The magnetos, instead of being wound, as ordinarily, for 10,000 ohms, are wound to ring through 50,000 ohms, and a battery is placed inside of the magneto-box, the transformer and receiver being mounted on a separate L-shaped piece connected by a flexible cord to the magneto-box. The impedance of the series arc circuits, when used for telephoning, is very great, owing to the capacity of the rubber-covered, lead-sheathed cable, and, in order to talk successfully, it was found necessary to use condensers in connection with both telephones. With their use we are able to hold conversation over our longest series arc circuit, which is 12 miles underground and three miles overhead, and contains 65 lamps. The method is very simple, as may be seen from the accompanying Fig. 4. The telephone at the station end, except at time of test, is left constantly in circuit. When the subway foreman has completed his arrangements he connects his telephone, one wire to the copper of the cable and the other to the lead sheath, calls up the tester and so advises him. The foreman then disconnects his 'phone, and the tester does likewise, at the same time switching in his galvanometer. The latter then makes his test and throws his telephone back into circuit. After the lapse of three minutes the foreman also reconnects his telephone and calls up to know the result of the test and get further instructions. In this way the work of overhauling and renovating is very much facilitated, and the cost of maintenance and repair sensibly reduced.

The other large company distributing two-phase current in this city uses Westinghouse apparatus, and, if I am correctly informed, a variation of the Mershon system of distribution, which is somewhat different from the system just considered. The generators are of the two-phase type, with "star" connection, and generate a potential of 25 times the voltage used on the lamp.

The generator leads, of which there are four, are carried through double-throw switches to the bus-bars, and from these the feeders are taken, as is shown in Fig. 5. The feeders consist of three wires, two being taken from one phase—the red, for instance—and the third, of smaller size, the so-called "power wire," is taken from one of the bus-bars of the other or black phase. Therefore, on this feeder (No. 1) the lighting is carried on the red phase and the power taken from both; on the next feeder (No. 2) the lighting is taken from the black phase and the power from both. In this manner the feeders are balanced between the two sets of bus-bars, so that the load is evenly distributed on the generators.

A large part of the distribution, instead of being

made from house-to-house transformers, is accomplished by two large transformers being placed in the vaults or basements of the larger customers, and secondary mains run out from these places to the surrounding installations, as shown on secondary mains, No. 1. The larger of these two transformers carries the lighting load, and is wound with a ratio of 25 to two, the primary wires being connected to the cables of one phase and the secondary to the two heavy distributing cables, having a potential difference of 220 volts. The other or smaller transformer is wound with a ratio of 25 to four. One of its primary wires is connected to the so-called "power wire" and the other to the center of the primary of the lighting transformer. One of its secondary wires is connected to the secondary "power wire," and the other to one of the secondary lighting wires. You will therefore see that the difference of potential between the secondary leads of this transformer is 220 volts, and that the resultant pressure between the "power wire" and the other lighting cable is 310 volts.

Where incandescents and arc lighting only are required the two lighting cables are carried into the installations and an economy coil placed at the service to divide the pressure into two equal pressures of 110 volts each. Two sizes of coils are used, one of large and special design for theater work and the other for ordinary installations. The leakage loss on the latter varies from .1 to .5 ampere at 200 volts, which goes on during the 24 hours of the day. This probably offsets the saving of leakage loss due to the use of large transformers in sub-stations, instead of a greater number of small transformers, as in the house-to-house system. Where arc lights only are required, the 220-volt wires are carried direct to the lamp and an economy coil used having a ratio of 220 to 32. Where motors are required, the "power wire" is also brought in and the motor connected on the three wires as shown, although, as a rule, motor customers' premises are used as transformer sub-stations.

In conclusion, I desire to say that both methods are capable of good work, and, so far as cost of operation is concerned, there is under the existing circumstances but little difference, I think, between the two. It is undoubtedly true, however, that in the matter of power service the Mershon method has a distinct advantage in operating elevator motors of large size, because the primary current is taken, one-half from the lighting circuits and the remainder from the "power wire," whereas in the other method it is taken entirely from the lighting circuits, and the heavy inrush currents at the time the motors start vary the pressure and sometimes produce disagreeable effects upon the lighting, particularly in localities where the copper is scant.

As compared with single-phase distribution, I should say that either of the two-phase systems here described was superior in two important particulars, viz., in the matter of providing a second service, as before stated, and in operating elevator motors. The latter point is one of very great importance, as you will appreciate when I say that in New York city there are installed upward of 15,000 horse power in elevator motors alone, which yield annually a revenue far in excess of what might generally be supposed.

Municipal Electricians at Wilmington.

The National Association of Municipal Electricians will hold its annual convention in Wilmington, Del., on September 5th and 6th. It is expected that delegates will be present from 100 to 150 cities of the United States and Canada. During the convention papers will be read by the following-named gentlemen: Thomas Flood, commissioner of Wire Department, Boston; M. W. Mead, city electrician, Pittsburg; George F. MacDonald, superintendent of fire telegraph, Ottawa, Canada; S. D. Wheeler, superintendent fire telegraph, Springfield; W. H. Thompson, superintendent of fire telegraph, Richmond; Captain William Brophy, chief electrician, Boston; John Weigel, superintendent of police telegraph, Boston.

Jonathan W. Aydon of Wilmington, the president of the association, has secured the Pyle Cycle Academy, where an electrical exhibition will be held during the entire week, September 4th to 9th, inclusive. The following-named concerns have taken space: Frederick Pearce, New York; Okonite company, New York; M. & I. Electric company, New York; Kerite company, New York; Gamewell Fire-alarm company, New York; Standard Underground Cable company, Pittsburg; Habirshaw Wire company, New York; F. M. Ferrin, Boston; J. S. Wilson, Boston; Shelby Electric company, Shelby, O.; Montauk Multiphase Cable company, New York; Wilmington City Electric company, Wilmington, Del.; Columbia Phonograph company, New York; Electric Carriage Automobile company, Philadelphia; Kings County Electric Equipment company, Brooklyn.

The Gardner, Westminster and Fitchburg Street Railway company has been incorporated under the laws of Massachusetts at Fitchburg, Mass., and will construct a road 10 miles long. The route will be from Gardner to Fitchburg, with a connecting link to Wachusett Lake. The officers are: President, F. S. Coolidge; vice-president, E. F. Blodgett; clerk and treasurer, J. F. Stiles of Gardner. It is expected that the line will be in operation by July 1st.

"Diamond H" Push-button Switches.

It would seem that the demand for push-button switches has been more than satisfied by the various types upon the market, and that very little improvement could be made in switches of this class. Like many other articles of manufacture in the electrical line, improvement can be looked for only in details, but the manufacturer who makes the most successful combination of improved details will have an article which will command a ready market. The "Diamond H" line of push-button switches, herewith illustrated, is said to have many points of merit. It has been the aim of the manufacturer of this line to answer objections made in the past by engineers, wiremen and others against the various modifications of this general type of

laminated, and held together by a central bushing. This spool is shown in section in Fig. 5. It is loosely mounted in an elongated opening in the switch plate, and is driven by a pin through its central opening. The body of the spool is surrounded by a steel sleeve, thus preventing the edges of the opening in the switch plate from cutting the mica. Mica, being a practically perfect insulator, a non-absorbent of moisture and unaffected by changes of temperature, is by far the best material that can be used for this purpose. The movement of the buttons is smooth, and the pressure required is uniform throughout their travel, and nothing else has been sacrificed to secure this end. Details of less importance than those referred to have been carefully considered, and the result is a switch

Fig. 1.

Fig. 2.

"DIAMOND H" PUSH-BUTTON SWITCHES.

Fig. 3.

Fig. 4.

Fig. 5.

switch. The main points that have been considered in the construction of this switch are: First, positive mechanism and good contacts, with good wearing qualities of both; second, perfect insulation of the current-carrying parts, both between the terminals and from the other metal portions of the switch; third, ease and uniformity of movement and simplicity of mechanism.

A few details of construction will be of interest to those whose experience with switches of this type has not been entirely satisfactory. Fig. 1 shows the switch as a whole, with a solid-brass face-plate.

which the manufacturer, the Hart Manufacturing company, believes to be thoroughly good and reliable.

Steel-plate Electric Fan with Enclosed Motor.

One of the greatest difficulties in employing an electric fan under certain conditions lies in the prevalence of dust in the atmosphere, which would ultimately injure or derange the motor. To obviate this difficulty a special type of fan, with enclosed

STEEL-PLATE ELECTRIC FAN WITH ENCLOSED MOTOR.

The ears for attaching the switch to the wall or woodwork are recessed in the back of the face-plate, avoiding the necessity of cutting a recess in the wall for them. Fig. 2 is a 10-ampere double-pole switch with face-plate removed. The mechanism and contact are enclosed in a porcelain base, shown with the front side cut away. The switch plate, one of which is shown in the cut, are of the knife-switch pattern and, owing to the device for driving them into and out of the contact clips, a high velocity and consequently, a short arc is assured. The contact Fig. 3, is of phosphor-bronze, attached to a brass upright, which carries the binding screw. The phosphor-bronze clip is comparatively long and wide, which insures flexibility and firm pressure upon the end of the switch plate. The spring Fig. 4, is a double coiled spring of comparatively large diameter, made of steel music wire, and is intended to engage the moving parts of the switch. It is to be noted that no unnecessary strain is put upon it. The insulation of the current-carrying parts is effected by spools made of sheet mica,

motor, has been designed, and is being built by the B. F. Sturtevant company of Boston, Mass.

As shown in the illustration, the fan itself is of this company's usual steel-plate construction. To its side is attached a cast-iron plate having three projecting lugs. These lugs center and support the field ring, while a light cast-iron support renders the whole arrangement entirely stable.

The motor itself is of the four-pole type, the armature being barrel-wound, and the general construction such as to best suit the conditions specified. Carbon brushes and reaction holders are employed, and the entire design is made such as to insure continuous operation without sparking, even when left unattended for considerable periods of time.

The hemispherical castings, which are bolted to the sides of the field ring, serve to entirely enclose the motor, while the door in the outer casing renders it perfectly accessible. Ring oiler bearings support the shaft, and all trouble from oil is avoided. Fans of this type are primarily constructed for ventilating purposes, and under such conditions create pressures

of about one ounce per square inch. They can, however, be constructed to create higher pressures and to serve as exhaust fans for the handling of refuse material.

Electricity for Private Mansions and Hotels.

The Westinghouse gas engine, under the most severe tests, has proved reliable and efficient. The regulation has been so improved that it is now largely used for electric lighting. This has opened up a new field of usefulness. With gas engines and electric generators, country mansions, country clubs, suburban residences or summer hotels can obtain the best, the most economical, the safest and the most easily manipulated illumination in every room and in every part of the grounds. A gas engine can be started at a moment's notice and stopped with equal promptitude. Gasoline can be used for driving the engine should there be no gas supply in the neighborhood. There is no disagreeable odor and the apparatus is practically noiseless.

Among notable installations of private electric plants driven by Westinghouse gas engines is that at the residence of George Gould at Lakewood, N. J. Fig. 1 illustrates the interior of the power room. Equipments for similar work are now in operation at the following-named summer places: Louis Marx, Alexandria, N. Y.; the Kirkwood Inn, Scarborough Beach, Me.; W. Lutgen, Linden, N. J.; De Le Roy Dresser, Oyster Bay, N. Y.; Miss E. J. Clark, Pomfret, Conn.; A. S. Appar, Ridgfield, Conn.; F. C. Beach, Stratford, Conn.; M. S. Gottfried, Elkhart Lake, Wis.; F. W. Matthiesson, Deer Park, Ill.

One of the most notable instances of the adoption of electricity is that of the Kirkwood Inn, Scarborough Beach, Me., shown in Fig 2. On the coast of Maine, eight miles from Portland, where the summer heat is tempered by the fresh sea breezes, stands the Kirkwood Inn. At an elevation of 75 feet above sea level, the house faces the ocean, looking south. From the veranda a wide sloping lawn, dotted here and there with clumps of evergreens and flowers, reaches to the bluff. At the foot is the ocean, with a two-mile stretch of the finest beach in the world. Behind the house is a thick wood, rivaling the primeval forests in its dense and restful shade. The estate of the Kirkwood Inn includes many acres of woodland, affording a great playground for the visitors to this charming summer resort. Here one may enjoy rambles into the lovely country, cycling, golf and tennis. The more mature can drive through the forest glades, which, at night, are lit electrically. In the midst of the rural surroundings the visitor is astonished to find the comfort and beauty of the electric light.

Standing hidden in the woods, away from the hotel, is the electrical plant. A Westinghouse gas

FIG. 2. ELECTRICITY FOR PRIVATE MANSIONS AND HOTELS.

engine of 30 horse power drives a Westinghouse electric generator, and also a triplex pump. Gasoline supplies the motive power to the engine. Wires conduct electricity to light the lawn and grounds. In addition to the interior lighting in every room, the veranda is tastefully festooned with electric lights. The hotel presents a perfect blaze of light that attracts attention from passing mariners many miles out at sea. The pump, operated by the gas engine, supplies thousands of gallons of water each day. A large ice-cream freezer is also driven by the engine. A laundry, which will be electrically op-

erated, is now in course of construction. This plant was installed in the spring of 1898. Its successful and economical operation and its freedom from noise and odor have led to the installation of similar plants in various parts of the country, notably by the Florida East Coast Hotel system, which is installing Westinghouse gas engines at a number of its hotels.

Wherever there is power supplied by a Westinghouse gas or gasoline engine, working in connection with a Westinghouse dynamo, it can be applied to many useful and labor-saving purposes. Not only will it afford a safe, steady and brilliant illumination for the incandescent lamps within the house, but also for arc lamps of greater brilliancy throughout the grounds. It can be applied to the elevator service, sewing machines, ventilating fans, pumps, lathes, sawing, preparing fodder, ice-cream freezers, churns and laundry work. It can be made to supply storage batteries in yachts and automobiles. The heating power may be utilized for cooking and warming the house. All these and many other forms of work are possible with an established gas-engine and electric plant.

Visit to the Schenectady Factories of the General Electric Company.

On Friday, May 26th, the delegates to the convention of the National Electric Light association visited the works at Schenectady as the guests of the General Electric company, which provided a special train comprising seven coaches. The special left New York in the morning, carrying several hundred guests, and arrived in Schenectady about noon. Luncheon was served on the train before Schenectady was reached. On arriving at the works the party was conducted through the buildings, which are located in a tract comprising 130 acres of ground. The first works were started at this place in 1886, having been brought there from New York, and the factories have increased rapidly to their present enormous proportions. The iron foundry, armature-disk department, armature-winding department, power station, assembling, erecting and testing departments, transformer and commutator departments, street-railway shops and complete wire and cable-making plant, general offices and engineering department were visited in turn, and a perfectly bewildering mass of electrical machinery and apparatus, from the smallest parts to the heaviest dynamos, was inspected. Every detail of manufacture has been most carefully worked out, special tools of all kinds being used, with the result of a finished product showing thorough workmanship and the highest engineering design. In the large machine shop one of the most interesting details noticed was the moving by an overhead crane of the machine tools, instead of the casting, on very heavy work, thereby effecting a saving in time, the casting having to be only set once to carry out all the work on it.

During the afternoon the ladies took a drive through the surrounding country. A banquet was afterward served in the gallery of the new machine shop, which is the largest building of its kind in the world. After a most excellent menu speeches were made by C. A. Coffin, president of the General Electric company; S. Dana Greene, general manager, the mayor of Schenectady and others.

Too much praise cannot be given to the officials of the General Electric company and to E. H. Mullin, general advertising agent of the company, in whose hands the details of the trip were left, for the entire success of the entertainment. One and all, they laid themselves out to give the visitors a good time, and they succeeded. After the banquet the special train returned to New York, arriving about midnight.

Automobiles for the Army.

General Greeley, chief of the United States Signal Service, on Monday awarded a contract for three electric automobile telegraph and balloon wagons to be used by the Signal Corps of the army. The successful bidder was the Fischer Equipment company of Chicago. Each automobile will cost about \$1,800, and with about \$1,500 added for extra batteries will make a total of \$8,000. The specifications of the contract provide that two vehicles shall be suitable for heavy work and one for light work. It is proposed to use them in connection with balloon work and experiments to be conducted in the Marconi system of wireless telegraphy. The heavy automobiles are to carry not less than 800 pounds, not including the driver, and to be charged with electricity to run not less than twelve miles without recharging. They are also to be provided with extra wiring to a switchboard inside the wagon, with the terminals, so as to obtain readily, as needed, the entire voltage of a battery of 55 volts or only 10 volts. It is proposed to use the heavy wagons for general delivery or emergency work. They are to be so arranged that at any time they can be converted into a signal corps station, with telegraph lines running to military headquarters, or, when not needed for this work, to carry batteries for general service in the field. The light wagon will be built to carry not less than four persons, and will be fitted with a switchboard the same as the others. Its minimum radius of action without recharging will also be 12 miles. Each vehicle is to be supplied with duplicate batteries and so fitted that it can be drawn by horses. It is proposed to have them fitted with either hard-rubber or pneumatic tires. This, however, will be optional with the inspecting officer.

American and German Iron Workers Compared.

Among the recent work of the Berlin Iron Bridge company of East Berlin, Conn., was a large foundry building for a manufacturing concern of Berlin, Germany. The steel framework was manufactured at East Berlin, in Connecticut, and shipped to Berlin, Germany, and employees of the Berlin Iron Bridge company were sent to Germany to place the steel framework in position.

Mr. George Klimm, himself born of German parents, was superintendent in charge of the work, and has but recently returned with his men. As Mr. Klimm and his men were in Germany soon after the breaking out of the Spanish-American war, they naturally excited considerable attention among the German mechanics. Mr. Klimm says, as reported in the Hartford Courant, that as soon as he reached Berlin he found the feeling among all classes of German workmen with whom he came in contact was decidedly against the United States. They had no doubt whatever that Spain would defeat us; and after the destruction of the Spanish fleet and the fall of Santiago, the Germans claimed even then that our victories were due to the fact that our army and navy were full of German officers and gunners. Under no circumstances would they admit any superiority in anything American.

Mr. Klimm, in describing the customs of the German workingman, says: "The ordinary German

many Germans in my gang who were good men; but, after an experience in all parts of the United States, from the negroes of the South to the lumbermen of the North, I have no hesitation in saying that the ordinary Yankee will do as much as any two Germans. At least, that is my experience. They pay their men about the same as we do here. In fact, I found that I had to pay my labor help in Germany as much as I did in almost any part of the United States; but they are not good mechanics and they do not seem to have any idea of taking any advantage of their work. They stand around for the boss to show them how to do anything rather than to go ahead on their own hook. This was especially the case with the men working aloft. In fact, where an ordinary American bridge builder would hang on with his legs and work with his hands, the Germans insisted that they must have a staging built, while in ninety-nine cases out of a hundred the American would have taken less time to do the work than he would to have put in the staging."

"How does the quality of our work compare with that furnished by German bridge builders?"

"I had very little opportunity to observe, but the work which I saw at Berlin, built by German bridge builders, seemed to me much inferior to that furnished by my own company. All our work was carefully punched and fitted before it went from here, so that my work consisted entirely in putting

Western Electrician

FIG. 1. ELECTRICITY FOR PRIVATE MANSIONS AND HOTELS.

mechanic takes a cup of coffee as soon as he gets up and starts in to work at six o'clock in the morning. At 8:30 he knocks off for breakfast, at noon for dinner, and at four in the afternoon he knocks off for lunch, but works until seven in the evening, when he quits for the day and for supper. The food of the ordinary German mechanic is much plainer than we are in the habit of receiving in this country. You must be aware of the fact that bridge builders like myself are in the habit of traveling all over the United States and are familiar with all kinds of fare, but the poorest and plainest I have had in my 20 years' experience was that I received in Germany. We had very little meat and no pastry whatever; but of beer we had any quantity at all times, in all places and under all circumstances. In fact, beer seems to take the place of bread with the German workingman."

"I suppose you employed some German workingmen?" asked the Courant reporter.

"Yes, sir. I took over with me 10 men from here, and employed from 10 to 50 Germans on the work at Berlin, while it was progressing."

"How does the ordinary German workingman compare with the American?"

"The German workingmen are not in it with the American. They don't, as a rule, show any ambition. Of course, there are exceptions, and I had

it in place. The German erectors were very much interested in our method of handling this work, and they were all much astonished to find that I did not have a lot of reamers and hack-saws in my outfit. In America a bridge builder's kit contains a hack-saw or reamer; but in Germany it is the principal tool, as the work is so poorly fitted at the shops that the greatest portion of it must be reamed and fitted in the field.

"I am, of course, employed by the Berlin Iron Bridge company as a foreman, to erect their work, and know nothing about prices, but from what I saw in Germany I am satisfied, from our improved methods of manufacturing, that the American bridge builder can compete successfully with the Germans, and I believe this business will develop rapidly, for certainly they have nothing in Berlin to compare with the building which we lately completed."

The Hackensack (N. J.) Gas and Electric company has absorbed the lighting companies of Englewood, Rutherford and Ridgewood. The consolidated company is to be known as the Gas and Electric company of Bergen County, with \$2,000,000 capital. Frank B. Poor will be president and the controlling interest will remain in his hands.

Taxation of Franchises.

Corporations enjoying franchises in New York are interested in the estimates that are being made of the probable effect of the Ford franchise tax upon their annual incomes. Matthew Marshall of the Sun claims that the estimates hitherto published, both of the value of the franchises and of the amount likely to be derived from the tax upon them, are grossly exaggerated. For example, one newspaper, the day after the original bill was passed, asserted that it would add \$1,000,000,000 to the assessed value of the real estate within the city alone, thus permitting a constitutional addition to the city debt of \$100,000,000, and relieving other property of taxes now paid by it to the amount of \$25,000,000 a year. An expert in the state comptroller's office estimates the yield of the tax in New York at \$10,000,000, and in the entire state at \$15,000,000 to \$17,000,000. That this is also too much only a little investigation is needed to show.

The most numerous franchises in New York reached by the new bill are those of the street-railroad corporations, the largest of which is the Metropolitan Street Railway company. This company owns no lines absolutely, but is the lessee of over 200 miles of the tracks of other companies, and derives from them an annual gross income of over \$11,000,000. The principal tracks it leases are those of the Broadway and Seventh Avenue company, the Second Avenue, the Fourth Avenue, the Sixth Avenue, the Eighth Avenue and the Ninth Avenue, with a number of smaller cross-town lines and extensions. The Metropolitan took these tracks just as they were originally constructed to be operated by horses, and has rebuilt the most important of them, so as to operate them with cables and electricity. Consequently, the rentals it pays are merely rentals of the franchises to build and operate the lines and nothing more, and as these rentals amount to \$2,300,000 a year, that sum, at least, if no more, may be assumed to be the value of franchises. The principal represented by an annual payment of \$2,300,000 is at five per cent. \$46,000,000, and the tax upon it at 2½ per cent. would come to \$1,150,000. Since, however, the custom is to assess real estate at 60 per cent. of its full value, the commissioners would be justified in calling the value of the franchises used by the Metropolitan company \$27,600,000, a tax upon which of 2½ per cent. would amount to but \$690,000, or a little less than 1½ per cent. on the Metropolitan's capital of \$40,000,000.

The street-railroad company in the boroughs of Manhattan and the Bronx next in importance to the Metropolitan is the Third Avenue, which owns 28 miles of cable road, now undergoing a change into an underground electric-trolley road, and nearly 100 miles of road operated by horses and by the overhead electric trolley. The company has a capital of \$12,000,000—shortly to be increased to \$22,000,000—a debt of \$20,000,000 and a gross annual income of \$2,500,000. The chief franchises it has purchased are those of the Dry Dock and East Broadway company and of the Union Railway company. How much it paid for them is not known exactly, but it reported in 1897, among its assets, stocks and bonds and other permanent investments to the amount of over \$6,000,000, and the premium on its present capital is \$12,000,000, making a total of \$18,000,000, of which 60 per cent. is \$10,800,000, yielding, at 2½ per cent., \$270,000.

In the borough of Brooklyn the Brooklyn Rapid Transit company, with a capital of \$40,000,000 and a debt of \$12,000,000, now owns or leases, altogether, 164 miles of horse and electric-trolley road, for a part of which it pays in rentals \$1,560,000 annually, besides having issued stock to the amount of \$9,500,000 to purchase the rest. Capitalizing \$1,560,000 at five per cent. gives \$31,200,000, and adding to it \$9,500,000, gives a total of \$40,700,000. The expenditures on the property for construction and equipment have probably been met by its bond issues, so that \$40,700,000 may be assumed to represent the value of the company's franchises. Of this 60 per cent. would be \$24,420,000, and a tax of 2½ per cent. on it would be \$610,500, or about 1½ per cent. on the company's \$40,000,000 capital.

No data are accessible for the computation of the value of the Manhattan elevated-railway franchises. Of the \$48,000,000 present capital of the company only about one-half, or \$24,000,000, represents cash paid, the other \$24,000,000 having been given away to purchasers of the bonds with which its structures were built and equipped. Since the stock is selling at 10 per cent. premium, its franchises are therefore certainly to be reckoned as worth \$24,000,000, and adding \$4,800,000 for the premium on the stock, they may be said to be worth \$28,800,000, of which 60 per cent. is \$17,280,000. A tax on this amount of 2½ per cent. would yield \$432,000, or less than one per cent. on \$48,000,000. The two elevated railroads in the borough of Brooklyn have both recently been sold for a price which makes the value of the franchises for them very doubtful, and it may be estimated at nothing.

The only steam surface railroad companies enjoying franchises in New York are the New York Central in the borough and the Long Island in the borough of Brooklyn. The principal franchise belonging to the Central it holds through its lease of the Harlem line, only a short stretch of which lies within the city limits. For the entire Harlem line

the Central pays a rental of \$840,000 yearly, and it has expended, besides, more than \$8,000,000 in adapting to the city's requirements the section between Forty-second street and the Harlem River. How much it would have to pay for an entrance into the city over a roadbed owned in fee it is hard to estimate, and in any case it would have to cross a number of streets either above or below grade. A strip 100 feet wide from Forty-second to One-hundred-and-forty-second street would embrace 800 lots in the blocks, and the equivalent of 300 lots for the street crossings, making 1,100 lots in all, which, at \$25,000 a lot, comes nearly to \$28,000,000, and at a 60 per cent. valuation, to \$16,800,000, on which a 2½ per cent. tax would yield \$420,000. The right-of-way into Brooklyn enjoyed by the Long Island Railroad company is, of course, far less valuable, and may be roughly estimated at \$10,000,000, or, for taxing purposes, at \$6,000,000, on which the tax of 2½ per cent. would amount to \$150,000.

The appraisalment of gas-company, subway-company and telegraph-company franchises is a difficult matter. If the commissioners should adopt the Massachusetts rule, and arrive at the value of the franchises by taking the market value of the stocks of the companies enjoying them, deducting from it the assessed value of all other property, and calling 60 per cent. of the remainder the value of the franchises, the amount would be startlingly large. Approximately, the Consolidated Gas company's franchises are worth, on this method of estimate, \$30,000,000, those of the Brooklyn Union company \$20,000,000, those of the New Amsterdam \$10,000,000, those of the Standard \$10,000,000, and those of the Mutual \$5,000,000. The subway privileges of the New York Gas and Electric Light, Heat and Power company may be put down at not less than \$10,000,000, and those of the Kings County Electric Light and Power company at \$5,000,000. The Western Union Telegraph company uses the subways of the New York Gas and Electric company and pays rental for them, and the American Telephone company strings its wires from housetop to housetop, so that none of them will have to pay the new tax.

Summing up the foregoing estimates, none of which can be said by anyone to be too low, and most of which will by the companies affected probably be scouted as far too high, the amounts added to the taxable real estate of the city by the new law are:

Metropolitan Street Railway	\$ 27,600,000
Third Avenue	10,800,000
Brooklyn Rapid Transit	24,420,000
Manhattan Elevated	17,280,000
New York Central Railroad	16,800,000
Long Island Railroad	6,000,000
Gas and electric companies	90,000,000
Add for small companies omitted	1,100,000
Total	\$184,000,000

This gives \$184,000,000, at the utmost, for the value of franchises in this city, and it is not probable that it will be raised by the commissioners to more than \$200,000,000. Assuming the franchises of other parts of the state to be, like their other assessed property, worth two-thirds as much as those of New York city, their value on this basis will be \$133,000,000, making \$333,000,000 for the entire state. A tax of 2½ per cent., therefore, would give \$5,000,000 only for the city, and \$8,333,333 for the entire state, or about one-half the estimate of the comptroller's expert, and a much smaller fraction than those of the newspapers.

Telegraph Line to Dawson.

H. A. Munn of the Victoria Yukon Trading company, who has just returned to Victoria, B. C., from Lake Bennett, tells the local newspaper writers of great progress being made by the telegraph builders. He says: "The telegraph construction party sent out by the Dominion government under Mr. J. B. Charleson has lost no time in getting to work on the line to Dawson. The poles are already cut down as far as White Horse, and the wire will very soon be strung to Cariboo Crossing. Two camps are operating now, one from Bennett and one from Cariboo Crossing, but so soon as the lake and rivers open the construction corps will be divided into three parts, the men living on camp scows, which will drop down the river, keeping abreast of the work. The materials and supplies will be delivered on scows. Mr. Charleson is determined to have a message from Dawson before the close of the season of 1899."

The Gorge Railroad Sold.

The Niagara Falls and Lewiston electric railroad, better known as the "Gorge road," has been sold at sheriff's sale and was purchased by Herbert P. Bissell of Buffalo for \$6,184, which was the amount he had advanced to the receiver, on behalf of the creditors, to put the line in repair. The sale was subject to a mortgage of \$1,000,000. Mr. Bissell has reorganized the company, and in the future it will be known as the Niagara Gorge Railroad company. The capital of the new company will be \$1,000,000, whereas the old company was capitalized at \$1,400,000. New York and Buffalo capital will be interested in the new company. All winter the line has been idle, but during the month of May Mr. Bissell had about 200 men at work putting the roadbed and overhead construction in good repair in order that the road might renew operations in June.

Capt. George H. Tilly Reported Dead.

General Greeley, chief signal officer of the army, received a cablegram on May 28th from Major Thompson at Manila, reporting that a party landing for the repair of the cable at Escalante, Island of Negros, had been treacherously attacked by natives, that Captain George H. Tilly, Signal Corps, was missing, and that the worst was feared. Tilly's services in the Philippines, says a Washington correspondent, have been marked by such ability, courage and zeal that his superiors placed him in the foremost rank of subordinate officers. The cable operations referred to are not those of the Signal Corps, but of the Eastern Extension Cable company, which has been permitted to repair and replace certain cables in the Visayan Islands. Tilly doubtless accompanied the expedition as the representative of the United States, the supervision of all telegraph lines and cables being a part of his duties. No other casualties in the Signal Corps have been as yet reported in this expedition.

Captain Tilly was a well-known resident of Helena, Mont. He was the son of George E. Tilly of Jamaica, L. I., and at the outbreak of hostilities was night manager of the Western Union Telegraph company in Helena. Captain Tilly was well known in New York and Chicago, where he was formerly employed. He was under orders to return home soon, and was on detached orders with a few of his men, awaiting relief.

Electrical Development of Las Vegas.

The city of Las Vegas, in New Mexico, which has a population of less than 10,000, is an enterprising, up-to-date community. It has a street-car line, established in 1881, of which E. Rosenwald is the president, and two telephone exchanges. The Colorado company, of which Mrs. A. M. Shout has been manager since 1884, has in use 143 city instruments, with stations at the Hot Springs, the Agua Pura reservoir, Rociada, Mora, Sapicilo, La Cueva, San Ignacio, Watrous, Los Alamos and El Porvenir. The Las Vegas company, organized in 1894, with V. H. Jameson as manager, has 126 city telephones. Under competition rates have been reduced to \$36 per year for business houses and \$15 per year for residences. The Western Union Telegraph company has two offices, George M. Birdsall, manager, while the Postal company has one, with Mrs. Gray in charge. There is also a flourishing electric-light company.

Stole 700 Feet of Live Wire.

[From the New Haven Evening Register.]

The Fair Haven and Westville Railroad company reported to the New Haven police that thieves had stolen several hundred feet of feed wire belonging to the railroad and in use on the Whitney avenue line. It was an extraordinary piece of thievery and unique in this locality. It was a case of stealing "live" and "hot" wire.

The feed wire runs along on the poles and is used to reinforce the power of the trolley wire. The feed wire is a heavy wire, weighing about one pound to the foot, and is heavily insulated. It costs the railroad company about 20 cents a pound.

About 700 feet of the wire was stolen by the thieves. The wire is alive all night. The cutting of it must have been attended with considerable danger, unless the ordinary protected plyers used by railroad men were employed to cut it.

It is not known exactly at what hour the wire was cut and stolen, but it probably was near midnight, when all cars had ceased to run. The crew on the first car out yesterday morning discovered the theft. The wire taken by the thieves weighed about 700 pounds, and can be sold for junk at about 15 cents a pound.

COMMUNICATIONS.

Electric Lighter for Fire-engine Boiler Wanted.

To the Editor of the Western Electrician:

I am looking for an automatic lighter to attach to a quick-steaming boiler belonging to our fire department, so that the pulling of any street box will light the fire in addition to ringing the alarm. Not having gas, I am rather puzzled how to accomplish this result. If any of your advertisers deal in anything that would meet my ideas, kindly place me in communication with them.

A. L. BOWES,
Assistant Chief of Fire Department.
Millville, Mass., May 28, 1899.

New Rheostats for Old.

To the Editor of the Western Electrician:

This company is making a collection of rheostats and already has a number of curious specimens. To make this collection more complete we will replace to starting rheostats over five years old and under 10 horse power with our latest type of apparatus. If you will kindly insert this notice in your reading columns we shall be greatly obliged.

J. GILBERT HICKCOX,
Secretary Cutler-Hammer Manufacturing company.
Chicago, May 29, 1899.

CORRESPONDENCE.

New York Notes.

New York, May 29.—Bids for public lighting of the city by gas and electricity were opened last week by Henry S. Kearney, commissioner of public buildings, lighting and supplies. For years the city has been divided for street lighting among the various gas and electric-light companies, and there has been no competition. The same conditions, practically, prevail this year. The electric arc-light bids for Manhattan were: Harlem Lighting company, 40 and 50 cents a lamp a night; Brush Electric Light company, 40, 45 and 50 cents; Union Electric Light and Power company, 10 and 15 cents an hour; Manhattan Electric Light company, 40 and 50 cents a night; Edison Electric Illuminating company, 40 cents a night; Mount Morris Electric Light company, 40 and 45 cents a night. For electric lights in the Bronx the North River Electric Light and Power company bid 45 cents a lamp a night; the Pelham Electric Light and Power company, 30 cents, and the Bronx Gas and Electric Light company, 35 cents. There was but one bid for electric lights in Brooklyn, that of the Edison Electric Illuminating company, which was the same as last year—34 cents a night for each 1,200 candle-power lamp and 17 cents for each 600 candle-power lamp. The Jamaica Electric Light company's bid was 27.4 cents a night for each arc lamp. For Richmond, the Staten Island Electric company bid 27.4 cents a night for each arc lamp.

In Hoboken the new North River Light, Heat and Power company, which is building a large plant to compete with the North Hudson Light, Heat and Power company, has hit upon a novel plan to get a foothold. It seems that the contract of the city of Hoboken with the old company for electric street lighting contains a clause terminating the agreement at any time when the tax commission's shall fail to make the necessary appropriation. Accordingly, the new company addressed itself to the tax commissioners and showed them that they need make no appropriation, because they might have the lights free for the remainder of the present fiscal year from the new company. The contract would thus be abrogated, it was argued, and after the free term the new company would bind itself to furnish public lighting for from two to 10 years at a rate not exceeding \$80 a year a light, the present rate being \$138.70 a year. Thus, says the new company, the city may save over \$50,000 by terminating the existing contract, which was made in September, 1892, for a term of 10 years. For doing this the new company asks the right to use the streets on the same terms as the company now doing business. Mr. Bonta, the president of the North River company, explained to the tax commissioners that it was only necessary for them to fail to make an appropriation of \$28,000 asked for electric street-lighting purposes, and the contract with the old company would terminate. "We will then furnish electric light free to the city for the rest of the fiscal year, ending April 30, 1900," he said. "If the council gives us a franchise we will be ready to have all the poles and wires up in 10 days." Mr. Bonta presented a bond for \$25,000, issued by the American Surety company, to show that the company meant what it said. The tax commissioners all said that the scheme proposed by the new company was a good one, and a report of a committee explicitly stating that no appropriation was to be made for street electric lighting was unanimously adopted. Another resolution was adopted, asking the council to accept the new company's proposition. Mayor Fagan, who is said to favor the old company, entered the room before the final action was taken by the board. He made no remarks other than to say to a reporter that the council has the power to amend the tax ordinance making appropriations before confirming the budget.

Alexander E. Orr, formerly president of the Rapid Transit Commission, was re-elected to that office at a special meeting of the commission held last week. Mr. Orr's term of office as commissioner expired upon his resignation of the office of president of the Chamber of Commerce, but he was re-elected a member of the commission to succeed John Claffin, who resigned. The resignation of Lewis L. Delafield, the secretary, was not acted upon. It will be, however, at a meeting called for June 1st, and his successor will then be chosen from the large number of applicants who are seeking the place.

The New York Municipal Street Railway company, which was recently incorporated to build an electric railroad in the northwestern part of the borough of Manhattan, will be given a hearing June 5th on a bill granting it a franchise.

An official of the Manhattan company is reported as stating that plans for the electrical equipment have been made and that specifications will probably be ready in a few days.

A fine "practical joke," by which it is possible that an employe of the Paterson Railway company was killed, is reported in the papers. It is the practice at the street-railway shops in Paterson for the employes, in washing after their day's labor, to use soft soap, which they take from a barrel. About 6 o'clock Magill, the victim, went to "wash up." When he dipped his hands in the barrel he gave a loud scream and dropped to the pavement, which was wet. Andrew Lasky, who was close be-

side Magill, leaned down to pick him up, but found that Magill was dead. Subsequent examination led to the discovery that a wire had been run through the barrel of soft soap and connected with a trolley wire. The wet pavement completed the circuit. Joseph Grant and Christopher Ashfield, fellow employes of Magill, the perpetrators of the "joke," were taken to jail on a charge of manslaughter. They admitted that they ran the wire through the barrel with the intention of shocking those who should use the soap, and meant it merely as a practical joke. The railway potential of 500 volts is not considered sufficient to kill a man in ordinary health, but the dead man may have had a weak heart. At any rate, the joke was a cruel and dangerous one, and doubtless its authors will be severely punished.

M. S.

PERSONAL.

Arthur S. Ives, electrical engineer of the Prindle Pump company of New York, is spending a few days in Chicago.

Clinton L. Rossiter, president of the Brooklyn Rapid Transit company, returned from Europe on Memorial Day. His trip abroad was undertaken entirely for recreation, he said.

General William A. Bancroft, general manager of the Boston Elevated Railway company, received an offer from the Chicago West and North Side surface lines to become the general manager of that system. He announced his decision, however, to remain in Boston. He is brigadier-general of the Massachusetts militia and went to camp as a volunteer in the late war, although not called upon to perform active service at the front. His salary in the position he now holds is said to be \$25,000 a year. He has been mayor of Cambridge, Mass., three terms and holds a prominent place in the affections of the people of the state, many of his friends asserting that he can be elected as governor whenever he says the word. In his college days at Harvard he was famous as an athlete and was captain of the university crew that defeated Yale.

Prof. Thomas R. Mercein of Milwaukee, the secretary of the Northwestern Electrical association, was one of those who did not escape the vigilance of the interviewer of the New York Tribune during the recent convention in that city. Wireless telegraphy was the subject of the conversation, and Prof. Mercein is thus reported: "The scope of wireless telegraphy depends entirely upon the degree of perfection which can be attained in the instruments. It has been used across the English Channel, a distance of 30 miles. Interpassing ships and other obstacles did not interfere with it in the least. Theoretically, there is no reason why messages should not be flashed over the ocean in the same way, but the instruments used at present are not sufficiently perfected to permit this. Some of the best talent in the world is at work on the subject, and I believe that it will be a matter of only a few years at most until Marconi's system is conceded to be as practical as the telephone."

