danger of overloading the station is at stake, the rate is increased.

And, further, in an isolated plant where two generators are run in series on the three-wire system, and there is insufficient capacity, the lack of capacity being but a peak of short-time length, not sufficient to warrant the installation of another generator, good practice would indicate the running of the power mains in parallel with the outsides of the three-wire system. Could the central station object to this? Now this is practically the same as using an equalizer, for the current would be supplied to the lighting system.

The writer had occasion some time ago to estimate the cost of furnishing lighting to the extent of 160 amperes direct from the central-station light mains, and of supplying the same amount of current by running the central-station power mains in parallel with the outsides of a local plant's three-wire system, and he found that the cost of using the light mains was divided by three by using the power mains. Where an isolated plant is installed and the central-station mains are used for Sunday lighting or such other times of light load as will not warrant the running of the plant, it would be better to use a motor-generator, or a three-wire generator could be designed for such a purpose, though it would be hardly practical, perhaps. It would have to be a 220-volt generator with a third brush placed midway of the other two. Such a machine would undoubtedly spark badly with any great difference in load, but it is likely that this would be considered better than paying the lighting rates. By such a method the losses would increase as the load, whereas, with an equalizer, the losses simply increase as the difference in load.

While the means of obtaining this balance are possibly numerous, a few of these methods will be mentioned and may be of interest.

In Fig. 1 *A* and *B* are two 110-volt compound-wound machines and *C* is a 220-volt generator. Where the motors are of different capacities and different speeds they are belted together, that their counter-electromotive forces, when running empty, may be alike. In operation the action of such an equalizer is as follows:

Should more lamps or load be placed on *A*'s cir-

cut, the potential difference of that circuit will fall, while the potential of *B*'s circuit will rise the necessary amount to take up the 220 volts existing between the outside wires. *A*'s counter-electromotive force now becomes its electromotive force and supplies current to its circuit, and *B* will run as motor with an increased speed, the amount of increase of speed, of course, depending upon the conditions or extent of unbalancing. As both machines are compound-wound, with the winding so proportioned that they will compensate for any *C*R losses in the armatures, any deviation from what may be termed the critical speed will be very slight. It must be remembered that the series turns act in reverse directions in motor and generator, as the

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

PRACTICAL APPLICATIONS OF THE ROTARY EQUALIZER.

difference in load or balance becomes greater, so that the necessity for the series turns will be more apparent, and the finer the adjustment the finer the balance that can be maintained.

Should a reverse condition of balance take place, so that *B*'s circuit is the heavier loaded, *B* will become a generator and *A* a motor; in fact, a reverse order of things will take place.

In Fig. 2 *A* is a 220-volt generator, *B* a 220-volt motor, *C* and *D* two 110-volt machines. In operation this plan is similar to that indicated in Fig. 1, with the only difference that it can take care of a larger lack of balance. The 220-volt motor *B* is a small machine with a pulley at each end of the armature shaft and belted to both machines *C* and *D*, and it makes up for the losses of these machines (*C* and *D*) and allows them to be run at their full capacity; that is, they will deliver, if necessary, their full output to the line.

In Fig. 3 *B* is a 220-volt motor, *C* is a 110-volt machine, while *A* represents the 220-volt generator. The action of the device is the same as in the previous ones given. When No. 1 circuit is heavily loaded *C* will run as a motor and current will be generated by *B* and so raise the potential. The objection to this plan is that it will not regulate as closely, neither will it take care of so great a difference in load, the unbalancing being only equal to the capacity of the 110-volt machine.

Another system for equalizing might be mentioned. It is by use of the storage battery (Fig. 4). But it can hardly be as efficient as using the machines, due to the lower efficiency of transformation; neither is it as practical, for with the machines as energy is absorbed on one side it is given off on the other. This is not the case with the battery. Further, with the storage battery the initial cost would be considerably greater, and necessarily the cost of upkeep would be greater, for it should be installed of such capacity as would take care of the entire system in case of failure of the generating plant. Its greatest field, however, is possibly that of an auxiliary in times of heavy calls of short duration, and the fact that it would tend to increase the plant efficiency by allowing of the generators to be shut down during hours of light load must also be taken into consideration.

But probably the best arrangement for an equalizer is that of having one single machine with two windings on its armature and two commutators. This would undoubtedly give the best results with a minimum of trouble, the losses also being the lowest possible—one friction loss, one hysteresis and eddy current loss, one field loss, one set of journals, no armature reaction (consequently no sparking at the brushes with change of load), no change of speed if the armature resistance is of such a value that the *C*R drop through it would equal the raise in voltage on the other side.

In using separate machines armature reaction should be taken into account, and since the reaction

in motor and generator are in opposite directions the brushes should be set at a compromise between the two tendencies.

Practical Hints for the Electrical Mechanic.

A contributor of the WESTERN ELECTRICIAN made a galvanometer recently on the following lines: The base-piece *A*, Fig. 1, is wood. The lamp *B* is a common oil lamp. The screen *C* is a piece of tin tacked to the top of the upright board *D*. The lens *E* is a common magnifying-glass, such as is sold by dealers in optical goods, and is mounted in a wooden frame. Fig. 2 shows a good way to mount the glass. The vertical piece of wood is provided with a bore the diameter of the glass, and the glass is set in this. The lens-holder is mortised into the platform piece, and four screws which pass through the latter are used for leveling the glass on the base. The coil and needle plan is at *F*, in Fig. 1. The platform is wood and is fitted with leveling screws. Fig. 3 shows the plan of the needle suspension. The needle *A* is common steel with temper drum. A piece of mirror *B* is glued on at *B*. The core *C* can be made of cardboard. An ordinary lamp chimney will do to set over the coils, but it should be fitted with a cap like that shown in section in Fig. 4. This cap or top-piece is wood provided with a five-eighths-inch hole in the middle and fitted with a thumb-screw, as shown. A piece of this wood is glued over the opening in the cap and a small hole is put through the center of this for the suspension fiber of the needle system. Coming now to the coils, these can be wound on the form in Fig. 5. After winding the coils, shellac and dry them. Two are required, one for each side of the needle system. No. 32 to 36 wire is used. We now have the instrument ready to set up. Carry the top end of the fiber to the cap of the chimney, connect with the thumb-head, wind and adjust the system until the bottom needle is suspended in the center of the coil and the top needle is about one-half inch above the upper coil. The instrument may now be adjusted and used on practically the same principle as the regulation kind.

SETTING BRUSHES.

The diagram of Fig. 6 is given to show an instance in which the brushes are not set diametrically opposite, for this is a multipolar motor with cross-connected armature. In four-pole machines of this type the brushes are set at 90 degrees, with two sets of brushes, and for the six-pole machines at 180 degrees. Therefore, to set the brushes on one of these machines, first determine the correct position by means of a blue-print draft, and maintain this position. A common trouble is due to setting the brushes too far apart on these machines, resulting in the blowing of the safety fuse.