PUBLICATIONS.

Kendrick & Davis, successors to the Porter Standard Motor company, Lebanon, N. H., have issued a neat little catalogue, describing their various products. The Porter Standard motors, now manufactured by Kendrick & Davis, are well known.

The Western Electric company has mailed to the trade bulletins on the S. K. C. single-phase motors and Type G transformers. They are Nos. 101, 102 and 103. The S. K. C. lightning arrester for alternating-current apparatus is fully illustrated and described in Bulletin No. 104.

Five catalogue bulletins recently issued by the Westinghouse Electric and Manufacturing company give, by a mere enumeration of titles, some idea of the varied activities of this important company: No. 222, "Direct-connected Railway Generators;" No. 223, "Lightning Arresters for Alternating-current and Direct-current Circuits;" No. 225, "Alternating-current Fan Motors for 50 and 100-volt Circuits;" No. 226, "Direct-current Fan Motors for 100-125-volt Circuits;" No. 228, "Polyphase Motors." These publications are attractively illustrated and are at once valuable to the consumer and creditable to their authors and designers.

The elaborate treatise on "Mechanical Draft" recently issued by the B. F. Sturtevant company of Boston, Mass., is unique as a trade publication in that it presents no personal claims for the merit of the system or the apparatus necessary for its operation, but relies solely on the statements of unbiased witnesses to emphasize its features. For this reason the following quotation from this important work is of especial interest and value. It consists of a summary of the especial advantages of mechanical draft, as presented by the well-known engineer, Mr. Alfred Blechyden, in a paper before the British Institution of Mechanical Engineers. Mr. Blechyden says: "First, it seems fairly well established that, if the boilers are well constructed and are provided with ample room to insure circulation, their steaming power may, without injury, be increased to about 30 to 40 per cent. over that obtained on natural draft for continuous working, and may be about doubled for short runs. Secondly, such augmentation is accompanied, in normal cases, by an increased consumption per indicated horse

power. But, thirdly, the amount of greater power being indicated, it may, with moderate assistance of forced draft, be developed with a smaller expenditure of fuel, the grates, etc., being properly proportioned. Fourthly, forced draft enables an inferior fuel to be used; and, fifthly, under certain conditions of weather, when, with normal proportions of boiler it would be impossible to maintain steam with natural draft, the normal power may, with forced draft, be insured. In particular cases any or all these advantages may be a source of economy; and the first of them may render possible that which would otherwise be impracticable."

TRADE NEWS.

The Krotz-Kelly company, formerly Krotz, Allen & Kelly, exploiters of the K. A. K. conduit electric-railway system, is now actively pushing its system. The K. A. K. electric-railway system has been in practical operation in Springfield, O., for some time, and good results are claimed.

Bids for furnishing and installing a complete police-patrol system throughout the city of St. Paul, Minn., will be received by Matt. Jensen, the city clerk, until June 15th. The proposals must include the removal of the present system and the installation of a new system on plans laid down by the bidder himself.

The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals, until June 6th, for furnishing the naval home at Philadelphia, Pa., with a quantity of electrical supplies required during the next fiscal year. Blank proposals will be furnished upon application to the governor of the naval home.

The Navy Department, through the Bureau of Supplies and Accounts, is inviting sealed proposals, until June 6th, for furnishing the Norfolk, Va., navy yard with four generating sets and spare parts. Blank proposals will be furnished upon application to the Navy Pay Office at Norfolk. Bids will also be received at the same time and place for furnishing the New York navy yard with two generating sets and spare parts for one set. The Navy Pay Office at New York will furnish any information desired by intending bidders.

BUSINESS.

The Hemingray Glass company of Covington, Ky., is busy with orders and takes an optimistic view of the business situation.

The advantages claimed for the Moloney transformer, manufactured by the Moloney Electric company of St. Louis, have now become so well known that the company is kept busy filling its orders.

The Nowotny Electric company of Cincinnati is securing its share of the arc-lamp trade. The company has placed on the market the Nowotny long-burning enclosed arc lamp for inside and outdoor service.

The Electric Appliance company calls especial attention to a clever torch known as the Willson combination alcohol torch. This torch seems to be a useful tool for all electrical workers and should find a large market.

James Leffel & Co. of Springfield, O., the well-known water-wheel manufacturers, find it a difficult matter to keep up with their orders. The company has been obliged to work its force overtime, and reports that the demand for its products is greater than ever.

John S. Nowotny, 373 East Second street, Cincinnati, manufacturer of arc lamps and dealer in electrical specialties, states that he is meeting with success in his new venture. Mr. Nowotny is well known to the electrical trade and is the inventor of the Nowotny arc lamp.

The Robbins & Meyers company of Springfield, O., states that the sales of its standard fans have been so large that it has been obliged to put on a night force. The Robbins & Meyers company has just purchased a large factory adjoining its present shops, and it is stated that it will shortly go into the manufacture of dynamos and motors.

A. C. Becken, 103 State street, Chicago, who handles the Paillard non-magnetic watch, says that he has met with success in placing this watch among the electrical fraternity. The Paillard watches are said to be good timekeepers, and have been welcomed by those who come in proximity to electrical machinery, as they are guaranteed to be absolutely non-magnetic.

Martin De Tamble has placed a contract with the Western Electric company for one 40-kilowatt Western Electric direct-current generator and a switchboard. The construction department of the Western Electric company will install the apparatus and do the wiring for 500 to candle power lamps. The installation is for the building at 153 West Jackson boulevard, Chicago.

The Vesta electric bicycle lamp, manufactured and placed on the market by the Vesta Accumulator company, of which D. P. Perry is president, is said to be meeting with great success. It seems to be giving the best of satisfaction, and many points of superiority over other bicycle lamps are claimed. The demand for the Vesta lamp is increasing daily.

and Mr. Perry is well pleased with his sales and the prospects for future business.

The Lynn Incandescent Lamp company of 681 Washington street, Lynn, Mass., calls particular attention to the advantages of its "renewed" lamps. It publishes testimonials to the efficiency of these lamps from the Jellico (Tenn.) Electric Light, Heat and Power company; Southern Electrical Works, Atlanta, Ga.; Abner Driver, Osceola, Ark., and C. F. Kissel, Indianapolis, Ind.

The single-pole carbon lightning arrester, for telephone and telegraph use, which has recently been placed on the market by the American Electric Fuse company, 345 South Canal street, Chicago, is claimed to be selling well. The manufacturer states that this is the only single-pole carbon lightning arrester made and that it embodies features which will interest all telephone and telegraph men.

The American Reflector and Lighting company of Chicago reports a steadily increasing business in reflectors, etc. The American company is one of the best known in this line of business, and under the careful supervision of Manager Charles Landis it is meeting with success. It has made some of the largest reflector installations in the United States, and is always on the alert for improvements in this particular line.

The Hobart Electric Manufacturing company of Troy, O., under the careful management of G. C. Hobart, has worked up an excellent trade in dyna-

mos and motors. The company claims many points of superiority for its machines. The Hobart company is prepared to rent dynamos and motors, giving the lessee the privilege of buying the machine at any time, and is meeting with success in this particular branch of its business.

M. J. Isaacs, general manager of the K. McLennan company of Chicago, the well-known manufacturer of Gale's commutator compound, reports that the sales of this widely known compound are constantly on the increase. At the present time it is used not only in every state in the Union, but in many foreign countries as well. Gale's compound must be giving entire satisfaction to all those who have used it, judging from its popularity.

In every electric-light station in the country there are old lamp bases, many of which, doubtless, are thrown aside, and in that way wasted. Goldsmith Brothers, 63 and 65 Washington street, Chicago, make a specialty of buying up old lamp bases, for which they pay a cash price, besides paying the freight. They have been long established, do more in this line of business, it is said, than any other house in the country, and through their wide trade have gained an excellent reputation for fair dealing.

The Central Electric company, Chicago, is pleased with the rapidly increasing orders for the ventilating outfits built by the Fuller company. This type of apparatus is built direct-connected for operation on

direct-current circuits of from 110 to 500 volts. The blades of the fans are scientifically calculated as to their helical pitch for angle of contact with the air, and this fact, in connection with a proper proportion of fan diameter with the actual horse power of motor, produces a highly efficient product. The Fuller "air propellers" can be used for exhaust or forced-draft purposes. Should it be desired to change the direction of the air current after the motor is installed, the desired result can be effected readily by a reversal of terminals.

The Bullock Electric Manufacturing company of Cincinnati, Ohio, is experiencing the practical results of prosperous times, coupled with a record for high-grade electrical machinery. With the new factory, with treble the capacity of the former works, and with new tools being added almost daily, the company still finds it very difficult to supply promptly the machines called for by its sales department. But this difficulty will soon be obviated by increased facilities. Numerous special machine tools, which have been delayed by the crowded condition of the makers' factories, are soon to arrive, and with these in operation it will be possible to deliver more promptly. The Type "N" Bullock slow-speed motor, so admirably adapted to the driving of machine tools and other machinery by direct connection, is receiving much deserved attention from consulting and contracting engineers both at home and abroad.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued May 23, 1899.

- 625,321. Socket for Incandescent Lamps. Adolphe A. Chaillet, Shelby, O. Application filed February 28, 1898.

A cam member for an incandescent-lamp socket consisting of the annular insulated block flat on its base but having on its top surface ratchet-cam faces, there being depressions of varying degrees between the faces, deeper depressions being adapted to receive metallic plates which form electric terminals.

- 625,364. Electric Signal. Julian M. Smith, New Orleans, La. Application filed April 30, 1898.

A lever is arranged to move the circuit-closer; a latch on the lever is arranged to engage the circuit-closer, and a movable device on the lever is connected with the latch.

- 625,408. Electro-mechanical Apparatus. Albert D. Neal, Boston, and Howard F. Eaton, Quincy, Mass. Application filed November 19, 1892. Renewed October 27, 1898.

The movable arm has an electromagnet to move it in one direction, a second electromagnet to move it in an opposite direction, means operated by the electromagnets to produce a multiplied or extended movement of the arm, movable stops or pins operatively connected together to be simultaneously moved, to limit the movement of the arm or device at different points or stations in the range of its movement, and electromagnets to operate the pins or stops.

- 625,410. Apparatus for Producing Igniting Sparks. Max Osterberg and Alexander Fischer, New York, N. Y. Application filed April 21, 1898.

In an electric spark-producing apparatus the combination of a primary coil, a circuit-breaker in circuit therewith, means for mechanically operating the circuit-breaker to produce a single rapid break after a relatively long period of closure of the circuit, and in shunt with the primary coil and in inductive relation thereto a secondary coil and spark terminals in the circuit thereof.

NO. 625,410.

- 625,431. Electric Arc Lamp. Sigmund Bergmann, New York, N. Y. Application filed May 7, 1897.

An arc-including chamber is adjustable relatively to the carbon feeding and regulating mechanism, and an outer including chamber is adjustable relatively to the arc-including chamber.

- 625,432. Electric Arc Lamp. Sigmund Bergmann, New York, N. Y. Application filed April 17, 1898.

Combined with the actuating magnets of an armature are a guide, a yoke mounted on the guide, a clutch and dashpot carried by the yoke, and a spring surrounding the guide and interposed between the yoke and the armature.

- 625,454. Regulator for Electric-car Motors. Hiram S. Maxam, London, England. Application filed November 5, 1898.

Each car of a train of electrically propelled cars has a rod or bar movable longitudinally with respect to the car, means for maintaining the bars in a given normal position with respect to their respective cars, connections between the bars and the circuit controllers on the cars whereby the current applied to each car motor will be varied in accordance with the changes of relative position of the rod and the car, the rods or bars being coupled together in an inextensible series throughout the train.

- 625,462. Electrode for Dry Storage Batteries. Leonard Pavet New York, N. Y. Application filed December 30, 1898.

An electrode for dry storage batteries is provided with exterior vertical electrically conducting tube of tubes, and the tube or tubes are in electrically conductive connection with the electrode.

- 625,473. Electrical Attachment Plug. Albert P. Seymour, Syracuse, N. Y. Application filed February 9, 1899.

An unglazed porcelain plug member is formed with a shank and a disk-shaped upper portion of only slightly greater diameter than the shank, having a flat upper surface, terminals secured to the shank and terminals arranged and secured on the flat upper surface, and an externally glazed cap having a depending marginal wall forming within an opening fitted to receive the top of the plug, and integral reinforcing projections within the opening extending downwardly and inwardly to engage with the upper surface between the terminal plates and sustain the cover a short distance above the flat surface, but permitting it to drop sufficiently to surround the plug top.

NO. 625,462.

- 625,489. Holder for Electroplating. William Y. Buck, Bristol, Conn. Application filed November 4, 1898.

In a holder for electroplating a bar of conductive material, perforated from top to bottom, at right angles with its longitudinal axis, by a number of holes, which are arranged from end to end of the bar at a convenient distance apart, and are alternately inclined in opposite directions from the vertical and from each other, in combination with a conductive handle, which is rigidly united with the bar, and is adapted to hold the same suspended in a bath in a horizontal position.

- 625,512. Electric Railway. Robert Lundell, New York, N. Y. Application filed April 5, 1898.

In an electric railway a current feeder or main including a source of electrical energy, together with sectional service conductors and electromagnetic switching devices for operatively connecting the sectional service conductors in sequence to the current feeder or main; in combination with stationary relays for operating the electromagnetic switching devices, the relays being included in a circuit with a separate or independent source of electrical energy.

- 625,554. Trolley Controller. Louis M. Halsey, New York, N. Y. Application filed November 24, 1897. Renewed November 1, 1898.

The trolley pole, the slotted harp thereon, a spring-actuated reel carried by the pole, and a rope guide on the harp, in combination with a U-shaped lever mounted in the harp, a trolley wheel and its shaft carried in one end of the lever, the overhung ends of the shaft being received and guided in the slots in the harp, a dog at the opposite end of the lever adapted to engage a trolley rope passing through the guide, and a spring tending to tilt the lever and force the dog into engagement.

NO. 625,509.

- 625,566. Manufacture of Elements for Secondary Batteries. Frank King, London, England. Application filed November 25, 1898.

An element for secondary batteries consisting of a grid having active material applied thereto, the outer or exposed surface of the active material being formed with pyramidal projections.

- 625,597. Means for Ascertaining the Potential at Any Point Upon Systems of Distribution. Samuel L. Phillips and George G. Tilden,

- Washington, D. C. Application filed March 6, 1899.

Claim is made for the combination with a system of electrical distribution of a measuring instrument at any point of distribution connected to the mains at that point to indicate variations in potential, a responding instrument at the generating station connected to one of the mains and to earth through a battery, and one or more resistances in the battery circuit, cut in or out by the vibration in opposite directions of the index of the measuring instrument.

- 625,599. Electric-lighting Apparatus. Andrew Plecher, Savannah, Ga. Application filed October 4, 1898.

An electric X-ray lamp comprising a vacuum bulb with two cathode terminals, and one or more electromagnets wrapped to form induction coils having each one pole within the bulb and provided with a light-emitting surface, the induction coil having a central core, a helix connecting with a primary wire, another helix connecting with the secondary wire, the end of the secondary helix being connected to the core of the induction coil and forming the cathode terminal.

- 625,609. Incandescent Electric-lamp Fixture. Benjamin F. Rout, Stanford, Ky. Application filed August 2, 1898.

A lamp fixture comprising a support, a casing section rigidly mounted on the support, a casing section mounted to rotate relatively to the fixed section, a drum secured to the rotatable section and designed to receive and wind the electric conductors, a spring for moving the drum and rotatable section in one direction, and a socket on the rotatable section for receiving the base of an electric lamp.

NO. 625,597.

- 625,632. Electric Controller. William W. Adams and Harold McGeorge, Cleveland, O. Application filed October 17, 1898.

The combination in a controller of the casing having a hub, a series of concentric spools, a segmental bridge mounted on the casing and carrying contact plates, and a brushholder having brushes adapted to move over the surface of the plates.

- 625,639. Electrical Switch. Norval L. Burchell, Washington, D. C. Application filed December 14, 1898.

In an electric switch there is the combination of a pole-piece, a switch blade and operating means therefor, the parts being so arranged that the switch may be opened and locked by a straight pull or push and then closed by a continuation of the motion in the same direction.

- 625,647. Alternating-current Range and Position Finder. Albert C. Crehore, Hanover, N. H., and George O. Squier, Fortress Monroe, Va. Application filed January 29, 1898.

The method of obtaining parallelism between two instruments at a distance from one another consists in varying the reactance of an alternating-current circuit at one point in correspondence with the position of the instrument at such point and correspondingly varying the reactance in the circuit at the other instrument to restore the balance or normal condition of the circuit.

- 625,683. Electrode for Secondary Batteries. Jules Julien, Brussels, Belgium. Application filed October 24, 1896.

In a Plante accumulator a negative electrode is formed of a series of superposed corrugated sheets of suitable metal, having the corrugations running diagonally to the sides thereof, and having active material applied on both sides thereof, while leaving narrow diagonal interstices for the access of the electrolyte and bands for connecting the sheets together.

Suspension Bridge for Trolley Lines at Niagara.

The new suspension bridge being built by the International Traction company across the lower Niagara River, near Lewiston, is nearing completion, and it will not be many weeks before it is brought into service for the crossing of electric cars, thus making the second international crossing-place between New York state and the Dominion of Canada for trolley cars, the first being over the upper steel arch bridge, seven miles up the river.

In the construction of this new bridge there has been ample opportunity for comparison afforded between the past and the present-day methods in bridge construction across great rivers, for on this iden-

double-tracked, in order to afford every facility for cars passing on and off the bridge.

The view presented in the illustration is looking from New York toward the Canadian side. The erection of steel commenced on the New York side and proceeded out over the river to Canada, extremely rapid progress being made. It is expected that the bridge will be opened to public crossing this month.

Chicago North and West Side Surface Roads Leased to Chicago Union Traction Company

By vote of the stockholders of the North Chicago Street Railroad company and the West Chicago Street Railroad company, on June 2d, the street-car

It has always been my idea that all the street-railway companies in Chicago would have to be consolidated. The intramural system of this city has always tended toward that end. In laying out the North and West Side lines and the suburban lines it has always been my idea that some time they would come under one head. When we are a great metropolitan city, instead of a scattered community, it will be necessary for the street railways to be combined—not only the surface roads, but the elevated roads as well. It is not for me to do that work, but it is one of the inevitable things of the future. I regard it as absolutely sure that some day all the intramural lines will be consolidated under one management.

The management of the North and West Side companies has spared no effort, no labor, no thought, to make the companies the best to be found anywhere. If we had had a little better feeling between the municipality and ourselves we could have accomplished more. The municipality has seemed to think that the companies alone had an interest in the street-car system. But the people have the greatest interest in them. The street railways have built up Chicago in a great measure to what it is now. Look back 12 or 13 years and see the difference between the conditions then and what we have now. You can remember—or some of you can remember—the little horse cars we

SUSPENSION BRIDGE FOR TROLLEY LINES AT NIAGARA.

tical site, nearly 50 years ago, a suspension bridge was built. The old bridge, however, was of wood, whereas the new bridge is of steel. The old bridge was wrecked by wind February 1, 1864, since which time there has been no crossing facilities at that point, and, in fact, none were needed, for the anticipations of the early-day promoters were not realized. Now, however, the trolley has become a great feature in the development of the Niagara region, and this bridge will form one of the links in a belt line electric-car service about the ever-beautiful Niagara Gorge.

This new structure has been described in the Western Electrician. It will be recalled that the cable span is 1,040 feet, and the suspended span 800 feet. The width of the roadway is 25 feet, and through the center will run a single track for electric cars, with driveways on either side. The height of the bridge above the water is 65 feet, and it is about 15 feet above the tracks of the Niagara Gorge railroad. Long approaches lead to the bridge on either side of the river from the north, and these approaches will be

lines and plant of these companies were leased to the new Chicago Union Traction company—or, rather, the president and directors, in each case, were directed to make the leases "whenever," in the language of the formal resolution, "the said Chicago Union Traction company shall have complied with the terms of the said lease requiring a deposit of securities to be made with the Illinois Trust and Savings Bank, to secure the payment of the rentals and the performance of the covenants of the said lease by the said traction company."

Mr. C. T. Yerkes presided at both meetings, probably for the last time. He made interesting speeches, which the daily newspapers term a valedictory address. Following are extracts:

I wish to congratulate the stockholders on the profitable condition of the company and the progress made in carrying on the road so that they may turn their stocks into investments. I think it is a proper ending for a great work when the stock can take care of itself. I have put the best efforts of my life into this work, and have received the pleasure of my life from it. I look back with a great deal of pride upon what has been done on the North Side. We've done it against great opposition, and we have had to fight for everything we obtained.

had then, with straw on the floors in the winter, for heating was not thought of in those days. And you can remember how we threw away our horse cars and put in the cable, spending millions in making the improvement. And then you know how we put in electricity.

I am proud to think of what we have done. I do not care for applause or praise. A man praises you to-day and very likely curses you to-morrow.

We have made many improvements, but the thing is not perfect by any means.

They talk about municipal control of the street railways, and they refer to Glasgow as an example of that system in practice. Well, I can only say that when we have as good men in office and as competent city officials as they have in Glasgow it will be time enough to think about city control. But you have not that kind of men in this city now.

Mr. Yerkes still retains his holdings in the Chicago Consolidated Traction company, which includes the outlying surface feeder lines of the North and West Sides, and he also has his controlling interest in the Union Elevated Railroad company, in the Lake Street Elevated Railroad company and in the Northwestern Elevated Railroad company. The new traction company is considering the acquisition, by lease, of the Consolidated Traction company. This step, when taken, will probably in-

volve the purchase of the Yerkes holdings and his absolute retirement from the surface lines of Chicago. The completion of the Northwestern elevated railroad will, it is predicted, be a signal for the resumption of negotiations looking to the consolidation of the elevated properties, the purchase of Mr. Yerkes' holdings in them and his retirement from all traction interests in Chicago. In due course the directors and officers of the West and North Side companies will resign to the new company, and their places will be taken by men representing the Chicago Union Traction company.

The new company has, it is stated, a capital stock of \$32,000,000, of which \$12,000,000 is to be preferred. All of the preferred stock has been subscribed, and the money received from this sale will be used to retire Mr. Yerkes' holdings. It is said that Egbert Jamieson, until now general counsel of the North Chicago company, will probably be the president of the Chicago Union Traction company, with John M. Roach, also of the North Side system, as general manager of the consolidated system.

Lowering Heavy Electrical Machinery over the Niagara Bank.

The Niagara electrical fraternity witnessed an interesting feat a few days ago, when the field of the large new generator made by the Walker company for the Buffalo and Niagara Falls Electric Light and Power company was lowered over the high bank to the central station of the Niagara Falls Hydraulic Power and Manufacturing company below. This field weighed about 17½ tons, and the lowering it over the cliff proved quite a task.

Upon its arrival at Niagara Falls it was switched onto the Central tracks, near the canal basin, and taken off the car and moved toward the edge of the

FIG. 1. LOWERING HEAVY ELECTRICAL MACHINERY OVER THE NIAGARA BANK.

bluff, just to the south of the lower works of the Pittsburg Reduction company, and north of the Cliff paper mill, where a large derrick is stationed for lowering machinery over the bluff. The field was made fast to the derrick boom and then raised in order to clear the low roof of one of the Cliff Paper company's buildings. It was then swung out over the high bank to the position shown in Fig. 1. It was then found to be impossible to swing the derrick boom any further around in order to get the field over where it was desired to drop it. An examination revealed that the bed of the derrick was broken, and it was necessary to return the field to the high bank. This was done, and three days later the attempt was repeated successfully, this time the field being placed in the power station in safety. It was the largest single piece of machinery ever lowered over the cliff, but the derrick had picked up heavier combined weights. The safe arrival of the field in the power house relieved many fears.

Incidentally, it may be remarked that in Fig. 2 may be seen a new aluminum bar running up the big penstock. This bar carries current for the operation of an alloy works on the high bank, where a small amount of power is used.

Poles and Wires in Private Alleys.

It is laid down in some of the authorities that the erection of electric light poles by city authorities for the purpose of lighting the public ways and places is not a taking of private property for public use, even though the ground that the use of the streets for this purpose is in the nature of an exercise of the police power of the city. But when an electric-light company erects poles or strings wires, not for the purpose of lighting public ways and places, but for the purpose of supplying light to private individuals and firms for the satisfaction of its own corporate and commercial interests, the Supreme Court of Illinois holds, in the recently decided case of Carpenter against the Central Electric company, such erection of poles and stringing of wires constitute an additional easement on the public way or private alley, for which the owner is entitled to demand compensation.

The Supreme Court states that it has been

said that the legal relations of electric-light wires, through the streets of a city must be analogous to those of gas pipes, upon the ground that both the electric-light wires and the gas pipes are means of furnishing light from a central source of supply, and that, if the laying of gas pipes in a city street is not an additional servitude on the land of the abutting owner, the same should be true of laying tubes for electric-light wires, or placing posts in the ground for carrying the wires overhead.

This doctrine, however, the court continues, applies only to such public streets and alleys as are under the control of the municipality, and where the light to be transmitted by the wires or pipes is for the benefit of the public, as well as of property owners, along the line of the street. The doctrine, it insists, can have no application to a private alley where the fee of the ground in the alley is in the abutting owners, and where the easement, consisting of the use of the alley, is confined to a limited number of property owners, whose lands abut upon the alley.

Power at the Paris Exposition.

By JOHN T. BRAMBALL.

The decision of the Paris Exposition management to establish an electric power plant upon the contracted space of the exposition grounds is disappointing to those who believe that the seat of energy of this great exposition, which shall stand as the demonstration of the world's progress in the arts and sciences at the close of the nineteenth century, should itself be a worthy exponent of the engineering skill of the age.

What, then, should the Paris power plant of 1900 be like? Certainly not fashioned after those that preceded it, for that would confess inability to make further progress. It should mark a distinct advance upon the World's Fair at Chicago.

Looking back at the three American international expositions—New York, 1853, Philadelphia, 1876, and Chicago, 1893—as well as those of London, 1851, Paris, 1867, and Vienna, 1873, it is not difficult to associate the grand productions of inventive genius with the accelerated progress in the mechanical arts which followed in the next decade. But, to consider solely the subject of power generation, the Crystal Palace in New York was ill-provided in that respect. America's industries in 1856 were still of the infant character, and the greater part of the machinery was imported from English workshops. The New York Tribune's reports of the exhibition, as edited for republication by Horace Greeley, devoted a hundred times the space to agricultural machinery (and indeed there was not much else) that they gave to the steam engine. Only one of these was mentioned as a primary motor, and this was dismissed with the following description:

The beam engine, from Providence, by Corliss and Nightingale, exhibits a new application of governor * * *. The workmanship and the ingenuity displayed in this machine are above all praise. As to its practical utility only experience can decide.

The Paris Exposition of 1867 was not remarkable for its machinery, but was noted by Geddes as the first world's fair to show processes of industry in action. The best example of transmission of power, according to the report of the American commissioners, was a "telodynamic" (wire rope) machine from Germany, capable of transmitting 120 horse power 400 feet, and a "hydro-aero dynamic wheel" (compressed air) from Belgium, which transmitted nine horse power 600 feet, and was thought capable, under favorable conditions, of developing 15 horse power. The prime-power engines, though more numerous, did not differ materially from those of the London exhibition of 1851, except that there seems to have been, according to the report of Special Commissioner Auchinclose, a marked adoption of the American model.

In regard to the Vienna Exposition of 1873, the situation is best explained in a paper by Professor James Hart, making comparisons with the Centennial Exposition, then about to open. Professor Hart said:

In the department of machinery, if in no other, the Centennial ought to eclipse all its predecessors. It is in the power of our manufacturers and inventors to make a display of machinery at Philadelphia that shall throw London, Paris and Vienna completely in the shade. This utterance is not the outpouring of enthusiastic patriotism; it is based on a careful study of the Machinery Hall at Vienna. There were more "inventive brains" in the little section occupied by America than in all the rest of the huge Machinery Hall. By the side of our ingenious contrivances, that did their work with such economy of space and force, and with such precision, the cumbersome structures from Germany, France and even England, seemed 20 years behind the times. In this connection America may lay claim to a unique distinction. Mr. Corliss was the only person who received a diploma of honor without being an actual exhibitor. But in truth the entire Machinery Hall, with its appointments, was his exhibition, for every stationary engine at work in the building or on the grounds was in principle a Corliss engine.

Grandly did the builders of the Centennial meet the hopes of its promoters and its friends. London, Paris and Vienna were indeed surpassed by the long lines of busily working machinery, which stretched away along the lines on either hand, all receiving their energy from a single master engine. The Corliss 1,000 horse-power giant of 1876 was, in itself, the first world's fair power plant.

But 1893, the occasion of the Columbian quadri-centennial, saw another great step taken in the dominion of mind over matter, in the great central power plant, which, from the Brobdingnagian battery of boilers adjoining the Palace of Mechanic Arts and the silent cyclopean Corliss of 3,000 horse power, transmitted power and light through the agency of

ponderous dynamos to every part of the capacious grounds of the exposition. Nor was this all. Not only were there no visible wires and no shafting and belting beyond the central plant itself, but there was no visible fuel supply. The power seemed to be produced by magic. There was smoke, indeed, from the great stacks, but no coal. The fuel was pumped from the oilfields of Ohio, 200 miles distant, and automatically fed to the furnaces in Jackson Park.

And now, what of Paris in 1900? Oil or gas being unavailable as a steam producer, must she go back to the antiquated system of shoveling coal beneath the great boilers that are to supply steam for her power plant on the Seine? Must great piles of coal obstruct the Champs de Mars, and boats take cargoes of ashes at the Pont de Jena? Must huge chimneys belch forth smoke to sully the white walls of the Trocadero and smut the fine fabrics in her Palais de l'Industrie? It is to be hoped that the Queen City of the world will never consent to such a confession of weakness. What then remains?

The Schaffhausen-Frankfort experiment demonstrated the possibilities of long-distance transmission of power, which was confirmed by the Niagara-New York experiment. While neither was practically satisfactory from an economic point of view, they were as scientifically successful as was the telephone at Philadelphia in 1876. It now remains for France to outdo the achievements of Germany and America in the practical transmission of power, and to proclaim to the world that France celebrates the closing of the century with a feat of engineering worthy of the event and of herself.

The problem, though new, is not a difficult one

FIG. 2. LOWERING HEAVY ELECTRICAL MACHINERY OVER THE NIAGARA BANK.

for engineers. In the coal mines of Du Nord and Pas-de-Calais, within 100 miles of Paris, are great stores of energy which modern science may transmit to Paris or to the Mediterranean, if necessary, by electricity. By establishing the power plant at the mines instead of at the exposition itself, many economies are effected, which more than offset any increase in cost of the plant and the losses in transmission. Not only the cost of delivering coal would be saved (it is 1.8 cents a ton per mile on French railways), but the "run of the mine" being used, the first cost of fuel would be far less. At the exposition grounds valuable space would be gained for exhibits; the handling of coal and ashes would be avoided in crowded streets and grounds; the smoke nuisance would not worry exhibitors, and the fire risk would be materially lessened. These are important features to be taken into consideration when the matter of economy is discussed.

The feasibility of conducting high potentials such a distance, or even greater, with a practical efficiency need be no longer questioned. The Niagara electrical engineers place the economic limit nearer 500 miles than 100. As to cost of plant, the conductors would furnish the heaviest item, but the copper or aluminum should not be charged on the account as a permanent investment, since the value of the metal does not deteriorate by use. Indeed, it is not unlikely that the successful operation of the plant would encourage sufficient patronage from city consumers after the close of the exposition to warrant its continuance and extension, and thus stand as a model to London, Chicago and other great cities in the matter of the abolition of the smoke nuisance.

Nearly three years ago the suggestion was made by the writer to the directors of the Paris Exposition of 1900 of a plan for the generation and transmission of power as thus outlined, and the proposal, coming from this country, and originating, in a sense, with the Chicago Exposition, its adoption would add to the record of London (1851), Paris (1867) and Vienna (1873) another laurel wreath for America.

A Few Practical Suggestions.

By L. F. SIMDELL.

A center crank was recently made true by the home-made rig designed as in Fig. 1. The crank was used between a motor and a plunger pump. The service rendered was very ineffective, due to the improper alignment of the yoke and wrist pin. The yoke wobbled badly and communicated the jarring motion to the motor and to the flywheel of the pump, resulting in loss of power, irregular work and bad service in general. In making these cranks, for use in crank-and-flywheel electrically driven pumps, the practice is to rough out the crank-shaft, slot the yoke as far back as the wrist-pin and then turn the latter true in a special rig. In the event of the shaft or yoke springing or anything occurring to disturb the alignment of the crank after it is in service, it may be necessary to turn the crank-pin on center cranks again. The rig in Fig. 1 may be used for this purpose. The brackets (BB) are cast-iron, and are bored at the upper projections to receive the ends of the crank-shaft, as shown. This will bring the pin at the center (A), opposite which point the centering pins (CC) are provided in the bracket. We now have the crank-shaft in a turning center, and it is secured in the turning lathe by holding the part (E) to the face plate, while the arm of the opposite bracket (D) is centered on the turning point. The work is now in position for turning, and, with the proper tools, the pin can be readily trued.

SWITCHBOARDS.

In Figs. 2, 3, 4, 5 and 6 are shown shop methods for turning, truing and putting switchboard connec-

A FEW PRACTICAL SUGGESTIONS.

tions into order. It is a commendable practice to make inspections of the switchboards to ascertain whether the proper adjustment has been lost through the wear or fracture of any of the supports. Sometimes the shoulders of the supporting studs become worn, or the stud itself becomes bent, allowing the switchboard to settle and lose its alignment. As is known to electricians, it is necessary that all rheostat fittings must be perfect. When dynamos are operated together, a rheostat connection may give out unexpectedly and cause the loss of an armature. Fuses or circuit-breakers are provided on each feeder leaving the switchboard, but unless the corresponding parts are in perfect operating condition, serious trouble may arise.

In examining a switchboard that gave trouble through the repeated failure of shunt-field connections, I found that some of the fastenings employed to secure rheostats to the back of the switchboard were untrue and generally imperfect. I removed these and trued the pins by placing each in a turning latch between centers, as in Fig. 2. After locating the irregularity, I secured the base end to the face plate and turned off sufficient metal to reduce the pin to an even condition. A key was used to secure the base pin in place, but most of these keys were found to be loose, and failed to answer the purpose intended. This was rectified by boring a set-screw hole opposite the key and providing a small set-screw (F), the point of which was forced against the key, holding the latter firmly in place.

Some of the switchboard connections were found in the shape shown in Fig. 3, in which the supporting bolt was too small in diameter to fill the hole in the board. The board was therefore shifty at that end. This defect of workmanship was fixed by providing metal sleeves (H), Fig. 4, for the loose bolts.

It is hardly necessary to inform electrical men that fire-insurance inspectors are more particular than formerly and that more thorough inspections are made of even the smallest details of switchboard construction. A new switchboard, just from the manufacturer's, is usually in good condition, and the inspector is usually satisfied with a casual examination to make sure that the switchboard is located 12 inches from combustible stuffs, or separated therefrom by the proper non-inflammable insulating materials; that the fittings are electrically and mechanically perfect; that the lightning arresters are properly provided for; that there are no kinks or coils in the wires between the outdoor lines and the arresters; that drops and jacks are in good working order, and that the board itself is properly designed, mounted on hard rubber or other substance and correctly set and wired. But when the inspectors examine boards that have been in service a number of years they are more careful to locate defects, as they are aware that switchboards, like other apparatus, are subject to the influences of mechanical and electrical strains, as well as ordinary use. Often a little mechanical skill can repair the effects upon shoulders of studs, and pin supports. Fig. 5 shows a badly worn shoulder at (I). It may not be convenient to replace the pin with a new one, and the old one can be made useful again by turning off the worn portion in the lathe and shrinking on a ring, as at (J), Fig. 6, to make up for the metal removed.

THE USE OF THE FILE IN ELECTRICAL WORK.

The proper use of the file in ordinary filing operations in the electrical repair and construction shop is of such importance, and the tool is so frequently incorrectly handled on delicate parts of motors and switchboards, that a few suggestions and illustrations may be serviceable. The electrical machinist is obliged to use the file on iron, steel (soft), copper, brass, marble, slate, porcelain, ivory, hard rubber, etc. In filing a flat surface, as in Fig. 7, the tendency is to depress the file at each stroke, as per the dotted lines, so that after filing a short time the center (B) will be higher than the edges (CC). In order to avoid rounding off the edges at (CC) several points have to be considered. Some endeavor to overcome the trouble by using very short files, files of large cutting capacity, square files, etc. An ordinary flat file of from 12 to 18 inches length is best, and, with a straight edge at hand to test the edges frequently while filing, the strokes may be given the file with one hand grasping the handle of the file and the other supporting and steadying the point. An equal pressure is necessary, and depressing the file at either end must be avoided. To file a key-way the same rules apply to avoid taking off the edges at (DD), Fig. 8. The file should be the square or pillar pattern, and provided with safety edges to cut downward, and with edges to suit the conditions, if it is desired to cut the sides of the key-way.

In filing curved work, as in Fig. 9, some electrical machinists make the mistake of using a round file, like (E). It is impossible to get a true curve with the small round file, even if it is skillfully moved over the surface from right to left and the reverse at every stroke. The half-round file (F) should be used, but not as some use it. The method of applying the strokes to one place until a certain depth is obtained, and then proceeding to another point, does not result in uniform work. The best process is to sweep the file from (H) to (G), Fig. 10, and vice versa, continually, with the forward and backward strokes, taking off metal in the entire curve each time, thus gradually reducing the curve to the required dimensions. This causes the file cuttings to cross each other and produce much truer results than in the former plan.

It frequently happens that the electrical machinist does not possess the file required with the safety edge on the right side for the work in hand. If an attempt is made to reduce a flat surface next a shoulder with a file provided with all its edges, the shoulder will, of course, be cut into, as at (I), Fig. 11. If no file is at hand with a safety edge on that side, the same file may be smoothed on that edge by holding it on the emery wheel a few minutes. The proper surface can then be filed without abrading the shoulder. If a half-round file is used for this purpose, the shoulder will be cut into, as at (J), Fig. 12. If a circular cavity or recess is wanted in the flat surface near the shoulder, it will not do to use a round file, as such a file will cut both ways, sinking the recess into both surface and shoulder, as at (L), Fig. 13. The remedy consists in holding the file on the emery wheel until a safety edge is made at (P), Fig. 14. The recess may then be cut with safety.

Lord Kelvin's Genius.

[Professor Oliver Lodge in the Liverpool Post.]

The modern theory of electricity, developed so brilliantly by Clerk Maxwell, was begun by him (Lord Kelvin). The science of thermodynamics owes much to him; the theoretical laws of thermoelectricity were wholly worked out by him; and to him long ago is due the theory of those electric oscillations which were elaborated practically by Hertz, and have recently been exciting some popular interest as affording a method of wireless telegraphy.

In the higher regions of optics also he has worked much, and in his Baltimore lectures and elsewhere has striven to unveil the mystery of the connection between ether and matter, as revealed in the facts of radiation, fluorescence, phosphorescence, selective

absorption and dispersion. The definition and the experimental determination of the absolute zero of temperature are both due to him. The vortex theory of matter constitutes one of his most brilliant but incompletely worked out speculations. The kinetic theory of its elasticity and rigidity is a definite contribution to that view of the physical universe which seeks to resolve the whole of merely material existence into the two fundamental entities—ether and motion. Let anyone ask what is the size of an atom, and he is referred to Lord Kelvin.

Let him ask what is the age of the earth, and if he mean anything definite by this question—if he mean, for instance, what time has elapsed since the earth was a molten mass beginning to cool—it is again to Lord Kelvin that he must go. And then the tides; all the higher mathematical work on the tides, with their various causes and perturbations, is based on Kelvin's pioneering work, and to him all writers on this abstruse subject look up and defer as their master.

Happy in the circumstances of his education, pertinacious in his unwearied industry, and undistracted by other interests from a constant devotion

A FEW PRACTICAL SUGGESTIONS.

to definite dynamical science, narrow perhaps in some of its aspects, but all the more intense for that, he stands before us now a monument of human power and influence, one of the benefactors of the human species, one who has been happily preserved with hardly diminished energy for nearly 60 years of peaceful, epoch-making work, one on whom posterity will heap high honors, and will regard with feelings of envy us of the present generation who are still illuminated by his living presence.

Canadian Electrical Association.

At the convention of the Canadian Electrical Association, to be held at the New Royal Hotel, Hamilton, Ont., on June 28th, 29th and 30th, papers are to be read as follows: "Meters," A. A. Dion, Ottawa; "Cost of Power," C. B. Hunt, London; "Inspection," W. J. Plewes, Montreal; "The Enclosed Arc Lamp and Its Use," W. A. Turbayne, Hamilton; "The Incandescent Lamp for Central Stations," E. E. Cary, St. Catharines; "Central-station Accounting from a Business Point of View," P. H. Hart, Montreal; "Transformer Economy," F. E. Leonard, Jr., Montreal. In addition, there will be a "question box," and Mr. H. R. Leyden will lead a discussion on high-tension power distribution. The "social features" include trips to Burlington Beach, (and an excursion on the lake), Grimsby and De Cew Falls, where the large plant of the Cataract Power company is located.

Single-phase Distribution.¹

By HERBERT A. WAGNER.

Each system, single-phase, two-phase and three-phase, has its own particular province where it is supremely adapted to the work to be done. In the transmission of power to operate large motors, both the two and three-phase systems are superior to the single-phase, although time may even modify this condition.

Simplicity is one of the prime requisites in an

conduits and other construction items does not increase in proportion to the cross-section of the copper.

The actual difference in the cost of conductors installed for underground transmission between single and three-phase is almost insignificant. This slight difference can always be made up completely by operating the single-phase at a slightly higher pressure. If the cost of copper alone was considered, the single-phase would have to be operated at a pressure 15 per cent. higher than the three-phase

largely used for lighting, equally loaded at all times, and it is, therefore, impossible to keep the different phase circuits of two or three-phase systems balanced when used for single-phase local distribution, and we have demonstrated that they must, of necessity, be so used in practice.

In either the two-phase or three-phase systems an unbalanced load on the different phases causes an unbalancing of the pressure on those phases at the generator, and consequent difficulty to regulate closely, this being most marked in the three-phase system. In this particular, and in slightly less complication in local distribution, the two-phase system is superior to the three-phase.

It is quite necessary to carefully consider all these characteristics of the three systems in deciding which one to use in any particular case. As I have said, each has a field in which it is the most suitable.

For long-distance transmission, for power or rotary transformers only, the three-phase system is most clearly indicated.

For the same service as just stated, with a small proportion of lighting, the three-phase current may be transformed to two-phase for the latter, or single-phase current may be used from one of the three-phase circuits.

For shorter transmission and general distribution, where rotary transformers are also required, the two-phase system is indicated.

For all general distribution, where rotary transformers are not required, and extremely large motors, starting under load, are not to be supplied, the single-phase system should always be used. For cities, large and small, this class of service is the one usually required, with the exception of cases where it is necessary, in order to conform with long-existing conditions, to supply direct-current mains with direct current from rotaries. Here the three-phase system is, of course, the most applicable.

I have not considered the use of rotaries with single-phase currents, not because their operation is impracticable, but simply for the reason that none of large capacity have ever been made. They can be made, and so made that they will operate as satisfactorily as on two or three-phase circuits. It would complicate them more to make them self-starting by alternating current, but many two-phase rotary installations have been made which are not self-starting. A separate starting device or motor is used, which would be equally as applicable to single-phase circuits. Single-phase rotaries of a given size would have less capacity than two or three-phase, and, therefore, for a given capacity, would cost slightly more. That they will eventually be used quite extensively on single-phase circuits is quite certain.

It was not my intention to digress very far from the subject indicated by my title, but it seemed necessary to clearly define the position and sphere of single-phase work, by way of introduction.

Probably, the best example of pure single-phase distribution on a large scale is furnished by the Missouri-Edison Electric company of St. Louis, and I can best show its possibilities by describing the results obtained by this company. The methods of distribution employed by this company have been so frequently described that they are undoubtedly

FIG. 1. SINGLE-PHASE DISTRIBUTION.

electrical installation, and the multiplication of parts or members decreases or eliminates it. It is hardly necessary to go into the details of the complications to which polyphase distribution may lead, but of these the multiplication of wires is the very least. The complication of the switchboard apparatus and appliances, and also those used in connection with local distribution and services, is most discouraging.

Consider, for instance, low-tension local distribution mains on the three-phase system in combination with the Edison three-wire system, making six circuits to equally divide your lamps between in such a manner that the balance will be quite nearly maintained at all times, at each or adjacent customers.

In all successful low-tension distribution systems junction boxes are used at street intersections. These are arranged for distribution in four directions, and at feeder terminals and some other intersections are quite frequently six-way boxes. Imagine such boxes with 24 or 36 cables entering them. The neutrals in such a system could never be allowed to ground, as they would all three be at different potentials. It is absolutely impracticable, and the three-phase advocate will answer by saying that he would separate his circuits for general distribution and run his lighting circuits single-phase, using his three phases each for a different district or section of a district. For power customers he would use all three circuits, of course. Now, everyone who operates a large central station knows how impossible it is to separate light and power. Small motors are required by almost every lighting customer. If the solution then is to use single-phase motors for small powers, where is the size line to be drawn? Single-phase motors can be made just as efficient as three-phase. True, they will cost more if so made, but when the saving in cost of transformers and distribution devices is considered, the balance is in favor of the single-phase motor.

It must, of course, be borne in mind that the subject now under consideration is general distribution for all electrical applications, and not for power distribution alone. We might then be advised that we could confine our three-phase system to our transmission line and feeders, where we could save very greatly in the amount of copper required.

For ordinary distribution in large cities the cost of transmission lines or feeders is but a small proportion of the total cost, where alternating current is used. Of this small proportion we are told we can save 25 per cent. But is this true? It is as far as copper is concerned, but the cost of insulation,

¹ Read before the National Electric Light Association, at New York, May 23-25, 1899.

for equal cost. Considering the total cost of line installation, however, this difference would not be over 10 per cent. in pressure for overhead lines, and less than five per cent. for underground lines. Have we ever so nearly reached the safe limit of pressure that anyone could say, "You cannot safely go 10 per cent. higher?" Can we not as safely run 10

FIG. 3. SINGLE-PHASE DISTRIBUTION.—GRAPHICAL LOG OF LOAD ON UNDERGROUND FEEDERS.

per cent. higher when we have only two-thirds the length of line to operate and practically but two-thirds of the surface in contact with insulation from which leakage or breakdown might occur?

As two-phase distribution requires the same amount of copper as single-phase at the same pressure, it has no point of even apparent superiority, except the debated one of greater adaptability for running motors.

On regulation—and this is a very important factor—the single-phase is far superior to the two-phase or three-phase system. I contend that it is impossible to keep two separate feeders supplying current

familiar to most of you. I will, therefore, mention them but briefly.

In a large portion of the city the usual system of individual transformers for every customer or adjacent customers is used. The current for these transformers is supplied by overhead feeders and distributed over high-tension overhead mains. In some districts one transformer is used to supply current for an entire block by means of three-wire low-tension secondary mains.

The principal business portion of the city is now supplied by underground conductors, covering a district of 40 miles of streets. A low-tension Edison

three-wire network of mains is used throughout this district, and these mains are supplied by high-tension feeders, each of which terminates in a transformer of the same capacity as the feeder. Pressure wires run from the mains near the terminal of each transformer back to the station. Each feeder has a regulator or booster at the station.

From this network of three-wire single-phase alternating-current mains current is furnished for incandescent lamps, arc lamps and motors.

There are at present about 1,000 horse power of single-phase motors in operation, varying in size from one-half horse power to 25 horse power. Many of these have replaced direct-current 500-volt motors, and there is not one that is not giving perfect satisfaction. Current is charged for entirely by meter.

The most novel feature of this system is the transformer, and the method of making it practically a part of the feeder to which its drop is added, and is cared for by the feeder regulator at the station. The pressure wires indicate the pressure on the secondary mains, which can be kept constant, however much the drop in feeder and transformer may vary.

The transformers were designed for remarkably high-average efficiency, and actually show the highest efficiency at about one-quarter load. The specifications for these transformers limited the iron loss to 250 watts, the copper loss at full load to 3,200 watts, and the regulation to four per cent. Thirty of these, of 110 kilowatts capacity each, are in service on as many feeders. They all run slightly under the specified losses. Tests on six of these transformers, picked out at random, are as follows:

TESTS ON 110-KILOWATT TRANSFORMERS.

No.	Loss in Watts.		Efficiencies.		Regulation.	
	Iron.	Copper.	¼ Load.	Full Load.	Per Cent.	Per Cent.
1.....	224	3,199	98.4	96.9	3.50	
2.....	335	3,080	98.4	97	3.44	
3.....	244	3,162	98.4	97	3.44	
4.....	231	3,125	98.4	96.8	3.48	
5.....	250	3,050	98.4	97.1	3.38	
6.....	249	3,125	98.4	97	3.49

An actual efficiency curve is shown in Fig. 1. Most of these transformers have been in use for nearly a year, during which time not one has ever been out of service or shown any defect of any kind. The highest recorded load on any one was 130 kilowatts.

Fig. 2 shows a map of the district in which the transformers are used. The full black circles indicate manholes in which transformers are placed at the feeder terminals. The feeders are not shown on the map, the heavy lines indicating only the three-wire system of mains fed by the feeder transformers.

The feeder regulators at the station make it possible not only to regulate the pressure with the greatest precision, but to divide the load between the feeders and their transformers in any way desired. By slightly lowering the pressure on one feeder, and slightly raising it on an adjacent one, a large proportion or all of the load of the first can be transferred to the second without sensibly altering the pressure on the mains. This operation is almost identical to that of dividing the load between two direct-current generators running in parallel. All feeders can be kept almost equally loaded in this way, if desired.

Fig. 3 shows a number of load curves of feeders operated in this way. It will be noticed that the fluctuations in load on feeders Nos. 1, 2, 3, 4, 5, 6 follow each other very closely, and that several are extremely close to curve A, which is the total load curve for this district, plotted at one-tenth scale. These feeders were not operated at this time to divide the load as closely as possible, but to give the best pressure regulation. Both conditions are very fairly met, however, at the same time. Curves 7, 8, 9, 10 are for a portion of the district somewhat separated from that of the first curves noted on the higher portion of the scale, but, grouped as they are, they agree very well between themselves and curve B, which is the total district load, at one-fiftieth scale. Curve 11 follows a path which seems quite erratic, but its principal load is two theaters, and at this time it was feeding a few blocks of mains which were completely separated, temporarily, from the rest of the system. Its lack of conformity to the other load curves shows very forcibly the advantages of an interconnected system of mains.

The load record for this particular day was selected for these curves, as illustrating unusually well the relative load variation on different feeders. The day was an unusually dark one, and was also a matinee day for the theaters. At half past 11 in the morning the total load in the business district reached within seven per cent. of the maximum at the time of the usual peak. The fog began to lighten slightly until one o'clock, when it again grew darker until half past. The relief during the next half hour was checked somewhat in effect by the theater matinees.

It is our custom to plot quite frequently curves of this kind, showing loads on all feeders in a district, for the purpose, among others, of establishing the best pressure wire to adopt for a period as standard for general regulation. The bus-bar pressure is always regulated by the indications of this standard pressure wire, and the individual feeders whose pressure departs from the standard, up or down, are regulated independently, from time to time, by their own regulators.

The effect of a slight drop in pressure on one feeder in transferring the load from that feeder to an adjacent feeder or feeders is shown by the curves

in Fig. 4. Here the pressure on feeder No. 1 was dropped 1½ volts. Feeders Nos. 2, 3 and 4 promptly took their proportion of the load, leaving feeder No. 1 practically without load. Feeder No. 1 could then have been cut out and taken out of service, if desired, leaving the portion of the district about its terminal 1½ volts low in pressure. This is on the assumption that the other feeders were allowed to remain at their original pressure; but by means of their regulators the pressure of each or any one could be raised slightly and the pressure at the terminal of No. 1 could in this manner be brought to approximately the normal figure, with only a slight raise at the terminals of the other feeders. All feeders are provided with fuses at the station

load indicated, showing that the junction box fuses had also been blown, completely separating the feeder from the system. The voltmeter connected with the mains adjacent to the terminal of the disabled feeder then showed the pressure at that point to be slightly less than two volts below the normal. It was found to be necessary, however, to raise three adjacent feeders but one-half of a volt each above the normal to bring the pressure of the first named point about right. Absolutely no inconvenience was observable in the operation of the system, and no complaints were received from any customer. This feeder happened to be one of the most isolated of all our feeders, and one supplying individually a far greater proportion of the district than any

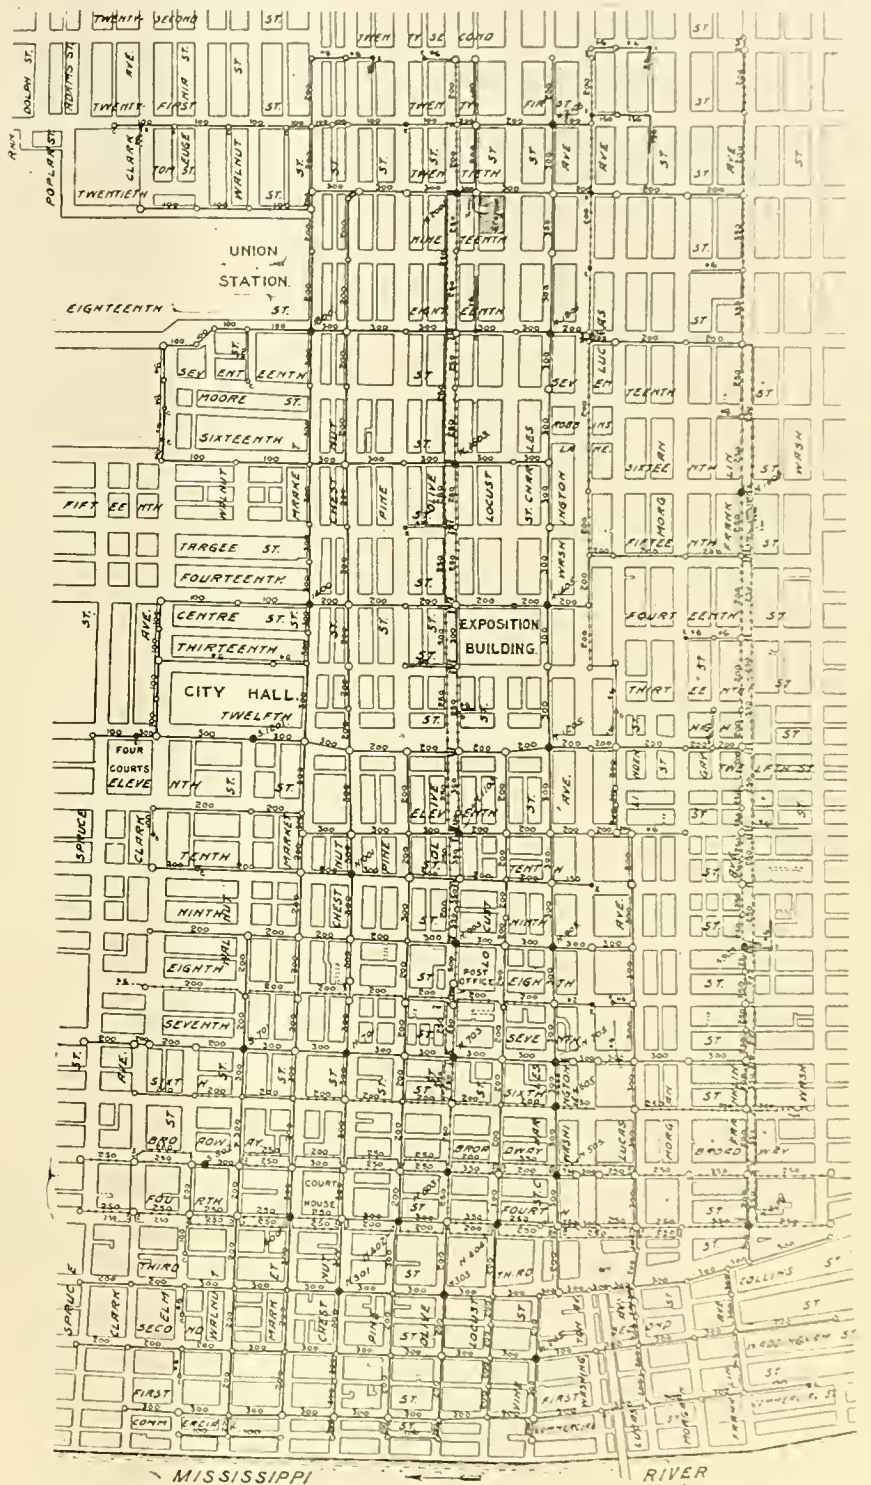

FIG. 2. SINGLE-PHASE DISTRIBUTION.—MAP SHOWING UNDERGROUND DISTRICT IN ST. LOUIS

end, and the secondary terminals of each transformer are led into junction boxes provided with copper fuses. These fuses are intended to protect the rest of the system in case of any defect developing in a feeder or its transformer. We have, thus far, had but one such accident, but this, of course, had to occur at the time of maximum load. A defective joint in a two-conductor feeder cable developed a short-circuit about three blocks from the feeder end. The first indication was given by the feeder-ammeter index trying to knock out the side of its case. This was almost immediately followed by the blowing of the feeder fuse at the station. The next thing noticed was a great activity on the part of the ammeters on adjacent feeders. They soon settled down, however, with a slightly increased

other, being the one shown on the map terminating at Third and Chestnut streets.

The method of eliminating the effect of transformer drop by making it a part of the feeder renders it possible to regulate, with a system of interconnected mains and the use of pressure wires, as closely as in a direct-current system; and the use of individual feeder regulators enables the pressure to be adjusted with the greatest precision. The uniformity of pressure obtained in the actual operation of this system is shown by the recording voltmeter chart in Fig. 5. This chart was taken from a voltmeter situated about 6,000 feet from the station and about 500 feet from a feeder and pressure-wire

Eastern Office: 148 Times Building, New York.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the entire contents of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION.—In advance, postage prepaid, \$3.00 for a full year of 52 numbers; in clubs of four or more, \$2.50, with free extra copy for eight subscriptions; foreign countries, \$5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—the only general electrical paper published in the West—thoroughly covers a territory exclusively its own. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers desiring western trade will appreciate the UNEQUALLED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

CONVENTIONS AND EXPOSITIONS.

International Electrical Exposition in Commemoration of Volta, Como, Italy, May 20th to October 25th. (The date of the festival of the centenary of Volta at Como is fixed for September 18th.) American Institute of Electrical Engineers, Boston, June 26th to 29th.

American Society of Civil Engineers, Stockton Hotel, Cape May, N. J., June 27th to 30th.

Canadian Electrical Association, Hamilton, Ont., June 28th to 30th.

Southern Telephone Association, Memphis, Tenn., July 5th.

American Association for the Advancement of Science, Columbus, O., August 21st to 25th.

International Meteorological Committee, St. Petersburg, August 25th.

National Association of Municipal Electricians, Wilmington, Del., September 5th and 6th.

Philadelphia Exposition of American Manufactures for Export, September 15th to November 10th. (Under the auspices of the Philadelphia Commercial Museum and the Franklin Institute.)

American Electro-therapeutic Association, Willard's Hotel, Washington, D. C., September 17th to 21st.

Chicago Exposition of Electrical Arts, Tattersall's, September 25th to October 9th.

International Exhibition of Motor-Vehicles, Berlin, Germany, during September.

American Street Railway Association, Tattersall's, Chicago, October 17th to 22th.

At the meeting of the International Meteorological committee at St. Petersburg, on August 25th, Professor Rücker of England will submit a report on "Terrestrial Magnetism and Atmospheric Electricity," and W. von Bezold of Germany will read a paper upon "Protection of Magnetic Observatories against Industrial Electrical Works." The latter subject, it will be remembered, was discussed at the international conference at London last year. The meeting will be attended by the most distinguished specialists in this line, and will be of an official character. The United States will be represented by Willis L. Moore, chief of the Weather Bureau.

Mr. Yerkes' retirement from the active management of street-railway properties in Chicago is an important event of more than local significance. Mr. Yerkes has been a powerful factor in the development of modern street-railway practice. The properties under his control were extended and their values greatly enhanced during his management. In some respects Mr. Yerkes is a remarkably able manager, but his unfortunate faculty for antagonizing the public and disregarding the convenience and comfort of his patrons accomplished his downfall. During the last few years he displayed a bitterness and resentment against those who opposed his projects that revealed a weakness not suspected in his earlier operations. In retiring Mr. Yerkes expresses his satisfaction at the conclusion of his labors in Chicago, and there seems to be no disposition on the part of the public to detain him. Let us hope that he will find a more congenial field of operation elsewhere.

The practice of endowing educational institutions has not extended to engineering schools in this country, excepting in a few notable instances. For this reason the announcement of the intention of Andrew Carnegie to donate \$50,000 to Stevens Institute for a new engineering laboratory will be of particular interest. President Morton and the trustees had the building of the laboratory in mind for some time, but were unable to start the work on account of a lack of funds. President Morton explained the situation to Mr. Carnegie some time ago, but at the time received no assurance of assistance. It is evident, however, that the conversation made an impression upon Mr. Carnegie, for on Saturday last President Morton got a letter from Mr. Carnegie, who is in Scotland, saying that it would give him great pleasure to donate \$50,000 for the building of new laboratory. President Morton said that the plans for the new laboratory would be prepared at once, and that when completed it would equal or surpass those of Cornell, Columbia and the Massachusetts Institute.

Modern science bears witness to the wisdom of our forefathers and grandmothers, whose injunction, "Don't worry," if heeded, might have prevented much of the physical suffering, as well as mental anguish, that has been visited upon poor humanity. By the aid of the X-ray it has been determined that worrying stops digestion, causes dyspepsia, retards all the normal physical processes and demoralizes both body and mind. It wastes the forces of life, destroying the tissues without accomplishing anything. It has long been admitted that to worry is to fire into the air instead of at the enemy, but it has never been fully understood just how care and anxiety accomplished so much ruin. Now, however, all has been made clear by the investigations conducted by Dr. Fritz Lange of Munich, through the use of Crookes tubes and fluorescent screens. The X-ray was turned upon the stomach of a happy and contented cat, and the investigator was enabled to witness the process of digestion going on as it should in all well-regulated stomachs. Then he introduced care and irritation into the feline mind by placing a live mouse just beyond reach, and, he declares, digestion was stopped thereby. In spite of Dr. Lange's demonstration, however, it is greatly to be feared that we will go on worrying just the same, and suffer the consequences.

When the announcement was made several months ago that the Navy Department had determined not to extend the use of electricity on board ship, the Western Electrician expressed surprise and urged a reconsideration, believing that such a decision would be detrimental to the department and would retard the general adoption of electrical appliances in the merchant marine. It was difficult to understand the

mental process by which the decision of the Navy Department was reached, in view of the enthusiastic reports that were made upon the performance, during the Spanish war, of the electrical apparatus with which the latest vessels had been equipped. Now, it transpires that the whole trouble was the outgrowth of a factional dispute between two of the bureaus or branches of the service. A Washington dispatch last week announced that one of the causes of friction between the members of the Naval Board on Construction was moved by an agreement of the board that all deck winches on war vessels, except battleships, shall be run hereafter by electricity, and that the question of the use of electricity for operating them on battleships will be taken up later. The Engineer Corps of the navy has insisted that the winches shall be run entirely by steam, and, in consequence of its determined attitude, the board got into a tangle.

The dispatch continues: "The question may seem of little importance to laymen, but it caused a great deal of trouble at the meetings of the board. It is to end such internal controversies that Secretary Long has appointed a board, with Assistant Secretary Allen as president, to harmonize the differences between the various naval bureaus in regard to work on the construction and repair of warships."

It is greatly to be regretted that decisive action was not taken several months ago, as the battleships now building might have been furnished with electrical equipment. Now, however, there is reason to believe that by the time they are ready for service this part of their equipment will be antiquated. It has been the boast of the American navy heretofore that it has been a pioneer in the adoption of improvements in mechanical equipment, but now it must be admitted that a step backward has been taken deliberately and in the face of the most convincing proof of the error contemplated.

A remarkably favorable showing, unprecedented in the history of American export trade, appears in the statistics just prepared by the United States Treasury Department showing the exports of electrical machinery during the 10 months ended April 30, 1899. During that period the total exports in this line aggregated \$2,276,694, as against \$1,702,812 for the same period of last year. Under the classification of instruments and apparatus for scientific purposes, in which are included telegraph, telephone and other electrical apparatus, a still larger increase is noted, the exports in these lines during the 10 months of the current fiscal year amounting in value to \$3,537,993, as compared with a value of \$2,324,307 for the preceding 10 months.

The natural inference from these figures is that electrical manufacturers of this country have demonstrated their ability to compete with those of other countries, not only in neutral markets, but in the home markets of the more advanced industrial nations, particularly the United Kingdom and Germany. The electrical industry of this country has, in fact, been developed to the point where it seems to be not only practicable, but comparatively easy, to supply a considerable portion of the outside world as well as the home market. The conditions of manufacture in the United States to-day favor successful competition in foreign markets in many lines in which, at one time, we were exposed to the rivalry of foreign industries.

The observations of United States consuls in European countries and elsewhere encourage the belief that American manufacturers have a distinct advantage in the greater ingenuity of their operatives and in the economy of labor-saving machinery over foreign competitors, and that the obstacles they have to overcome are chiefly those of the special trade methods of different countries, the longer credits given by European exporters and occasional government discriminations by foreign nations against them.

It is very evident that the export of electrical machinery and appliances is no longer a matter of experiment, but that our large manufacturers have satisfied themselves that it is feasible to dispose of their surplus productions in all parts of the world, and have addressed themselves seriously to the study of the conditions which are requisite for healthful and permanent growth. The great increase in the applications to consular officers for specific information and for assistance in introducing American goods affords strong evidence of the general perception of this fact among American manufacturers.

American Institute of Electrical Engineers.

The sixteenth general meeting of the Institute will be held at the Massachusetts Institute of Technology, Boston, on June 26th, 27th and 28th. The meeting of 1890 was held at the same place and was quite largely attended, considering the membership at that time, which was only 540, or less than half the present number.

Papers for presentation are scheduled as follows: "Polyphase Electric Testing Methods," by Professor H. J. Ryan; "Symbolic Representation of General Alternating Waves and of Double-frequency Vector Products," by Charles P. Steinmetz; "Note on the Progress of the Closed-globe Arc Lamp," by Louis B. Marks; "The Cost of Operation of Some Building Plants in New York City," by Percival R. Moses; "Constant-current Transformers," by Professor W. L. Robb; "Notes on Recent Developments in Single-phase Induction Motors," by Charles P. Steinmetz; "Elements of Design Favorable to Speed Regulation in Plants Driven by Water Power," by A. V. Garratt; "Protection of Alternating Secondary Circuits," by Dr. Cary T. Hutchinson; "Air Gap and Core Distribution" (part second), by Professor W. E. Goldsborough; "Electricity in Coal Mining," by Professor J. P. Jackson. Other papers suggested, but not definitely settled upon, may be presented by A. D. Adams, S. E. Doane, E. A. Sperry and Professor Laws.

Among the objects of engineering interest which are likely to be visited are the Cambridge pumping station, the South Boston electric-light station, the electric plant of the Union railway station, the Atlantic Avenue Edison station, the central power station of the Boston elevated railroad, the West End power station at Cambridge, and the new Boston fire-alarm station.

New York Electrical Society.

The annual meeting of the New York Electrical society for the election of officers took place at the electrical exhibition, Madison Square Garden, on Saturday evening, June 3d.

The following-named members were elected: Frank Gordon Rice, Charles B. McLeer, J. C. Forsyth, Edward A. Mahar, Jr., Ernest R. Bartlett, Charles M. Crowfoot, A. M. Young, J. Arthur Holly, Joseph M. Cooper and Henri W. B. Blomquist.

The report of the secretary showed that 135 members were elected during the year and that the total number of members on the books of the society was 704. The average standard of the meetings has been appreciably raised and the average attendance throughout the year has exceeded 200. The secretary does not recall any time when the society has stood so high in public estimation, has had a larger steady accession to membership and could point to a better record in a year's work than now.

The report of the treasurer is correspondingly good, as it showed that the society is in better financial shape than ever before. A detailed statement of the receipts and disbursements for the last year will shortly be mailed to each member of the society.

The election of officers resulted as follows: President, Gano S. Dunn; vice-presidents, Dr. C. A. Doremus, Frank A. Pattison, Charles Blizard, Arthur Williams, F. V. Henshaw and Stephen L. Coles; secretary, George H. Guy; treasurer, Henry A. Sinclair.

After the business meeting Mr. W. I. Clark lectured on the "Possibilities of Wireless Telegraphy."

American Electro-therapeutic Association.

The coming meeting of the American Electro-therapeutic association, to be held in Washington, D. C., September 19th, 20th and 21st, will be held at Willard's Hotel, corner of Fourteenth street and Pennsylvania avenue, N. W. For the use of exhibitors Willard's Hall has been secured. This hall immediately adjoins the hotel, and may be entered either from the hotel or from F street. The dimensions are 40 by 50 feet, and it is proposed to subdivide the floor space by three aisles, leaving exhibition spaces six feet deep by such length as individual exhibitors may desire. All possible arrangements have been made for the convenience of exhibitors, including either direct or alternating current. A charge for space will be made. Clifton Mayfield, M. D., 1335 Thirtieth street, N. W., Washington, D. C., is the chairman of the committee on exhibits.

Specification for a Professor.

It is rather an odd conceit to set forth in the form of specifications the qualifications that are desired in applicants for a vacancy in a college faculty. The Railway Age gives an instance, however, in the letter reprinted below. But it is probably a fair assumption that the writer had some certain individual in mind when he indited the half-playful epistle to his friend.

University of Illinois,
Urbana, Ill., May 18, 1899.

Prof. R. A. Smart, Lafayette, Ind.
Dear Sir: I inclose you the following specifications for an assistant in my department. If you know of a person suitable for the place I should be pleased to have you advise him of the vacancy.

Specification B: For an assistant professor in railway mechanical engineering at the University of Illinois.

Applicant must be a graduate from a leading technical school of the United States.

The following preferences are indicated: Age 35 to 40; American; height, 5 feet to 6 inches; weight, 150 pounds; two years' teaching experience, railway experience in shop, draft ing-room or testing department of importance, Application, stating experience, should be made in the handwriting of the applicant to L. P. Breckenridge, professor of mechanical engineering, Urbana, Ill.

Information: Salary, \$1,650. University is located at Urbana and Champaign, Ill., 120 miles south of Chicago on the Illinois Central railroad. Attendance for 1898-1899, 1,821. The work will be largely experimental. Locomotive road tests and dynamometer car experiments.

L. P. BRECKENRIDGE,
Professor of Mechanical Engineering.

The Water-power Failure in Austin.

On the Pacific Coast and in other localities it has happened that costly electrical power-transmission plants have been rendered useless for considerable periods of time by the lack of water, owing to periods of unusual drouth. Lack of initial power is a very serious thing to power-distributing companies, which are held responsible by their customers, and rightly so, for the original surveys and calculations of the watershed should be so thorough and conservative that the margin of safety will allow of operation in any conceivable low-water emergency. If this is not done, the power company must either maintain a steam plant of full-load capacity, to be idle 10 months in the year, and to be operated, usually, only with expensive fuel when used, or else shut down entirely and suffer great loss of prestige and revenue. It is well that these few failures in the continuous operation of water-power plants should be widely known, so that builders of later installations may profit by the experience. With this view the subjoined account of the failure of power supply at Austin, Texas, is reproduced from the Southern Industrial and Lumber Review. It will be observed that it is written from the point of view of an ardent well-wisher of the Austin plant; yet the lesson is none the less obvious:

"The facts concerning the shut-down are simply as follows: The Colorado River watershed has practically been without rains which drain to streams for nearly eight months. This is one of the most extraordinary periods of drouth on record, and the same may never be repeated and certainly will not be, in the ordinary course of events, for years. The construction of the great dam was perhaps faulty in the placing of the penstocks so high that the turbines cease to operate when the water falls eight feet below the crest of a dam 60 feet high. It has been demonstrated that at the time of the shut-down, after the severe drouth referred to, one or two feet more of water would have carried the plant over the period of practical stoppage, one month, and therefore had the penstocks been four or five feet lower, a still longer period of drouth could have been met without interruption.

"During all the period of anxiety and chagrin caused by the misfortune, there was a vast reservoir of water, of a depth of nearly 50 feet, at the dam proper, and running back for 30 miles—water enough to run the plant for a year without another drop of rain falling.

"This was the condition which led the people with great unanimity to demand a shut-down to enable the water to rise. It was a fine example of municipal unselfishness. People went back to lamps and candles, others to gas, and very many to the old electric-light company. They were willing to see their street cars drawn by mules and steam again; they were willing to patch up old steam boilers to run their printing-presses and other machines requiring power. There was no complaint. There was never any shut-down of the water-pumping plant, and the supply was never materially curtailed. The people watched with joy the rise of the water on the gauge at the dam, inch by inch, and finally when the floods came and the roar of the cataract over the crest could be heard for miles there was great rejoicing on all sides.

"The city has met this crisis in the history of the great plant with fortitude, and has thus given another proof of its faith in the enterprise. It will in the future authorize an expenditure to provide an auxiliary steam plant to guard against a shut-down in the future. It is said also that the placing of 'flash boards' on the crest is in contemplation by the Water and Light Commission. These precautions will surely prevent a repetition of the annoyance of this year."

Lightning Struck Twice in the Same Place.

A fierce thunderstorm passed over Manhasset, L. I., on June 1st, in which Christ Church was struck by lightning and considerably damaged. This is the second time within three years, says the New York Tribune, that this church has suffered from lightning. The most remarkable circumstance is that the course of the electricity this time was largely an exact counterpart of that taken by it before. The same one of eight wooden pillars supporting the church porch was shattered as before. From this point the current jumped both times in a horizontal direction to the east side of the church, tore off a line of clapboards till it reached a window, up which it moved about 15 feet, when again it moved horizontally to a metal gutter at the tran-

sept, from which it passed to a globe molding above the channel on the inside and from the molding descended by another window to the channel, tearing off one plaster as it found exit to the earth. The same course was followed and repeated except that the current then also followed horizontally to the west side of the church, as well as to the east side.

Electrical Power Applications in a Stove Foundry.

In a paper recently read before the American Foundrymen's association W. J. Keep of Detroit described some of the methods for handling materials in use at the works of the Michigan Stove company. A prominent feature of the apparatus is an open-air overhead traveling crane operated by electric motors. This crane reaches every part of the yard. It is an ordinary bridge, without a floor, provided with lateral trusses to allow the cab which contains the hoisting machinery to run on the lower chords. The bottom of the cab is of plate-glass, enabling the operator to see everything in the yard beneath him. In the cab are three controllers for operating the crane. The motor for moving the bridge is located at one end and the torsion of the shaft allows the other end to lag a little behind. When the crane can be spared the motor will be moved to the center, so that the travel of both ends may be the same. The length of the crane is 60 feet from one track to the other. Its capacity is three tons; the length of wheel base is 14 feet; the speed of hoist is 50 feet per minute, of cab 100 feet, and of bridge 130 feet. The motor for hoisting is six horse power, that for moving the cab 12 horse power, and for moving the bridge 12 horse power. The trestles for the bridge are pine; these on the foundry end are a part of the frame of the foundry, and on the other side form the frame of the flask house.

Another improvement is the use of an electric winch for moving steam cars on the main railroad track. At the farther end of the track is a sheave around which runs a five-eighths-inch steel-wire cable, each end of which is wound around one of the drums of the winch. One of the drums runs at twice the speed of the other, and one drum is free to unwind as the other winds the cable. At one point in the cable there is a link into which is hooked the end of a chain, the other end of which is attached to a car. An electric signal tells which rope to wind and when to stop. The motor of the winch is eight horse power and will move on the straight track several cars. It takes one man at the coupling and one man at the winch to move a car or to make up a train. This winch will be used at a future time to run some kind of coal conveyor to a receiving bin over the boilers, which are already fitted with Murohy smokeless furnaces, which have hoppers for self-feeding from this storage bin, but thus far, says Mr. Keep, no satisfactory conveyor has been found. There is an electrical generating plant on the premises, and all parts of the works are lighted, saving over \$50 each month during a good part of the year in gas bills. Mr. Keep concludes: "For various reasons we have not saved half the labor that we anticipated, and we expect to do much better in time. As it is, the saving is such that after setting aside \$1,000 each year for interest on the investment, we shall pay for the whole investment in three years with the present saving."

TRIFLING TECHNICALITIES.

"My horse has reasoning powers, I tell you."
"I wish what respect particularly?"
"Well, instead of shying at that automobile cab he edged up to it and kicked it."—Chicago Record.

Watts—"I see Tesla now claims he can telegraph clear around the world without wires."

Potts—"Clear around the world? I should think it would be cheaper to just telegraph across the room."—Washington Star.

"How do you explain the phenomena upon which you base your new discovery?" asked the inquisitive friend.

"Why, I adopt the usual method. I use words so big as to prevent anybody who is not in the same business from undertaking to contradict me. And then if anybody objects I can say it is professional jealousy."—Washington Star.

If the veracity of the New York Sun is to be relied upon, a new "hold-up" method has been practiced in the wicked metropolis of the East. Mr. Goroditzki of Philadelphia was the alleged victim. The story is that he was walking in Grand street, when he saw a man with an electric machine peddling shocks to children at a penny a shock. The little ones laughed so much that he fished out a penny and said he'd try the machine himself. "He bulls out der handle a lidle way," said Goroditzki, as reported in the Sun, "und I veels somedings dickle mine handt. Den he bulls out der handle away out, und bode off mine handts so up in der air und I gan't get 'em down. Vile hellless art I a loafer runs up und he dakes mine vatch and schain. I stamb und rache und schwear, but der feller mit der machine keebs mine handts in der air until der dief iss gone, ven he bushes der handle in und runs away mit der machine."

DEVELOPMENT OF THE TELEPHONE FIELD.

Stories of the Telephone.

[From the New York Tribune.]

The different ends of a connected telephone often present strange contrasts. At a large dinner at a Fifth avenue palace the other day the hostess waited for one of her guests, a woman who was known to be somewhat absent-minded.

"I should not wonder in the least if she has forgotten all about my dinner," said the former, and forthwith the telephone was brought into requisition. "I want Mrs. S!" called the impatient hostess to the servant who answered the call.

His mistress, in dishabille, was comfortably seated, reading an interesting book. She went to the telephone immediately.

"We are waiting dinner for you, Amelia," said the magnificently gowned woman at one end.

"Good gracious, Margaret, is this the date I was to have dined with you?" exclaimed Amelia, who was in a dressing gown and slippers, at the other end. "I am simply overwhelmed with mortification, but I entirely forgot that this was the night."

"Jump into a cab and come as you are," urged the first speaker.

"You wouldn't ask me to if you could see me!" laughed the other.

This contrast between the two situations suggested a topic of conversation after the guests were seated.

"I had rather an amusing experience in the way of a dissimilarity of situations between two speakers at either end of the telephone," remarked one of the guests. "Like everyone else at Tuxedo, when the telephone first came into vogue we used it continually as a method of conversation with our friends, and for convenience it was placed in my husband's dressing-room. One night, after I had gone to bed, the bell suddenly rang out with a persistence that would not be ignored. I hastily sprang from my bed in the dark, and started for the phone at a good pace, when suddenly I plunged headlong into Jack's bathtub, which was half full of water. Still the thing kept on ringing, and, fearing it might wake the baby, who was in the next room, I hurried, wet, cold and bedraggled, to the instrument.