USE OF THE MICROSCOPE.

It is well known among electrical engineers and mechanics that much time and trouble is saved if the proper outfit is used. For ordinary microscopic work in the electrical business, the following apparatus may be used, representing only the most essential pieces: Microscope, complete with two eye-pieces, a two-inch and a one-inch, and two objectives, a one-inch and one-fourth-inch. This will give the following approximate enlargements in diameters:

Eye-pieces.	Objectives.	
	One inch.	One-quarter inch.
Two inches	50 Diameters.	200 Diameters.
One inch.....	100 Diameters.	400 Diameters.

A few three-by-one-inch glass slides and oblong cover glasses are also to be included, together with a half-dozen bottles to hold the test solutions that are required; also a few fine needles held in soft pieces of wood (handles), to be used in handling wires and small work while under examination. The most important point to be observed in commencing microscopic work is to select a window facing the north if possible, and in a room where there is the least amount of dust. It is best to keep the microscope when not in use locked in a case, and it and all the utensils for the work placed in a closet. This will insure them being always clean and ready for use.

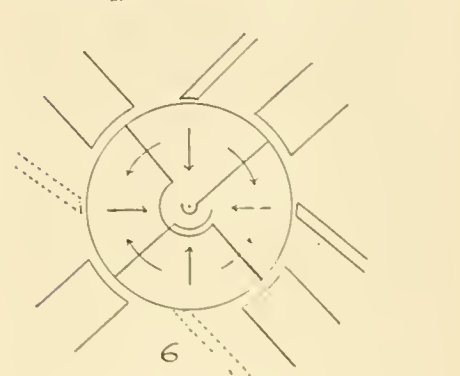

Submarine Telegraphs of the World.

Recent government statistics show that the submarine telegraphs of the world number 1,500. Their aggregate length is 170,000 miles; their total cost is estimated at \$250,000,000, and the number of messages annually transmitted over them 6,000,000. All the grand divisions of the earth are now connected by their wires. Adding to the submarine lines the land-telegraph systems by which they are connected and through which they bring interior points of the various continents into instantaneous communication, the total length of telegraph lines of the world is \$35,000 miles, the length of their single wires, or conductors, 3,500,000 miles, and the total number of messages annually sent over them 305,000,000, or an average of 1,000,000 each day. Of the 170,000 miles of submarine telegraphs, about 150,000 belong to 35 companies operating the commercial cables, which number about 320; the remainder are mostly short lines controlled by governments, and connecting forts, batteries, signal stations, lighthouses, etc., the aggregate of government lines being about 1,150 and their total length about 20,000 miles. In addition to this, the governments of the world hold about 80,000 miles of cable in stock for war purposes, ready to be laid at a moment's notice.

Patent Systems of the United States and Foreign Countries Compared.

By W. C. JOSE.

The possession of a patent system is the highest test of the civilization of a people. The last species of property to be recognized is the product of the intellect, that intangible subject-matter the right of ownership in which cannot be physically asserted, but must rest in the recognition and good-will of the populace. Before the dawn of civilization, the last act of semi-barbarism in the progress of a nation toward the light is the granting of patent for inventions by royal gift or legislative enactment for a money consideration, and the first act in the early morning of civilization is the establishment of a uniform patent system accessible to all, whereby the patent is granted for a limited term in consideration of the eventual gift of the invention to the public. Tried by this test, China stands just below the line of civilization and Japan has within a few years risen above it. In China patents for inventions can be procured only by royal grant and for a considerable influence and money outlay, while Japan, closely following the successful termination of the war which marked her break from the semi-barbarian past, has joined the modern nations by the adoption of a patent system. It is interesting to note in the case of Japan how the nation had made a considerable advance in the adoption of the materials of civilization before it awoke to the grander idea of the right of property in the product of the mind. Travelers in Japan, a few years ago, tell us that the disregard or lack of conception of this idea of right of ownership had proceeded to such a stage as to lead the Japanese artificers not only to copy the manufactures of foreigners, but to copy and adopt their name plates and personal marks of identification as well. But Japan has now taken the final step that carries her full into the sisterhood of enlightened

PRACTICAL HINTS FOR THE ELECTRICAL MECHANIC

nations by her formal recognition of the right of ownership in the produce of the mind. The evolution of the patent system among nations has been toward the growth of the patent privilege and the removal of restrictions in its grant and enjoyment, and the principal nations of the world have advanced far in this direction, while the United States stands pre-eminently first and foremost. During its brief life, as the life of nations is reckoned, the United States has given to the world in number of inventions more than any two of the other nations, and, as for quality, the steamboat, the cotton gin, the sewing machine, the telegraph, the telephone, the phonograph, the commercial arc lamp and the incandescent lamp form a list which cannot be approached by any other nation, and in connection with

1. Read before the Chicago Electrical Association, March 3 1899.

which but one nation, Great Britain, with the steam engine, the railway and the Bessemer process, is worthy of mention.

The idea of property, from the first gleam of ownership to the international recognition of patent and copyright property, has been a slow and labored growth. Anthropologists tell us that in the earliest stages of savagery the idea of property is unknown or very dimly outlined; that the savage first begins to assert ownership of the weapon with which he procures his food and defends his person—his club, his spear or his bow and arrow—and as though fascinated by the first sense of the right of appropriation, we find him lavishing the greatest care upon his treasured implement of livelihood and warfare, decorating it with the extravagance of his nature, placing its consideration above his own comfort, and at death, if violent, clutching it in his last death grip, if peaceful, placidly drawing the treasure to his breast to carry it with him to his happy hunting ground. The next assertion of ownership is as to those things which the savage can attach to his person, the scant raiment, the jewelry, the gew-gaws, the ringlets and anklets; as yet the growing thought has scarcely advanced beyond his immediate person. His abode, if not the natural cave or rift in the rock or tree, the home of a single night, is the property of the tribe, but in time the humble abode begins to vest itself with an idea of appropriation, and the savage, for the first time, feels that "his home is his

immovable land itself, thus giving to the individual the fixity which renders civilization possible, and far along the journey comes the recognition of property in the product of the intellect—the value minted by the mind, the thought wrought into wood or iron or stone, or embalmed in written word. Society learns that it is well to encourage efforts of the creative mind, and a franchise or monopoly for a limited time in the proceeds or profits of that which the individual creates is the best and easiest form of compensation, since it places the reward in the efforts of the individual himself, and is a spur to his efforts, and, moreover, is in the nature of an indirect tax on consumption, and is therefore easily borne by the people.

From the recognition of ownership in the first crude weapon to the recognition of property in patents and copyrights is a long journey, and they are as far removed as the club of the savage from the machine gun, the log canoe from the Oregon, or the savage's grunt from the poems of Shakespeare.