"Hello! I cried, angrily. 'Is that you, Polly?' called out a gay voice, which I recognized as belonging to one of my friends. 'I am stopping here at the club. How are you, dear? We are just through dinner. A large party of us came down from New York. Charlie S— is here at the phone and wants to speak to you.' Then I heard laughter and chaffing, and I could fancy them all in the gay clubroom in their smart dresses. In a minute Mr. S— spoke. 'How do you do, Mrs. A—,' he began, and for fully 10 minutes I had to carry on a light conversation, first with one and then with another of the party, while I stood shivering in the dark in my damp and scanty garments."

"That was really a contrast," said one of her audience. "A thing that always seems so strange to me about a telephone is how a voice can be carried a great distance in a storm. Last winter I was stopping at a country house on an island near Stamford. It was blowing a furious gale of sleet and snow. The water was dashing madly against the rocks and the great trees about the house were swaying in the blast. All nature seemed to be in the wildest commotion, but the wires held fast, and when I rang up a friend in New York and his quiet voice came to me all the way through the wild night without a change in its tone it did seem almost marvelous."

A business house of Aberdeen, Scotland, recently engaged as office boy a raw country youth. It was part of his duties to attend to the telephone in his master's absence. When first called upon to answer the bell, in reply to the usual query, "Are you there?" he nodded assent. Again the question came, and still again, and each time the boy gave an answering nod. When the question came for the fourth time, however, the boy, losing his temper, roared through the telephone:

"Man, a' ye blin'? I've been noddin' me heid aff for t' last hauf 'oor!"

Wisconsin Telephone Company.

Stockholders of the Wisconsin Telephone company will hold a special meeting June 19th for the purpose of increasing the capital stock from \$1,200,000 to \$3,000,000. It is intended to use the new capital in extending the long-distance lines to many points in the state not now reached, in the erection of new exchange buildings and in making other improvements. An energetic canvass for new business is also being made, and the company will endeavor to increase the number of its subscribers to 25,000. Only copper lines will be built in extending the service. The principal improvements will be made in Milwaukee, but other cities will also be benefited. La Crosse has received word that \$25,000 to \$30,000 will be expended there in improvements.

San Jacinto, Cal., will soon have a telephone exchange system.

Telephone Ordinance Vetoed.

Mayor Hoos of Jersey City has vetoed an ordinance granting a franchise to the Hudson Telephone company to extend its lines through certain streets in the city. The company is endeavoring to gain a foothold in the city in order to compete with the New York and New Jersey Telephone company, but is having some difficulty. An ordinance passed by the Board of Street and Water Commissioners several weeks ago, granting a franchise, was vetoed by the mayor on the ground that the company should be required to give the city some compensation for the franchise. The board sustained the veto and adopted a new ordinance which required the company to pay two per cent. of the dividends. That was the company's suggestion. Mayor Hoos insists that this is not sufficient compensation, and, besides, is too indefinite, as the company might never declare any dividends. He suggests that the company should be required to pay \$1,000 cash and one per cent. of its gross earnings for the first four years, two per cent. the next four, three per cent. the next four, four per cent. the next and five per cent. the next, remaining thereafter at that figure.

Bell Instrument Output.

It is a matter of common knowledge that the present demand for Bell instruments is larger than ever before in the history of the corporation. This is due partly to the extension of the company's lines and the increase in existing exchanges, and largely to the competition of independent exchanges, which has made it necessary for the Bell interests to replace their old apparatus with modern equipment to meet the improved service of the newcomers. The gross output of instruments for the month ended May 20th amounted to 55,302, whereas the orders for instruments amounted to 62,000. The following table gives the net output of instruments by months for the last four years, showing clearly the rise in general business prosperity:

	1899.	1898.	1897.	1896.
January.....	31,829	15,820	8,036	10,052
February.....	35,787	13,107	11,665	10,857
March.....	53,503	13,172	12,697	11,952
April.....	48,402	16,125	13,181	15,195
May.....	34,937	20,493	12,146	12,464
June.....	14,321	9,588	10,937

Danger in Telephoning Society Leaders.

A man who said his name was Robert Smith entered the long-distance telephone office in Syracuse the other day and announced that he wanted to talk with Mrs. Cornelius Vanderbilt, Jr., and with Mrs. Levi P. Morton and her daughters. When told that they could not be communicated with in that manner, he said impatiently: "Why, they are well known in New York and anyone can tell who they are. I am on terms of familiarity with all of New York's '400,' and frequently call them up on the telephone. I have talked with them on the telephone a dozen times within the last few weeks." The young woman in charge of the telephone called in Detectives Dorner and Wood, and they locked Smith up at headquarters. Smith is thought to be demented.

MANUFACTURERS AND DEALERS.

C. W. Farr, president of the Farr Telephone and Construction Supply company of Chicago, informed a representative of the Western Electrician that the business of the Farr company during the last four months was about double that for the same months in 1898. This is certainly an excellent showing, and speaks well for the energy of the Farr company's officers and its products.

During the last week the Western Telephone Construction company has been busy placing a lot of new machinery in its factory at 250 South Clinton street, Chicago. The addition is practically a duplicate of the present equipment, thus giving the company double the capacity heretofore enjoyed. The company reports an extraordinary order business and most flattering letters with reference to the recent improvements in its telephone apparatus.

EXTENSIONS AND IMPROVEMENTS.

The board of management of the National Telephone company has decided to construct a line from Fort Wayne to Decatur.

The Rocky Mountain Bell Telephone company intends to begin the construction at once of a line through Idaho from Webster to Buffalo Hump via the Seven Devils.

The Bell Telephone company is establishing a number of pay stations in Montreal on the nickel-in-the-slot principle. The instruments will be placed in drug stores, but the system will be distinct from the ordinary telephone in the store. The person who may desire to use the instrument will call up central, but connection will not be made until a five-cent piece has first been deposited in the slot.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The Northwestern Telephone Exchange company has added a 50-drop switchboard to its exchange in St. Cloud, Minn. The system has 175 connections now, and is expected to reach 200 shortly.

Supplies are arriving for the Zenith Telephone company's new exchange for Duluth, Minn., and work will soon be begun.

The Chinook-Cleveland Telephone company has awarded contracts for the construction of a telephone line from Chinook, Mont., to Cleveland.

The Mutual Telephone company of Des Moines, Ia., will establish a sub-exchange at East Des Moines and one at Valley Junction, a suburb of Des Moines.

Had the city of Minneapolis appealed from the decision of the court with reference to the Northwestern Telephone Exchange company's right to set poles on Lake street, because that street was a postroad, it would have won the case. The point at issue was the same as has recently been decided in the Supreme Court of the United States.

The Germania (Ia.) Telephone company is building a toll line from Algona, Ia., to Belmond.

The Ogden Telephone company is constructing a telephone exchange in Ogden, Ia.

A telephone line will be built between Hampton, Ia., and Belmond, by a Mason City company.

The Mississippi Valley Telephone company outwitted J. B. Gilfillan in Minneapolis, despite his almost sleepless vigilance. He objected to a pole being placed in front of his property, and an officer was on guard day and night to keep the company from putting it there anyway. But there was a hiatus of 30 minutes between the time of the night man's relief and the arrival at the disputed point of the day man. The night before the pole was set the council gave the company permission to set the pole, and the next morning, between 3:30 and 4 a. m., the pole was set. The ex-congressman soon discovered the work was done, and he gathered a few objectors and proposed to cut the pole down. The policeman on the beat telephoned for help, and the matter was referred to the city attorney, who held the telephone company had the right to keep the pole there, after the council's action.

The Fairmont (Minn.) Telephone company has begun constructing a toll line from Wilbert to Armstrong, and will start work soon on a line to Madelia.

The Duluth (Minn.) Telephone company announces that all patrons will receive a rebate for the full amount of rental for the period service was interrupted by the fire in the central office.

The Nevada Mutual Telephone company has purchased materials for its new exchange to be installed at Nevada, Ia.

The Billings and Musselshell Telephone company of Billings, Mont., has erected poles for a new toll line, and will string wires as rapidly as possible.

The Winona (Minn.) Telephone company has placed an order for a new switchboard of 1,200 drops.

A riot was almost precipitated in Beloit, Wis., by the attempt of the Wisconsin Telephone company to plant a pole in front of E. Fluekiger's residence. The latter placed a chair over the hole and sat there most of the afternoon, and the workmen were driven away by citizens. The mayor then suspended further operations by the company.

The Northwestern Telephone Exchange company is offering special inducements to people of Fargo, N. D., to take telephone service.

Hawarden, Ia., will vote, June 12th, on granting a telephone franchise to the Hawarden Telephone exchange.

The Washington (Ia.) Telephone company is building a toll line to Wellman, Ia.

Charles Blumenstein of Wellman, Ia., contemplates a telephone line to a creamery eight miles north of Wellman.

Bruening Bros. have ordered materials for the construction of the new telephone system at Ackley, Iowa.

W. B. Sirom has been granted a franchise for a telephone exchange at Hector, Minn.

The Northwestern Telephone Exchange company will begin work at once rebuilding the exchange at Grand Forks, N. D.

T. A. Potter of the Western Electric company of Britt, Ia., is to be made general manager. B. C. Way will succeed him as secretary. This company is pushing toll-line construction in South Dakota. A line is being built to Woonsocket, and between Mitchell and Chamberlain. The Dakota Central Telephone company will connect with the system at Woonsocket, building from Huron for the purpose.

J. G. Lindsay, manager of the Mississippi Valley Telephone company at Muscatine, Ia., has been arrested on a charge of misappropriating \$245 of the company's money.

The Home Telephone company of Sioux City, Ia., has made connections with the Sheldon, Rock Rapids, Cherokee and Spirit Lake independent systems, including 300 miles of toll lines with 40 towns.

Work will be started on the new telephone exchange at Fonda, Ia., as soon as the materials arrive.

The Northwestern Telephone Exchange company has found its business increasing so much in Min-

neapolis that a new contract office has been opened at 430 Nicollet avenue, with toll instruments.

The Standard Telephone company has just installed an exchange at Mabel, Minn.

The Cedar Valley Telephone company has just been granted a franchise at Iowa Falls, Ia. The Iowa Telephone company already has an exchange there, and at once arranged to give Sunday and all-night service, and is otherwise preparing for a fight.

let the contract to construct its line from Pine City, Minn., to Sandstone.

It is reported at Ottumwa, Ia., that the old telephone company is making contracts at 75 and even 50 cents a month.

The Perry Telephone company of Perry, Ia., has changed its name to the Hawkeye Telephone company.

The Iowa Telephone company announces that a

Single-Phase Distribution.

[Continued from page 27]

terminal. It is, therefore, a fair average pressure chart. I am confident that no two-phase or three-phase stations can show charts equal to this, nor can it readily be beaten in direct-current work.

In my paper read before the association last year I gave the calculated efficiency for the system, assuming each feeder to be operated at its rated capacity. I am now able to give these efficiencies as obtained by a direct measurement on the system in actual operation.

Fig. 6 shows an efficiency curve for all loads plotted from actual tests. The losses in detail at four of the several loads from which the efficiency curves were plotted and given in following table:

LOSSES AND EFFICIENCY OF UNDERGROUND SYSTEM OF DISTRIBUTION.

Load at station	in kilowatt	100	150	200	1120
Feeder loss		0.4	0.6	0.8	1.6
Transformer iron loss		0.5	0.5	0.5	0.5
Booster iron loss		0.5	0.5	0.5	0.5
Transformer copper loss		0.5	0.5	0.5	2.5
Booster copper loss		0.5	0.5	0.5	0.5
Secondary mains and house wiring		0.5	0.5	0.5	4.6
Total losses in kilowatt		1.23	2.6	2.0	11.7
Energy delivered		37.7	405.4	370.0	1368
Efficiency		75.7	91	72.6	90

The efficiency at 100 kilowatts is the minimum efficiency. The efficiency at 430 kilowatts is the maximum efficiency.

The station load of 950 kilowatts was the average daily load at the time these tests were made, the maximum station load being 2,000 kilowatts. The average load for the year, based on the same maximum, would be considerably less than 950, and would, therefore, more nearly approach the maximum efficiency of over 94 per cent. In these tabulated losses are included the losses in the feeder regulators or boosters. These, being a part of the station apparatus, are usually excluded in calculations of distribution efficiency. If we excluded them in this case, we would increase the efficiency shown from one-half to one per cent., according to the load. In looking over this table, one is struck at once with the remarkably small transformer iron loss. That the transformers were most carefully designed to keep down to the lowest possible amount this constant loss has been mentioned before. To make the effect of this clear in a more striking way, we will consider the result of cutting out one feeder completely on the average load of 950 kilowatts. This is a favorite suggestion for decreasing the losses with light loads in alternating-current distribution. There being 30 transformers in service, by cutting one out we would decrease the transformer iron

FIG. 4. SINGLE PHASE DISTRIBUTION.—CHANGE OF FEEDER LOAD BY DROPPING POTENTIAL 1 1/2 PER CENT AT FEEDER END.

The Cedar Valley company announces that it is quite ready for a fight also.

The People's Telephone company of Chatfield, Minn., inaugurated a 24-hour service June 1st.

The Northwestern Telephone Exchange company is pushing work on the new line to give a more direct connection between the Twin Cities and Fargo, N. D., and will soon have it completed. The company finds the telegraph, used in connection with the telephone, is a great saving of time. A station can be called by wire, and the person wanted sent for, without waiting for the wire to be clear to that point, as was the case when the telephone only was used.

The residents of Corvuso, Greenleaf, Cedar Mills and Acoma are anxious to get telephone connection with Hutchinson, Minn.

The Lime Springs and Bristol Telephone company has been formed at Lime Springs, Ia., with \$1,000 capital stock.

The Le Sueur Telephone company has been incorporated at Le Sueur, Minn.

The Janesville Telephone company has over 400 connections made for the new exchange at Janesville, Wis. A similar exchange is about to be put in at Beloit, Wis.

W. J. Bonwell of St. Paul contemplates putting in a telephone exchange at Hibbing, Minn.

The Minnesota Mutual Telephone company will soon extend its wires west through Herman, Minn.

The Nevada Mutual Telephone company has been granted a franchise, by popular vote, at Nevada, Ia.

The telephone company will work from Harvey, N. D., west to Anamoose, N. D., at once, and will build an extension from Cathay, N. D., to New Rockford and Carrington.

R. H. Larrabee and T. Pagenkopf propose to form a local telephone exchange at Sleepy Eye, Minn.

The New Ulm (Minn.) Telephone company has sold its toll lines to the Western Electric Telephone company.

The Commercial Telephone company is building a line between Montour and Le Grand, and also between Montour and Tama.

Cloid H. Smith has received supplies at Odebolt, Ia., for his new exchange. He is preparing to build a line to Beloit and one to Schleswig.

The Little Wolf River Telephone company will extend its line from Fond du Lac, Wis., to Ripon, Waupun and other points.

W. T. Sparks, an applicant for a telephone franchise at Waunakee, Wis., is unwilling to accept the franchise tendered.

The Wolf River Telephone company is an applicant for a franchise at Watertown, Wis.

The council of St. Paul has finally passed an ordinance acceptable to the American Telephone and Telegraph company for a long-distance telephone franchise, and the mayor has signed it. It provides for connection within 90 days.

The Oshkosh (Wis.) Northwestern Telephone company has received the new 600-drop switchboard for its new exchange, which is now about ready for occupancy.

A local exchange is talked of for Brodhead, Wis., H. L. Wortham being the promoter.

The Minnesota Mutual Telephone company has

toll line will be constructed from Dubuque, Ia., to Waukon, Lansing and New Albin, Ia.

The Germania Telephone company of Germania, Ia., is building a local system, and will connect with the surrounding towns.

The telephone exchange at Oelwein, Ia., has been removed to new quarters, and a new switchboard of 100 drops put in.

E. E. Smith, manager of the telephone exchange at Owatonna, Minn., has gone to Hector, Minn., where he will install an exchange.

FIG. 5. SINGLE-PHASE DISTRIBUTION.

The Inland Telephone and Telegraph company has begun putting its wires in the business district of Spokane, Wash., underground. It will take about eight months to complete the work, and the expense is estimated at \$140,000 to \$150,000.

The Wisconsin Telephone company proposes to extend two long-distance lines to West Superior, Wis., one from Ashland and one from Abbotsford, Wis.

loss one-thirtieth, or one-fourth of a kilowatt. We would, however, increase our feeder loss, by the addition of one-thirtieth of the current to each feeder, in the ratio of 30 squared to 3 squared. This would increase the feeder loss about seven per cent., or slightly over two kilowatts. The copper loss in the other transformers would be increased in the same proportion, or to the extent of a little less than three-fourths of a kilowatt. The actual result, then, of

cutting out one feeder and its transformer would be to decrease the transformer loss one-fourth of a kilowatt, and increase other losses to the extent of $2\frac{1}{4}$ kilowatts; or, in other words, we would actually increase our total losses in this case by $2\frac{1}{2}$ kilowatts.

Fig. 7 shows efficiency and power-factor curves of a 10 horse power single-phase motor. It has also been thoroughly demonstrated that single-phase alternating-current motors can be built for variable-speed work, and there are already many

rent motor, in such a way as to give a constant torque at all speeds. The efficiency of this motor at full speed is the same as that shown in Fig. 7. A number of installations have been made in St. Louis of motor-generator sets for transforming single-phase alternating-current energy into direct current for uses to which direct current only is applicable. These outfits consist of induction motors, directly connected to direct-current generators. So far, there has not been a single demand for current or energy for any purpose for which electric current has ever been used, which we have not been able to supply efficiently from our single-phase alternating-current mains. This experience, and the knowledge that current is required for as many different purposes in the city of St. Louis as in any other existing city, lead me to state positively that single-phase currents can be used for general distribution to supply all requirements. As I have stated before, each class of current, single-phase, two-phase or three-phase, has a field of its own; and the field in which single-phase current reigns supreme is that of general distribution.

Having been assigned the title of this paper, it has been impossible for me to avoid repeating much that I said last year, and I have been afraid from the first of appearing to rehearse an old story. It gives me some satisfaction, however, to be able to make statements based on the actual operation, for over a year, of a system embodying a special form of single-phase distribution, for which, a year ago, I made many claims that were looked upon by many as hypothetical. All that has been presented for this system has been fully achieved in its operation.

Electricity on New Cruisers.

The six fine cruisers—Denver, Des Moines, Chattanooga, Galveston, Tacoma and Cleveland—authorized by Congress last March will show an increased use of electric power for auxiliary machinery. The blowers for ventilation and forced draught, the ammunition hoists, winches and anchor hoists will be operated by electricity, the only auxiliary steam engines being for the ice machines, steering gear, dynamos, distilling plant and machine shop. The main engines will be of the vertical triple-expansion type in separate water-tight compartments, developing 4,500 horse power. They will get steam from six water-tube boilers aggregating 4,700 horse power and installed in two air-tight compartments. The weight of the machinery is limited to 405 tons; 22 tons of engines will be carried, and there will be 40 tons of reserve feed-water. The cruisers will have two smokestacks, with their tops 70 feet above the grates. Steam heat will be fitted throughout the hull. For electric light and power there will be four generating units, weighing not over 35 tons. These cruisers will have a displacement of about 3,200 tons each and a speed of about 16½ knots

FIG. 6 SINGLE-PHASE DISTRIBUTION.

It is hardly necessary to state that, with this system, we never cut out feeders, if we can avoid it.

The ratio of current delivered to customers, as shown by customers' meters, to the actual station output, as shown by the station wattmeters, while not an exact measure of the distribution efficiency, owing to the losses in the customers' meters and their failure to record properly at small loads, is, nevertheless, a good indication for relative comparison. On the single-phase underground-distribution system described, this ratio of customers' meter readings to station output reaches 86 2-10 per cent. The meters used on customers' premises are the most recent type of induction wattmeters. The station meters are of the Thomson recording type, and these are carefully checked by the half-hourly records of station indicating wattmeters, both being frequently calibrated. While this figure may be the highest on record, it has been obtained with such great care, month after month, that I feel great confidence in its accuracy. The greater portion of the overhead distribution of this same company is of the usual form, with individual transformers to each customer, as already stated. A large portion of the current supplied in this way is used in residences, and, consequently, the load factor is very low. The meters used in this work are recording amperemeters, which let a considerable amount of current slip by unrecorded with light loads. The transformers are all of modern design and of high efficiency for their size. I may surprise you, however, when I state that the ratio of customers' meter readings to station output in this overhead distribution is only 48 3-10 per cent. I am also as positive of the accuracy of this low figure as of that of the remarkably high one for the underground system.

The only strong argument that has ever been made against single-phase distribution is the contention that the single-phase current is not suitable for operating motors. I admit that, until quite recently, it has not been shown positively that motors could be operated by single-phase current as efficiently and with as great reliability as by two or three-phase currents. For over two years, however, we have been operating single-phase motors in St. Louis with the greatest success, and we now have about 1,000 horse power in such motors connected to our lines. As stated before, these motors vary in size from one-half to 25 horse power. The efficiency is as high as that of direct-current motors, or two or three-phase motors, and in construction they are fully as simple and free from complication. The type used for constant speed work is started and stopped by a single switch, placed in any convenient location, and without the use of rheostat or controller. A commutator is used to secure the required torque at starting and to bring the motor up to speed, after which it is entirely disconnected.

Our experience has shown that the cost of maintenance on these motors is very much less than that of direct-current motors, and as low as that of two or three-phase motors.

such motors in use where full torque is required at varying speeds, such as driving direct-connected elevators and operating ventilating fans. These motors are operated without commutator, but require a controlling device for varying the speed. In Fig.

FIG. 7. SINGLE-PHASE DISTRIBUTION.

8 are shown torque and current curves of a single-phase variable-speed motor. These torque curves, taken at different positions of the controller, show that full-load torque can be obtained at any speed from zero to full speed; in fact, the motor can be controlled with as much ease as a series direct-cur-

rent motor. The steel hulls will be sheathed with wood and copper below the water line, giving comparative independence of dry-docks. As modern cruisers go, they will not be fast, but they will be comfortable boats, with heavy armament of five-inch rapid-firing rifles and a wide cruising radius.

New Ward Leonard Rheostat.

A new rheostat for all continuous-duty purposes, such as motor-speed regulation, is illustrated herewith. This rheostat is believed to contain many new and important advantages, and it is extremely compact. A cast-iron plate has parallel ribs extending along the back; between these ribs there are long slot-like openings so that a grid-like construction is obtained. The entire back surface of the grid, including the walls on both sides of the ribs, is covered with porcelain enamel, and then a coil of wire is placed between the ribs and over the slot; this coil of wire is attached by enamel to both the side walls of the ribs between which it lies. The ribs extend up high enough to thoroughly protect the coil lying between them in the V-shaped space.

It will be seen that this construction gives excellent ventilation, while holding the coil at two points in each whorl of the coil. This attachment of the wire at intervals only leaves it free to expand without producing any breaking strain on the enamel which attaches it, and yet the attachment permits of a free conduction of heat to the entire surface of the cast-iron. Thus the result is obtained of having nearly perfect conditions for heat convection by air currents, together with the large heat absorptive capacity of the cast-iron and the large radiating surface obtained by the grid with the extended ribs.

This rheostat is the invention of Mr. H. Ward Leonard, and the the Ward Leonard Electric company of Bronxville, N. Y., is placing it on the market. The grid shown in the illustration is one of 40 sold to the South Side Elevated Railroad company at Chicago, and is 10 by 10 inches. It has 200 ohms resistance and will be used directly across 600 volts, so that it will carry three amperes continuously, and hence dissipates continuously 1,800 watts.

CORRESPONDENCE.

New York Notes.

New York, June 5.—The electrical show came to an end on Saturday night. It is said to show a good balance on the right side of the ledger, and the exhibitors express themselves as entirely satisfied with their end of the business. Congratulations were extended to President C. O. Baker, Jr., Vice-president H. L. Shippy, Secretary and Treasurer George F. Porter, J. W. Godfrey and to General Manager Marcus Nathan, who has kept the show well in hand, and carried out to the fullest extent every subject that could add to its popularity. The voting contest that has been going on at the show also closed on Saturday. The prize was an automobile for the most popular actress, and was won by Maude Adams, with 14,764 votes to her credit. The next in the list was Lillian Russell, who polled 13,615 votes. The other contestants re-

from his position as superintendent of the police telegraph system of Hoboken by Mayor Fagan of that city. Mr. Banta, as president of the new electric-light company, offered to supply the city of Hoboken with free electric lights for a year in return for a franchise allowing the new company the same privileges as are enjoyed by the North Hudson Light, Heat and Power company, which has a monopoly of the electric-light business in Hoboken. Mayor Fagan and a majority of the Common Council have taken a decidedly friendly stand toward the old company, which is controlled by the Shanley syndicate. It is generally believed in Hoboken, according to the New Jersey editor of the Tribune, that Mr. Banta's dismissal as superintendent of the police telegraph system is due to the Hoboken idea of "getting hunk." It is said that no fault whatever is found with his work.

Work is steadily progressing on the electrical

NEW WARD LEONARD RHEOSTAT.

equipment of the Brooklyn elevated railroad, and it is expected that the Fifth avenue division, as far as Thirty-sixth street, will be ready for electricity within two weeks. The stations, like the cars, are being wired for electric lights.

New York may have an automobile club, like Paris. Whitney Lyon, at the request of a number of owners of automobiles, has called a meeting at the Waldorf-Astoria for Wednesday evening, for the purpose of an informal discussion as to the feasibility of organizing such a club in this city. In the course of his statement Mr. Lyon says: "In view of the rapidly increasing number of those who own and operate self-propelled pleasure vehicles in this country and the general widespread interest in the subject, both here and abroad, and the almost certain use of the automobile as a form of sport in the United States, and the difficulty of procuring proper storage and care for the vehicles, it has been thought desirable to call this meeting of owners or intending owners of these vehicles for a conference looking toward the formation of a club which, in due time, shall have a clubhouse where the carriages may be properly stored and cared for by competent mechan-

FIG. 8. SINGLE-PHASE DISTRIBUTION.—TORQUE AND CURRENT CURVE OF FIVE HORSE POWER SINGLE-PHASE VARIABLE SPEED MOTORS.

ceived the following votes: Mrs. Leslie Carter, 8,994; Viola Allen, 5,640; May Irwin, 4,129; Edna May, 3,974, and Julia Marlowe, 1,565.

The electrical soap-barrel "joke" that I mentioned last week was investigated by the coroner of Paterson, and the jury decided that the death of Magill, the victim, was caused by his coming in contact with a live electric wire run through a barrel of soft-soap, and that the wire was placed there by Joseph Grant.

Bion L. Burrows was chosen secretary of the Rapid Transit Commission, succeeding L. L. DeLafield, on Thursday last. Mr. Burrows is a graduate of Cornell University and prepared for the law, but did not practice. He was for part of Mayor Strong's administration the mayor's private secretary. He was strongly recommended for the place as secretary of the Rapid Transit Commission by ex-Mayor Strong and General Anson G. McCook. The salary will be \$2,500.

Mr. A. K. Banta, president of the North River Light, Heat and Power company, has been deposed

PERSONAL.

H. K. Gilman, the president of the Western Electrical Supply company of St. Louis, called on his friends in Chicago early in the week.

E. M. Reed, of F. M. Reed & Co., contracting electrical engineer of Kansas City, was in Chicago during the week purchasing electrical goods.

The University of Colorado has just conferred the degree of LL. D. on Brigadier-General Irving Hale, who has so distinguished himself in the Philippines. General Hale is the well-known Denver electrical man.

Albert Pack, the millionaire promoter of Detroit's three-cent experiment in street-railway service, died last week from the effects of an operation for liver disease. Mr. Pack was born in 1842. The foundation of his fortune was made in pine lands.

M. M. Wood, well known in the electrical field as the inventor of Wood's railway specialties, and formerly with the Ohio Brass company of Mansfield and the Central Union Brass company of St. Louis, has been appointed manager of the railway department of the Central Electric company of Chicago.

Lieutenant-Colonel Robert Craig, United States Signal Corps, has been ordered to Manila to become press censor there and chief signal officer to General Otis. He will relieve Major Thompson, who has done such excellent work in maintaining the communication between General Otis and the troops in the field. Major Thompson will return to San Francisco.

Oscar Oliven, an electrical engineer in the employment of the Union Electrical company of Berlin, is in the United States. He will devote several weeks to studying the electric vehicles of this country, after which he will go to Buenos Ayres, where he will superintend the building of a large electrical plant and the establishment of a street-car system. Mr. Oliven was astonished at the number of automobiles he saw in New York. He thinks that in a year or two New York will have more of these vehicles than any of the European cities, and even now he regards the average American automobile as far superior to those of Paris. "Their speed may not be so great," he said, "but you are wise enough not to sacrifice all the other good points for speed. These cars combine comfort and safety, and beauty to a remarkable degree. In Paris they have a great many of the benzine motors, which are very bad-smelling, but I have seen none of them here." Mr. Oliven was very complimentary in referring to American electricians, saying that in Berlin and other European cities they are preferred to native-born men.

ELECTRIC LIGHTING.

The Electrical Installation company of Chicago has just closed contract for the complete rehabilitation of the Vicksburg (Miss.) electric-lighting system. Work will be started immediately and rushed to completion within 90 days.

The Waxahachie (Texas) Electric Light company is said to be the first electrical company in the South to use aluminum as an electrical conductor. It has placed an order for about 500 pounds of the metal in bare wire of large size.

The Terrace City Improvement and Construction company has been incorporated with a capital of \$100,000 to furnish electricity for lighting purposes in Yonkers, N. Y. The directors are Oren E. Wilson of Albany, David L. Gluck of New York and Fremont Wilson of Yonkers.

The new electric-light plant to be erected at Sixty-fourth street and Wentworth avenue, Chicago, for street illumination, is to be called the "Robert A. Waller station." Comptroller Waller was one of the most active advocates of an extension of lighting facilities on the South Side.

The War Department, through the United States Engineer's Office at Newport, R. I., is inviting sealed proposals, until June 24th, for furnishing and installing an electric-light and power plant in the gun emplacement at the Dumplings, Conanicut, R. I. Specifications and any information desired by prospective bidders will be furnished upon application to Major D. W. Lockwood, Newport, R. I.

A superb granite column, 40 feet high, is to be erected in the open space in front of the new South Union station in Boston, and it will have at the top a brilliant cluster of electric lamps, for the purpose of illuminating the square, which has been renamed Dewey Square. The pedestal is already in place and work is going forward rapidly. In proportions and beauty of material and construction the shaft promises to be one of the handsomest memorials in the city, and will fitly honor the great admiral. The polished base weighs 14 tons and the column entire will represent about 200 tons of massive granite and wrought iron.

The Treasury Department is inviting sealed proposals until June 20th for installing an electric-light and power plant in the United States custom house at Cincinnati, Ohio. Specifications and plans can be obtained upon application to H. A. Taylor, assistant secretary of the treasury, Washington, D. C., or to the custodian of the building

ics, and where may be found also a library of literature upon the development of the automobile, as well as suitable meeting rooms for social intercourse and general suitable change of views upon the subject. It is proposed to restrict the membership to owners of good social standing, and to strictly eliminate any trade interests, following the general lines which have been so successful in establishing the well-known organizations abroad."

There were sharp fluctuations in the copper market last week. The stock of the Amalgamated Copper company closed a week ago Saturday at 100 bid, 100¹/₂ asked. On Thursday it sold down as low as 85, for small lots, and closed at 88¹/₄ bid, 90 asked. On Friday, however, on support by "insiders," it is said, it made a noteworthy advance, sales being made as high as 95, and the final quotation being 94 bid, 95 asked. In Boston, too, where Boston and Montana dropped more than 40 points on Thursday, and the other copper stocks suffered correspondingly, a general rally occurred later, the stocks regaining a large part of their losses. M. S.

at Cincinnati. Request for plans and specifications must be accompanied by a certified check in the sum of \$10 as a guarantee that such plans and specifications will be returned to the department. The amount will be returned to the bidder on their receipt. Proposals from actual manufacturers only will receive consideration.

The Edison Electric company of South Bend has been incorporated at South Bend, Ind., with \$100,000 capital. The incorporators are Otto M. Knoblock, George A. Baker, A. W. Morrell, George Wyman and Samuel S. Perley. The council will be asked for a franchise, and the company will proceed to put in a modern generating plant, using the three-wire system and 110-volt direct current for commercial lighting. The feeders and wires in the central part of the city will be run in conduits, and in every particular the plant will be a first-class one. Messrs. Knoblock and Morrell of the incorporators are connected with the Miller-Knoblock company, South Bend, Ind., manufacturer of electrical machinery.

ELECTRIC RAILWAYS.

The Broadway cable line in St. Louis is to be rebuilt for electrical operation.

The United Projects Syndicate of London has purchased the tramway system of Vera Cruz and will operate it by electricity.

The Big Rock Railroad company of Little Rock, Ark., is a new organization formed to build a railway line into the suburbs of the city.

It is reported that Albert L. Johnson, brother of Tom L. Johnson, and a well-known street-railway man, is in London endeavoring to secure the right to build and operate electric street-railway lines in that city.

The Indianapolis and Greenfield Rapid Transit company has been granted a franchise through Knightstown. This company proposes to build from Indianapolis east to New Castle. J. J. Cooper of Indianapolis is president.

Work has been begun on the new electric railway to run from Houston, Texas, to Oak Lawn, a suburb. J. B. Frost and others, who some time ago purchased the Magnolia Park railway, are the projectors of this enterprise.

It is stated that the syndicate that recently purchased the interests of the Consolidated Street Railway company at Dallas, Texas, is contemplating the substitution of the trolley system, for the operation of its 24 miles of line, for the animal power now in use.

More than one electric railway now building or projected is claimed to be "the longest in the world." The distinction is claimed for the line from Toledo to Dayton, O., which will be 153 miles long. It is said that work will be begun at once in both directions from Lima, O.

Peter Schwab of Hamilton, Ohio, heretofore a stockholder in the Cincinnati and Miami Valley Traction company, has secured a controlling interest in that company, it is said, in the interest of a syndicate which proposes to consolidate several of the electric-railroad companies in that vicinity.

A company is being formed at Fort Worth, Texas, with J. E. Martin at the head, for the purpose of constructing an electric street-railway line to traverse the eastern portion of the city, which is the most densely populated part of the town, but which at present has no street-car accommodations.

In order to save its charter rights the Martha's Vineyard (Mass.) Street Railway company had an old steam-railway baggage car dragged through the streets of that town by horse power the other day. The tracks for the electric cars have not been laid, owing to the fact that a location has not yet been agreed upon.

Angered by alleged abuse of a fellow-countryman, a number of Russian Jews recently attacked the conductor and motorman of a West Twelfth street car in Chicago. One of their methods of disabling the car was the cutting of the guide rope of the trolley pole, with the idea that the supply of motive power was thus shut off.

Boston capitalists are said to be behind a project to develop the water power of the Farmington River in Connecticut, and to operate an electric railway from Avon, New Hartford, Winsted and North Berkshire, with a branch line connecting Torrington and Winsted at Burrville. The company is incorporated under Maine laws with \$3,000,000 capital.

The new Niagara Gorge Railroad company, organized with a capital stock of \$1,000,000, has been incorporated. The company is organized to operate the famous Gorge road at Niagara, recently sold by the receiver. The company will also control the franchises of the Niagara Falls Tower company, the Buttery Whirlpool Rapids company, the Niagara Rapids View company and the Niagara Whirlpool Rapid Elevator company, all of which were owned by the dissolved railroad company. The capital stock is divided into 10,000 shares. The directors are Francis V. Greene, Avery D. Andrews and George V. Turner of New York, and

Herbert P. Bissell, Edward W. Eams, Clarence M. Bushnell, William C. Cornwall, J. Henry Metcalf, B. L. Jones and Herbert H. Hewitt of Buffalo. The new company began the operation of the Gorge road on June 4th.

The Indianapolis and Martinsville Transit company has secured right-of-way through Marion County, and also through Morgan County to Martinsville. The route is from Indianapolis southwest through Maywood, Valley Mills, West Newton, Friendswood, Brooklyn, Bethany Park, Center-ton, Matthews and Martinsville. The officers are: P. H. Fitzgerald, president; J. C. Tarkington, vice-president, general manager and purchasing agent; Joseph T. Elliott, Jr., secretary; Sterling R. Holt, treasurer.

The Galveston City street railway and the Gulf City street railway of Galveston, Texas, are to be sold on September 5th by order of foreclosure entered in the Federal Court of that district. An ordinance was introduced in the City Council of Galveston authorizing the purchaser of these two lines to consolidate them, and reaffirming all the rights and privileges the lines now enjoy. It also grants the purchaser franchise to build and operate lines on a number of other prominent streets of the city. This grant is to continue for a period of 25 years, at the expiration of which time the city is to have the right to purchase the lines.

AUTOMOBILES.

An American manufacturing company has just acquired an extensive piece of land and a plant at Coventry. The capital is said to be \$500,000, and the company means to rush the construction of automobiles, which has been rather neglected in England.

The Studebaker Bros. Manufacturing company of South Bend, Ind., is said to have closed contracts for the construction of automobiles aggregating in the neighborhood of \$1,000,000. New York and Boston capitalists are interested in the deal. In order to supply this new demand large additions to the works will be immediately erected. The cost of the new departments will be \$400,000.

An English correspondent says that considerable interest is being shown in automobiles in Great Britain. The dukes of Marlborough and Manchester are doing all they can to start the fashion. A great automobile show will be opened on June 17th, at Richmond, by Prince Edward of Saxe-Weimar. There will be tests of hill climbing and races between fast trotting horses and automobiles.

Dr. Playfair, the London physician who was condemned to pay \$50,000 damages for libel a few years ago, was hurt in a queer automobile accident recently. He was going up a hill when something gave way and the carriage began to roll backward down the slope. The driver applied the power brake to the rear wheels, forgetting that he was going backward, with the result that the carriage stood up on end and tipped backward, bruising Dr. Playfair as it fell upon him.

The National Bicycle and Motor company of Bridgeport, Conn., has been incorporated with a capital of \$2,500,000. All the stock is subscribed for by A. W. Paige, Judge George P. Carroll and Philip L. Holzer of Bridgeport. They represent capitalists, but at this time refuse to divulge their names. The purpose for which the company is organized is to manufacture, buy and sell bicycles, motor carriages, automobiles, autotrucks, electric vehicles, cars and conveyances and parts thereof, and all other kinds of articles made of wood or metal.

The automobile which left Cleveland, O., at seven o'clock on Monday morning, May 22d, to establish an automobile record between Cleveland and New York, arrived in front of the Astor House in the latter city at 5:45 p. m. on May 26th. The record made was 707.4 miles in 40 hours and four minutes of actual running. This is an average of 17.6 miles an hour. The trip was accomplished with only one accident of a serious nature—the breaking of an axle. Alexander Winton operated the vehicle, and was accompanied by George B. Shanks of the Cleveland Plain Dealer. This speed record was outdone, however, in France on May 24th. In the automobile race from Bordeaux to Paris, a distance of 333 miles, M. Charron won in a petroleum vehicle, covering the distance in 11 hours, 43 minutes and 22 seconds, beating the previous record by three hours, 35 minutes and 11 seconds. M. Charron claims that his automobile can maintain an average of 30 miles an hour for 12 hours. It has four seats and is of 14 horse power. The difference in speed in the United States and France is largely attributed to the respective conditions of the roads. However, an international race is proposed. M. Charron, winner of the automobile race from Paris to Bordeaux, authorizes the New York Tribune correspondent in Paris to enable his acceptance of Mr. Winton's challenge to French chauffeurs for a race in the United States over a course of 1,000 miles or less. The sum of 50,000 francs has already been subscribed by Charron's backers, it being understood that the prize is to be 100,000 francs. M. Charron, who has never

been in the United States, will be accompanied by the Chevalier René de Knyff, the well-known motor-carriage amateur, who was second in the recent Bordeaux-Paris race, and, as a member of the executive committee of the Automobile Club of France, will look after Charron's interests during his American trip.