The patent system of the United States is the result of the enactment of Congress, founded on the clause of the constitution authorizing the encouragement of science and art by the granting of patents and copyrights, for limited periods, to inventors and authors. The spirit of our patent system is, however, derived from that of Great Britain, improved in many particulars, and the patent systems of the other foreign countries are modeled after that

our forefathers wisely omitted this feature, and provided for the grant of patents only to the first and original inventor. This provision encourages the effort to construct something new, rather than to spend time in trying to find and appropriate what has been previously discovered by others; and, moreover, it removes a very enticing incentive to mental theft. Franklin invented his famous open stove, and in the spirit of philanthropy which pervaded that great benefactor, determined to give the benefits thereof freely to the public, but the patent laws of England circumvented him, and an iron founder took out a patent on it in England and made a small fortune in vending it.

A few of the foreign countries have followed the example of England in this respect, while others, as Germany, France and Belgium, have followed it to a degree, since they grant the patent to anyone who applies for it, but if contested the patent will be declared invalid if it appears that the patent has been granted upon the invention of another without his consent. The patent is thus not *prima facie* evidence of validity of title. In the United States the patent will be granted only to the actual inventor, or at his request to his assignee, but the oath of the inventor to the effect that he believes himself to be the first and original inventor is a prerequisite to the grant of the patent. Some of the countries, as Sweden, Norway and Denmark, follow the practice of the United States in this respect.

While, as to this feature of granting the patent to the first to apply, England and the other countries mentioned are more liberal in the grant of the patent, it is not a liberality in favor of the inventor, but is rather a hindrance to his proper enjoyment of his rights. The American plan is evidently the more logical and just, and this fact is evidenced by the adoption of the spirit of the American idea by most of the other countries, among which may be included the colonies of Great Britain, each of which has its own patent system.

As to the remaining points of difference between the patent systems of the United States and foreign countries, it will be found that they reside in certain assistance which the United States gives to the inventor which the other countries withhold, and in certain restrictions to the enjoyment of the monopoly imposed by other countries which are absent in our system. The United States system thus offers the greatest encouragement to the inventor by assisting him to determine the true scope of his invention and by placing the fewest obstacles in the path of his enjoyment thereof, after the procurement of the patent.

The principal difference between the patent systems of the United States and foreign countries may be enumerated as follows:

1. The United States protects the inventor by granting the patent only to the first and original inventor, while some of the foreign countries grant the patent to the first to apply.

2. The United States provides an examining corps to assist the inventor in determining the state of the art and the true scope of his invention, whereas most of the foreign countries grant the patent as requested without inquiry as to novelty.

3. The United States gives to the inventor a preliminary period of two years within which to try his invention by public use to determine its practicality and value, before applying for a patent, while in foreign countries the knowledge or use of the invention in the country prior to the application invalidates the patent.

4. The United States places no requirement upon the practicing or working of the invention, while foreign countries usually require the putting of the invention into practical operation within a definite period.

5. The United States places no restriction upon the importation of the patented device, whereas such restriction is imposed by some of the foreign countries.

6. The United States requires the payment of no taxes after the grant of the patent, whereas the foreign countries usually exact a yearly tax or annuity, increasing from year to year, the failure to pay which causes a forfeiture of the patent.

7. In some of the foreign countries a compulsory grant of licenses is provided for, where the patentee refuses or is unable to fill the demand for the article, while in the United States compulsory licenses are not provided.

8. In the United States the term of the patent begins to run from the grant of the patent, while in the foreign countries the term usually dates from the filing of the application.

9. Some foreign countries provide that the domestic patent shall expire with the first foreign patent to expire on the same invention. About a year ago a similar provision in the laws of the United States was repealed.

Besides the above there are many differences of minor importance.

The first distinction referred to above has already been discussed.

As to the second, the examining corps as provided in the United States comprises a number of trained experts experienced in the various lines of industry, who, upon the filing of an application for a patent, examine into the novelty of the invention and make a report thereon. The letters-patent are in the nature of a contract between the inventor and the government, the consideration flow-

FIG. 1. ELECTRIC STAGE ELEVATORS.—MOTOR MECHANISM.

palace," and defends its temporary locality with his life. With the ownership of the home there come the various household implements, simple at first and few, but gradually increasing in number and growing in complexity. As yet, however, his simple mind can conceive ownership only in that which he can grasp in the hand, which he can lift and carry away; but as he begins to tame the animals that co-inhabit the land of his roamings, a widened sense of property appears, but as yet not advancing beyond those things which are movable—chattels, as the law names them. In the pastoral stage ownership of the land is unknown; temporary occupation of the land upon which the flock is for the time grazing is asserted—the easement, as it is called, is recognized or fought for; but so soon as the fodder is well cropped, the flock moves on to fresh fields. It is only when man begins to till the soil that the sense of the right to appropriate and own the land finds its birth. The annual or periodic crop, needing constant watching and care, necessitates the exclusive enjoyment of the soil, and with the individual thus bound to the earth, the seed of civilization is, as it were, planted. Fixed in locality, and no longer put to the necessity of frequent removal, the rude hut of hides or bark gives way to the more permanent structures of wood and stone, and in the leisure between the hours of toil the mind becomes free to think, and the constant sight of the clumsy home leads to its embellishment within and without, and architecture appears, and in the ever-present attempt of man to lessen labor and increase leisure, labor-saving devices begin to appear, simple at first and confined to the home and the farm, and thence ramifying to the thousand and one pursuits which growing civilization soon creates.

That the growth of the idea of property is slow is thus apparent, recognizing first the essential of life and existence, then passing to things that can be appropriated to the person, then to movables generally, and, finally to the

of Great Britain, with the frequent embodiment of more or less of the characteristic features of the system of the United States. While it cannot be questioned that the systems of foreign countries contain some points of advantage over our own, the patent system of the United States, by its remarkable and unequalled success, must be admitted to possess, as a whole, advantages over all other systems. It is worthy of note that the amendments in the laws of foreign countries have rather been a departure from the mother system of Great Britain and an approach to the system of the United States.

In the very early days, when England began to awake to the importance of her growing foreign trade, the little island, begirt with harbors from which her ships sailed out in all directions, sought to encourage manufactures and industries within her borders, as these she recognized to be the foundation of trade. In order to spur her fearless traders to penetrate every corner of the earth, patents of monopoly were granted, not only to those who should from the recesses of the mind bring to light new inventions, but also to those who by their travels abroad should learn of an art or industry and who should introduce the knowledge thereof into England. A system of monopolies was thus built up, which, in effect, parceled out the trade of the nation to various monopolists, each exclusively controlling some particular branch of industry, like the sale of salt, tea and the like. These monopolies led to abuses and the corruption of government, as is usually the case with prolonged franchises, and, finally, a law was passed wiping out all monopolies, and providing only for the grant of patents for a limited period to the producer or importer of a new invention or discovery. England thus retained the feature wherein patents are granted to one who introduces the knowledge of the invention into England, even though he be not the first inventor, and this feature is present in the English patent system to-day.

In the drafting of the American patent system

ing from the inventor being the complete disclosure of his invention so that the public may enjoy it after the expiration of the patent, and the consideration on the part of the government being the grant of an exclusive monopoly to practice the invention for a term of years. The examiners are, in effect, attorneys for the government, and the application for a patent is in the nature of the first draft of a contract which is submitted for their consideration. In the application the inventor outlines the scope of the monopoly to which he believes himself entitled in view of the prior art as the inventor understands it. If, in his examination, the examiner discovers prior patents, publications or uses which render the real invention narrower than the inventor supposed, he is called upon to redraft his claims, which set forth the essential novelty of the invention. By amendment the inventor brings his claims to the scope commensurate with the state of the art, and as thus amended the application matures into the letters-patent. If the examiner finds no novelty in the invention, the application is rejected upon the cited instances of prior invention. From an adverse decision of the examiner an appeal lies to the Board of Examiners-in-Chief, consisting of three judges, and from their adverse decision appeal may be taken to the commissioner of patents, and from his decision to the Court of Appeals of the District of Columbia. As a final resort the inventor may bring a bill in equity in the Federal courts to compel the commissioner of patents to issue the patent. The inventor thus has ample recourse if he considers the action of the examiner erroneous.

Germany has adopted the American system of examination as to novelty preliminary to the grant of the letters-patent, as have also to a degree Canada, Denmark, Sweden and a few other countries. With the exception of Germany, however, the examinations are not rigid or efficient.

In Great Britain, France and Belgium no examination as to novelty is made, and the letters-patent are granted upon the application as filed if the papers are formal. The result is that the patentee does not know whether his patent covers a novel invention or one which has been re-patented a number of times. An examination of English patents discloses the fact that the same invention is repeatedly patented unknowingly by different inventors, and such subsequent patents are, of course, invalid. If he would know whether or not his invention is patentable he must determine by a private examination at considerable expense what the government by the division of labor could perform for a merely nominal sum.

The examining system, however, presents in prac-

Electric Mail Transmission in Conduits.

Some time ago the WESTERN ELECTRICIAN described and illustrated the system invented by Mr. N. Sampson of Chicago for imbedding conduits for electric wires in curbstones made of concrete. This combined curb and conduit system leaves the middle of the street in undisturbed possession of sewer, gas and water pipes and is claimed to have many advantages, one of them being that of "relieving the electrical conscience forever of all blame for torn-up streets and poorly replaced pavements."

An interesting development of this system is the proposal to make the curb large enough to contain

ELECTRIC MAIL TRANSMISSION IN CONDUITS.

ducts of sufficient size for the electrical transmission of mail in miniature railway carriages. It is thought to be entirely practicable to transmit sacks of mail between the main postoffice and sub-stations in cities and between the postoffice and railroad stations by this method. The accompanying sketch shows roughly the outlines of the scheme, the ducts for electrical conductors being placed in the upper portion of the curb and the conduit for mail transmission in the lower part. Of course the conduit will not be large enough to permit a motorman on the train, but Mr. Sampson claims to have worked out all details of the scheme, such as the switching of cars and their automatic stoppage at the proper point. Owing to the requirements of the patent laws, however, he does not desire to make these details public at present.

It is asserted that the electrical transmission scheme is much superior to pneumatic tubes, owing to its greater possibilities in the way of capacity and speed. Second, third and fourth-class mail matter could be handled in pouches as well as letters, to which the pneumatic system is confined. Postmaster Gordon of Chicago made a report on the subject to the postmaster-general last year, and his

Touching the relative capacities of the pneumatic and other systems, the postmaster makes some interesting observations. He says: "About 60 tons of local mail are interchanged every day between six principal railroad depots and the general postoffice [in Chicago]. To transport any large quantity of mail through pneumatic tubes in any reasonable time it is necessary that the mail should proceed in a regular manner. If, for instance, 10 tons of mail were set down in front of the opening of a pneumatic tube in our temporary postoffice and there was just half an hour to make the connection at the Union Depot, three-quarters of a mile away, I venture to say that connection could not be made. On the other hand, if these same 10 tons of mail were loaded on wagons at the temporary postoffice and the wagons then driven to the Union Depot the connection could be made within the time specified. Such would also be the case if electric or cable cars were used."

"In the use of pneumatic tubes bulk would have to be broken at one end and restored at the other, and these things would constitute a bar to the successful connection of the mail. In the case of the wagon, electric or cable systems bulk would not have to be broken, and there would be an orderly progression. To transfer to tons of mail in a short time a tube would have to be large enough to convey a good-sized package. I believe that the largest tube that can be used in order to make the pneumatic system commercially profitable is a 10-inch tube. A tube of such size would be of little value to the Chicago postoffice." A tube 48 inches in diameter would be necessary for the largest sacks of mail.

Electric Stage Elevators.

In the remodeled Drury Lane Theater in London the stage is made in movable sections. These sections are really the platforms of electric elevators, and two have been equipped for operation. The platforms are carried on bridges and are about 40 feet wide and eight feet deep. The bridges are made of two light steel arched lattice girders of simple but substantial design; they are 38 feet 10 inches in length, spaced five feet six inches apart in one elevator and five feet two inches in the other, and well braced together to form one rigid structure, on the top of which the flooring forming part of the stage is fixed. The steel portion of each movable stage section weighs a little over 4½ tons; the wooden platform, which forms part of the stage floor, together with the joists on which it rests, weighs about 1½ tons more, the total weight being between six and 6½ tons. From four to 4½ tons of this total weight is counterbalanced.

The elevators have been designed to travel from the mezzanine floor, situated eight feet six inches below the stage, to a height of 10 feet six inches above the stage, and to insure smoothness and silence in working, with freedom from "binding," the ends or legs of the girders have been made of a considerable depth, sliding in angle guides attached to substantial steel stanchions.

The elevator mechanism is placed entirely below the platforms, in order to allow a clear uninterrupted floor when the tops of the lifts are "flush" at ordinary stage level. Each section has a totally independent and complete set of mechanism to work it. Power is supplied from the electric mains to a four-pole enclosed-type, shunt-wound motor, which develops 7½ horse power at 520 revolutions per minute, but is capable of working at higher rates on emergencies. The speed is reduced in the ratio of 104 to one, through a large worm and worm-wheel, as shown in Fig. 1, the worm-wheel being geared to a shaft which carries two winding drums making five revolutions per minute. Upon these drums are wound steel-wire ropes, which pass over guide pulleys and are connected to four places on the legs of the section—one near each corner. The speed of lifting, corresponding to the full speed of the motor, is 16 feet per minute, which can be reduced through resistances in circuit with the motor to six feet per minute.