PUBLICATIONS.

The catalogue of the Westinghouse Junior engine, issued by the Westinghouse Machine company of Pittsburg, is a handsome piece of work. It shows how the Junior engine, which is made in sizes running from five to 100 horse power, is a first-class product, although sold on a small margin of profit. A special bearing is made for the direct connection of these small engines to dynamos.

The Western Electric company is mailing to the trade a neat circular descriptive of the Matchless electric lighter. These lighters are made of the finest white china, and can be operated with batteries or connected to electric-light mains. They have the indorsement of the Board of Fire Underwriters. The Western Electric company also requests those persons interested in arc lamps who have not received a copy of its catalogue of Petite lamps to write for one.

The new catalogue "12" from the Ferracuta Machine company of Bridgeton, N. J., depicts the various styles of foot and power presses and other machinery manufactured by that company, many of which are especially adapted for electrical work of all kinds. Over 300 sizes and kinds of presses are described, and electrical-goods manufacturers will be especially pleased with the large double-crank presses, which are capable of cutting the largest size of armature disks. The Ferracuta company has recently placed on the market a new disk notcher, which is adapted for notching various sizes of armature disks, from three inches to 48 inches in diameter. This has proved of great interest. The company will be glad to send catalogue and full information about its tools to those interested.

TECHNICAL SCHOOLS.

The University of Michigan issues a "general announcement" for 1899-1900 of its Department of Engineering. The pamphlet describes the work of the department and gives a register of the alumni.

At a meeting of the Washington University board of trustees in St. Louis on May 27th President Brookings announced that he had secured from Samuel Cupples a building for civil engineering and architecture, to cost \$100,000, and \$150,000 toward the endowment of the school of engineering and architecture, thus making the aggregate gifts of Mr. Cupples, within the last 60 days, to this department of the university, \$400,000.

Entrance examinations for the Massachusetts Institute of Technology of Boston will be held in a large number of cities on June 20th and 30th. H. W. Tyler, the secretary of the school, can give all needful information. Announcement is made of extra summer courses during the months of June and July. These are private undertakings on the part of certain instructors and have the approval of the Institute. The courses include studies in mechanical drawing, mathematics, architecture, chemistry, physics (including mechanics, light, electricity, heat, physical measurements and electrical testing), mechanism and shopwork.

President Henry Morton of Stevens Institute of Technology, Hoboken, N. J., announces that Andrew Carnegie has offered to give \$50,000 to the fund now being raised for the purpose of building an engineering laboratory. Mr. Carnegie's generosity will enable the authorities of the institution to proceed without loss of time in erecting the new building and making other improvements at Stevens, including the construction of a chemical laboratory, which have been in contemplation for a long time. In his letter to President Morton, offering the gift, Mr. Carnegie said: "We owe much to Stevens, for many valuable men have come to us from it."

It is said that the most delicate calorimeter in the world is now in the possession of the Johns Hopkins University. It is an instrument for finding the relative quantity of heat in different qualities of coal, and was manufactured by I. W. Williams of Boston. It consists of a bomb, or heavy shell, about the size of a large orange, in which a small platinum crucible is suspended by a small wire, and a jacketed tank of water. A gramme of coal dust is compressed into a cake and placed in the platinum crucible. Then the sphere, after receiving oxygen under 375 pounds pressure, and being rendered air-tight by a screwcap, is immersed in the tank. By an electric spark the oxygen is ignited with the coal, and the increase of temperature in the water, caused by the combustion of the coal, is accurately measured by two delicate thermometers. The bomb is made of aluminum bronze, weighs about two pounds, and is coated on the inside with 20 coats of gold plating.

The chair of mechanical engineering in McGill University, Montreal, rendered vacant by the departure of Professor I. T. Nicholson to the new technical school in Manchester, has been filled by

the appointment of R. J. Durlay, who has been assistant professor since 1897. Mr. Durlay is a science graduate of London University.

MISCELLANEOUS.

Commissioner Peck announces that he has prevailed upon Mr. Edison to make a special exhibit of his electrical inventions at the Paris Exposition next year.

A dispatch from Germany in the daily papers states that an electro-technical congress was opened on May 26th at Göttingen, Hanover. There were 150 delegates in attendance, it is said.

The boom in copper has caused such increased activity in the Lake Superior copper region that there is a great scarcity of dwellings for the numbers of miners and workmen who have lately gone into the district. All the available houses are occupied and hundreds of men working at the mines and mills are unable to bring their families there for lack of a roof to shelter them. Preparations are being made for the building of modern tenement flats at Houghton and other points on the lake.

What is said to be the biggest zinc-mining deal ever made in the Missouri-Kansas district was consummated at Joplin, Mo., on June 1st. Colley & Co., Boston bankers, purchased the Rogers & Miner 80-acre tract of mineral land at Aurora, and 458 acres adjoining, known as the Flourney farm, for \$800,000. The property bought contains three rich zinc mines, the No. 1, Prosperity and Tuttle mines, which are producing about 250 tons of zinc ore a week. It is said that this property was bought 10 years ago by A. H. Rogers and S. H. Miner for \$85.

The National Exposition of Electrical Arts, which will be held at Tattersall's, Chicago, from September 25th to October 9th, gives promise of assuming greater proportions than the officers of the exposition hoped for. Active preparations for this exposition are now being made, and applications for space are already beginning to come in. President N. J. Heimbach, Manager W. E. Burnham and Secretary T. Carrabine feel much elated at the interest shown by the electrical fraternity in the coming exposition. The company will be pleased to send full particulars to those interested.

Comparing the machine-shop methods of American and British manufacturers, with the Atbara bridge incident as a text, a writer in Cassier's Magazine says: "Electrically driven shop tools, heavy ones as well as light ones, have eliminated many difficulties of operation, and electric cranes have greatly simplified the handling of heavy pieces. The principle of portability in the tools, moreover, has been applied to the widest possible extent, and, in itself, has contributed almost as much as any one other thing to that rapidity and excellence of output for which American shops have become noted."

TRADE NEWS.

The general offices of the Electric Storage Battery company have been removed to its factory building, Nineteenth street and Allegheny avenue, Philadelphia.

The W. J. Tindall company of Cohoes, N. Y., has been incorporated, to manufacture and sell electrical appliances for medical and surgical uses. The authorized capital is \$3,000, and the directors are William J. Tindall and Philo A. Turner of Cohoes and Charles A. Tindall and Edward E. Gardner of New York.

A recent advertisement made Mr. W. N. Matthews of 312 Commercial building, St. Louis, says that the Missouri-Edison company of that city is "substitut-

ing smaller units for large ones," whereas the true state of the case, of course, is precisely the reverse. Mr. Matthews offers the superseded machines for sale. The error was made in transcribing the notes of a stenographer.

In a recent baseball game that created considerable excitement in Warren, O., the team of the New York and Ohio company beat the aggregation of the Warren Electric and Specialty company by a score of 15 to 11. After lasting 3¼ hours the game was called in the seventh inning on account of darkness. The losers thought that if the full nine innings had been played they would have won.

BUSINESS.

Siegel, Cooper & Co., Chicago, have placed an order with the Western Electric company for one 125-kilowatt direct-current generator and one 80-light arc dynamo. These machines are to be installed in the buyers' store in Chicago.

Notwithstanding the fact that the spring season was not warm enough to be an ideal season for the fan-motor business, the Electric Appliance company of 92 and 94 West Van Buren street, Chicago, reports that its sales of fan motors up to date are very encouraging and indicate that the demand during the season will be very heavy.

The 36-inch water wheel set up by the American Impulse Wheel company of New York in the Massachusetts Institute of Technology showed an efficiency of over 80 per cent., the manufacturer states, on the first test, before the bearings had worn smooth. In design and finish it is running satisfactorily. "This," says the American company, "adds only another testimony to the many before given that the water-wheels of this company are superior in design, mechanical workmanship and efficiency. Wherever we have installed wheels the same report comes back—that the machines are giving perfect satisfaction."

The Western Electrical Supply company of St. Louis is keeping pace with the times with its usual spirit of push and energy, and is always picking up good things for the trade in general. The company's numerous salesmen are at the present time "hustling" for business in nearly every locality in the central, western and southern states, and from their genial attitude and general appearance of being thoroughly satisfied with themselves and the world in general, they are evidently receiving their share of the patronage. This state of affairs is but natural, however, considering the general high quality of goods that are handled by the house they represent.

The active condition of the rheostat business at the present time is one of the best proofs of large sales and good prospects for the manufacturer of motors and dynamos. The Iron Clad Resistance company of Westfield, N. J., is one of those manufacturers that find themselves in an overwhelmed condition, but this company is in a position to increase factory facilities to meet every demand. The personnel of this institution is well known to the trade. R. H. Mansfield, Jr., is president, A. W. Berresford, vice-president, and A. P. Munning is secretary and treasurer. The Iron Clad Resistance company makes a full line of theater dimmers, dynamo-field rheostats, motor-starting and motor-regulating rheostats, ventilating-fan controllers, also special rheostats and resistance plates. It is the purpose of the company from now on to push its goods aggressively in the western market. In a short time there will be available to the trade detailed information of a special dimmer the company is now introducing.

"It is surprising," said J. J. Wood of the Fort Wayne Electric Works, "the immense amount of business that is being done in the electrical line.

We have been necessarily handicapped while perfecting our new organization, but in spite of all this, we are running our factory full time and have been obliged to add several hundred men to our factory force within the last week or two."

The Knutson arc-lamp clutch placed on the market by A. W. Knutson & Co. of Galzburg, Ill., is meeting with great success. The device seems in truth to "fill a long felt want," and it is said to overcome the troubles of the arc-lamp trimmer. The manufacturers state that hundreds of dollars in lamp repairs may be saved by the use of the Knutson clutch. The electric-light company of Galzburg, which is using this clutch, informs Knutson & Co. that it saved in the neighborhood of \$200 in lamp repairs by the use of the Knutson clutch. Other letters, speaking in the highest terms of the device, are being received.

The Montauk automatic thermostatic fire-detective cable covers a field which, heretofore, electrically speaking, has been but tentatively occupied, and installations of it are rapidly multiplying. Stanley & Patterson of New York, a firm well known to the electrical trade, and jobbers of this cable, among other installations have recently placed an equipment in the home of Mr. Joseph Pulitzer of the New York World; Doscher & Hartwell, electrical contractors, among other installations, have recently equipped the winter residence of Mr. George Taylor in New York city, and also his summer residence on Long Island; the Jenney Construction company is doing a good business in the installation of this cable, and among the installations made by it may be mentioned the winter and summer residences of Mr. A. A. Cowles, president of the Ansonia Brass and Copper company. Among the various installations made by the Gamewell Auxiliary Fire-alarm company, the Dundee Chemical Works, Passaic, N. J., and the Jessup & Moore Paper Mills, Wilmington, Del., may be cited.

The Metropolitan Steam Boiler Compound Manufacturing company of Brooklyn is now making an especial drive for business among the electric-light stations and other electric-power plants of the West and Middle West. The Metropolitan company refers to itself as a "boiler doctor," and it offers engineers and others having boilers in charge "consultation free." In a word, the Metropolitan company analyzes feed water and prescribes and cures the particular disease with which the boiler is afflicted. It is particularly interested in securing western business, and it offers to mail to any engineer sending the company the horse power of his plant, with his home and business address, a valuable morocco-leather-covered note-book. President Edward E. Graves of the Metropolitan company is full of enterprise, and his offer of "a valuable water-front lot in Kings County, Greater New York," as an inducement to chief engineers to send their business and private address, shows that he knows how to bring his goods to the attention of those interested. Mr. Graves offers to reasons, as follows, why level-headed men use the Metropolitan compound to prevent the destruction of their steam boilers: "First, it removes and prevents scaling, pitting, corroding and foaming; second, it is absolutely safe and perfectly harmless; third, it preserves and does not injure the iron; fourth, it reduces interruption to service by avoiding frequent opening of boilers; fifth, it insures safety by removing the great causes of explosion; sixth, it is the cheapest, because after boilers are free from incrustation, it requires but a small quantity to keep them clean; seventh, it has no equal; a trial will insure so that you would not be without it; eighth, the annual saving of coal from 15 to 70 per cent.; ninth, cheaper than any product in the market, its benefits taken into consideration, and tenth, 25 years on the market."

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued May 30, 1899.

625,763. Ground Detector. Edward M. Hewlett, Schenectady, N. Y. Application filed December 12, 1898.

A polyphase distribution system, a polyphase resistance having a number of branches connected across the lines and a common junction, and one or more static measuring instruments connected between ground and intermediate points in the resistance branches.

625,786. Electric-lighting Device. Samuel E. Mosher, Chillicothe, O. Application filed February 28, 1898.

A sparking device comprises a standard, two sparking members movably connected with the standard, one of the sparking members movable independent of the other and yieldingly connected therewith, and means for moving one of the members.

625,787. Electric-lighting Device. Samuel E. Mosher, Chillicothe, O. Application filed March 21, 1898.

An electrical lighting device is described comprising sparking members, one supporting the other and insulated therefrom, one of the sparking members being movable in relation to the other, an endwise moving support, a stop for the movable sparking member and a spring for holding the movable sparking member out of contact with its contacting sparking member whereby the parts are adapted to operate as described.

625,788. Electric-lighting Device. Samuel E. Mosher, Chillicothe, O. Application filed May 2, 1898.

A sparking mechanism consists of a swinging member, relatively movable sparking members, both of the members connected with the swing member and the point of connection of one being farther away from the pivotal point of the swinging member than the other, whereby one sparking member is caused to move past the other when the swinging member is actuated.

625,792. Electromagnetic Mechanism for Actuating Engine Valves. Ernest W. Naylor, Philadelphia, Pa. Application filed August 2, 1898.

As a circuit controller for electrically actuated valves there is a rotating disk having one or more sickle-shaped contact plates on its face, with their inner edge or edges formed in a curve receding from the center of the disk.

625,797. Telephone Switchboard. James M. Overshiner, Elwood, Ind. Application filed March 1, 1899.

The combination is described of a jack, a drop having an independently movable part and a plug constructed and adapted to enter the jack and to engage the movable part on the drop so as to restore the latter only when the plug is withdrawn.

625,806. Operating Dynamo-electric Machines. Edwin W. Rice, Jr., Schenectady, N. Y. Application filed March 1, 1897.

In an end-play device for rotary converters, the combination with the shaft of the rotary converter of an irradial, annular magnetizing coil mounted in inductive relation to the end of the shaft and with its axes substantially coincident with that of the shaft, and means for passing a magnetizing current through the coil and for varying the value of the magnetizing current.

625,816. System of Electrical Distribution. Elhu Thomson, Swampscott, Mass. Application filed September 10, 1897.

One claim is for the combination with constant potential mains of a circuit across the mains containing a number of transformer secondaries of the constant-potential type connected in series, with translating devices between them, and a regulating device connected in the series circuit and tending to maintain constant current therein.

625,823. Telegraphy by Means of Electric Light. Karl Zickler, Brunn, Austria-Hungary. Application filed June 24, 1898.

The sender apparatus has means for producing and intermittently projecting a pencil of ultra-violet rays in the direction of a receiving apparatus, which has an anodized electrode chamber containing rarefied gas between a disk-

shaped cathode electrode to receive the rays projected from the sender, and an anode mounted in proximity to the cathode and means for utilizing the sparks produced between the electrodes by the ultra-violet rays.

625,828. Cable Coupling. Frank E. Case, Schenectady, N. Y. Application filed March 21, 1898.

A cable section is composed of a plurality of separate wires of smaller cables, a terminal for each wire, an insulating support for holding and spacing the terminals, each terminal being provided with a projection or hook for holding the cable section in place, and a projection which acts as a lever to assist in releasing the terminal.

625,830. Inspector's Indicating Wattmeter. Frank P. Cox, Lynn, Mass. Application filed February 18, 1899.

A box contains the working parts of the apparatus, comprising a flat plate having holes therein to permit the insertion of the lamps, which plate is supported within the box, sockets mounted between the plate and the base of the instrument, and means for preventing foreign substances from entering the instrument case through the openings in the plate.

625,875. Electrically Controlled and Operated Railway Signal. William Daves, Jersey City, N. J. Application filed December 12, 1898.

A relay in the track circuit is arranged to be cut out by the presence of a train on the rails within the circuit, a motor circuit is closed and opened at the relay, and has intermediate separable contacts therein, a time circuit is primarily opened and closed at the relay and has intermediate contacts to open and close the circuit, and a time mechanism is operated by the time circuit and interposed therein to break the motor circuit and the time circuit, and a make-and-break device in the time circuit imparts intermittent motion to the time mechanism.

625,915. Controller. Thorsten von Zweigbergk, Cleveland, O. Application filed February 27, 1899.

The combination of a governing switch and two independent handles, either adapted to operate the switch, one to govern motors in running and the other to apply an electric brake.

NO. 625,816.

625,921. Rotary Circuit-breaker. Hans Boas, Berlin, Germany. Application filed October 20, 1898.

A rotary circuit-breaker comprises a receptacle containing a conducting fluid, a centrifugal apparatus having a vertical tube dipping into the receptacle and a rotating horizontal tube in combination with a metallic segmental ring or tube, against which the conducting fluid is ejected.

625,923. Magnet-bell Striker. Richard Brueckner, Boston, Mass. Application filed October 29, 1898.

A permanent magnet has electromagnetic coils wound on cores secured to one polar extremity thereof, an armature-supporting yoke fitted upon the ends of the cores and a projection from the yoke extending to the other polar extremity of the permanent magnet to retain the armature yoke in position.

625,938. Accumulator Plate. Harry G. Osburn, Chicago, Ill. Application filed July 27, 1898.

An accumulator plate is formed of a sheet of metal and has a series of sections joined to the body of the plate by narrow necks at opposite ends of the sections and bent or twisted into transverse positions to form the side walls of transverse pockets.

625,953. Electric Device for Propelling and Controlling Vehicles. Rudolph M. Hunter, Philadelphia, Pa. Application filed March 29, 1899.

An electric motive mechanism for vehicles consisting of a battery box having a pivot connection for attachment to a vehicle body, springs and axles for sustaining the battery box, a pair of driving wheels, two electric motors for respectively rotating the wheels, one or more steering wheels also supporting the battery box, means for adjusting the angle of the steering wheels, and a battery in the box for supplying current to the motors.

626,009. Transmitting Movement to a Distance By Electromagnetic Mechanism. Emile Raverot and Pierre Belly, Paris, France. Application filed July 27, 1898.

An automatic reversing switch for an electric motor consists of two electromagnets in multiple arc, means for breaking the circuit of each electromagnet, an armature for each electromagnet, each armature carrying two separate contact arms, a stationary contact co-operating with each arm, two supply mains, each connected with two diagonally opposite contact arms, and two distributing mains, each connected with two directly opposite stationary contacts.

626,017. Incandescent Electric Lamp. Ralph W. Carroll, Blandinsville, Ill. Application filed July 1, 1898.

An incandescent electric lamp comprising a socket casing, an insulating socket block mounted therein, an insulating disk mounted above the socket block whereby a chamber is formed between the socket block and the disk, metal standards connecting the block and disk, binding posts passing through the disk and connecting with two of the standards, a plurality of contact springs secured to the socket block, a switch mounted in two of the standards, one of which is connected with one of the binding posts, the switch being cylindrical in form and provided with segmental contact plates of varying length adapted to make connection with the springs, a plurality of conductors passing through the socket block, one of which is connected with one of the standards which is connected with another of the binding posts, and the others of which conductors are connected with the springs, and a detachable bulb provided with a plurality of filaments and a plurality of annular contact plates in electrical connection therewith and which are connected with the conductors in the socket block by means of a plurality of annular contact plates.

NO. 626,009.

626,020. Mechanism for Starting, Stopping and Reversing Direction of Motion of Electric Motors and for Controlling Speed of Same. Frank H. Foster, New York, N. Y. Application filed July 8, 1898.

The combination is described with a current controller and a source of electric-current supply of an electromagnet and controlling devices intermediate the electromagnet and the current controller, whereby such current controller when brought into operation may be moved forward with a variable motion, and the variation in this motion at different portions of the travel of the controller predetermined and made uniform at all times.

626,033. Electrolytic Apparatus and Process of Treating Impregnators Therefor. Marcel Perreux-Lloyd, Paris, France. Application filed July 9, 1898.

The process of treating impregnators for use in electrolytic apparatus consists in thoroughly impregnating the impregator with a solution of formic aldehyde and subsequently rendering the aldehyde inert or inoperative by treating the impregator in a bath of commercial acetic acid.

NO. 626,131.

625,065. Insulator. Welles E. Holmes, Newton, Mass. Application filed February 16, 1899.

An insulator comprising a clamp adapted to loosely engage a conductor, a spool of insulating material having a socket to detachably receive the clamp and a support for the spool.

626,114. Telephone-connecting Circuit. George K. Thomson, Malden, and Thomas C. Wales, Jr., Newton, Mass. Application filed August 6, 1898.

The trunk circuit has a repeating coil with four windings normally in series in pairs with the respective conductors of the circuit and an electromagnetic switching device, while a cord circuit is divided by a repeating coil of four windings, with a battery signaling keys and a disconnected source of calling current in the calling plug circuit, with a party relay sub-station circuit having a call bell in a ground branch from each conductor thereof, whereby when the trunk circuit is connected between the cord circuit and the relay circuit current from the battery circulates through the circuit thus organized, and by manipulating the keys the call bells are selectively operated.

626,131. Selective Electric Signal. John A. Barrett, Summit, N. J. Application filed July 28, 1898.

An electromotive appliance consists of two iron cores normally and permanently magnetized with like polarity and magnetization-modifying helices or windings surrounding the cores respectively, combined with a permanently magnetized armature common to and as a whole polarized oppositely to the poles of both of the cores, the armature being normally attracted to the poles by these co-operatively opposed polarities, and adapted to be repelled therefrom only when such currents are caused to pass through the windings of both cores, as to reverse the polarity of the poles of both simultaneously.

626,132. Selective Privacy-switch for Multiple-station Telephone Lines. John A. Barrett, Summit, N. J. Application filed July 28, 1898.

Claim is made for the combination with the line conductors of a multiple-station telephone line and the telephones at the stations thereof of a privacy device at each station determining the operative condition of the telephone, the actuating magnet of the device being connected with the line conductors, and the privacy devices at all of the stations being organized to act simultaneously to simultaneously render all telephones operative or inoperative, the circuit connections of the different privacy devices being arranged in diverse combinations, and means at the central office for producing in the line specialized currents adapted to actuate any corresponding privacy device through the agency of the circuit combinations.

626,134. Prepayment Electrical Meter. Charles O. Bastian, London, England. Application filed December 13, 1897.

A circuit-closer for the main circuit has a spring arm adapted to be struck by a lug and to be moved into the position to close the main circuit through the meter, during the partial rotation of a spindle set in motion by the insertion of a coin. A spring catch is adapted to engage the circuit-closer in its closed position; a spring tends to hold the circuit-closer out of contact, and a magnet in the local circuit is adapted to become energized and to release the catch from the circuit-closer and break the main circuit.

626,135. Electrolytic Meter. Charles O. Bastian, London, England. Application filed September 26, 1898.

The meter consists of a glass frame or open-work support with thin sheets or surfaces of platinum mounted opposite one another on the frame so that the sheets cannot come in contact, means for securing the sheets to the frame, and platinum wires connected to the platinum sheets and also connected to the circuit wires.

NO. 626,172.

626,143. Insulated Joint for Electric Fixtures. Edmund E. Clift, Philadelphia, Pa. Application filed February 8, 1899.

The combination contains two flanged sections, each having an extension adapted to be coupled to a pipe, a screw threaded on the flange of one section, an internally flanged coupling section adapted to the threaded flange, a screw connecting the coupling section to the other flanged section, non-conducting material between the several sections, and a non-conducting thimble extending through the openings in the two flanged sections.

626,146. Telephone Toll Circuit. Henry M. Crane, Boston, and Thomas C. Wales, Jr., Newton, Mass. Application filed May 25, 1898.

The combination is a toll trunking circuit multiplied to a plurality of sections, at which sections three distinct operative functions are performed; of means at the first section for receiving a call from a sub-station and for switching the trunk circuit thereto, means at the second section for rectifying obstructions in the circuit so made up, and means at the third section for connecting the trunk circuit to the called-for circuit, with an automatic disconnecting signal at the first section.

626,168. Trolley Catcher. Frank N. Kelsey, New Haven, Conn. Application filed December 14, 1898.

In a trolley catch the combination of a casing having a stationary arbor, a rotative device on the arbor, a trolley arm connected with the rotative device, a locker for the latter, a detent for holding the locker in its inoperative position, and a centrifugally operated trip device for the detent carried by the rotative device.

626,172. Rotary Transformer or Synchronous Motor. Benjamin G. Lamme, Pittsburg, Pa. Application filed July 24, 1897.

A rotary transformer or synchronous alternating-current motor, the field-magnet pole pieces of which are provided with combined low-resistance, non-magnetic rings and coil shields, for counteracting the field distortion caused by armature reaction.

626,190. Electric Arc Lamp. John R. Pepin, Chicago, Ill. Application filed October 28, 1898.

The essential features are an electromagnet, a central tube, a soft iron core, a tube within the core, a rod and piston, a clutch pivoted to a lug on the tube, a rod pivoted on the clutch, a bracket, a flange or base-supporting magnet, a carbon held in the carbon-holding tube, and a collar adjusted by a set screw to a carbon-holding tube adapted to hold the tube and the carbon when the lamp is dead.

Western Electrician

CHICAGO, JUNE 17, 1899.

No. 24

Electric Transfer Table.

The practice of the Chicago City Railway company is to overhaul every part of its rolling stock at least once a year. This entails the handling of the cars several times during their progress through the shops and early impressed upon the management the necessity of employing some means of shifting them about quickly and economically. Before the system was equipped electrically and the lines extended to all parts of the South Division, the cable cars were pushed from one part of the repair shops to the other by laborers, but the increase in the number of cars and the additional

large open car is shown on the table. The picture was taken while the table was in service carrying cars from one end of the shop to the other.

A view of the table itself (Fig. 2) without a car is presented on page 338, showing the peculiar construction of the truck. The electrical equipment is placed in the front of the car, which has a raised platform upon which the motorman stands. A No. 3 Westinghouse motor of 25 horse power capacity is suspended from the car axle in the ordinary manner. Current is taken from the company's regular railway circuit. Two overhead wires are employed, and a special trolley with two prongs and wheels

Twenty-first and Twentieth streets, in the rear of the company's offices and cable plant. The overhead trolley wires are fastened securely above the track and the trolley pressed against them, as it is desirable that the connection shall not be broken. On both sides of the track, all through the shop, tracks are placed at regular intervals upon which the cars are shifted for inspection and repairs.

When the cars are brought in from the bays or off the road for repairs, they are taken up to the second floor on the electric elevator already described in the *Western Electrician*, run onto the transfer table and shifted to the department of the

FIG. 1. ELECTRIC TRANSFER TABLE.—MOVING CAR IN CHICAGO CITY RAILWAY COMPANY'S REPAIR SHOPS.

weight of the motors following the introduction of electricity made it a serious problem to handle them in this manner.

Some idea of the nature of the task may be gained from the fact that when the cars are taken off the road at the end of the season the car bodies are cleaned and painted, cushions are cleaned and repaired, curtains washed, and the trucks, running gear and motor equipments examined and repaired, thus sending every car of the several thousand employed through all departments of the shops at least once every year.

During the last year the company has been experimenting with mechanically operated transfer tables for the purpose of facilitating the movement of the cars from one department to another. As a result of these experiments Charles E. Moore, the master mechanic of the company, constructed the large transfer table shown in the accompanying illustration. This transfer table is capable of carrying the largest and heaviest car operated by the company. In the illustration (Fig. 1) on this page a

makes contact with these wires and completes the circuit which conveys the current to the motor. Two rheostats are connected in series with the motor, and a third, of two panels, is connected in shunt with the field to cut down the speed. At the left of the platform is a G. E. controller and behind it a lever which controls a clutch, by means of which the motor may be made to propel the transfer table or operate a drum on which is wound a rope used for hauling the cars on the truck. It is a very simple and efficient arrangement, and has proved very successful. The electrical equipment was installed by William C. Bryant, an electrician of the company.

The peculiar construction of the device enables the operators to run the cars onto the table directly from the tracks on the floor, the iron bridging between the front and back axles being depressed so that it barely clears the floor.

The track upon which the transfer table runs extends through the center of the second floor of the repair shops, which are on Dearborn street, between

shops in which the repair work is to be begun. After this the car may be moved half a dozen times before it is ready for service, and it is in this work that the transfer table comes into play. It has proved a great time-saver and an economical device.

Chicago Union Traction Company.

Mr. Egbert Jamieson, the general counsel of the North Chicago Street Railroad company, who was offered the presidency of the new Chicago Union Traction company, about to be incorporated to consolidate the North and West Side surface street-railway systems of Chicago, has, it is believed, declined the position. Whether Mr. John M. Roach will be made the general manager of the consolidated system is not known. Mr. Roach, who is now general manager of the North Chicago system, has been mentioned in connection with the position, but at this writing it appears that none of the officers of the new company has been settled upon. Undoubtedly, an organization will be effected in a few days.

Rotary Transformers and Storage Batteries as Related to Long-distance Transmission.¹

By WILLIAM LISPENARD ROBB.

This paper is intended not as a general treatment of the subject of rotary transformers and storage batteries, but rather as a statement of the conditions under which we operate at Hartford, of the difficulties met with in the operation of that particular plant, the way in which these difficulties have been overcome, and the advantages that have been found in the operation of the rotary transformers and battery.

The main source of power is water power on the Farmington River, approximately 11 miles from Hartford. The water power at present developed is capable, under the most favorable conditions, of delivering at the switchboard in Hartford about 1,200 electrical horse power. The power is generated by two 600-kilowatt alternators and transmitted to Hartford on the three-phase system under 10,000 volts pressure.

The water power is supplemented by an auxiliary steam plant in Hartford, consisting of two compound, condensing Couper-Corliss engines, having a combined capacity of 1,600 horse power. These engines supply the power to operate one 600-kilowatt alternator and one 400-kilowatt rotary transformer so arranged that it can be connected with engines and operated as a direct or alternating-cur-

rent generator. This rotary is so operated whenever, owing to low water or repairs on the transmission line, the supply of alternating current is insufficient for the alternating-current load and all the rotary transformers.

Two systems of distribution are used. In the central portion of the city the distribution is on the three-wire, 220-volt, direct-current system. This part of the service is practically all underground. The feeders are lead-covered cables drawn in cement-lined ducts. The distribution is in part by Edison tubes and in part by lead-covered cables drawn in ducts. Outside the central portion of the city the feeders are supplied with two-phase alternating current under 2,400 volts pressure, and the distribution is, in general, on three-wire, 220-volt systems, supplied from 10 or 20-kilowatt transformers, although a few smaller transformers are still in service. This service is in part underground, but, in general, overhead. Constant-potential, enclosed-arc lamps, incandescent lamps and motors, in the case of both alternating and direct currents, are operated on the same three-wire system. All the commercial arc lamps, whether on the direct or alternating system, are of the constant-potential, enclosed type, as are also the street lamps in streets in which there is a three-wire system. In other streets the street lamps are of the series alternating-current enclosed-arc type, and are operated from constant-current transformers.

Three rotary transformers supply direct current to the three-wire, direct-current system. One has a capacity of 400 kilowatts, and is located at the steam plant. Two have a capacity of 250 kilowatts each and are located in a battery sub-station, which is situated in the heart of the business section of

the city, and about three-quarters of a mile from the steam plant. The storage battery has a capacity of 2,500 horse power hours at a five-hour rate of discharge. The 250-kilowatt rotaries and the battery were installed in the fall of 1896 and the 400-kilowatt rotary in the fall of 1898. All three rotaries and the battery supply currents to the same three-wire system.

The three alternators are always operated in parallel. At least one rotary transformer and storage battery are always connected to the three-wire, direct-current system. The direct and alternating-current systems are consequently interlocked, and the whole plant, including alternators, rotary transformers and battery, is practically operated in parallel.

The rotary transformers are of the two-phase type, and are so designed that by cutting in or out turns of the primary of the static transformers the voltage of the rotaries may be varied between 230 and 360 volts. This wide range of voltage is necessitated by the fact that the rotaries are at times run directly on the line, and at other times used in charging the battery, frequently at high charging rates. This wide range of voltage that can be obtained from the rotary does away with the boosters, otherwise necessary in charging.

The rotary transformers are two-wire and simply supply the current to the outside wires of the three-wire system. The neutral wire is connected with the middle point of the secondaries of the two static transformers. This point is always midway, as re-

they are used for running machinery in factories, and, consequently, are only started twice a day—we find no practical difficulty in operating induction motors and lights from the same system of distribution.

The three alternators, one operated by steam and the other two operated by water power at a distance of 11 miles from the first, have been continuously run parallel during the past three years. No difficulty whatsoever has been found in this method of operation.

The operation of the rotary transformers has not been so simple a matter. At the outset there was great excess of sparking at the commutator. This sparking was soon found to depend very largely on the variety of brushes used. It was found that a very soft carbon brush gave the best results, but, without special treatment of the brushes, sparking, although diminished, is still excessive. The method of treating the brushes suggested by our superintendent, Mr. Rollins, was tried and found effective. The carbon brushes are first raised to a red heat, and then plunged in ordinary lubricating oil and allowed to cool. When brushes treated in this manner were used all vicious sparking was stopped, and in this particular the transformers ran as smoothly as direct-current generators of the best type. At the outset, in operating the rotaries, considerable difficulty was met with in preventing pumping when the engines were supplying power to the system. This pumping could be traced to the variation in the angular speed of the engines, and when the water power alone was supplying the power there was little, if any, pumping. It was found that this tendency to pumping could be checked by varying the field excitation of the rotary transformers or by temporarily throwing a portion of the load on the storage battery. Only once in the past three years has the pumping been such as to cause any serious interruption. The switchboard at the sub-station was originally arranged to give the greatest possible flexibility in operation. Both rotaries could be run in multiple with the battery, or both rotaries could be run in multiple feeding into the line and the excess of current used to charge the battery, or one rotary could be run on the line and the second rotary used to charge the battery independently. This last method of operation was found impracticable. Under this condition the pumping would immediately begin, and it necessitated giving up this method of operation. Notwithstanding the above-mentioned difficulties, when a year ago it was decided to increase the direct-current machinery, we had gained sufficient confidence in the rotary system to purchase a 400-kilowatt rotary rather than a direct-current generator.

The third rotary, when tested, proved to be free from any tendency toward pumping, either when operated from the steam plant or from the water power, and was in every way as nearly perfect as a machine could be. However, when thrown on the line with the two older rotaries, they immediately began pumping, and it was found impossible to run the three rotaries together. The pumping in a rotary system seems to be cumulative; it is very easy to stop it if the proper remedy is applied as soon as the first tendency to pump is noticed. If allowed to go on it quickly gets beyond control. The impossibility of running the three rotaries together necessitated some change. The Westinghouse company's engineers maintained that the corrective device could be applied with equal effect to any one of the three rotaries. Copper strips were attached to the pole-pieces of the 400-kilowatt rotary. This rotary, of itself, was all right, but the developing of any tendency of the system toward pumping was entirely overcome by means of these copper strips. The system now works perfectly, whether operated by steam or water power. Even under the trying conditions of running the rotaries under different voltages, two feeding directly into the line and the third independently charging the battery, no trouble with pumping is experienced. In all other respects the rotary transformers have been all that could be asked for; they have run practically continuously night and day for nearly three years, and have had practically no repairs, the commutators simply being turned down once or twice a year.

With storage batteries one looks for frequent renewals of plates. The Hartford battery has had its share of renewals. The battery was bought under a five-year guarantee, which has since been renewed for five additional years. The renewals have not been in excess of what was expected, and no investment of the company has been considered more satisfactory than the battery. The method of deciding when the battery is to be renewed under the guarantee is perhaps interesting. Whenever any plate or number of plates have lost one-third of the original capacity they are replaced by new plates. In this way the battery is being continually renewed, and its capacity should never be less than 90 per cent. of its original capacity.

The four accompanying charts, made from the daily records of the company, represent the load on Wednesday, November 23, and Saturday, November 26, 1898.

The part shaded with horizontal lines represents the alternating-current load, the upper portion representing the series arc street lights. The part shaded with diagonal lines represents the charge and discharge of storage battery, lines sloping to

FIG. 2. ELECTRIC TRANSFER TABLE.—SIDE VIEW, SHOWING CONSTRUCTION.

gards electric pressure, between the two terminals of the rotary transformer.

The storage battery is at all times kept on the line for the purpose of regulation and to meet any emergency call for extra power.

It was necessary to generate alternating current rather than direct current, as the main source of power is located 11 miles from the center of distribution. This condition very generally applies to water powers that have not already been developed for other purposes than the production of electricity. The same condition applies in the case of companies supplying large areas when it is desired to supply all the power from one central power plant, so located that the power can be produced at the minimum cost. In the Hartford case, at the auxiliary steam plant, one generator supplies alternating current. The second generator, which in its normal use is a rotary transformer, when supplied with mechanical power from the engines, furnishes both alternating and direct current to the system in any proportions that may be desired.

Two of the rotaries are started and brought into synchronism by induction motors built on their shafts; the third is brought into synchronism as a direct-current motor, the current necessary for this being supplied from the direct-current system.

The direct-current system of distribution was adopted for the central portion of the city, as it was considered the only one on which all kinds of service could be given from the same wires, especially if those wires were placed underground. In that section of the city a large number of motors are being frequently stopped and started. It is considered that induction motors operated under these conditions would seriously interfere with the lighting service. In sections of the city where the motors are in continuous use—for example, when

¹ Read before the National Electric Light Association at New York May 2, 21 and 25, 1899.

the right representing the discharge and lines sloping to the left the charge. The horizontal dotted line represents the total full-load capacity of the direct-current machinery installed on November 23d. The unshaded area represents the direct-current load carried directly by the rotary transformers.

An inspection of the charts representing the direct-current system shows that the average load on the rotaries during the 24 hours was over 80 per cent. of their rated full-load capacity. The maxi-

battery system to the Hartford company have been very great. With the battery the company has been able to use a great quantity of water power that would otherwise have gone to waste. What would otherwise have been waste water power has been utilized at the peak of the load at the time when power is most valuable. The total output of the water power during the past year was over 90 per cent. of the possible output. When operating by steam, the engines have been run at an economical

has frequently been allowed to feed the battery system through the rotaries.

The transformer and battery station is operated by three men—the superintendent, an assistant and the care of battery and two of the rotaries. The labor in caring for the station is a minimum.

The system could, of course, be operated by direct-current generators connected to alternating-current motors. This would necessitate a large

ROTARY TRANSFORMERS AND STORAGE BATTERIES AS RELATED TO LONG-DISTANCE TRANSMISSION

imum load on the system was 83 per cent. more than the full-load capacity of the rotary transformers.

A comparison of the curves for the two days illustrates the great flexibility of the storage battery. On Wednesday it was used at the high rate of discharge for a short period. On Saturday the discharge was at a lower rate, but was continued for a much longer time.

The upper portion of the area representing battery charge and discharge represents the charge and discharge of an isolated storage battery in one of the department stores.

The advantages of the rotary transformer and

load, the advantages of the storage battery being nearly, if not quite, as great in connection with the operation of the steam plant as of the water plant.

The regulation of the system is much better with the battery than it could possibly be without it, and the service is much more reliable. The interlocking of the battery with the alternating current by means of the rotary transformers makes the battery act as a regulator on the alternating-current system as well as on the direct. During the daytime on Sundays the entire load, both direct and alternating, can be carried by the storage battery. The battery

of each 250-kilowatt transformer and 300-kilowatt motor, direct-connected to two 125-kilowatt generators, and a smaller motor direct-connected to two boosters. The result would be a much greater investment in machinery, much greater floor space occupied, greater complication and expense of operation and a lower efficiency.