There are compensating arrangements for equalizing the tension in the ropes, so that the pull is quite steady and uniform. The movement is controlled by a combined starting and reversing switch, which is operated by a man at a station below stage level, so placed that he can see the elevators. A hand gear is provided for working each elevator in case of failure of the electric power, and automatic safety appliances are in position to operate in case of emergency. Automatic switches cut off the current from the motor in case the attendant should forget to throw the switch at the right place. Gear is also arranged to lock the "bridges" in certain positions when used as part of a fixed scene. A large factor of safety has been allowed in apportioning the strength of the various parts of the mechanism.

The elevators have been thoroughly tested, and have worked with great smoothness and without any jar or shock on starting or stopping. They were designed to carry a live load of two tons, representing the weight of about 30 people, but they have during the tests operated much heavier loads than this. Fig. 2 shows each platform loaded with a coach weighing 3,200 pounds and several people.

The description and illustrations are taken from the *Electrical Review* of London.

FIG. 2. ELECTRIC STAGE ELEVATORS.—PLATFORMS ELEVATED UNDER LOAD.

tic one objection which is avoided in the English system. In the American system the inventor's rights are determined by the language of the claims which he accepts in his patent, and if he accepts claims narrower in scope than he might have obtained he is held to have abandoned what he fails to claim. An unskilled attorney or an obstinate examiner may thus lose to an inventor the true fruits of his invention. The failure of the inventor or his attorney to claim all he was entitled to claim, or the refusal of the examiner to allow a claim as broad as the inventor considers his invention to support.

conclusion was unfavorable to the pneumatic tubes; he favors the cable or electric system. On the question of speed he says: "If pneumatic carriers travel from the postoffice to the Union Depot at 60 miles an hour they are two minutes in transit. If it requires 10 minutes to load and unload the carriers and to pouch the mail the actual speed between these points is 12 minutes. If, on the other hand, the cable or electric system could take pouches and sacks and could convey them from the postoffice to the postal cars at the rate of 12 miles an hour, including the time for loading and unloading, the actual speed would be five minutes, or seven minutes less than the time taken by the pneumatic system."

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the entire contents of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, \$3.00 for a full year of 52 numbers; in clubs of four or more, \$2.50, with free extra copy for eight subscriptions; foreign countries, \$5.00 a year, single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—the only general electrical paper published in the West—thoroughly covers a territory exclusively its own. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers desiring western trade will appreciate the UNEQUALLED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

According to cable despatches in the daily papers from London the government has announced its intention to engage in the telephone business, and an appropriation of \$10,000,000 has been asked for the purpose of beginning the work. The details of the government's policy have not been given in the meager despatches alluded to, but it may be taken for granted from the enthusiastic support which the proposition received in Parliament that the enterprise will be given a fair trial by the government.

The attitude of the National company in England to-day is somewhat similar to that of the Bell company in this country at the time of the expiration of the fundamental Bell patents. Equally arrogant and hostile to the public, they command little respect and no sympathy in their trial. In this country the result of the policy of the old Bell monopoly is plainly seen in the encouragement that is everywhere extended to independent enterprises. Judging from the expressions of opinion in the English press, the same condition would confront the National company if the field had been thrown open to competition. Whatever the plans of the government may be, it is safe to assume that the public will welcome any change that will promise relief from the obnoxious corporation which now controls the field.

In his recent annual address Mr. J. S. Walker of Nashville, Tenn., the president of the Engineering Association of the South, quoted with approval this remark of the late James B. Francis: "It takes nine pounds of common sense to apply one pound of science." Mr. Walker made a plea for practical business methods in engineering work. The gist of his address is contained in these words: "The savants have originated little, and their mental habit is such that they cannot direct; still our debt to them is very great, and we cannot do without them. But when we come to educate the rising generation of engineers, I, for one, fear that we may have them too much educated and refined for the work they are to do; and it is more than probable that the great schools, with their refined and extended courses on subjects which are only truly taught by actual experience, while they may help and assist to train, will be found as not tending to elevate the great mass of engineers."

Mr. Walker's position will be approved by many who have had occasion to give this subject careful consideration, and his views should have influence with educators and directors of manual training, scientific and engineering schools. The subject is one of great importance to technical trades and the engineering fraternity.

Two important decisions affecting the rights of electrical corporations to occupy public highways with poles carrying wires used in the transaction of their business have just been reported—one in New Jersey and the other in New York.

The former was in the case of Benjamin Nicoll, a property-owner of Morristown, against the New York and New Jersey Telephone company, and was decided on March 7th by the New Jersey Court of Errors and Appeals. Judge Dixon, who wrote the decision, says that the use of public highways for the erection of telegraph and telephone poles does not come within the definition of public easement in that state, and he finds, therefore, that provision must be made for compensation to abutting property-owners who have a fee in the bed of the highway. A similar decision was made by the New York Court of Appeals in 1894 in the case of a property-owner against the American Telephone and Telegraph company. Judge Rufus W. Peckham prepared the opinion in that case, in which he declared that "neither the state nor its corporation can appropriate any portion of the public highway permanently to its own special, continuous and exclusive use by setting up poles therein, although the purpose to, which they are to be applied is to string wires thereon and thus to transmit messages for all the public at a reasonable compensation."

The second decision referred to was pronounced by the Court of Appeals of New York, and was also handed down on March 7th. While the principal question involved was the privileges of electric-lighting companies, the decision also had a reference to telegraphy and telephony, and it is to be noted that electric-lighting stands on a different basis from electric message sending in the view of the law, the former being recognized as a legitimate and necessary street use for public purposes, while the latter is not. The court establishes some interesting propositions in regard to this subject of lighting highways. Light, being an aid to the public in traveling upon a highway in the night time, subserves a street purpose, and in cities and incorporated villages it is declared to be not only a right but a duty of the municipal authorities to supply it. "Not so with telegraph and telephone wires," says Judge Haight.

"They in nowise preserve or improve the streets or aid the public in traveling over them." The placing of the necessary poles and wires for lighting a highway must therefore be deemed one of the uses for which the land was taken and does not impose upon it an additional burden for which an abutting owner is entitled to compensation. This rule is held to apply to rural districts as well as to more thickly populated localities, if the inhabitants are willing to pay the expense. The court intimates, however, that if the highway be only a country road, lightly traveled and where no necessity exists for light, a taxpayer might object effectively.

It is now an old story, but nevertheless an interesting one for electrical men, which is told in the "Red Book of Spain," and from which translations have been made for the American press. These excerpts disclose the effect upon the Spanish government of the interruption of telegraphic communication with the seat of war, and they establish the fact that the cable cutting in the Philippines and Cuba did more to cripple Spain than any other event excepting the decisive engagements at Manila and Santiago.

Lieut. E. Capehart, who made observations recently of the mine defenses of Santiago harbor, has reported to the government that the entrance to the harbor was protected with electrical and contact mines. The electrical mines were of the Latimer-Clark type, containing gun-cotton, and the contact mines of the Bustamente pattern, carrying smaller charges. The electrical or observation mines were planted in mid-channel, and were controlled first by two stations on the west or Socapa bank, one on Cay Smith and another at Estrella Cove, on the east bank. The station at Estrella Cove and the inner one on the Socapa bank were in the best possible positions for protection, and could have been operated even should the banks have been swept by the guns of our fleet. In the cove just beyond the Morro the operator could, in almost perfect security, observe his mine field until the ships to be destroyed were almost abeam of him, and could operate the mines long before he could have been discovered. The electrical mines were planted on the bottom in from seven to 11 fathoms, and the contact mines were anchored to float at about 11 feet below the surface of the water. The mine fields were well protected.