To sum the matter up, my Hartford experience has convinced me that the most satisfactory method of supplying electric energy over a considerable area is from a central power station generating alternating current, the current being distributed to rotary and battery sub-station of high voltage.

the energy locally distributed on the three-wire, direct-current system.

DISCUSSION.

Mr. Ayer: I want to ask Professor Robb to explain the operation of the copper strips to the field of the rotary, to determine how the correction of "pumping" was effected. That may be old to many, but it is new to me, and I think it would be interesting to us to have a fuller explanation of it.

Professor Robb: I am rather under obligations to say nothing about that. The engineer who put in the rotaries particularly asked me not to go into that subject. By that means, however, we do away with any change in the magnetization of the field magnets. Any tendency to do that is to dampen immediately, so that there is no pumping produced. You do not get the first swing in the pendulum. It is checked at the outset.

Mr. Ferguson: I would ask Mr. Robb if he is able to obtain independent regulation on each side of the system, using two, three and four rotaries with the storage battery?

Professor Robb: You mean on that method of taking the neutral from the alternating system?

Mr. Ferguson: Yes, sir.

Professor Robb: We are fortunately so situated in having all our three-wire system recently installed, that the system is very nearly perfectly balanced as regards feeders at full load, and, of course, that neutral is absolutely midway in our practice between the two outside wires. At full load our system is so balanced that we do not need it. At times of low load we need the variation in voltage on the two systems, and accomplish that by varying the losses, simply pulling out feeders on one side of the system until we balance the voltage at our junction boxes. There are ways, as you know, by means of one very small unit, by which we are able to boost one side to meet the conditions which are found in the larger Edison plants.

Mr. Edgar: I think it is rather difficult for any of us to discuss intelligently Professor Robb's paper, because I think he is the only one in the country who has had just that sort of experience. Some of the members present have undoubtedly had a large experience with all currents, and some of us have had considerable experience with storage batteries, but I doubt if any of us has carried the combination as far as he has. He has done what we have been thinking of doing for the last two years, but I did not realize that he had carried the matter as far as he has. We have the same sort of a case, only approaching it from the other side. We have five or six large storage batteries, some of which are located so far from our three-wire generating station that it is rather difficult to charge them, and we have been discussing seriously during the last year the installation of an alternator for that purpose only. Our idea is to take up the easy end of it first and transmit high-tension current to the various battery sub-stations, and then, by means of rotary converters, turn it into continuous current. The question of how to generate or how to obtain that high tension has been discussed quite fully. It seems to resolve itself into putting in alternating dynamos, run by engines, or dynamos generating both alternating and continuous current, as Professor Robb is doing, or taking the three-wire system in our large stations and transforming it by means of rotaries into high-tension, and by static transformers raising it and carrying it over the city. We have been somewhat unsettled as to the possibility of doing it commercially—the idea of rotary transformers operating in one direction with quite a high range of voltage, and then at times being compelled to operate in the opposite direction with a high range of voltage. We have been in doubt as to whether it could be accomplished practically, and for that reason I am particularly impressed with what Professor Robb has been doing.

Mr. Ayer: I think Professor Robb has been doing something else, which is a great advance in electric lighting, and which will be of great value to the central stations in smaller cities. For a good many years we have been talking about series alternating lamps, and have had various statements about them, but no one has found them satisfactory until recently. It appears that they have been operating them on a very extensive scale, something like 600 or 700 lights, using the enclosed arc. They have solved the problem, it seems to me, and have lifted a lot of troubles from the central-station managers. It lets them get away from the direct-current machine and use the alternators; and taking the alternating-current stations, where they have them installed, and are compelled to hang on to small units, they have now the opportunity of getting out. I think it would be interesting to many of the members here, who may know of it, but who never saw the system in practical operation, to have Professor Robb say something about his experience in detail in operating series enclosed arcs on the alternating system.

Professor Robb: Before I start in to answer that question I should like to say a few words more about the third rotary transformer, which I did not bring out very well in my paper. That transformer differs from the other in the fact that its shaft is continued out beyond the bearings, so that we can bring it to one of the engines and use it for direct-current generating current machines. During the

time when we were still operating series direct-current arc lamps we took from that machine every evening 150 kilowatts of direct current and ran the series arc machines from the shaft from which that was shifted by the rotary transformer, the machine acting at the same time as a synchronous motor of 250 kilowatts. There are times when it is more advantageous to take the current from that motor than the other. The way in which we have operated our series arc lamps in streets is by Brush and Excelsior machines belted to the line shafting, which is directly connected to one large 600-kilowatt synchronous motor. Operating under these conditions, it was necessary for us to supply to the synchronous motor 550 watts of alternating current for every nominal 1,200 candle power lamp operated. A year ago last month we installed as a trial the first 30-light constant-current transformer which the General Electric company built for operating enclosed alternating series lights. That proved so satisfactory, and tested out so thoroughly, and the lights ran so steadily, that during the summer we placed an order for six 100-light transformers. These have been installed, and at the present time are all running. Operating under these conditions, we supply directly to each lamp 400 watts of alternating current. In that way we save 150 watts on every lamp. The lamps have been in continuous operation since they were installed, and work with perfect satisfaction. We operate these transformers from sub-stations. We get a piece of land in an out-of-the-way place, behind some house or factory, and build a house 10 feet square and put in a 200-light transformer. No one goes near the transformers but once from the time they are started until they are stopped. The inspector of that district turns the lights on and off, and is supposed to visit the house once during the night. We have a Bristol recording ammeter for each sub-station.

G. SACCO ALBANESE.

When the inspector starts it he connects the ammeter on to one of the transformers, and when he makes his inspection he transfers it, and the swinging of the needle tells us when he went there. The line on the recording ammeter is absolutely uniform, and there is not a hair's variation between the $6\frac{1}{4}$ amperes on which we run, from night to morning. The transformers are practically automatic; they are made of two stationary coils and two movable coils balanced on knife edges. All the motion is the slight motion in the knife edge when the transformer is started and stopped; it hardly varies during the night.

Mr. Wagner: I believe Mr. Ayer made a remark that to his knowledge there had been no satisfactory installation of series alternating-current arc lamps, except probably this installation in Hartford. Mr. Ayer evidently has not been West during the last two years, or he might have seen such a plant in St. Louis. We have had for nearly two years and a half from 2,300 to 2,600 series alternating arc lamps in constant operation, which have been perfectly satisfactory in every respect to the city authorities and the citizens. The lamps are operated by transformers placed in the sub-stations. The system is not as absolutely automatic in its regulation as that which Professor Robb is using, but for the entire station output, composed of the arc lamps, incandescent lamps and power, we have only one switchboard attendant on watch, and he is not kept very busy.

Mr. Doherty: Theoretically, we could not get the same photometric value on alternating-current arc lamps as on series arc lamps, especially so on the two-phase system. I am in favor of any system which may be used with small units. I would ask if any photometric measurements have been made to determine the relative efficiency of these two methods?

Professor Robb: Mr. Ryan of the General Electric company has made many tests on that subject and published them in a paper.

G. Sacco Albanese.

The young electrical engineer whose portrait is given herewith, Mr. G. Sacco Albanese, has recently been honored by the French government with the decoration of an officer of the Academy of Arts and Sciences. This decoration is known as the purple ribbon, and is said to be esteemed by Frenchmen as next to the well-known red ribbon of the Legion of Honor. Mr. Albanese is not a native of France, but much of his electrical work, particularly the construction of electric railways, was performed in that country or in French possessions. His work has been so well done that it has attracted the favorable attention of the government.

Mr. Albanese was born on the island of Malta, but is quite a citizen of the world and speaks six languages. His electrical training was obtained in the United States, and he is proud of it and also of his membership in the American Institute of Electrical Engineers, as may be judged by the badge so prominently displayed on the necktie in the picture, which was taken in Algiers.

The beginning of Mr. Albanese's practical electrical work was at Mr. Edison's laboratory in Orange, N. J. Afterward the young Maltese became connected with the Thomson-Houston company, working in the shops at Lynn and doing outside work. He has had wide experience in construction work. After a trip to Venezuela, Mr. Albanese returned to the United States, and at the World's Columbian Exposition in Chicago he was connected with the electrical engineering staff as an inspector.

In 1895 Mr. Albanese entered the service of the Compagnie Française Thomson-Houston in Paris. The company intrusted to him the construction of the street-railway lines of Rouen (the historical town of Jeanne d'Arc) and also those of Algiers (the first tramway system in French Africa). Mr. Albanese is at present superintending the equipping of the important plant at Nice, the fashionable winter resort on the Riviera. Mr. Albanese has gained an excellent reputation among French engineers for his executive ability. He hopes to be able, before long, to pay a visit to the United States, where he left many friends.

Electroplating Hulls of Vessels.

The advantages of copperplating for the submerged portions of hulls of vessels subjected to the action of salt water are well known. Where the hulls are of iron or steel, it has been the custom, to obtain the anti-fouling benefits of the copper, to incase the hulls in wood which is in turn sheathed with copper. But, although this plan has been quite extensively used, the sea-water is apt to find its way into the space filled with wood and set up electrolytic action between the copper and iron, damaging the hull. Apparently, it would be a great advantage to apply the copper directly to the iron, by electroplating, and a New York company, the National Ship Copper Plating company, has devised the interesting process for doing this which is illustrated by the accompanying cuts, which are reproduced from the Iron Age.

An ocean tug was electroplated with copper about four years ago, and when carefully examined last November, after continuous service in salt water, the surface of the copper was in excellent condition, with no evidence of galvanic action. In some places the copper was somewhat reduced in thickness, but in no place was the iron unprotected. An intimate union existed between the two metals.

The new system provides a method of handling the electroplating baths in contact with the vessel by atmospheric pressure. Fig. 1 shows the plan outline of a vessel (A), at one end of which is located a boiler and engine (B), and near by a dynamo (C), an exhaust or vacuum pump (D), a drain tank (E), a solution reservoir (F) and a pump (G). The dynamo and pumps are connected with the engine to perform the required work, and the pump (G), which is located by the side of the reservoir, is connected with it by a feed pipe. The other side of the pump has a drain pipe (H), Figs. 2 and 3, which extends around the vessel, and is brought to the reservoir, where it terminates in the base of a standpipe. The upper end of this standpipe has an overflow pipe, through which it discharges back into the reservoir.

The pipe (H) is located on the floor of the dock and has at intervals short nipples provided with cocks and means for connecting a union (I), Fig. 4. This pipe (H) is designed to supply the electrolytic solution to the bath through the flexible tube (K), Fig. 2, the latter having a union at its upper end which connects it to the bath through the medium of a nipple, secured in the side wall of the bath. Near the lower end of this flexible tube (K) is a short branch connection provided with a cock, and a union for attaching it to the nipples along the line of the pipe (N). This pipe (N) branches out from the solution reservoir (F), so that when the bath (K) is filled with the solution and it is desired to withdraw the same, cock (J) is closed and cock (M) is opened, and the liquid in the bath will then pass down through the branch tube and back to the reservoir through the pipe (N).

As it is an important matter to keep the metallic saturation of the solution constant in the bath, and

equable in all of the baths at the same time, and, further, that the entire surface of the vessel's hull which is in process of treatment within the area of the bath should have a uniform exposure or contact of this solution, it is necessary to cause an upward movement of the solution through the bath, such movement being opposite to the gravitating tendency of the saturated solution, and instead of having the solution enter at one point below and escape through a single pipe above, means are provided as shown in Figs. 2 and 4. In Fig. 3, near the base, within the bath, a horizontal pipe is connected centrally with the inlet nipple (J). This pipe is closed at both ends and has on its upper side a line of small orifices, through which the solution enters the bath and passes up through the nipple (I) and down through a flexible tube to the drain pipe (N).

It will be seen that the pump (G) forces the solution from the reservoir, through the line pipe (H) to the flexible tube (K) thence into the bath, and overflows from the pipe (N) back into the reservoir, thereby keeping a constant movement of

The United States Government's Magnetic Observations.

By JAMES E. PRICE.

When a comet is seen blazing in the heavens, making night awesome to the superstitious and bringing pleasure to the scientific mind, public attention turns to the astronomical observatory, in order to learn all that is possible of the interesting visitor. But when a great ship goes down to destruction because the compass needle failed to keep its proper position, few people find any connection between this disaster and an observatory. Yet there is such connection, and a very important one, when the needle's deflection is caused by terrestrial magnetism, which is nearly always brought about by this trouble. And this fact is most interestingly attested in five observatories owned by Uncle Sam, and devoted to the study of magnetism. These scientific outfits are established at San Antonio, Texas, Los Angeles, Cal., Key West, Fla., Madison, Wis., and near Washington, D. C. One will also be placed at Honolulu, Hawaii.

disturbance in connection with the "epoch of elongation," that is the contraction or expansion of the needle in a certain direction. These epochs cover periods of a great many years each, varying, of course, according to geographical position and force of magnetic influence.

As far back as 1660, a record shows that at that time, in the neighborhood of New York City, the compass needle was nearly stationary, pointing about 67 1/2 degrees west of north. From this position it began moving toward the east, and after an epoch of 124 years, the declination showed but 4 1/2 degrees west declination. This epoch terminated in 1784, since which date the needle's motion has been toward the west, the present value being about nine degrees.

It is said by experts in this science that (in the United States and south of latitude 49) to make a complete oscillation of the compass needle—winging once forward and once backward in an arc of several degrees—requires from 250 to 350 years, but that there is no record of a "cycle" of this nature completed.

Another peculiarity of the magnetic current is that it exerts its influence in the deepest water as well as near or on land, flowing from the great magnet, earth, and up through the heavy body of the ocean as easily as it permeates the atmosphere. From all its dry surface and water-covered portions our planet is continually throwing off this subtle force, which is sometimes exhibited to such an extent that the consequent disturbance is called "magnetic storms."

The latter are liable to occur at any time, and are frequently manifest simultaneously in various quarters of the globe; they are often accompanied by strong manifestations of electric earth currents and a display of auroral lights. During the disturbance the magnetic needle is much affected, and at the same time sun spots are very apt to be seen; in fact, magnetic storms seem to have a great deal to do with sun spots, being often coincident with the 11-year period of the latter. Some of these storms are very intense, as that of November, 1882, when Lieutenant Greely, while at Lady Franklin Bay, observed the range of needle declination to be about 20° 28'.

The fact that there is value in the study of terrestrial magnetism is at once apparent, but its application to purposes other than those mentioned has not been practically demonstrated. However, it has been said that the Weather Bureau experts at Washington have been for some time desirous of using magnetic data gathered at the United States observatory at that place, in making weather forecasts. But discoveries in the magnetic field have not yet advanced far enough (if they ever do) to be of service in this direction.

Uncle Sam's magnetic observatory in the District of Columbia is a most interesting place to all who care for natural phenomena and scientific progress. The building which contains the apparatus used in this work is situated not far from the splendid equipment of the new Naval Observatory, upon a high level plateau overlooking the capital. From an architectural point of view the magnetic observatory building amounts to but little, for it is quite a small structure, unornamented and built of wood. But it has a characteristic attachment. This is a high mound of earth situated just at the back of the house, having its top perforated by ventilating pipes, which lead down into an underground room, in which the magnetic investigating outfit is kept. This room has double walls with intervening air spaces, and is heated by small gas stoves, which keep the temperature of the place constant.

The apparatus consists principally of an automatic recorder, operated by means of clockwork machinery and three magnetic needles. The latter are mounted on stone pillar supports, arranged north, west and east, and are enclosed in glass-covered cylinders. Opening into each of these is a narrow wooden-boxed channel, about six feet long, which extends to the corresponding side of a wooden case that contains the recording mechanism, the work of which is to keep in motion a sheet of sensitized photographic paper. The needles are so nicely balanced that the least magnetic wave makes them vibrate, and every motion is reflected by a small mirror placed behind each of the three. By this, with the aid of a spot of light, centered on each of the reflectors, the position of each needle is continually thrown through the boxed channel and upon the moving sensitized paper, which makes a photographic record. The paper is taken from the recorder every two days and put through a developing process. If there has been magnetic disturbance the sheets will contain irregular lines, corresponding to the force and direction of the magnetic impulses. But if the needles have remained fixed at any time during the two days' period, straight lines will appear, showing the absence of magnetic waves at that particular instant. The magnetic record thus obtained is reproduced upon blue-prints, copies of which are sent to observatories in this country and Europe.

For some of the information herein contained I am indebted to Mr. C. A. Schott of the Coast and Geodetic Survey, who not long ago was awarded the Wilde prize by the French Academy of Sciences for his discoveries in terrestrial magnetism.

Fig. 1. Plan.

Fig. 2. Flexible Pipe.

Fig. 3. End of Vessel with Bath in Position.

Fig. 4. Side View of Bath.

Fig. 5. End View of Bath.

ELECTROPLATING HULLS OF VESSELS.

the solution through the bath. As the capacity of the pump should be greater than is required by all the combined baths in the series, the residue travels around the supply pipe (H) and is forced up into the standpipe, which by its height determines the pressure of the solution in the various baths.

Each bath has anode holders placed at intervals along its side walls, and as they are equidistant from the side of the vessel when the bath is in position, however much the bath may be curved (to conform to the curvature of the vessel), the electro-deposition will be uniform on the cathode. Otherwise, the electrolytic action would be greater over the zone where the anode approached close to the cathode surface.

The bath has a concave flexible web. A flexible tube leads to the air pipe (U), which is provided with nipples at suitable intervals. This pipe is connected with the vacuum pump (D). This pump is constantly in action, so that as air is exhausted from the bath atmospheric pressure holds it in position.

It is evident that with this method the plates of a vessel may be copper coated after bending and before insertion in the ship. Rivet heads and exposed edges may be copperplated after completion of the ship. In fact, the plan provides for electroplating any part of the vessel at any time and to any required thickness.

The study of terrestrial magnetism has been going on for many years, and some valuable data concerning it have been gathered—information which has been applied practically for the benefit of the mariner, the miner and the land surveyor; but in all cases the observations have had much to do with the compass, the needle of which at times becomes exceedingly erratic. These changes are closely watched at the various magnetic observatories and notes made of the different positions of the needle, the time of occurrence and the force and direction of the magnetic current. The facts are tabulated, published by the United States Coast and Geodetic Survey, and distributed so that any navigator, by consulting his magnetic chart, can tell just what the extent of compass variation there should be in a given latitude; and not only can he obtain up-to-date information in this particular, but, if so desired, he can tell the extent of needle variation which occurred more than a hundred years ago, or can look years into the future and get accurate data in the same line. In fact, the government's experts in this work make their reports to cover periods far ahead of current time, as, for instance, in the 1807 report, which is entitled "Distribution of the Magnetic Dip and Magnetic Intensity in the United States for the Epoch January 1, 1900."

One of the most striking features in magnetic

Once more the British project for a Pacific cable is reopened, this time by the imperial government. There has been so much dissatisfaction manifested throughout the colonial possessions over the terms proposed heretofore that it was questionable whether the scheme could be successfully put through on that basis.

Chicago newspapers are indulging in wild speculation regarding the introduction of an automatic-telephone service in this city in opposition to the Bell system. The possibility of the successful accomplishment of such a project is so remote that one would not be surprised to find the Bell interests encouraging the idea, hoping thereby to postpone indefinitely, if not, indeed, to kill effectually, all serious opposition to its plant in this city.

In view of the increasing trade between this country and Japan great interest will attach to the announcement that patent protection will be granted foreign inventors in the land of the mikado on the same terms as natives. Heretofore, there has been no way to protect foreign patents in Japan, and that empire is filled with machines made by the Japanese in imitation of the best American and European patents.

Elsewhere in this issue the details of the plans for the annual meeting of the Independent Telephone association are presented. The organization has again favored Chicago by selecting this city as the place of meeting, and the manufacturers and dealers located here have shown their appreciation by preparing an elaborate plan of entertainment for visitors, which will culminate in a banquet at the Auditorium Hotel as the closing feature of the meeting.

The association seems to have awakened to a realization of its position and its purpose, and the officers exhibit a commendable desire to make the organization something beyond a pretext for an annual wrangle. At the present time the spirit of harmony prevails, and there appears to be a real, live interest in the industry.

of the Independent Telephone association, and that henceforth it will prove a powerful factor in the telephone world.

The plan of this year's meeting will be entirely different from all former gatherings. There will be public sessions, at which topics of interest to telephone men and to the public will be discussed. There will be many features to attract exchange managers, and a large representation of this important element is expected.

The maneuvers at the torpedo station at Newport do not possess the same interest for the public this year as formerly, but they will doubtless be carefully followed by naval experts. The officers of the North Atlantic squadron have been invited to go on board the torpedo boats for personal observation.

The torpedo boat was the bogie of the Spanish-American war. Before actual hostilities were commenced and while the public was engaged in comparing the relative strength of the respective navies, much apprehension was expressed on account of the superiority of the Spanish torpedo equipment over that of this country.

Fortunately, experience showed that these fears were groundless. The torpedo boat was not an appreciable factor in the war. At Manila one attempt was made by torpedo boats to destroy the Olympia, but the machine guns played such havoc that it was abandoned. Again, at Santiago, two torpedo boats accompanied Cervera in his famous dash, but they were completely riddled and sunk before they could get within striking distance of the American fleet.

Electrical Uses of Aluminum.

Aluminum is attracting attention as a commercial possibility in the transmission of electricity abroad as well as at home. Mr. Ernest Kilburn Scott has an article in a recent issue of the London Electrical Review, pointing out what he considers some practical electrical applications of the light metal. The essential part of Mr. Scott's article is given:

Owing to its greater sectional area for a given current, it is as a bare conductor that aluminum shows to best advantage, when compared with copper. There are many cases where it could be used, as, for example, the bus-bars of large switchboards, either to fasten directly on the slate or be supported behind the board by projections from the cast-iron standards. The increased sectional area gives larger contact surface for connection bolts, cable eyes, etc.

Connections between Accumulator Switches and the Regulating Cells.—This is always a very heavy item, but especially so where the generating station is badly planned and the switchboard a long way from the regulating cells.

Switch Arms.—Heavy currents and long breaks necessitate switch levers of 18 inches, or even more, in length, and these, if made of a copper alloy or gun-metal, bring considerable stress to bear on the slate or marble on which they may be mounted. Obviously, with a light-weight switch arm a more sudden break can be allowed.

Power-transmission Lines.—Many of the long-distance transmission schemes abroad are for mines, etc., situated in most inaccessible places, and therefore, on account of the considerable saving in the weight, there seems to be an opening for the use of bare aluminum wire, and incidentally, also, there would be a slight saving in insulators.

Removable Telephone and Telegraphic Lines.—The reduction in weight is a specially valuable feature for field military purposes, as the size of the conductor for such work is fixed at a certain minimum size for mechanical reasons. The saving in weight over copper is therefore practically as 3.3 is to 1.

Portable Testing Instruments.—Some of the portable testing sets, ammeters, ohmmeters, etc., at present on the market are exceedingly heavy, and although there are comparatively few users of such apparatus, according to Mr. Scott, makers would undoubtedly find it pay to use the lighter metal more freely.

Brush-holders.—Aluminum-alloy castings have been used for brush-holders because of the variation of pressure (due to gravity) between the brushes on the top side and those on the under side of a commutator. The lighter castings reduce this variation, while, at the same time, the total weight on the brush rocker is considerably reduced in large machines.

Pure aluminum has a specific conductivity of 67 per cent. of that of pure copper. With one-half per cent. of impurity the conductivity is reduced to 61 per cent., while with one per cent. impurity the conductivity is 59 per cent. It is when we compare the castings made in the two metals that aluminum shows to best advantage, for, although both must be alloyed with other metals to give sound castings, the reduction in conductivity on this account is relatively greater with copper than with aluminum. Good nickel-aluminum castings can be made having a conductivity of 45 to 50 per cent. of that of rolled copper, but it is very seldom that ordinary copper-alloy castings such as are used every day for switch work and similar purposes exceed this figure. There is little difference in the tensile strengths.

For some time there was a difficulty in getting good aluminum-alloy castings, but this has now practically disappeared, owing to brass foundries and others having learnt by experience the peculiarities of the metal. Soldering and brazing, although they can be performed, are still drawbacks when compared with copper, but there is this to be considered, that for most of the purposes enumerated above mechanical joints may be used; in fact, for some purposes they are preferred.

Niagara Falls Power Company.

The Niagara Falls Power company has elected as directors Edward D. Adams, John Jacob Astor, George S. Bowdoin, Charles F. Clarke, Charles Lanier, Joseph Laroque, D. O. Mills, William B. Rankine, Francis Lynde Stetson, F. W. Whitridge and Edward A. Wickes. The board of directors organized by electing these officers: President, D. O. Mills; first vice-president, Edward A. Wickes; second vice-president and treasurer, William B. Rankine; secretary, F. L. Lovelace; assistant secretary and treasurer, W. Paxton Little; executive committee, Edward D. Adams, Francis Lynde Stetson, D. O. Mills, Charles Lanier, F. W. Whitridge. The directors of the power company have been directors of the Cataract Construction company, which, having completed its contracts with the power company, goes out of business. In their new positions they take the places of the old board of directors of the Niagara Falls Power company. Among those who retire are General Benjamin Flagler, Hon. W. Cary Ely, Charles A. Sweet, L. W. Pettibone, Hon. Peter A. Porter, E. S. Wheeler, W. S. Humbert, Coleman Sellers and Arthur Master. Future affairs of the Niagara Falls Power company will be directed from Niagara Falls, at which point Second Vice-president William B. Rankine will make his home.

What Jersey Lightning Can Do.

Lightning played some queer freak at the farmhouse of Garrett Baird, in Somerset County, N. J., last month. The house is in Hillsborough township, some two miles east of Harlingen, the nearest railway station. It is a substantial two-story structure, and was occupied by Baird's father before him. The exact time of the stroke was 10:31 a. m. on May 23d; the stopping of the clock at that moment shows this. It was a prankish bolt, for while it did all sorts of odd things with the house and its fittings and furnishings, it harmed no person.

Mrs. Baird was standing on a chair in the dining room whitewashing the wall at the time, says the New York Tribune. A colored boy of twelve was on the covered porch in the rear of the house, while Baird and a hired man were in the barn, some 200 feet away. The lightning descended first on a pine tree near the house, and several feet higher than the peak of the roof. It left the tree after traveling a short distance, leaped over to the gutter of the house and tore out the corner post completely, leaving the rooms on both floors exposed to view. Thence it darted in various directions, visiting every room in the place except that on the ground floor used by the Bairds for a sleeping apartment. Mortar was torn from the ceilings everywhere and pictures and ornaments were knocked down.

Mrs. Baird was stunned by the experience, but suffered no bodily injury. The room was filled with flames and, so it seemed to her, with sulphurous fumes. Her first idea was that her clothing was on fire, but, feeling her dress, she found this was not so. She was so frightened that she screamed. Just then the darkey boy rushed in, crying:

"Oh, Mrs. Baird, are you killed? I am!"

"But he wasn't. He had been on the porch cleaning a mahogany stand. The lightning had torn it from his grasp and hurled it 15 feet away. The top was split, but the boy, in spite of his statement to the contrary, was not killed. He wasn't even hurt, but he was the worst-scared darkey in the state.

After a gay journey through the cellar, and feeling that it had had all the fun it wanted in the house, the bolt skipped over the ground for a visit to the barn. The work "skip" is accurately used, for several holes were made in the line of flight. A pet cat was killed here, but a lot of turkeys near by were not harmed. The lightning struck the barn near the top and shattered several rafters.

When Baird heard his wife's screams he rushed to her assistance, but found there was nothing to be done for her. The house was on fire in the upper part, however, but after a little delay the flames were put out. In the dining room a window-sash had been broken, and most of the pictures were knocked down. A framed motto had escaped the pious bolt. This read, "God Bless Our Home." The ruin in the house was picturesque. One leg had been wrenched from the sewing machine. The glass panels of the front door and the iron grating covering them had been knocked out. The lock of this door had been utterly shattered, and bits of it lay all over the hall. A hanging lamp was broken. In the kitchen the pump was torn apart and the iron sink cracked. The clock was stopped, but, beyond its shattered glass, was apparently not injured. In the cellar cans of preserved vegetables and fruit were strewn on the floor. Emerging here, the lightning tore away a brick from the window.

Opportunity for Water-power Development in the South.

[From The Tradesman.]

The great natural water power at the Falls of Yadkin River, North Carolina, is to be utilized for the generation of electricity. The electric energy will be used to operate a great cotton mill. The river is forced through a narrow channel of not more than 75 feet wide, the stream above the narrows being 1,000 feet wide. The fall through the short and narrow gorge is about 40 feet. The company said to have undertaken to develop this power claims to have a capital of \$5,000,000, and proposes to distribute electric power over a radius of 50 miles around Yadkin Falls. The whole of the eastern slope of the Blue Ridge, known as the Piedmont region, from Middle Virginia through the Carolinas and well into Georgia, is dotted with fine water powers that can be cheaply developed. Properly harnessed, they would produce enough electric current to turn the world's machinery. Projects looking to the operation of railways by electricity generated by water power, through that region, for hauling granite and marble from the quarries, moving other freights and carrying passengers, are being seriously discussed by men who have the money and credit required, and why not? The lighting and operation of electric railroads in Sacramento is by electricity, generated by a waterfall 30 miles distant, and two cities in the state of Oregon are soon to be furnished light and power in the same way.

What can be done at Niagara and on the Pacific slope can be done in and by the South, that has millions of horse power tumbling down the streams that run from her mountain slopes. Harness the torrents; make them answer instead of coal and steam enginery. Switzerland has been, for 10 years or more, making use of the waters that issue from

the Alps to create electric current for operating textile mill, hardware, ironing, wood-working machinery and railway, and the time must be close at hand when the same thing will be done in the South where the streams are never seriously frozen by ice, and where, being fed by springs, their volume is remarkably uniform. All the running of street railroads, all the water pumping and lighting to supply southern cities, will in time be the work of electrical energy, produced by water.

Must Furnish Protection for Children.

"Walters against the Denver Consolidated Electric Light company" is the title of two cases that were recently considered together in the Court of Appeals of Colorado. Both had been dismissed because it was held that the complaints did not state causes of action.

One of the complaints set forth the business of the electric-light company; that it had extended its wires to the house of the plaintiff's father, for the purpose of supplying light to that house; that it had attached to the house, near to and directly under the window, a converter, and near to and above the converter, and directly under the window, had placed two iron supports to hold glass insulators, to which were attached wires, connecting with the house, and conveying the electric current for furnishing light to the house; that the company had carelessly suffered the wires to become uncovered and uninsulated; that the plaintiff, a child 12 years of age, who was residing with his father, upon looking out of the window, and seeing that one of the insulators had been removed from its iron support, and knowing nothing of the danger incident to his coming in contact with the wires attached to the insulator, seized the insulator for the purpose of replacing it upon its support, and received a charge of electricity from the naked wire which his hands touched, resulting in serious and permanent injury to him.

The objections to this complaint were: First, that the facts alleged did not constitute negligence on the part of the defendant company, within the contemplation of the law; second, that the complaint showed that the proximate cause of the injury was the act of the plaintiff in seizing the insulator, and not the exposed condition of the wire; and, third, that it appeared upon the face of the complaint that the plaintiff was guilty of negligence contributing to the injury.

But all of these contentions the Court of Appeals sweeps aside. It says that it may concede that at places where there is no apparent possibility of injury ensuing from electric wires it would not be negligence to leave them uncovered, and that no duty to keep them insulated would exist, unless it was imposed by some express law. Nevertheless, the accident in question was one liable, and which the company must have known was liable, to happen at any dwelling to which electric appliances were similarly affixed, and in which there were children or persons ignorant of the purpose of the appliances or the nature of the electric fluid; and the court declares that it cannot say, as a matter of law, that proof would not be admissible, under the averments of the complaint, which would justify a verdict that in leaving the wire exposed as alleged the defendant was guilty of negligence. And if such proof would be admissible, the court holds, then the complaint, in so far as the charge of negligence was concerned, was sufficient.

As to the "proximate cause" of the injury, the court thinks that counsel fell into some confusion respecting the legal meaning of the term, and holds that the question of the legal effect of the boy's act in reaching out to the wire was in no manner connected with the question of proximate cause, and could be considered only in an examination of the charge of contributory negligence.

Nor does the court consider that from the statements of the complaint it could be said, as a matter of law, that the plaintiff was guilty of contributory negligence, as it might very naturally occur to him to replace what he saw out of place and to restore order where he found disorder, without apprehending danger.

Finally, referring to the other case decided with this, brought by the boy's mother, the court holds that negligence could not be imputed to her for taking hold of the boy while he was still in contact with the wire, so strong being the instinct of a mother.

On these grounds the court reverses the judgments in both cases.

Chicago Edison Improvements.

The annual meeting of the stockholders of the Chicago Edison company was held on June 12th and action was taken authorizing the issue of \$1,000,000 additional capital stock, making the total \$2,000,000. About \$500,000 of the stock will be issued at present, going at par pro rata to present holders. The money will be used to extend the underground system of the company in anticipation of much greater demands for electric power in the immediate future. The directors were re-elected as follows: Edward L. Brewster, F. S. Gorton, Samuel Insull, Joseph Leiter, R. T. Lane, J. J. Mitchell, Frank M. Phelps, A. F. Secherber, Byron L. Smith, A. A. Sprague and Lambert Tree.

DEVELOPMENT OF THE TELEPHONE FIELD.

Independent Telephone Association.

The annual meeting of the Independent Telephone association will be held at Chicago on June 26th, 27th and 28th. In many respects this gathering will be different from former conventions, as the principal part of the proceedings will be open to the public, and a programme of interesting papers upon subjects of special interest has been prepared. In order that visiting exchange managers may have an opportunity to examine new apparatus without neglecting the meetings it has been decided to set aside sufficient time to permit a careful examination of exhibits at the hotel or a visit to any of the local factories. Delegates will also be entertained by the Chicago manufacturers and supply men at a banquet and a tally-ho party and steamboat ride.

The arrangements for the meeting were completed last week, when President Thomas and Messrs. Critchfield, Dougherty and Fisher of the advisory board met representatives of the telephone manufacturing and supply houses at Chicago. Two days were occupied in completing arrangements, and several conferences were held with local representatives.

The Auditorium was selected as the headquarters of the association, and arrangements were made for holding the meeting in the large banquet hall. The smoking room of the hotel was also secured for exhibition purposes, so that out-of-town manufacturers may have ample opportunity to display their specialties. It was also decided to hold the banquet at the Auditorium. It is believed that this arrangement will prove convenient to the members and will insure a large attendance at the meetings of the association.

The Chicago manufacturers and supply men have arranged for the entertainment of the delegates during their visit, and the advisory board has approved of the plan. This includes a tally-ho ride on Wednesday afternoon, at the close of the convention. The party will leave the Auditorium at three o'clock and ride north on Michigan avenue to Monroe street, west on Monroe to La Salle, south on La Salle to Jackson boulevard and east on Jackson to Michigan, thence south through the boulevards and parks, returning by boat to the Auditorium, where the banquet will be served at 8 p. m. This will be a complimentary dinner to the association by the independent telephone interests of Chicago, and will be a fitting termination for what, it is hoped, will prove the most successful meeting that has yet been held.

The committee also secured a concession from the Auditorium Hotel management in the form of a reduction of 25 per cent. from regular rates for members of the association.

The passenger associations will give the usual rate of one and one-third fare from all points in the United States.

The programme for the convention and the entertainment features, as approved by the advisory board, follows:

MONDAY, JUNE 26TH.

The executive committee and the advisory board will meet at 8 p. m., in the parlor of the Auditorium Annex, to settle all business matters of the closing year, and to formulate reports of officers and committees.

TUESDAY, JUNE 27TH

The first session of the convention will be held in the banquet hall of the Auditorium Hotel at 10 a. m., and will be opened by the president, Judge James M. Thomas, who will deliver the annual address. Reports of the officers and committees will then be submitted.

This will be followed by introductions and a short social session at which new members will be received.

At 2 p. m. another session will be held, the programme of which is as follows:

Paper, by S. P. Sheerin of Indianapolis, president of the New Long-distance Telephone company of Indiana. Subject: "Value of Long-distance Toll Lines." Discussion.

Paper by C. L. Boyce, manager of the Citizens' Telephone company of Grand Rapids, Mich. Subject: "Operation and Maintenance." Discussion.

Paper by Maxime Reber, electrical engineer of the Cuyahoga Telephone company of Cleveland, Ohio. Subject: "Essentials of Telephone Construction." Discussion.

Paper by Hon. H. D. Critchfield, counsel for the United States Telephone company of Ohio. Subject: "Development of the Independent Telephone Business." Discussion.

After this session delegates and visitors will enjoy themselves in social session, and have an opportunity to meet their friends and visit points of interest in the city.

WEDNESDAY, JUNE 28TH.

The entire morning will be devoted to the inspection of exhibits; no formal session will be held. Visitors who wish to examine the local factories will be afforded an opportunity of doing so at this time.

At 1 p. m. visitors will assemble at the Auditorium, where tallies and coaches will be provided to take them through the city and the South Side parks and boulevards. At Jackson Park a steamer will be waiting to convey the party back to the city, af-

fording a delightful view of the city from the lake.

At 8 p. m. the banquet tendered by the Chicago manufacturers and supply men to the association will be given at the Auditorium Hotel. This will be the principal social feature of the meeting. The banquet hall will be appropriately decorated, and excellent music will be provided.

All persons connected in any way with the independent telephone interests are invited to attend the convention and enjoy the pleasures afforded by the tally-ho ride, the steamboat excursion and the banquet. Application for banquet tickets must be in the hands of the advisory board not later than Tuesday, June 27th, at 1 p. m. The programme of toasts and responses will be announced later.

The advisory board expects that there will be at least 500 telephone men in attendance, and the influence of such a gathering upon the public is expected to be very great.

Patent Decision Against Bell Interests.

A patent decision at Washington, D. C., on June 1st, which is of vital interest to the independent telephone companies, disposed of an interference suit covering strong and sneak-current protectors, brought against F. R. McBerty, an inventor and expert of the Western Electric company, by Frank B. Cook of the Sterling Electric company. The real defendant of this case, however, is the American Bell Telephone company. The case has been contested for two years. The Bell company evidently considered it of great importance, as Mr. H. A. Seymour, one of the ablest patent attorneys in Washington, was retained to assist the regular attorneys in the defense. These efforts were unavailing, however, as the decision was given in favor of Cook for the third time. The Bell company is using thousands of these protectors which infringe Mr. Cook's patents. On the other hand, Mr. Cook and the Sterling Electric company have made thousands of the same protectors for both Bell and independent telephone companies, their output being over 40,000 during the last three months.

The patents involved in this decision cover the principles contained in the manufacture of the well-known strong and sneak-current protector of the Sterling Electric company. The protectors are used upon cable terminals at the central office and individually at the subscriber's station.

Chicago Telephone Company's Improvements.

[From the Chicago Record.]

After the present fiscal year it is understood that the Chicago Telephone company will leave the 12 per cent. dividend class and go to a 10 per cent. basis. The action of the directors in ordering an enlargement of the capitalization to the full authorized limit—\$5,000,000—and their determination to submit a proposition that the limit be raised to \$15,000,000 are said to presage the prosecutions of such improvements and extensions of the service and plant as will put the company in the position of a model for the world. The company's management is said to have now mapped out work which will require about \$6,000,000 to carry out. The amount of stock at present outstanding is \$4,336,560, and the treasurer has been instructed to issue 6,635 shares at par pro rata to stockholders of record May 31st. The new stock must be paid for before June 24th, and the certificates will be issued July 1st. The company is hampered in its improvement work by the difficulty experienced in securing the delivery of supplies for which contracts have been made. The company has several new exchange buildings under construction, and everything is being done to provide for the operation of, say, 50,000 instruments. The company is contemplating the introduction of an optional measured-rate system, and has it under test at the present time. This system is designed to equalize charges and to make the service available for many thousands of persons who at the present time are without it. The measured rate, it is explained, will in no case make the annual cost greater than the present maximum, but in a great majority of cases it will result in a reduction of the cost to the subscriber. The plans on which the management is now at work contemplate 22 exchanges in Chicago, whenever the demands of the city require so large an equipment. The reduction of the dividend rate, it is said, is merely thought of as a natural adjustment under the new capitalization. If the stockholders vote for the increase of the capital stock to \$15,000,000, it is announced that the certificates will be issued only in such amounts and at such times as the needs of the company may dictate, and then to present holders at par pro rata.