It has been contended that the foothold gained by American manufacturers in foreign markets is due in large measure to the marvelous perfection attained in machinery designed and constructed in this country, and that this condition can be traced directly to the encouragement and protection offered inventors by the American patent system. The multiplicity of inventions has rendered the work of the Patent Office far more onerous and difficult than it used to be; the facilities at the disposal of the commissioner are inadequate, as they have not been increased in proportion to the demands upon the office, and, as a consequence, the value of a patent is less than it should be. Meanwhile the government turns into the treasury a large percentage of the money paid by inventors for the maintenance of the Patent Office. At the present time, when American manufacturers are reaching out for foreign markets, it is believed no greater aid can be given them than by fostering and stimulating invention. The United States can only become dominant in the markets of the world through labor-saving inventions which will enable this country to compete with the lower wages paid elsewhere. The greatest development in American exports must be in manufactured articles. "In labor-saving machinery and in the intelligence of the labor employed, the United States to-day is in advance of the world." While this is true of manufacturing industries generally, it applies with particular force to the electrical workers of the country. No other industry is so dependent upon the integrity and efficiency of the Patent Office, and none has more reason to appreciate the constant watchfulness that has been exercised in its management. The fault does not lie with the Patent Office, but with Congress. The management of the office has been satisfactory, but the appropriations for its maintenance and the needed improvements of the service have been inadequate. An organized movement, representing manufacturers, inventors and the patent bar, should be formed to urge upon Congress the necessity for providing facilities for efficiently carrying on this work.

Electrical Work in Mexico.

[Prepared for the WESTERN ELECTRICIAN by the Philadelphia Commercial Museum.]

Interesting information relative to the progress of electricity and the transmission of electric power at different points in Mexico is furnished in the correspondence of the Philadelphia Commercial Museum, and some hints are furnished that may possibly benefit American electricians.

The city of Merida, the capital of the state of Yucatan, Mexico, with a population of 40,000, has only one electric-light company and no electric railway. The electric-light plant is reported as being out-of-date, and its owner and manager, Miguel Espinosa Rendon, is said to be disinclined to make needed improvements. He holds the contract for lighting the city.

The Compania de Tranvias de Merida, incorporated with a capital of \$400,000, operates 24 miles of street-car lines and owns a concession from the government for laying tracks on every street in the city. This right is exclusive and has five years to run. The company operates 45 horse cars, but is open to negotiations for enlarging the capital for the purpose of adopting electric power and extending the system before the time limit of its franchise expires. The company last year paid a six per cent. dividend. The treasurer and general manager is N. Escalante y Peon of Escalante y Hijo, Merida, with whom correspondence can be conducted in English.

Negotiations with the Compania Mexicana de Electricidad of the City of Mexico might result in orders for equipment coming to the United States that have heretofore been placed in Germany. The company was established by Siemens & Halske of Berlin. The stock of the company is held by Germans, who naturally favor their countrymen in the purchases of supplies. The company has been contemplating extending its plant at about this time, and the opportunity of introducing American equipment and supplies should not be lost. The machines in use have a capacity of 800 horse power. The superintendent is D. Luis Bacmeister, and D. E. H. Horner is business manager. The technical work is in the hands of D. F. Neugebauer. The street-railroad company, which is controlled by Americans, is contemplating the adoption of electricity on the suburban lines, and later on the city lines. Electrical lines are practically unknown in Mexico, and there should be considerable business picked up there by American houses.

The city of Leon, the capital of the state of Guanajuato, a place of 120,000 inhabitants, has an installation for electric lighting which is not giving popular satisfaction, inasmuch as \$1.25 is charged for each incandescent lamp of 10 candle power. A correspondent suggests that cheaper power could be obtained by utilizing a waterfall, five miles distant. Leon has neither a water supply nor sewerage system, and the correspondent suggests that there is a "great future there for an enterprising person or company."

Hermosilla, a city of 15,000 inhabitants, in the state of Sonora, has no electric railroad. In June last an electric-lighting plant was established by Ricardo Uruchurtu, a Mexican, and Florence Monteverde, an American citizen. The plant was enlarged in August and is giving good service. This company also owns and operates a lighting plant at the port, Guaymas. The equipment was supplied by the General Electric company of Schenectady, N. Y.

In Santa Rosalia, Lower California, there are several plants for the transmission of light and power owned by the Bolco company of Guaymas. The company supplies about 1,000 horse power to its mines, factories, etc. The plant was purchased in Oerlikon, Switzerland. The company is dominated by Frenchmen.

An electric plant, to furnish 4,000 horse power, to be generated at Atlixco, state of Puebla, for the transmission of power to the cotton mills and factories around Puebla, is expected to be soon placed in operation. The concessionaire from the state, Sebastian de Mier, a well-known millionaire, received a temporary setback from the owner of the land at Atlixco, who demanded \$50,000, but as his concession carried with it the privilege of condemning property necessary for the work, Mr. de Mier has deposited \$10,000 to cover the value of the land to be used for the turbine pit, buildings, etc. The company having the contract for the installations and operations of the plant is represented by J. W. Ebert, to whom Mr. de Mier last summer leased the power. Mr. Ebert arranged in his turn with a company to put up a plant to cost not less than \$275,000, gold.

The installation, which is to be completed by April 1st, will include four Stanley generators of 1,200 horse power each, the wires to go a distance of 20 kilometers. There will be six copper wires, and it will be a three-phase system on the basis of 10,000 volts. The hydraulic installation is to be supplied by the Pelton Water Wheel company, New York, comprising four water wheels of 1,200 hydraulic horse power each. The power thus to be furnished will serve for the lighting plant of Puebla, consisting of 250 arc lights and 2,000 incandescents, as well as for the factories and mills around the city of Puebla.

Power will be drawn from extensive hydraulic works, which have just been completed by Mr. de Mier, at a cost of \$650,000, and primarily intended by him for the irrigation of his hacienda. The power plant is in the mountains, 12 miles south of Puebla; there a dam was put in, to divert the water from the

headwaters of the Atoyac River into a canal and tunnel system, which continues in a southwesterly direction 11 kilometers further. The water passes through four kilometers of canal, then a tunnel nearly five kilometers in length through the heart of a mountain, and, finally, through 10 tunnels and a canal for a distance of two kilometers. These latter tunnels vary in length from 100 to 600 feet. The large tunnel, which is a magnificent piece of masonry, is 2½ meters in height. There are in this tunnel 22 shafts, varying in depth from 50 feet to 125 feet, and which were used in the construction.