"What Might Have Been."

[From the Rochester Post Express.]

Professor Alexander Graham Bell tried again and again to persuade Don Cameron to buy for \$10,000 one-third interest in his telephone inventions. Cameron thought Bell a half-witted dreamer, refused to put up a dollar, and even went so far as to give orders that the crazy inventor, as he called him, should no longer be admitted to his office. That one-third in the invention is to-day worth not less than \$20,000,000.

Carty Bridging-bell Patent Upheld by Court of Appeals.

By a decision of the United States Circuit Court of Appeals for the Third Circuit, handed down in Philadelphia last week, the validity of the Carty bridging-bell telephone patent seems to have been finally established. The fact is one of considerable importance to all manufacturing and operating telephone companies, as a wide use is made of bridging systems. The patent—No. 449,106—was issued on March 31, 1891, to John J. Carty, and was assigned to the Western Electric company of Chicago. It was entitled "Telephone Circuit and Apparatus," but is more generally known as the Carty bridging-bell patent. On November 4, 1896, the Western Electric company brought suit in the United States Circuit Court for the Western District of Pennsylvania against the Millheim Electric Telephone company of Williamsport, Pa., for infringement of this patent. The case was argued in February, 1898, by George P. Barton for the plaintiff and the late Stanley S. Stout, acting for the Western Telephone Construction company of Chicago, which sold the apparatus complained of, for the defendant. The experts for the owner of the patent were C. D. Haskins, F. R. McBerty and Mr. Carty, the inventor. For the defense Kempster B. Miller testified as an expert. The case was tried before Judge Buffington at Pittsburg, and in July, 1898, a decision was rendered in favor of the complainant, upholding the patent. From this decision the Millheim company, supported by the Western Telephone Construction company, appealed to the United States Circuit Court of Appeals. On appeal the case was argued in March last in Philadelphia by Mr. Barton, for the appellee, and Josiah McRoberts for the appellants, Mr. Stout having died on June 18, 1898. The jurists who constituted the Court of Appeals were Judges Acheson, Dallas and Kirkpatrick, the last-named writing the opinion of the court. The decision was handed down on Thursday of last week and affirmed the decision of the court below, upholding the patent. The opinion is as follows:

"The respondents herein, the complainants below, filed their bill of complaint alleging infringement of letters patent No. 449,106, granted March 31, 1891, to John J. Carty, and by several assignments duly transferred to the complainants. The defenses set up in the answer were lack of novelty and patentability, prior publication and non-infringement. An examination of the record shows that prior to the Carty invention much difficulty had been experienced in communicating telephonically between different stations on a many-party line. The difficulty was increased with the number of stations and their distance from each other.

"This was due, in part, to the fact that the stations were as entireties connected on a series system, so that the call generator, the bell ringer and the voice currents had each to pass in series through each instrument, whereby the energy of the current was dissipated before reaching the distant station, and in part, because the lines were electrically unbalanced and subject to serious internal inductive disturbances, as well as from neighboring wires and currents.

"To obviate these difficulties Carty discontinued the practice of including the call-sending generator and the call-bell magnets and the telephone serially in the same circuit when calling, and substituted the connection of the said appliances in parallel bridges.

"The bell-magnet bridge was equipped with a magnet having a high coefficient of self-induction, and was normally and permanently closed at all stations. The generator bridge circuit was normally open, but adapted to be closed when sending a call. The connection of the telephone in a third bridge circuit at each station was normally open, but capable of being closed in multiple with its own bell-magnet circuit and the bell-magnet circuits of all the other stations when in use.

"The practical result was that when the call-bell generator was closed and put in connection with the main-line circuit, the low-frequency current of the call bell short-circuited through the bell magnets, and the bells were rung at all stations, including the home station. The call-bell generator circuit was then opened and disconnected. The telephone circuits between the two stations desiring to communicate were then closed and thereby put in multiple with each other and the call-bell magnet circuit. But while the telephone circuits were so in multiple with the bell-magnet circuits, yet the high-impedance magnets in the bell-magnet circuits rendered these last-named circuits opaque to the high-frequency voice currents of the telephone and enabled them to be transmitted undiminished over their own low-impedance circuit to the receiver with which they were in connection.

"By this combination of devices Carty obtained the effect of two distinct and separate circuits, one of which was adapted to the low-frequency currents of the bell generator and the other to the high-frequency voice currents of the telephone. It also had the effect of electrically balancing the lines, and thereby reducing to a minimum the annoyances of induction, which had so seriously interfered with the usefulness of the old system.

"So far as the record shows, there was no anti-

patron of this device. All the elements of the combination had been used before and the functions of each were well known in the art, but it does not appear that they had ever been similarly specifically combined for effectuating the purpose here accomplished. The grant of the patent carries with it the presumption of patentability, and this presumption has been strengthened by the general acceptance of the device, the acquiescence of those skilled in the art and their willingness to accept licenses thereunder.

"We have carefully considered the questions of prior publication and anticipation. The differences between the patent in suit and those cited as most nearly approaching the Carty device have been fully and particularly set out in the opinion of the learned judge below. [The opinion of Judge Buffington in this case was printed in the Western Electrician of July 30, 1898.]

"We fully concur in his conclusions and refrain from drawing the distinctions, lest we should but repeat what he has so clearly expressed.

"Infringement is charged in the bill and not denied, except in the unverified answer. Complainant's witness, after examination of defendant's system, testified that it was constructed and organized completely in accordance with the instructions contained in the patent in suit. Though these facts were peculiarly within their own knowledge, the defendants offered no contradictory evidence bearing on the question.

"We are of opinion that the patent is valid and infringed. The decree of the Circuit Court will be affirmed."

Improved Service in Ottawa.

[From the Ottawa, Ont., correspondent of the Western Electrician.]

The Bell Telephone company has completed arrangements for installing a new plant in Ottawa, which will give the capital of the Dominion a service as complete and up-to-date as any city in the world. The whole city has been rewired, and the subscribers will get a new instrument, designed on a different principle from those in use at present. The most elaborate and costly part of the equipment will be the new switchboard to be put in the central office. The improved system of this new board will also greatly facilitate the work of the operator. Instead of having to watch for the falling of the shutter connected with each subscriber's line, and instead of bells sounding, the board will be equipped with colored electric lights, which will change when "central" is wanted. The removal of the telephone from the hook automatically lights the particular lamp belonging to the subscriber's line; the operator makes the connection with the station asked for, and when the party called removes his ear-telephone from the hook, the lamp upon his line is also lighted. When both lamps go out, the operator knows that the conversation is ended. The whole system will be in operation soon, and it will entail an expenditure of \$750,000.

Michigan Movement.

[Special correspondence of the Western Electrician.]

Detroit, June 8.—The strike of the linemen of the Detroit Telephone company is to be settled by arbitration, the arbiters being H. T. Snider for the strikers, Alex. I. McLeod for the company, and Edward S. Lee as the third member. An early settlement of these long-standing differences is looked for.

An effort is now making in the state Legislature to bring the telephone and street-railway companies under the proposed Fleischauer taxation bill. Representative Moore said: "The Detroit street-railway system is worth \$17,000,000, and yet is paying only \$20,000 a year taxes, while the Michigan Central is worth \$30,000,000 and pays \$200,000. Now, that is unjust, and we ought to bring the Detroit street-railway system into this bill."

The Pingree men in the Legislature now in session are going to bring out a rival bill to the Graham measure for the taxation of telephones. It provides for a two per cent. specific tax on gross earnings on all telephone companies. It does not leave local exchanges to local taxation, as under the Graham bill. An effort will be made, it is asserted, to have the rate increased to three per cent. of the gross receipts. The effort will be continued from now until the fate of the bill is settled. J. H. G.

NEW COMPANIES.

The New York Suburban Telephone company has been incorporated at Albany, with a capital of \$10,000, and the privilege of increasing it to \$100,000. The general routes and points to be connected are as follows: Through the counties of Westchester, Putnam, Dutchess and Rockland, connecting the cities of Yonkers, Mount Vernon, New Rochelle, White Plains, Tarrytown, Poughkeepsie, Nyack, Port Chester, Rye and the various boroughs and villages thereof. The term of the company's existence is to be 30 years. The directors are Albert Devau, William Caxton and Charles Auth of New York, Henry A. Mott of Rye, James P. Powers of Elizabeth, George E. Archer of Mount Vernon and Hiram O. Hance of Plainfield.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The Minnesota Telephone company of Rush City, Minn., is preparing to extend a line to Princeton, Minn., 40 miles, at once.

The town of Humboldt, Ia., has granted franchises for telephone exchanges to the Electric Light and Power company, the Iowa Telephone company and to Messrs. Chase, Prouty and others.

The Iowa Telephone company of Ottumwa, Ia., announces reduced rates, which the Ottumwa Telephone company declares are too small to pay expenses.

The Clearfield and Mount Ayr Telephone company has completed connection with Alton, Ia.

The Ottumwa (Ia.) Long-distance Telephone company contemplates building a toll line to West Point, Ia.

The Cedar Valley Telephone company has been granted a franchise at Iowa Falls, Ia., and will build at once, putting in a local exchange, and it will also connect with Williams, Ia., to meet the Martin Telephone company.

The Wolf River Telephone company has about completed its line from Omro, Wis., to Ripon.

Enough subscriptions have been secured at Mountain Lake, Minn., to justify putting in a telephone exchange.

The Badger State Telephone company of Janesville, Wis., has let the contract to Jones & Winter of St. Paul to construct 100 miles of line.

The Standard Telephone company will build a line to Riceford, Minn., from Mabel, and back to Spring Grove.

The Automatic Telephone company of Salina, Kan., contemplates putting in an exchange at Walthalla, N. D.

The Western Electric Telephone company is rebuilding its line between Clear Lake and Britt, Ia.

The Northwestern Telephone Exchange company sought an injunction at Northfield, Minn., to prevent the Northfield Telephone company from stringing wires immediately under those of the former. A compromise has been proposed, and will probably be accepted.

The new telephone interests which recently secured the control of the Wisconsin Telephone company are said to have made an offer to the Dane County Telephone company of Madison, Wis., one of the strongest independent companies in the state.

The Wood County Telephone company of Centralia, Wis., will shortly be clear of debt, and the stockholders are now discussing whether it is best to reduce rates or to invest the earnings in extensions.

The Mankato (Minn.) Citizens' Telephone company has voluntarily advanced wages of its employees.

The People's Telephone company of Chatfield, Minn., has added a 40-drop switchboard and instituted all-night service.

The Northwestern Telephone Exchange company proposes to erect a building of its own at Grand Forks, N. D., for its exchange, in addition to rebuilding its entire system.

The Iowa Telephone company will build a toll line from Humboldt to Rutland, Ia., at once.

The Hawkeye Long-distance Telephone company has completed arrangements to build a toll system to cover Fayette County, Ia., and will also arrange to give farmers connections, if desired.

Otto Wettstein will put in a telephone exchange at Belle Plaine, Ia., at once. The exchange will start with 100 connections. He will also establish an exchange at Gladbrook, Ia.

Dr. W. W. Bradley of Forman, N. D., has begun rebuilding his telephone system. He will put in metallic circuits to every point.

The Northwestern Telephone Exchange company is working to induce the Minneapolis druggists to put in nickel-in-the-slot instruments, but the druggists have refused, fearing a loss of trade if they do.

The Northwestern Telephone Exchange company is preparing to build to Armour, S. D.

The Supreme Court of Minnesota has handed down a decision in the case of the Northwestern Telephone Exchange company against the Chicago, Milwaukee and St. Paul Railway company, declaring that the privileges of telephone companies, under federal statutes, may not be exercised over railroad property, unless vitally necessary. The telephone company sought to secure a right-of-way for its poles along the railroad right-of-way.

The Mutual Telephone company of Des Moines, Ia., will expend \$20,000 in improvements. The cables will be repaired and improved and changes made. The company will also establish a sub-exchange in East Des Moines.

The Winona Telephone company of Winona, Minn., is contemplating the erection of a new brick building for a central office and headquarters.

The Fort Dodge (Ia.) Telephone company has arranged for toll connection with Tara, Ia.

There are nearly 200 instruments connected with the telephone exchange in Brainerd, Minn., and the number is increasing steadily.

PERSONAL.

E. B. Overshiner of Longansport, Ind., was a Chicago visitor last week.

H. A. Brinkerhoff of Upper Sandusky, Ohio, has

succeeded Mr. George L. Johnson as manager of the La Crosse Telephone company of La Crosse, Wis.

Telephone Etiquette.

Mr. Angus S. Hubbard, the general manager of the Chicago Telephone company, advises patrons to observe the same rules of behavior in conducting transactions of a business as well as a social character by telephone as they would follow in personal intercourse.

"The great increase in the number of telephone users makes this a matter of far more importance to the business public than is generally realized," he says. "The telephone is an instrument for the saving of time in the transaction of business. Used with the same good sense and judgment that is applied to any other method of facilitating business or social intercourse, it answers that purpose admirably, but when abused or handled rudely it is distorted into an irritation and a cause of offense."

If the following suggestions were followed by the public, Mr. Hubbard said, the efficiency of the telephone service would be practically doubled:

1. If you wish to telephone anyone, make the call yourself and remain with the telephone at your ear until answered by the person called, or until you find out that he cannot be reached.
2. In answering a call give the name of your firm or office. This immediately identifies you and the calling party proceeds with conversation. The immediate answer, "This is Jones & Co. What do you want?" saves a great deal of time.
3. Do not ask anyone to "hold the wire," if you know you are to be away from the instrument more than a minute or two.
4. When your bell rings answer your telephone just as quickly as possible. The person calling you is waiting at the other end of the line, and both your time and his are busy to all callers when they are connected.
5. Do not talk to the telephone with "a chip on your shoulder" and address the operator in a tone of voice that never think of using to speaking to any of your own employees. Be courteous.

Wolf River Lines.

The People's Telephone company has been purchased by the Little Wolf River Telephone company of Weyauwega, Wis., which acquired possession on June 1st. The proposed lines will be built as planned by the People's Telephone company. The poles of the Little Wolf River Telephone company are already set as far as Waupun via Ripon, from Omro and Berlin. Ripon has already been connected up, and Waupun will be connected in a few days.

The line between Fond du Lac and Oshkosh has already been commenced, and the work on the exchange in Fond du Lac will be completed in July. The line from Clintonville to Shawano, which will connect with the Northeastern Telephone company, is about two-thirds completed, and this connection will be made in about two weeks. The poles are all set and the company will in a few days begin stringing wire for Ogdensburg and Big Falls. Poles are on the ground for Iola and Scandinavia.

MANUFACTURERS AND DEALERS.

The Edison Manufacturing company of New York calls the attention of telephone subscribers to its electric fans, which are fully described in a booklet which will be mailed to anyone sending name and address.

Probably the most remarkable shipment of telephones since the inauguration of the independent telephone business in opposition to the Bell company is reported by the Western Telephone Construction company of Chicago. Upon Saturday, June 3d, that company shipped seven complete telephone-exchange equipments, including switchboards, telephones and appurtenances, each of 100 drops capacity. For one day's business this is indeed a remarkable record. The Western company reports its May shipments as the largest in the history of the concern.

Everything is bustle and activity in the offices and factory of the Eureka Electric company of Chicago. Secretary and Treasurer Arthur Stein states that the demand for the Eureka apparatus has been greatly in excess of all expectations, and that the company is obliged to work its forces day and night in order to keep up with its orders. The Eureka company, through the energetic efforts of Messrs. Kusel and Stein, has been able to secure its full share of telephone business, and the favor with which its apparatus is being received will tend to keep it in the front rank of the telephone business.

The Western Telephone Construction company of Chicago has issued a circular, from which the following is an extract: "The recent decision by the United States Circuit Court of Appeals in Philadelphia, affirming and sustaining the Carty patent will undoubtedly result in an extensive series of lawsuits against telephone companies by the Bell monopoly. The Carty patent covers all forms of telephones permanently bridged in the line, that is to say, where two or more telephones are in use. This involves serious consequences to long distance and toll line telephone users. We desire now to positively assure our customers of our ability to prevent interference with the use of the Western Express No. 2 bridged type of telephone. These telephones have proved their superiority over everything else in the market." The Western company offers to change the spring bridging type of telephones to a positively non-infringing type of telephone. The telephone will be guaranteed to ring one more telephone on the line than it would previous to making the change.

Colonel Shay's New Connection.

J. H. Shay of Chicago, familiarly styled "Colonel Shay" by his friends in the electrical and street-railway field, has accepted a position with the Chicago Belting company, and will devote his attention particularly to the introduction of that company's product among the electric plants of the country. Colonel Shay has been selling belts all his life, and has established a reputation as an authority upon

J. H. SHAY.

the subject of belting. Moreover, in addition to his exceptional ability as a salesman and his acknowledged standing as an expert upon belting, he has won recognition by his reliability and strict observance of every requirement of his customers. He was connected with the Munson Belting company of Chicago for 16 years, and handled all that concern's large deals during that period. His old friends in the electrical and street-railway field will welcome him in his new capacity and extend their

FIGS. 1 AND 2. VICTOR MOTOR APPLICATIONS.

congratulations to the Chicago Belting company for securing such an able and efficient representative.

Portable Photometer for Central Stations and Lamp Salesmen.

Now that lamp buyers have become too critical to accept any incandescent lamp as having the candle power, voltage and efficiency marked on its

PORTABLE PHOTOMETER FOR CENTRAL STATIONS AND LAMP SALESMEN.

and the need of a means of testing is imperative. The photometer illustrated is put on the market by the Electric Motor and Equipment company, Newark, N. J., successor to the Newark Ornamental Iron and Steel Works, the well-known makers of electrically illuminated signs. It is a knock-down instrument five feet in length when extended, and capable of being packed into a space 24 inches long, 12 inches wide and nine inches high, and is made up in two styles, one for central-station use and the

other for salesmen, the former being somewhat stronger and the latter lighter.

The working standard of light is a duplex oil lamp, which is calibrated by the simple use of a primary standard placed in the socket in which the lamps are tested. These primary standards are special lamps made by the General Electric Lamp Works, seasoned and of low efficiency, and hence undergo very slow changes. By using one of these for a moment or two the oil lamp can be adjusted to the proper brilliancy, at which it will run for hours without readjustment.

The spot box is of the regular Bunsen grease-spot type, with inclined mirrors and working over a celluloid scale. A small german-silver resistance coil provides suitable means for adjusting the voltage over a range of about 15 per cent. Owing to the fact that the influence of extraneous light is more or less balanced out by the calibration of the working standard against the primary standard, placed in the position which the lamps to be tested subsequently occupy, no specially prepared dark room is necessary. The weight of the portable instrument is reduced to 12 pounds, complete, in a canvas carrying case.

It should be noted that the manufacturer has recently added to this simple equipment a special attachment for rotating the standard lamp and also the lamp which is being measured. This attachment is a valuable improvement.

Victor Motor Applications.

The accompanying illustrations show two of the specialties manufactured by the Victor Electric company of Chicago. Fig. 1 represents a small electric lathe. It is of one-sixth horse power and is provided with a set of seven mandrels, each of which can be attached directly to the armature shaft, one end of the shaft having a right-hand thread and the opposite end a left-hand thread. The motor is entirely encased in metal and is dust-proof. Its speed is under perfect control. It is finely finished in enamel and nickel. These machines have been sold extensively to jewelers, dentists and others who have light polishing, drilling and grinding to do. They are guaranteed against electrical and mechanical defects for two years.

The rotary transformer shown (Fig. 2) generates 60 amperes at six volts. The company makes

smaller transformers; in fact, it is prepared to furnish them of almost any capacity up to one horse power for 110 volts or 220 volts primary circuit. The greatest care is used to maintain perfect insulation between the two windings. The machines are provided with both speed and current regulators. Besides acting as transformers, they can be used for power purposes. With the exception of the commutators and brushes they are entirely iron-

clad. They are wound for slow speed and run with but very little noise. The machine is mounted on an oak base, finely finished, the transformer itself being finished in enamel and nickel.

The Bluestone Electric Light and Water company of Branawell, W. Va., has gone out of business, having sold its plant to the Pocahontas Light and Water company of Pocahontas, Va.

A. W. Knutson.

Mechanical genius is often found among those who have been reared upon farms without any facilities for developing their natural gifts. Sometimes when opportunity offers they develop their ability and acquire distinction as inventors and in the commercial world, as in the case of the subject of this sketch, A. W. Knutson, who was born at Dayton, Webster County, Iowa, on August 22, 1866. He passed his early years in the rural districts, working upon a farm until he was 17 years old. He then turned his attention to mechanical pursuits, for which he had always shown an inclination, and secured valuable experience in the service of the Interstate Elevated Rapid Transit Railway company of Kansas City and in manufacturing establishments of that city. Returning to his old home, he soon secured an opening at Galesburg, Ill., in the local electric-lighting plant, where he became familiar with electric-lighting apparatus and had considerable experience in repairing lamps. It was during this time that he conceived the idea of the Knutson gravity clutch, which has been described and illustrated in the Western Electrician. These clutches have given Mr. Knutson deserved prominence among the electrical men of his section. He is now manager of the firm of

A. W. KNUTSON.

A. W. Knutson & Co. of Galesburg, Ill., which manufactures these devices, and is building up a nice business.

Important Wisconsin Electric Railway Project.

The Geneva, Sycamore and Morris Railroad company proposes to build an electric railroad beginning at Geneva Lake, Wis., and passing south through McHenry and DeKalb counties, cutting across the northeast corner of La Salle and the southwest corner of Kendall counties, and ending at Morris, Grundy County. The route thus describes a wide curve, making an outer belt line varying in distance from Chicago from 50 to 65 miles. The road will be of standard gauge, with 85-pound steel rails. The main power house will be built at Sycamore, but there will be other power houses on the line. The president of the road is James Brenan of Sycamore. George Brown of Sycamore is treasurer of the company and ex-Mayor White of Sandwich is general manager. The chief

engineer is Major Gambel of Elgin. It is planned to do a passenger, express, mail and freight business on this road. The line will cross nine steam railroads, and it is the intention to provide switch tracks connecting with all of them and to transfer freight cars from one railroad to another.

The village of Princeton, Minn., voted to establish an electric-light and water system at a cost of \$16,000.

Electrical Protection of Safes and Vaults.

By CLYDE J. COLEMAN.

The title of this paper assumes that all people are not honest and implies the necessity for guarding against surreptitious entrance. No one questions the right of the proprietor to protection against theft.

I will first aim to justify the need for a thoroughly effective safeguard by a slight research in criminology. There is one instance on record where a steel-lined bank vault was entered from the top by first ascertaining the thickness of the steel with a very small drill, leaving a hole too small to be discernible from the inside, and then using a large drill provided with a gauge, so as to drill all but through the lining, and with this a series of holes was drilled embracing a section of sufficient size to admit a person when the section was removed. This method admitted of work being done each night over quite a period of time, as the drill, held from going clear through, did not show any marks from the vault interior, and still cut the metal so effectively that all that was necessary was to pound it down with a heavy sledge in order to gain access to the vault. In another instance, where entrance was gained to a vault from the top, and after the vault had been plundered a wedge was so placed that the lock and bolt work on the door could not be operated from the outside, in the morning the cashier, failing to open the vault, telegraphed for an expert, who worked for three or four days drilling before he succeeded in opening and discovered what had been done and that the vault had been robbed. This delay allowed the burglars sufficient time to successfully escape.

The uses of nitro-glycerine and other high explosives have been so successful as to show the folly of trying to make something so strong that it cannot be broken. The latest danger to the banker is the electric current. While it involves a certain amount of engineering on the part of the burglar, the conditions existing, especially in large cities, are such that it is a comparatively easy matter to provide sufficient power to effect an entrance to any vault, as it will accomplish what explosives cannot, owing to the environments in the larger cities making such a method extremely risky, while the electric arc can be used quietly, quickly, and employed so as to show no light. Where current from incandescent or power circuits cannot be obtained, storage batteries are by no means out of the question, as they can, for a case of this kind, be discharged far above their rated capacity, besides being made especially light for the occasion, as they need be used but once, and all the usual considerations of local action and long life do not have to be considered. The use of the electric arc does not require the amount of intelligence so often displayed in constructing an ingenious set of burglar's tools, and as to weight these tools often weigh over 500 pounds. An interesting thing is that no insulating material interposed between vault plates seems to make any difference with the arc, as it has been found by experiment that asbestos, concrete, etc., burn as readily as any metal, which is due no doubt to their fusing and becoming electrolytic conductors.

The present secretary of the United States Treasury, after investigating the subject of burning and the use of storage batteries, said he considered it entirely feasible for a burglar to rent a room adjacent to a bank and carry in as many batteries as he liked at his leisure, and offered the argument that if discovered they would not be evidence of criminal intent, as would burglar's tools. The future possibilities of new dangers are almost unlimited. It would be interesting to know what might be done with liquid air by pouring a couple of gallons on top of a safe and cooling the steel to a point where it could be easily broken with a sudden blow from a heavy hammer. Liquid oxygen might be used to burn a hole through a wall of steel by lighting a piece of sulphur and using it as a match to start the combustion of the steel and then turning in a stream of oxygen.

Now, coming directly to the subject of this paper, it might be well to divide electric protective systems broadly into open and closed-circuit systems. The open-circuit system, as its title implies, depends for its operation upon contacts or equivalent devices, closing a circuit to operate some alarm mechanism, when an unwarranted entrance is attempted. This system is little used, except in residences, and then it has proved really more of a nuisance than an advantage.

The closed-circuit system comprehends the use of a current of given strength, continuously traversing the line wire connecting the vaults or premises with the alarm station, together with contacts, circuits, linings, resistance coils, etc., and connected with a relay at the alarm station, which is so adjusted that this normal amount of current keeps the instrument balanced. Should the current be increased or decreased, which would be the case were any part of the circuit broken or short-circuited, the balance on the relay would be disturbed in such a way as to give an alarm by closing a local circuit connected with and controlling the alarm mechanism. But it has been found that a system of this kind is capable of being circumvented. By interpolating a low-resistance mil-ampere-meter in the circuit and employing two sets of variable resistances, so that

by gradually cutting in resistance on the alarm circuit and cutting out resistance across the alarm circuit, and by observing the mil-ampere-meter, so as to maintain at all times the current constant on the alarm-station end of the circuit, it is possible to finally shift the current from the protected structure to the artificial resistance, so that the circuits at the vault or guarded premises are rendered inoperative.

To overcome this difficulty and thoroughly protect the line wires (which are the most vulnerable part of an alarm system), a number of schemes have been proposed, such as having frequent predetermined signals, changes of resistance, voltage, etc., sent to the alarm station by a watchman or some automatic device. Then again, this must be so arranged as not to allow of its cycle of operations being ascertained by any outside means; it should also be capable of automatic operation at both ends; otherwise, it will involve so much constant manual attention at the alarm station as to be impractical. One very effective and simple method is to construct the line wire of a number of very fine and thinly insulated wires and braid the whole into a cable. By connecting each wire to the system the cable will present a veritable labyrinth of circuits so closely interwoven that it is physically impossible to do anything with it. Another method proposed is the use of wireless telegraphy, thereby dispensing with any wires to tamper with.

Instead of the usual alarm station, involving manual attention and consequently susceptible of collusion, a system much more practical for banks is one in which a large alarm mechanism is placed in a heavily constructed steel box, which, in turn, is electrically protected, so it cannot be tampered with, and is located in some conspicuous place on the bank premises. A system of this character must possess the advantage of being automatic in its operation and entirely under the control of the banker from the vault end.

ELECTRICAL BARRIERS.

One of the most exacting conditions relative to this branch of electrical engineering is to obtain a satisfactory protective means for the vault or guarded premises. Probably the simplest and most efficient window protection consists simply in cementing narrow tinfoil strips on the inner surface of the glass, as any breakage or fracture of the glass will suffice to open the circuit.

For guarding entrances or the walls of rooms, glass tubes filled with mercury and connected in circuit or tubes filled with water or compressed air, or, conversely, maintaining a vacuum in a partition or enclosure, have all been used, so that any disturbance from a normal condition will result in an alarm being given.

A very difficult barrier to circumvent is one in which steel wires are tensioned by a spring and adapted to a contact, so that any increase or diminution in its tension will allow a contact arm to touch a contact point located on either side of it, which is connected to the opposite side of the system, constituting practically a mechanical relay. A Frenchman proposes, by a burglar stepping on a mat, to automatically light a flashlight and open a shutter in a camera concealed in the ceiling and focused on the vault entrance, to obtain a photograph of the invaders. A rather ingenious and quite effective scheme contemplates balancing the safe on a scale platform, which is so connected to the alarm system that any weight added to or taken from it will cause an alarm. The Bank of France lowers its vaults each night in a pit filled with water, which connects with float devices, so in case it should be drained an alarm would be given.

One inventor does not propose to make any noise at all, and does not believe in letting a single burglar get away; to this end he constructs around the entrance of the vault a divided steel caging, each section of which is held open, against the pressure of a very strong spring, so arranged that any attempt to enter the vault will result in capture. Microphones have been located inside the vault and connected with a system and so adjusted that the noise attendant upon forcible entry or such as persons moving about in the interior of the vault would cause sufficient disturbance of the controlling current to actuate the alarm. It has also been proposed to connect the system with a transmitter at the alarm station, or at the banker's residence, so he may listen for any unusual noise should the alarm indicate a disturbance in the circuit.

The construction found to best fulfill all requirements in modern practice is an electrical lining covering the entire inner surface of the vault, which is constructed of a number of (tinfoil strips cemented on insulating paper and composed of several layers of such sheets, and placed between steel plates to afford mechanical protection against injury, also to render it absolutely impossible by any means to remove such mechanical armor without destroying or disturbing so delicate a condition as the linings, while at the same time there are no moving parts to get out of order or give trouble, and if substantially installed, is permanent for any length of time.

In conclusion I will say that a modern protective system should be sensitive to the conditions it is intended to guard against, while not involving such delicacy as to give trouble, and should, so far as possible, be automatic in its operations and incapable

of defeat by an expert connoisseur of electrical conditions, even to the minutest details.

The time belongs to the past when a system of fund may place all dependence upon mechanical safeguard, solely to resist physical force. They must provide such safeguard with something that will give notice of any attempt to enter, and electricity is to be found the best device for this purpose, that is the simplest and most efficient guardian.

CORRESPONDENCE.

New York Notes.

New York, June 12—Various reports about the electrical equipment of the Manhattan electric ways have been circulated but no authentic information has been given out. There is little doubt that a site for the power plant, which will be a very large one, has been selected, and it will have a water frontage. The units will be of great size. As to train equipment, it seems to be still undecided whether the Sprague multiple-unit or the older motor-car system shall be employed. Mr. Baker, the electrical superintendent, came from a road where the old plan of concentrating the motors on one car in a train is used, but the directors are said to be carefully investigating the Sprague system also. Open cars will be run in warm weather. It is reported that the Manhattan company expects to be in a position to sell surplus electricity, like the Metropolitan Street Railway Company.

The Automobile Club of America was organized at the Waldorf-Astoria last week. George F. Chamberlain was elected president and Honer W. Hedge was made secretary. The charter was signed by all of the men present, about 30 in number, and the following-named gentlemen were appointed as a committee to draft a constitution and by-laws: General George Moore Smith, Charles R. Flint, Whitney Lyon, Dr. Frank Hollister and William H. Hall. William E. Buzby was elected temporary treasurer. The object of the club is to advance in every legitimate way the interests of the owners of automobiles. A clubhouse will be opened and a stable procured where the vehicles can be properly cared for. It is thought much may be done to advance the use of the automobiles by securing more favorable legislation.

It is said that the manager of Alexander Winton's recent automobile expedition to New York, Charles Sanks of Cleveland, is in New York, with \$4,000 to cover the forfeit posted some days ago in Paris by M. Charron, the French automobilist, who issued a challenge to Winton to race over a course of 1,000 miles. Mr. Winton intends to make the Frenchman hold to his agreement. The forfeit of \$4,000 will be put up in New York, and correspondence will be at once entered into with M. Charron.

Thomas A. Edison and S. Mallory of Orange, N. J., William H. Shelmerdine, Harland Page, E. Clarence Miller, William S. Pilling, Luther S. Bent and Theron I. Crane of Philadelphia have incorporated the Edison Portland Cement company of Camden, N. J., to manufacture and deal in Portland and other cements. The authorized capital stock is \$11,000,000.

A dispatch from Trenton, N. J., states that the Liquefied Air company, with a capital of \$125,000 was incorporated on Saturday to manufacture and sell liquefied and compressed air. The capital stock is divided into \$31,250 of preferred and the remainder common stock. The preferred stock is to bear seven per cent. non-cumulative dividends. The incorporators are Charles A. Wilson, Justus Cox, Jr., and Harry B. Paul, all of Camden.

A recent review of the operations of the Brooklyn Rapid Transit company, of which Clinton I. Rossiter is president, shows that the company has brought into one system surface and elevated railways aggregating 504 miles of track. The capital stock of the company is \$45,000,000, and the funded indebtedness of the constituent companies is \$20,000,000. There are now in Brooklyn but two other independent lines—the Coney Island and Brooklyn railroad, with a mileage of 54 1/2, and the Van Brunt Street and Eric Basin railroad, a short electric line of 1.25 miles. M. S.

Northwestern Notations.

Minneapolis, June 12—A test case in Kenosha, Wis., has given H. S. Van Ingen of Kenosha \$75 damages and costs for injuries to his trees by the Chicago and Milwaukee Telegraph company.

E. H. Ford of Madison, Wis., has been engaged to furnish plans for the proposed municipal electric plant for Columbus, Wis.

C. Crickmore of Minneapolis has bought the electric-light plant at Appleton, Minn.

The Twin City Rapid Transit company has let the contract for grading the extension of the line from St. Paul to Stillwater, Minn., and expects to have cars running from St. Paul to Stillwater by July 1st, and to have the Stillwater system in operation by fall.

Feed wires of the street-railway system in Duluth, Minn., were found cut recently. Detectives were placed on the trail, and 10 men ex-employees of the company, were arrested. The arrest was made on Sunday when they were unable to get bail. A "sweat-box" investigation was put in force, the men

having no attorney to represent them. When the case came to trial they were discharged on a technicality. Warrants were issued for them again, but some escaped to Superior. The union then ordered a strike and the service was badly crippled as a result. The men declare the company arrested the men for spite, and has been using all the arbitrary and tyrannical measures possible to break up the union.

F. A. Valentine has retired from the management of the electric-light plant at Cannon Falls, Minn., and has gone to Minneapolis, where he will engage in the manufacture of electrical machinery, with his brother, Robert Valentine.

The city of Dubuque, Ia., has sued the street-railway company on assessments for street improvements for several years. The amount is \$7,579.

The Citizens' Traction company of Oshkosh, Wis., has formally accepted the franchise for an interurban line in and through Neenah, Wis., and filed a \$5,000 cash deposit. The company announces that contracts are let and materials are now on the way for the extension. The company has filed amended articles, permitting it to operate an interurban line between Oshkosh and Neenah, and increasing the capital stock from \$225,000 to \$500,000.

The United States court has ordered the transfer of the Light and Traction property in Dubuque, Ia., to the General Electric company. It has been in the hands of a receiver for several years.

The Chippewa Falls and Bloomer Electric Railway company is to be formed to build a line from Chippewa Falls, Wis., to Bloomer. The Chippewa Valley company is run by the same owners.

There is a movement on foot at Wenewoc, Wis., to put in an electric-light plant.

C. F. Loweth, civil engineer of St. Paul, is drawing plans for an electric-light system for Princeton, Minn.

The Fond du Lac (Wis.) Street Railway and Light company has purchased the plant of the Fond du Lac Electric company, the consideration being \$110,030.

There is talk at Deadwood, S. D., of constructing an electric railway to Lead, S. D., and other towns in the Hills.

The Madison (Wis.) Street Railway company will expend \$7,000 on improvements this season.

The city of East Grand Forks, Minn., will vote on establishing a municipal electric-light plant.

The council of Austin, Minn., will secure estimates of cost for an electric-lighting plant.

A new company is being formed at Lyons, Ia., to purchase the electric-light plant and put it in good condition.

The Interstate Traction company of Duluth, Minn., expects to have its line to Minnesota Point, using electric power, by June 10th. J.

PERSONAL.

W. R. Mason, the St. Louis representative of the Siemens & Halske Electric company, was in Chicago last week.

Luther Stieringer, the electrical expert, stopped in Chicago early in the week, on his way to the Pacific Coast.

J. F. Stauffer, treasurer of the George C. Towle Manufacturing company of Lancaster, Pa., has been spending several days in Chicago.

H. B. Slater, manager of the Cañon City Electric Light and Power company of Cañon City, Colo., was in Chicago early in the week. Mr. Slater contemplates increasing the capacity of his plant and is investigating apparatus for that purpose.

R. A. Willson, who was superintendent of the municipal light and power system at Marquette, Mich., for a number of years, is now filling a like position with a large private corporation in Helena, Mont. He was succeeded at Marquette by Charles Retaillic.

Marcus Nathan, manager of the Electrical Exhibition company of New York, is enjoying a western trip. He spent several days in Chicago and is now making the rounds of the Wisconsin summer resorts. He will visit California and then return to New York.

W. P. Sullivan, favorably known in electrical circles throughout the country, has been appointed sales agent for the McKenzie Furnace company of Chicago and will make his headquarters in this city. Mr. Sullivan's acquaintance and wide experience should insure his success in this venture.

B. G. Smith, manager of the Kankakee (Ill.) Electric Light company, was in Chicago early in the week. Mr. Smith says that the central-station business in Kankakee is good. The company uses water power nearly all of the year and supplies electric power to two street-railway companies.

A Berlin dispatch, dated June 6th, states that the Empress Augusta Victoria and the imperial crown prince were present on that day at the unveiling of the statue of Hermann von Helmholtz, the physicist, in front of the University of Berlin. Emperor William started the subscription for this statue with a pledge of 10,000 marks at the time of the Helmholtz funeral in 1894.

Albert Stanley, who succeeded John Grant as general manager of the Detroit street-railway lines, has been brought up in the company's service. He was originally promoted from superintendent of the Juffer Avenue line. Mr. Grant, who has resigned to accept a position as assistant general man-

ager of the Citizens' street railway of Indianapolis, was connected with Detroit railroads for many years. Mr. Grant's former duties as claim agent will now fall to Walter Ross, who has been employed for some time by the company as arbitrator. Albert Stanley saw service in the recent war as a sailor on board the Yosemite.

ELECTRIC LIGHTING.

The Brown Electric company has succeeded the Wytheville Electric Light company at Wytheville, Va.

The city of Winnipeg, Manitoba, has purchased two 100-light Western Electric arc machines and 220 Western Electric open arc lamps.

The Ennis Ice, Light and Water company's property at Ennis, Texas, was sold at auction last month for \$13,300, Fred W. Wolfe & Co. of Chicago being the purchasers. The new owners will take charge at once and continue the business in Ennis.

ELECTRIC RAILWAYS.

The White Line Traction company has been incorporated in Trenton, N. J., with a capital stock of \$4,000,000. The company's business will be the purchase and operation of street railways anywhere in New Jersey.

A serious strike among the employes of the "Big Consolidated" street-railway system of Cleveland is in progress. Very few cars are running on the lines of that system, and it is possible that the men on the "Little Consolidated" system may also strike. In the latter event the street-car service of the town would be practically at a standstill. The recognition of the street-car employes' union and higher wages are asked by the men.

Judge Marean of Brooklyn has handed down a decision in favor of the defendants in the action of Mrs. Aaron de Grauw against the Long Island Electric Railroad company and others to enjoin them from operating express cars on the street-surface railroads in Jamaica, L. I. He holds that the authority given to the railroads to "convey persons and property" comprehends the conveyance of property unaccompanied by persons. Trolley freight cars have been in operation in Brooklyn for a couple of years, but this is the first judicial decision in regard to the legal right to use them.