The total length of the hydraulic system is 11 kilometers. The fall in the upper canal and tunnel is 20 centimeters per kilometer, and in the lower end of the canal it is 60 centimeters per kilometer. The sectional capacity of the canal is six cubic meters per lineal meter. The actual flowage of water during the lowest stage in the dry season of the year is three cubic meters per second, or 3,000 liters.

This exhaustless volume of water flows through four 42-inch pipes from the entrance to the canal down the mountain side, a distance of 2,500 lineal feet, at an angle of 19 to 30 degrees and with a total perpendicular fall of 469 feet. This fall of 469 feet of 3,000 liters will produce over 4,000 horse power. The same water, after passing this first fall, is conveyed further down the valley upon the mountain side, some four kilometers, until another elevation is reached of some 200 feet above the valley, an elevation with a water supply capable of producing an additional 2,000 horse power, being a total at both falls from the same water of over 6,000 effective horse power to be utilized when the electric installation is completed for Puebla. Later on the same company may bring power to the City of Mexico.

BOOK TABLE.

ARMATURE WINDINGS AND ARMATURE CONSTRUCTION OF DIRECT-CURRENT DYNAMOS. By E. Arnold. Berlin: Julius Springer, 1899. (Third edition. With 418 illustrations in the text and 12 plates.)

The electrical fraternity has long been in anticipation of the appearance of a translation of the second edition of the above work, announced nearly a year ago as in preparation. When it does appear it will be welcomed no less heartily because of the publication within the last few weeks of the third edition, in the original German, of this valuable work. It is not improbable that the English translation will be corrected to date and embody the later developments contained in the present third edition. In any event, those investigators and practical men who are able to read the original will have access to a valuable work.

Unlike some works on this and other technical subjects that are intended for the use of the expert, this book is equally well adapted to the beginner, or perhaps the less advanced of students of practical electricity, for it begins with a very lucid explanation of the phenomena of induced currents, and by steps, both mathematically and graphically set forth, leads the reader by natural and gradual stages through the elements of the subject on to the intricate combinations of the various phenomena as experimentally tried and commercially carried out in practice. A spirit of catholicity pervades the whole work and attests to the author's unbiased mind and universality, for throughout American, English and German apparatus and methods are treated with refreshing impartiality.

The illustrations, which average more than one to a page, consist of reproductions from photographs of the actual armatures, but more largely of reproductions from shop working drawings, reduced to a convenient size to make them perfectly legible, and yet not so large as to be unnecessarily unwieldy, as is the case with one or more otherwise excellent American works. The combination of descriptive and mathematical text with the plan of profuse illustration, together with the world-wide fame of the author and the thorough up-to-date character of the work contributes to make the appearance of the volume something of an event in the electro-technical world.

Nernst Electric Light.

It is disclosed in the prospectus of the new English company bearing the name of the "Nernst Electric Light, Limited," that the rights of this invention—this new lamp which Mr. James Swinburne declares is "the greatest invention in electric lighting since the infancy of the industry"—are controlled by George Westinghouse for North America, Ganz & Co. of Budapest have the rights for Austria-Hungary, Italy and the Balkan states, and the Allgemeine Elektrizitäts Gesellschaft of Berlin controls the patents for the remaining European countries. The Nernst Electric Light company's territory is Asia, Africa, Australasia and South America, certainly large enough in extent to satisfy any moderate ambition. The capital of the company is £320,000, and the purchase price of the Nernst rights is £270,000, leaving a working capital of £50,000.

Nernst's invention consists in the use of a rod of highly refractory oxide instead of carbon as a light-giving body in incandescent lamps. Such materials are insulators when cold, but when heated are conductors, and as they stand a much higher temperature than carbon they can be run at a much higher electrical efficiency. As the oxides are not consumed, a vacuum globe is unnecessary. Large Nernst

lamps contain an electrical heating hood, to get the rods hot enough to begin to conduct. As soon as the rod takes the current the hood is cut out of circuit automatically. The rod itself, with the two wires on which it is mounted, is easily replaceable. In smaller lamps the movable hood is replaced by a stationary heater, so that the lamp is cheaper and simpler. No figures are given as to the cost of the new light to the user, but the company claims that there will be a great demand for the Nernst lamps and that in many cases existing lamps will be forced out of competition. The general attitude of the electrical public in England seems to be that of benevolent incredulity.

The WESTERN ELECTRICIAN is in receipt of a communication from Theodore Reyman of 46 First avenue, New York, who requests the publication of the following statement: "Having experimented with the higher oxides used by Professor Nernst, I have designed a new form of lamp which obviates the long wait before the oxide conducts the electric current. The method I use is the employment of an arc lamp, the upper carbon of which is raised by a magnet connected in series to form an arc. Around the arc I have placed a hollow cylinder of oxide connected in shunt around the arc. When the switch is turned no current flows through the oxide, but as the carbons complete the circuit the magnet raises the upper carbon, and the arc thus formed heats its jacket of oxide, which soon conducts the electric current under the intense heat evolved, and becomes incandescent. The arc between the carbon electrodes is broken, owing to the increased length of the arc and the reduced current which now passes through the incandescent cylinder of oxide. The upper carbon is fed by gravity when the current is turned off and is prepared to again impart the initial heat. I have successfully operated three such lamps, connected in series on 110-volt direct current."

At the meeting of the electrical section of the Franklin Institute of Philadelphia, held on February 28th, Professor Franklin of Lehigh University showed a new type of lamp made by himself, on the same principle as that invented by Professor Nernst of Goettingen University. The lamps shown were glass tubes about two inches long by one-fourth inch in diameter, filled with magnesium mixed with powdered glass, a platinum terminal contact being sealed in each end of the tubes. In Professor Franklin's experiments with these lamps he has secured a very satisfactory light.

American Manufactures in Russia.

[From the Washington correspondent of the WESTERN ELECTRICIAN.]

WASHINGTON, D. C., March 11.—Late advices state that our diplomatic officers at St. Petersburg, Russia, have been consulting with American residents of that city and Moscow, as well as American manufacturers who have visited the Russian capital during the last year, as to the advantages to be derived from an American exposition to be held in St. Petersburg in 1901, immediately following the Paris Exposition, as the best method of introducing and advertising goods and affording American manufacturers an opportunity to become acquainted with Russian merchants and familiarize themselves with the kind of goods adapted to that market and the methods of doing business. Such an exposition, it is pointed out, would result in the establishment of a Russo-American bank to handle American business, a commercial agency to report on the standing of business men in both countries, as well as an international express company and parcels post—all of which are essential to the proper development of trade with that rapidly growing country.

While some American manufactures are recognized by Russian importers and consumers as the best of their kind and are sold in large quantities, American manufactures in general are both discredited and handicapped in Russia, and the introduction of new goods made extremely difficult, for two reasons. The first is that European manufacturers, Germans especially, fill the Russian markets with inferior goods stamped, trademarked, etc., as "American," which, being accepted by the unsuspecting Russians as genuine American productions, discredit our manufactures to such an extent that nothing short of active and persistent personal effort can push new articles into general use. The second reason which operates against the introduction of American manufactures is the long credits given by the British, French, German and other manufacturers—credits based upon the reports of their agents, who traverse the empire and know exactly how far credit can be safely given.

The proposed exposition would overcome both these difficulties and would undoubtedly result in our manufacturers securing a much larger share of the trade of Russia. It would be a national advertisement of American industrial skill, and would be far-reaching in its results. Such an exposition as the one proposed is like a window display on a gigantic scale, in which are placed on view choice samples of the national stock in trade, which attract the thoughtful attention of prospective buyers. The electrical industry is as much interested in this export question as any other industry, and our electrical manufacturers should keep this proposed exhibition in mind and be alive to the value to be derived from making a creditable exhibit. A. F. T.

DEVELOPMENT OF THE TELEPHONE FIELD.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the WESTERN ELECTRICIAN.]

The Albia, Ia., telephone system has now 175 instruments in use.

C. M. McFatrige of Moravia, Ia., has sued the Ottumwa Long-distance Telephone company for \$1,350. Mr. McFatrige owned a line connecting Moravia and Blakesburg, which he sold to the defendant for \$1,500. The company paid him \$500 and was to pay the balance soon after, but he claims this has not been done, and sues for \$1,000 and interest, making a total of \$1,350.

The Iowa Telephone company announces that Nevada, Ia., will have all-night service hereafter. The new mutual telephone company at Nevada is having gratifying success in getting subscribers. About 75 instruments have been ordered, and more are in sight.

The town of Brighton, Ia., will vote on March 27th on granting a franchise to Robinson & Wilson for the Washington Telephone company; also to the Jefferson County Telephone company.

Fonda, Ia., will vote on March 27th on granting a telephone franchise to George Sanborn and others.

The Mutual Telephone company of Des Moines, Ia., has won its contest to get more of its instruments placed in the statehouse. The state executive council has ordered five new connections made, giving the Mutual nine instruments in the capitol building.

An effort is being made to secure sufficient subscribers at Renville, Minn., to put in a telephone exchange.

F. A. Meacham is working to establish a telephone exchange in Edgerton, Minn.

The council of St. Paul has passed a resolution asking the Legislature to take action to regulate the rights of telephone and telegraph companies. It calls for an amendment to prohibit such companies from occupying streets in cities without the consent of councils of the cities.

Some malicious person near Chippewa Falls, Wis., has been cutting the toll wires of the Chippewa Falls Telephone company. A reward of \$100 for the arrest and conviction of the perpetrator has been offered.

The council committee of Duluth, Minn., reports that it would cost about \$100,000 to install a telephone system for the city, and thinks that a plant cannot be operated on the rates proposed by a new company—\$30 and \$20 per annum—without losing money. The council left the matter of a new system, which is strongly favored by the mayor, to be settled by the incoming council.

The Great Northern Railway company cut down about 60 poles of the Northwestern Telephone Exchange company along its right-of-way between Orr and Inkster, N. D. The people on the line were indignant at the interruption to their telephone service. It arose from a right-of-way dispute.

Ex-Congressman Boen of Fergus Falls, Minn., is agitating the question of township telephone systems for the benefit of farmers. He thinks a system to connect with 100 dwellings in a township could be built for \$3,500, and in many localities the residents could do a great deal of the work. He thinks the Legislature ought to make provision for operating township telephone exchanges.

Ida Grove, Ia., will vote on March 27th on granting the Iowa Telephone company a franchise.

Gleason & Sleight of Ashland, Wis., are said to have begun suit against the Wisconsin Telephone company for damages alleged to have been the result of incompetent service. The complaint alleges that there is long delay in answering calls by the operator, and the service is very unsatisfactory in many ways.

The Standard Telephone company proposes to connect its toll system with Garnavillo, Ia., from Elkader to Guttenberg.

The Farmers and Traders' company of Fremont, Ia., has been formed to build a telephone system to connect with other cities and towns in the vicinity.

The Central Telephone company of Des Moines, Ia., is an applicant for a franchise at Pella, Ia.

The Rushford (Minn.) Telephone company is understood to be preparing to build toll lines in the spring to Albert Lea, Minn., on the west and Minneapolis on the north. It will connect with the independent exchange being constructed in Minneapolis.

The Badger State Telephone company will put in a telephone system at Milton, Wis. The company connects with 30 towns in Rock County and with other parts of the state.

The town of Odobolt, Ia., will vote on granting Clold H. Smith a franchise for a telephone exchange. He offers to give all-night service if he can secure 75 subscribers.

The Clearfield and Mount Ayr Telephone company is arranging with a number of people at Mount Ayr, Ia., to give them several bulletins daily of Chicago stock-market quotations.

In less than a year the telephone system at Glenwood, Minn., put in by J. J. Greaves, has reached 60 connections. Mr. Greaves contemplates extending a line to Green Isle, Minn., and connecting with the Sibley County system.

Avoca, Ia., votes on March 27th on granting a franchise to the Nebraska Telephone company.

The town of Sutherland, Ia., will vote on March

27th on granting franchises to the Iowa Telephone company and to the Nebraska Telephone company. The Owatonna (Minn.) Telephone company has installed a new switchboard of 240 drops.

Telephone Rates for New York.

The Marshall bill providing for lower telephone rates in New York has been transferred from the finance committee to the committee on miscellaneous corporations in the Senate, and as the latter committee has heretofore shown its hostility toward measures of this character it is feared that the present bill will be permitted to slumber until the close of the session.

The bill provides maximum rates for telephone service in the cities and towns of the state, and gives authority to the controller, the attorney-general and the state engineer to enforce the act. The sum of \$15,000 was to be appropriated to pay the expenses of the commission, and therefore the measure was consigned to the finance committee. The supporters of the Marshall bill felt more confident of a favorable report from the finance committee than from any other committee in the Senate.

Subsequently, however, the majority of the Republican members of the committee decided to give the bill to the committee on miscellaneous corporations. It was held a day by the action of Senator Brown (Republican) and the Democratic members. Then came a ground swell, from New York apparently, which affected all the Democratic members but Senator Douglas of Albany, who happened to be absent, and there was a practically unanimous desire to send the bill to the committee on miscellaneous corporations. This decision was made, but before the bill was sent back to the Senate the appropriation of \$15,000 was taken out, which would leave the State Telephone Commission, if it should be organized, without funds to carry on its work.

Senator Higgins, chairman of the finance committee, said on presenting the bill to the Senate, that the cancellation of the \$15,000 appropriation left the bill without reason for being in the hands of his committee, and it should be sent to the committee on miscellaneous corporations. He was sustained in this action by Republican and Democratic members of the finance committee, and the Senate approved the report.