The Collins Park and Belt Railroad company of Atlanta has applied for electric-railway franchises to cover every portion of that city. Ten routes are scheduled in the application, which has been filed with the city clerk. It is said that the company is prepared to spend \$2,000,000 in these extensions and improvements. J. C. Simmons is president of the company, and H. M. Atkinson, the well-known electrical man of Georgia, is associated with him. The competing electric-railway companies of Atlanta are the Atlanta Consolidated Street Railway company and the Atlanta Railway company.

It is reported that the Chicago City Railway company has withdrawn its financial support from the new Sans Souci summer garden at Cottage Grove avenue and Sixty-first street. Many residents of Hyde Park and Woodlawn regarded the project with disfavor, and there was some talk of trying to prevent the company opening the garden on the ground that it held a charter to move rolling stock and could not legally operate a place of amusement. President Hamilton of the company is reported to have said: "A railroad company cannot operate such an enterprise as this, and with its operation we will have absolutely nothing to do. I believe I have things in such shape that within a few days the company will not have a penny's interest in it."

Chicago newspapers assert that the construction of the General Electric Railway company's lines south of Twenty-second street will be begun in a few days. The Record has this information: "As soon as the litigation in the United States courts is disposed of the road will be built northward to the terminus at Jackson boulevard. The company has a traffic agreement with the Chicago City Railway company, but transfers will not be given from one system to the other. Officials of the Chicago City Railway and the General Electric companies are opposed to the installation of an underground trolley system, but they promise that a modern and effective motive power will be used." The Chicago and Western Indiana and the Monon steam-railroad companies are fighting the General Electric to keep the company south of Twenty-second street.

The Rockaway Electric Railway company and the Cross Country railroad, each with a capital of \$250,000, have filed articles of incorporation in the Queens county clerk's office, in Jamaica, N. Y. Patrick H. Flynn, the former trolley magnate of Brooklyn, is said to be behind the companies, which will gridiron Queens County. The Rockaway Electric Railway company proposes to build a double-track railroad at Rockaway Beach, about four miles in length, beginning at Central avenue, near Central street, and running to the New York, Woodhaven and Rockaway Beach railroad station at Hammel's. The Cross Country railroad will construct a trolley from Willets Point to College Point, through Flushing and through Dun-

ham street, South Road and Liberty avenue, Jamaica, to the Brooklyn city line, a distance of 15 miles.

The Havana Electric Railway company, which is composed mainly of Canadians, and was incorporated in January in New Jersey, has been organized with the following-named directors: A. F. Gault, Edwin Hanson, W. M. Donall and Frank Paul of Montreal, W. D. Mathews of Toronto, B. F. Pearson of Haliifax, N. S., G. B. M. Harvey, New York, and Percival Farquhar, New York. Mr. F. S. Pearson of New York is chief engineer of the company, and under his supervision plans have been made for equipping the railroad which runs from Regla to Guanabacoa and through each of these two towns, and recently taken over by this company. The work is expected to be finished by August 1st. It will then probably be the first electric railroad in Cuba. The company also owns the Regla ferry, running from Havana across the bay to Regla, there connecting with another line owned by the company.

A pleasant trip for Chicago city officials is outlined by Alderman Herrmann. At a recent council meeting he introduced a resolution, which was referred to the finance committee, providing for a roving street-railway commission. The resolution concludes as follows: "That the mayor appoint a commission of three aldermen, one civil engineer (if possible, a city employe), one electrical engineer (if possible, a city employe), whose duty it shall be during the summer vacation of the council to proceed to Boston, New York, Washington and such European cities as such committee shall find helpful, and make a thorough examination of topographical and other conditions, and of the state of mechanical and other progress in regard to the matters set out in the preamble hereto, to gather and collect detailed information, and to make report thereof to this council. The expense of such commission and clerical assistance, so far as such assistance may be necessary, and may be approved by the mayor, shall be paid out of moneys not otherwise appropriated."

AUTOMOBILES.

The Consolidated Traction company, Pittsburg, Pa., is about to add to its equipment in Pittsburg an automobile emergency wagon for use on its lines, particularly on the streets in the East End. It has been built by the Pope Manufacturing company. The new wagon will have a storage battery that will give it a mileage of not less than 15 miles at an average speed of 10 miles an hour on ordinary city streets where the average grade does not exceed one per cent., and where the maximum grade does not exceed to per cent.

Martin Maloney, who is actively interested in the Electric Vehicle company of New York, the parent company of the Illinois Electric Vehicle Transportation company of Chicago, of which Samuel Insull is president, was in Chicago last week. The Electric Vehicle company recently purchased the Siemens & Halske company, and it is presumed that the readjustment of the affairs of the latter company and the beginnings of the business of the Illinois company were the subjects of Mr. Maloney's conferences with the Chicago men interested.

PUBLICATIONS.

The Western Electric company has in press a bulletin fully describing hot-wire ammeters and voltmeters. These instruments may be used upon either direct or alternating current and are made either for switchboards or for portable use.

A handsome design, when appropriate, enhances the value of an advertisement. To attract attention is the first requisite of an "ad." How this may be done is shown in a booklet just issued for free distribution by the Trade Paper Advertising Agency, 150 Nassau street, New York city, which has secured the services of Harold McGill Davis, the experienced "ad" writer and designer. The booklet contains some effective designs.

The National Electrical Code, comprising the underwriters' rules for electrical wiring and the installation of apparatus, brought down to date, is issued in compact pamphlet form, suitable for the pocket, by the Underwriters' National Electric association. A quarterly "Supplement," giving a list of electrical fittings approved by the underwriters, is also issued. Information about these pamphlets may be had of W. H. Merrill, Jr., 67 East Twenty-first street, Chicago.

The eleventh edition of the catalogue and price-list of the presses, dies, drop hammers and other machinery made by the E. W. Bliss company of 17 Adams street, Brooklyn, makes an imposing cloth-bound volume of over 500 pages. It is, however, of convenient size for the hand and well adapted for the engineer or dynamo builder's reference library. This company makes machinery especially adapted for punching armature disks and sections, and its products have an excellent reputation among electrical men. It directs especial attention to its new-pattern inclinable power press.

The past decade has witnessed a great advance in the art of catalogue-making, particularly in the machinery trades. The modern catalogue must not only be attractive, but it must, above all, serve in

the best manner possible its primary purpose of furnishing information. Illustrations must be clear, explanations explicit and all information concisely given. The substantial character of most machinery demands similar character in the make-up of the catalogue describing it. Bold, clear type, good taste and simplicity in composition and first-class ink and paper have a subtle influence in impressing the reader with the idea of the high quality of the article described. Excellent examples of good catalogue-making are presented by the B. F. Sturtevant company. The publications of this company are of two classes—first, those which are purely educational in their character, comprising treatises on various subjects, leaflets regarding attendant advantages, etc.; second, the regular trade catalogues of the standard dimensions, 6½ inches by nine inches, each devoted to a specific line of manufactured goods. Separate catalogues in the same class bear the same cover design, but are printed and bound in different colors with proper titles, so that they may be readily distinguished. All catalogues are designated by individual numbers, the latest being No. 110. The most recent products are immediately presented by bulletins (designated by letters) preliminary to the issuance of complete catalogues regarding the given machines. Loss of time is thereby avoided, and the new designs can be sooner placed before the public.

INDUSTRIAL COMBINATIONS.

A. M. Young of New York and Waterbury, Conn., who is one of the prime movers in the scheme for uniting the trolley, gas and electric-lighting and power companies of Connecticut, is quoted as saying in an interview: "The Central Railway and Electric company of New Britain, the Waterbury Traction company of Waterbury, the Naugatuck Electric Light company of Naugatuck, the Norwalk Gas Light company, the Norwalk and South Norwalk Electric company, the Greenwich and the Housatonic Power companies have been purchased by R. A. C. Smith and his associates, who represent a strong syndicate of New York capitalists. It is their purpose to turn these properties over to the Connecticut Lighting and Power company. The purchase, together with the improvements and extensions contemplated, will represent an expenditure of about \$6,000,000. The development of the Housatonic Power company on the Housatonic River will contemplate the delivery of about 30,000 horse power in electric power through these various companies, which will be absorbed in the one company. This power is so centrally located that it can be readily and economically delivered to all the cities in the southern and western portions of the state."

TECHNICAL SCHOOLS.

Walter B. Snow of the engineering staff of the B. F. Sturtevant company of Boston presented a paper on the "Influence of Mechanical Draft Upon the Ultimate Efficiency of Steam Boilers," before the Engineering society at Columbus University on December 1st. The inquiries for copies of this paper have led to its publication in pamphlet form. It can be procured upon application to the B. F. Sturtevant company.

The Year Book of the Society of Engineers of the University of Minnesota is out for 1899. It contains a number of technical articles by Professors George D. Shepardson, John J. Flather, Morgan Brooks and others. The subjects of the three gentlemen named are, in order, "Methods of Transmitting Intelligence," "The Strength of a Gear Tooth" and "Engineering and Finance." In all there are 11 articles, suitably illustrated. The book is sold by the Society of Engineers, University of Minnesota, Minneapolis, Minn.

ELECTRICAL SECURITIES.

The new Traction and Electric company of Washington, D. C., offers to investors \$12,000,000 of a proposed issue of \$20,000,000 4½ per cent. 50-year bonds. The new company is to be capitalized at \$12,000,000, and will take over the Potomac Electric Power company and the United States Electric Lighting company, as well as the Metropolitan, Columbia, Anacostia, Georgetown, Brightwood, Forest Glen, Great Falls and Rockville street-railway systems. It is said that at the present rate of earnings the new company will be able to pay bond interest and about 2½ per cent. on the stock.

The New York Gas and Electric Light, Heat and Power company, of which Anthony N. Brady is president, offers for subscription \$5,000,000 of its first-mortgage five per cent. 50-year gold bonds, which are part of an issue of \$15,000,000. The company is to manufacture and purvey gas, both for illumination and for fuel, and electricity for producing light, heat or power throughout Greater New York. It owns or controls the Mount Morris Electric Light company, the North River Electric Light and Power company, the New York Heat, Light and Power company, the Yonkers Electric Light and Power company, the Borough of Manhattan Electric company, the Block Lighting and Power company No. 1, the Manhattan Lighting company, the Consolidated Telegraph and Electrical Subway company, and the Edison Electric Illuminating company of New York. Through the last

two companies named it owns the underground conduits by which alone electricity for lighting, heating and power purposes may be conveyed in New York city. There are now 300 miles of these subways in the borough of Manhattan and there are 250 miles of special tubing and cables. The conduits cost \$6,500,000 and have an annual rental value of \$750,000. The right to construct additional conduits as the necessity for them arises, either through the increase of its own business or the desire of other corporations to send electricity along underground conductors, is also owned by the New York Gas and Electric Light, Heat and Power company.

TELEGRAPH.

Many telegraph lines have been constructed in Mexico recently. The government has assumed possession and control of the line from Tepa to Pichucaclo in the state of Chiapas. The earnings for the latter half of 1898 were increased over 21 per cent. over the corresponding period of the year 1897.

The final details have been arranged for the laying of the cable between the United States and Germany, the last step being a satisfactory arrangement concerning government messages and tolls. The authorities at Washington have been informed that the actual work of laying the cable will be begun this summer and that the first message may pass over the line in the fall.

After encountering many difficulties, the Amazon Telegraph company has at last decided to abandon the cable in the River Amazon from Para to Manaus, but a land line is being constructed by the same company, with some reaches of cable. The company has issued bonds for the sum of \$625,000, with interest at five per cent. The paid-up capital amounts to \$1,250,000. A subsidy was granted by the Brazilian government, amounting to \$85,625 a year for 20 years.

In Boston the telegraph operators of the Associated Press in New England met recently and organized a society to be known as the New England Telegraph Corps of the Associated Press. A dinner was served at the American House, and at the business meeting the following-named officers were elected: President, E. M. Fisher, Boston; vice-president, R. E. Grandfield, Fall River; secretary, P. J. Stewart, Manchester, N. H.; treasurer, C. G. Rogers, Boston.

Emperor William, who seems to be taking a keen interest in the project for having a new cable laid between Germany and this country, has invited George G. Ward, vice-president and general manager of the Commercial Cable company, to cross the ocean and proceed to Cologne to attend a conference to be held there at an early date, the object being to push the plans for the laying of the cable. Mr. Ward sailed from New York on May 17th for Southampton en route to Germany.

In the House of Lords, May 15th, the Earl of Aberdeen asked, in view of the importance of arriving at an understanding with Canada and the Australian colonies in reference to the Pacific cable, if the government was disposed to reconsider some of its stipulations. The Earl of Selborne, under secretary for the colonies, said that the conditions were such as in the experience of the postoffice and the treasury had been considered prudent to make the work efficient. The government, he said, was prepared to review the whole matter in the light of any representation which might be made with a sincere desire to arrive at a mutually satisfactory decision.

MISCELLANEOUS.

It is said that the War Department at Washington is considering the advisability of soliciting offers for franchises for electric railways, gas and electric-light systems in Porto Rico.

A company which claims to have discovered a noiseless electrical typewriter that will revolutionize the business of typewriting by doing away with the pressure on the keys has been incorporated in New York state. It is known as the General Invention and Promoting company. The directors are Harry Bates, Joseph A. Murphy and Jessie Don Ennis. The capital stock of the company is \$5,000. Besides introducing the new typewriter, the company will protect and promote the inventions of George H. Ennis of Troy, who is the inventor of the typewriter in question, and also a process for refining iron, an electric motor, a process for heating and ventilating, a process for refining whisky and a process for generating power.

A committee of the City Council of Helena, Mont., after conferring with the county assessors, has valued franchises for tax assessment as follows: Helena Consolidated Water company, \$400,000; Western Union Telegraph company, \$1,000; Postal Telegraph company, \$1,000; Bell Telephone company, \$2,000; Helena Gas company, \$1,000; Helena Electric Light company, \$200,000; Independent Associated Press franchise, \$25,000; Herald Associated Press franchise, \$15,000; Helena Water and Electric Power company, \$1,000; Great Northern company, \$20,000; Northern Pacific Railway company, \$20,000. While the legality of the assessment will doubt-

less be determined in the courts, prominent attorneys say that the assessors have not acted without their functions as prescribed by law. It is believed that Helena is the first city in the country to tax press association and steam-railroad franchises.

TRADE NEWS.

George Cutter of Chicago says that he has another specialty nearly hatched. The newcomer will go by the name of "Cutter's arc cutout."

Since January 1st the Garton-Daniels Electric company of Keokuk, Ia., has shipped its arresters into every state of the Union and has made over 50 shipments abroad. It also states that the sale of these devices from January 1st to the present time are equal to the total sales of any preceding year. This success is taken as convincing proof of high merit in the company's devices.

The Simplex Electrical company of Boston reports a heavy rush of orders. Contracts have been recently secured by this company for furnishing all the electrical conductors in the new Williamson and Rose buildings of Cleveland, the Allen County court-house at Fort Wayne, Ind., and the Montgomery Ward building in Chicago. Mr. H. R. Hixson, with office at 1137 Monadnock building, Chicago, is the western selling agent of the company.

The electrical business at Fort Wayne has been run during the last 10 years under two or three different names—the Fort Wayne company, corporation and works—which has caused considerable confusion to the present management. A great many customers of the old company do not seem to have noted the last change in name, and a good deal of mail that is intended for the present concern, it is complained, goes to others, causing delay in reaching those from whom it is intended, which is embarrassing to all concerned. The Fort Wayne Electric Works is the name of the concern now.

Bids will be opened on July 1st, at the Sandy Hook proving grounds, Governor's Island, New York, for furnishing electrical material and supplies during the next fiscal year. Information will be furnished upon application to Major Frank Heath. The lowest bid for furnishing the New York navy yard with two generating sets, with compound engines and spare parts, was that of Burhorn & Granger of New York, at \$4,490.76. For furnishing the Norfolk navy yard with four direct-connected generating sets and spare parts the lowest bid was that of the Thresher Electric company of Dayton, O., at \$8,340.20. The proposal of the Crocker-Wheeler company of New York, in amount \$1,880, for furnishing electrical apparatus for Sandy Hook light vessel No. 51, has been accepted.

BUSINESS.

The construction department of the Western Electric company has secured the contract for wiring 5,000 lights in the Williamson building, Chicago.

"We must remain in town some of the time," says the Central Electric company of Chicago; and from this statement it argues that a Central Electric fan motor should be installed as a heat-dispeller.

Samuel Mankowitz, Chicago, dealer in general electrical supplies, reports an excellent trade. Mr. Mankowitz states that the demand for the goods he handles has increased from month to month, and he is now doing a better business than ever before. Mr. Mankowitz is well known to the electrical fraternity, and he is said to quote prices that usually secure the business.

As the temperature increases, so does the desire to keep cool. To this end a positive circulation and renewal of air is necessary, and may be secured in the simplest manner by an electrically driven fan. A most carefully designed apparatus of this type is that illustrated and described by the B. F. Sturtevant company in its "Bulletin M." The fan is designed to move air in large volumes, not merely to agitate it.

The Electric Appliance company has decided to bring out its well-known Acme tape hereafter under the name of "Eaco." This has been made necessary for the protection of the company's customers and itself as the reputation gained by the genuine Acme tape has caused the name to be adopted by manufacturers of what is said to be an inferior tape. The trade will appreciate this move, as poor tape is about the least desirable article known to electrical men.

W. N. Matthews of St. Louis reports that he has disposed of all of the No. 0000 stranded and Nos. 4, 8 and 10 weatherproof wire from his second-hand stock, also two 15 by 20 Russell engines, one 20 by 27 Russell engine, two 100 horse power boilers, one 3,000-light Westinghouse dynamo and a large lot of smaller material. He attributes his success in making the sales to the splendid condition of the machinery and material, which he is selling at low prices.

John S. Nowotny is an arc-lamp maker of long experience, and it may easily be believed that his new semi-vacuum, long burning, enclosed arc lamp is meeting the success that is claimed for it. He

says that he has all the lamp business that he can well handle, and that of all the new lamps put out none has been unsatisfactory. Mr. Nowotny, whose address is 313 East Second street, Cincinnati, thinks that, without exaggeration, his latest lamp is the best of the long-burning type that has been produced.

The Kester Electric Manufacturing company of 245 South Jefferson street, Chicago, is calling special attention to Kester's self-fluxing solder. This solder is especially made for all kinds of electrical work and, it is claimed, saves labor, time and money. It is said to make a perfect, secure, sound and non-corrosive joint. The company will be pleased to send samples and prices of the solder on application. The Kester company also manufactures the well-known Kester wire-cloth dynamo and motor brush, which is said to be giving satisfaction.

The Turner Engineering company of Bucyrus, O., will erect at once a complete boiler plant for the Marion Steam Shovel company, including a large self-supporting steel chimney, brick-lined, after special designs. The Marion company sends its shovels and dredging machinery to all parts of the world, and maintains its plant with the most improved money and labor-saving devices. After careful and exhaustive consideration of all water-tube boilers, the management decided to use the Turner boilers as possessing the greatest merit and economy.

The Charles Munson Belting company, recently organized, is now in a position to supply all of its patrons with belting. For a period covering

33 years the Munson belt has maintained a high reputation among American manufacturers, and the new company promises to use the same careful workmanship and supply the same high grade of leather as those which made the belt appreciated in the past. The reorganized company is fully equipped to furnish the best belting of all grades of pure oak tannage upon short notice. The address of the company is 22 to 36 South Canal street, Chicago.

President Edwin Raster of the Raster Carbon Rheostat company, Chicago, announces that his company is receiving more orders for rheostats than ever before, and that the business of the last two months has shown a large increase. The Raster rheostats are now in use all over the United States, and their merits are becoming better known from day to day. The Raster company has recently received some large orders from the Chicago City Railway company and others. It has recently issued a new descriptive catalogue and price-list, showing all of the company's latest improved types of rheostats. This book will be mailed to anyone on request.

E. E. Calkins, special agent for the Mexican Plantation association, 100 Washington street, Chicago, desires to call the attention of the electrical fraternity to the investment plan which the association is offering the public. The association offers shares at a small figure, payable monthly, and states that a life income of \$125 a month can be realized

from the investment. It is claimed that all but a few hundred shares have been sold, and it is expected that the balance will be disposed of by July 1st. The association has deeded its land to the Chicago Title and Trust company, and has filed a guarantee bond of \$100,000 with this company as an evidence of good faith with its shareholders. It is claimed that many prominent men are interested in the association. Further information will be furnished by Mr. Calkins on request.

As is now generally known throughout the East, the Chesley Electric company, Havemeyer building, New York was recently succeeded by the Chesley Machinery company. The latter is dealing largely in second-hand electric machinery, and is making a special drive for western trade. Its second-hand dynamos and motors are thoroughly overhauled and tested, supplied with new wearing parts and are guaranteed to give satisfactory service. The company states that it often has new machines that have never been used, and also machines that have been entirely rebuilt. It supplies many large concerns and has also sold second-hand dynamos to the United States government. A specialty is made of repairing heavy electrical machinery, for which the company has excellent facilities. Paying the highest prices for labor, the work is first-class. The factory is open day and night. As the Chesley Machinery company is now making a special effort for western business, purchasers of second-hand machinery would do well to have on file the company's list of bargains and stock on hand.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued June 6, 1899.

626,296. Device for Steering Motor-driven Vehicles. Edward J. Pennington, Walton-upon-Thames, England. Application filed December 30, 1897.

The means for steering a motor-driven road vehicle comprise an overhead wire or cable and an arm connected at its lower end to the steering apparatus of the vehicle and carrying at its upper end a pulley or the like which travels in engagement with the wire or cable.

No. 626,296.

626,298. Coin-controlled Electric Meter. Samuel L. Phillips and George G. Tilden, Washington, D. C. Application filed January 20, 1899.

A spring-closed switch is employed to make and break the circuit, a coin-operated lever having a latch to sustain the switch when open, an electric motor to open the latter, a circuit for the motor completed by the a tion of the metering mechanism, and means operated by the motor to open the switch and to break the motor circuit.

626,331. Process of Producing Neutral Chromate of Lead. Carl Luckow, Cologne-Dentz, Germany. Application filed December 31, 1897.

The process of producing neutral chromate of lead by means of electrolysis consists in using an anode of lead in connection with an aqueous solution as electrolyte containing from three-tenths to three per cent. of the sodium potassium or ammonium salts of chloric acid in mixture with the sodium, potassium or ammonium salts of chromic acid, passing electric current through the solution and maintaining the bath constant by the continuous addition of water and chromic acid.

626,361. Method of and Apparatus for Electroplating. Alfred A. Blackman, New York, N. Y. Application filed September 27, 1898.

The method is described of electroplating irregularly shaped articles by moving them continuously in one direction through the solution and changing their individual positions by continuous tumbling while subject to the electroplating current.

626,364. Automatic Fire-alarm System. Robert G. Callum and John W. Fritch, Washington, D. C. Application filed February 23, 1899.

An electric signal-transmitting instrument is operated by windable mechanism, a closed-circuit annunciator, and means whereby a circuit of the annunciator will be opened by the operation of the instrument and kept open until the instrument is set for another operation.

626,377. Electric Rail-road. Samuel H. Harrington, New York, N. Y. Application filed June 16, 1898.

A rail road having conical thimbles or plugs at its ends in combination with a conically perforated rail or rails into which the plug or plugs are tightly driven, and an anchorage for the plugs consisting of an edge portion of the rail driven inward from the edge of the rail perforation into the metal of the plug in tight frictional contact therewith after the plug is seated in the perforation.

626,378. Electric Rail-road. Samuel H. Harrington, New York, N. Y. Application filed June 16, 1898. Renewed February 28, 1899.

An electric rail road having conical thimbles and loops secured to its smaller ends in combination with annular wedge-shaped rings having slots of different depths and wedges adapted to enter the loops and rest in slots in the rings.

626,382. Auxiliary Electric Alarm for Telephone Call Bells. Morton M. Humphrey, Siloam Springs, Ark. Application filed May 27, 1898.

The combination with the magneto call box, its vibrating armature and the receiver lever, of an auxiliary alarm circuit terminating at the box, a gravity contact lever adapted to close the circuit, a trip lever projecting into the path of the armature and adapted to support the contact lever, and a setting lever having its vertical arm extending across the path of the tripping lever and its horizontal arm extending across the path of the receiver lever.

626,460. Filament for Incandescent Lamps and Process of Manufacturing Same. Thomas A. Edison, Llewellyn Park, N. J. Application filed March 31, 1898.

An improved filament for incandescent lamps, consisting of a highly refractory, non-conducting material, having isolated particles of conducting material therein.

626,462. Telephone System. William D. Gharky, Philadelphia, Pa. Application filed December 24, 1898.

A multiple-station metallic telephone circuit having at each station two bridges containing impedance and a conductor connecting the inductively middle point of each of the bridges with the ground, a signal-receiving instrument connected to respond to current in one of the ground conductors and a generator arranged to send signaling current through the other of the ground conductors to the line.

626,463. Telephone System. William D. Gharky, Philadelphia, Pa. Application filed December 24, 1898.

A multiple-station metallic telephone circuit having at each station two bridges containing impedance and a conductor connecting the inductively middle point of each of the bridges with the ground, a signal-receiving instrument connected to respond to current in one of the ground conductors and a generator arranged to send signaling current through the other of the ground conductors to the line.

No. 626,624.

One claim is given: In a telephone system a metallic circuit extending to a number of substations and common to all of them, coils of high impedance bridged across the metallic circuit at the various stations, branches from the middle points of the coils to earth or a return wire, signal-receiving instruments included in the branches, signal-transmitting instruments adapted to be connected across the metallic circuit at the various substations, and central-office apparatus comprising suitable receiving and transmitting apparatus to co-operate with the apparatus at the substations.

626,494. Electrical Signaling. Simon de Jager, Paterson, N. J. Application filed May 26, 1898.

Two sets of devices are adapted to coactively operate with means for sending electrical impulses of both polarities, and electrically controlled means, distinct from each other and actuated by the impulses, for operating the respective devices, the means being adapted to effect a coaction of their respective devices when one is actuated by an impulse opposite in polarity to and succeeding the last actuating impulse of the other.

626,496. Electric Motor or Dynamo-electric Machine. Robert Lundell, New York, N. Y. Application filed January 18, 1899.

A brush holder having a metal supporting shank surrounded by a substantially square insulating sleeve and clamped in a holder which permits the shank to be adjusted in a plane parallel with the diameter of commutation on the commutators.

No. 626,462.

626,501. Magazine Target Gun. John L. McCullough, New York, N. Y. Application filed February 24, 1899.

The combination is claimed with a magazine gun and a magazine lock connected with the gun and controlling the supply of cartridges thereto, of an electric circuit including a generator and a lock-controlling electromagnet, mechanism between the magnet and lock, whereby the magazine is unlocked by the excitation of the magnet, a coin chute, means whereby the dropping of a coin into the chute closes the circuit, a coin detainer in the chute and controlled by the circuit, and means whereby the cartridge moving out from the magazine breaks the circuit and sets free the detained coin.

626,592. Insulator. John A. Carpenter, Oxville, and Charles F. Tonn, Bluffs, Ill. Application filed November 15, 1898.

An insulator is described comprising two sections, lugs extended from one of the sections and adapted to be secured to the other section, the lugs being spaced apart and having their adjacent faces curved, and a yielding material between the lugs.

626,606. Telegraph Receiver or Relay. José Gallegos, San José de Guatemala, Guatemala. Application filed December 24, 1898.

The movable armature, the electromagnet having an end or pole movable in a plane perpendicular to that in which the armature moves and a circuit closer controlled by the movement of the armature are features claimed.

626,624. Circuit and Apparatus for Bridging Telephones. Charles T. Mason, Sumter, S. C. Application filed February 4, 1899.

A multiple-station telephone circuit having at each station a normally closed bridge of the main line including both bell-ringing magnets of low resistance and the armature coils of the generator, the bell magnets being permanently in series with the generator and adapted to be shunted in signaling.

626,629. Telephone. George F. Payne and Albert K. Keller, Philadelphia, Pa. Application filed April 13, 1897.

A telephone-substation apparatus comprising in combination a box or casing having a door, a fixed support within the casing, a movable support carrying a receiver and transmitter and pivoted at one extremity to the fixed support, a rotary switch connected to the movable support to be actuated in its motion and thereby change the telephone circuit, the movable support being adapted to project forwardly and without the box or casing when turned into the position of use, and when in such position constituting an impediment to the closure of the box door.

626,635. Process of Reducing Aluminum from Its Compounds. Gustav Schwahn, St. Louis, Mo. Application filed September 7, 1897.

As a process, subjecting a hot compound vapor containing aluminum to the action of a hot carbon-gas decolorizer, in the presence of incandescent carbon, for an appreciable length of time, while substantially excluding the air.

CHICAGO, JUNE 24, 1899.

No. 25

Death of Norman Williams.

The death of Norman Williams at Hampton Beach, N. H., on June 19th, removed an interesting figure from public life and closed the career of one who had much to do in shaping the early course of the telegraph and telephone interests of this country. Norman Williams was an able lawyer and a wise counselor, and his very able management of the legal complications growing out of the organization of the Western Union Telegraph company was an important factor in the adjustment of the conflicting interests involved in that great scheme.

It was in connection with the Western Union affairs and in conducting the legal battles of that company that Mr. Williams won his great reputation as a lawyer. This was probably the most important work of his career, and it served to give him a national reputation in his profession. Unfortunately for the legal fraternity, Mr. Williams acquired so many other interests that his attention was directed from the practice of the law, and of late years, although still a member of the firm of Williams, Holt & Wheeler, he was mainly engaged in other affairs. In another respect, however, this was fortunate, for the loss of the legal fraternity was more than compensated in the great public service which Mr. Williams was able to perform in promoting the educational and charitable institutions of Chicago, to which he gave a large part of his attention.

Mr. Williams' interest in electrical matters dated back to the early days of the telegraph, and his prominence in the Western Union litigation naturally resulted in his acquiring an intimate knowledge of the subject and brought him into personal contact with the leaders of the profession. Consequently, when the telephone appeared on the scene Mr. Williams directed his attention to this new means of transmitting intelligence, and, aside from his legal connection with the Bell interests, he became a prominent figure in the commercial development of the industry. He had since been closely identified with the Bell companies throughout the West, and at the time of his death held large interests in Bell properties.

By birth Mr. Williams was a New England man, but in all that pertained to the advancement of his adopted city he was thoroughly a Chicagoan. His parents were Norman and Mary Anne (Wentworth) Williams, who lived at Woodstock, Vt. He was born on February 1, 1835, passed his boyhood in Vermont, and was fitted for college at the Kimball Union Academy at Meriden, N. H. After completing his studies there he attended the University of Vermont, from which he graduated with the class of 1855. This was followed by a course at the Albany Law School and service in the office of Tracy, Converse & Barrett at Woodstock, Vt., after which Mr. Williams was admitted to practice as a lawyer in the New York and Vermont courts.

Mr. Williams' ancestors had long been prominent in New England history. His great-grandfather was one of the grantees in whom the English crown intrusted title to the town of Woodstock, and the succeeding generations were identified with the early political and military struggles of Vermont. Mr. Williams' grandfather, Jesse Williams, and his father, Norman Williams, were also interested in the public affairs of the state, and were men of much influence. The Wentworth family, of which Mr. Williams' mother was a member, was of English descent, and some of the male members served as governors of New Hampshire under the English kings in colonial days. They were members of the Tory party, and left the country when the British troops evacuated Boston.

With a family history of this kind there were consequently many ties which bound Mr. Williams to New England, but he was ambitious and sought his opportunity in Chicago. He removed to this city in October, 1858, and for two years practiced law alone. In 1860 he became associated with Messrs. King and Kales, the firm name being King, Kales & Williams. This was continued until 1866, when Mr. Williams withdrew and with General John L. Thompson established the famous law firm of Williams & Thompson, which continued until the death of General Thompson in 1888.

Mr. Williams, whose reputation as a business lawyer was won early, was identified in the formation of some of the largest and most successful enterprises ever undertaken in the West. In his professional capacity he assisted in the organization of

dent of the institution, and personally directed the work of organization. As a director of the Chicago Public Library, Mr. Williams was an active worker for the educational interests of the people, and suggested many valuable improvements. He performed valuable services as United States Commissioner to the Paris Electrical Exposition of 1881.

He was a member of the Chicago Club, Calumet Club, Literary Club and the University Club (Chicago and New York). In addition to native qualities which made him a widely beloved and respected man, Mr. Williams had the advantage of a thorough education, both by books and travel, having made extensive tours in the United States and foreign lands.

Mr. Williams was a trustee of the Second Presbyterian Church of Chicago and took a very active interest in its welfare. The Chicago Orphan Asylum was another institution of which Mr. Williams had long been president and in which he took great interest. In politics he was a Republican, and while he neither held nor sought office, he was much interested in the good conduct of public affairs, and labored assiduously to secure it. Mr. Williams was active during the first year of the Civil War in securing armor for the first regiment of colored soldiers recruited in Chicago. Mr. Williams was married at Ottawa, Ill., December 11, 1867, to Miss Catherine Caton, daughter of Hon. John Dean Caton, formerly chief justice of the Supreme Court of Illinois. There are three children living, two daughters, Laura and Mary, and one son, Norman. The elder daughter, Laura, married Major-general Merritt in London, Eng., October 24, 1898.

For several years before his death Mr. Williams gave comparatively little attention to his profession. Much time was required for his own affairs. He was interested in the Western Electric company, the Chicago Telephone company and the Central Union Telephone company.

Mr. Williams had been a sufferer from Bright's disease for three years. He went to his summer home in New Hampshire in April and failed gradually until death relieved him of his sufferings. All of his family attended him, including his wife and son, Norman Williams, Jr., his daughter, Miss Mary Williams, his son-in-law, General Wesley Merritt, and wife. They were at the bedside at the last.

The funeral was held at his summer home on Wednesday evening. The services were simple in character and were conducted by the Rev. David N. Evans, pastor of the Congregational Church at North Hamp-

ton. On Thursday morning the body, accompanied by the family, was taken on a special train to Boston and thence to Woodstock, Vt., where the interment took place.

Automobiles in Chicago.

At a meeting held last week the South Park commissioners of Chicago took the extraordinary measure of barring automobiles from using the South Side parks and boulevards of Chicago. The rule applied to all styles of automobiles, whether used for pleasure or by business houses for delivering goods. The argument for the exclusion was that the vehicles are a menace to the safety of pedestrians, bicyclists or persons driving in the parks or boulevards. The park police were ordered to enforce the rule, and Messrs. C. F. Woods, C. F. Corrigan, H. G. Osburn, W. Clyde Jones and G. S. Marchant were active in opposing it. However the new rule was so unreasonable that the board itself saw its absurdity, and the commissioners allowed it to become a dead letter.

NORMAN WILLIAMS.

Pullman's Palace Car company and became a member of its first board of directors. Mr. Williams also assisted in the organization of the Western Electric company and the Chicago Telephone company, and it is claimed that the first telephones used in Chicago were brought here under his direction. As already mentioned, the Western Union Telegraph company was another corporation in which Mr. Williams was prominently interested, especially in the management of its legal battles with the opposition companies in the West.

Owing to his faculty for disposing of business quickly, Mr. Williams, although giving minute attention to the details of the many affairs entrusted to him, found time to take an active interest in literary matters. He aided his brother, Edward H. Williams, who founded a public library in his native town, Woodstock, Vt., which is called, in honor of his father, "The Norman Williams Public Library." When the late John Crerar made his magnificent bequest for a great public library in Chicago, he named Norman Williams and Huntington W. Jackson as trustees. Mr. Williams was the first presi-

DEVELOPMENT OF THE TELEPHONE FIELD.

Independent Telephone Association.

The convention of the Independent Telephone Association at the Auditorium Hotel, Chicago, next week, promises to be an enthusiastic gathering. Many prominent and influential leaders in the independent movement, who have heretofore held aloof from the association, have joined with the officers and committees this year in the preliminary work, and all are working in harmony toward making this meeting a turning point in the history of the organization. Under date of June 20th, Judge Thomas writes: "Indications are at this writing very encouraging, and I think we will have the banner meeting of the association." Reports from exchange managers and from representatives of manufacturers and dealers from all parts of the country confirm this view.

The meeting next week will be conducted under the direction of the following-named officers and committees:

President James M. Thomas; first vice-president, H. C. Young; second vice-president, S. T. Slade; third vice-president, J. B. Ware; secretary and treasurer, W. J. Vesey; first assistant secretary, G. W. Beers; second assistant secretary, D. C. Dow. Advisory board, James M. Thomas, William J. Vesey, H. D. Critchfield, Hugh Dougherty, E. B. Fisher. Executive committee, I. A. Lumpkin, S. P. Sheerin, C. F. Bennett, T. A. Pedley, E. B. Fisher, H. D. Critchfield, H. C. Young, F. F. Sapt and D. A. Mossman.

The programme for the convention and the entertainment features, as approved by the advisory board, follow:

MONDAY, JUNE 26TH.

The executive committee and the advisory board will meet at eight p. m., in the parlor of the Auditorium Annex, to settle all business matters of the closing year, and to formulate reports of officers and committees.

TUESDAY, JUNE 27TH.

The first session of the convention will be held in the banquet hall of the Auditorium Hotel at 10 a. m., and will be opened by the president, Judge James M. Thomas, who will deliver the annual address. Reports of the officers and committees will then be submitted.

This will be followed by introductions and a short social session, at which new members will be received.

The afternoon session, which will introduce new features in the order of proceedings, will open at two p. m. and the following programme will be observed:

Paper, by S. P. Sheerin of Indianapolis, president of the New Long-distance Telephone company of Indiana. Subject: "Value of Long-distance Toll Lines." Discussion.

Paper, by C. L. Boyce, manager of the Citizens' Telephone company of Grand Rapids, Mich. Subject: "Operation and Maintenance." Discussion.

Paper, by Maxime Reber, electrical engineer of the Cuyahoga Telephone company of Cleveland, Ohio. Subject: "Essentials of Telephone Construction." Discussion.

Paper, by Hon. H. D. Critchfield, counsel for the United States Telephone company of Ohio. Subject: "Development of the Independent Telephone Business." Discussion.

WEDNESDAY, JUNE 28TH.

The entire morning will be devoted to the inspection of exhibits, as no formal session will be held. Visitors who wish to examine the local factories will be afforded an opportunity of doing so at this time.

At three p. m. members will assemble at the Auditorium, where tally-ho coaches will be provided to take them through the city and the South Side parks and boulevards. The party will start from the Auditorium and ride north on Michigan avenue to Monroe street, west on Monroe to La Salle, south on La Salle to Jackson boulevard and east on Jackson to Michigan, thence south through the boulevards and parks. At Jackson Park a steamer will be in waiting to convey the party back to the city, affording a delightful view of the city from the lake.

At eight p. m. the banquet tendered by the Chicago manufacturers and supply men to the association will be given at the Auditorium Hotel. This will be the principal social feature of the meeting. The banquet hall will be appropriately decorated, and excellent music will be provided. The list of toasts will not be arranged until Monday evening, when the advisory board and executive committee will complete all the arrangements.

On June 14th Judge Colt, in the United States Circuit Court at Boston, Mass., granted a preliminary injunction on complaint of the Electric Storage Battery Company of Philadelphia against the Quincy and Boston Street Railway company, restraining the latter from using and operating the elements of the Hatch storage battery installed at South Braintree, Mass., and used as an auxiliary to the trolley system. The bill held that the Hatch battery infringes the British patent owned by the Electric Storage Battery company. The injunction becomes effective on August 1st, as the railway company was given sixty days to remove the infringing batteries.

Chicago Board of Trade Telephone System.

The telephone has found a special field of usefulness in connection with industries and enterprises requiring constant intercommunication between the several departments and the principals in special lines of transactions. An excellent illustration of this is found in the private-telephone system recently installed in the Chicago Board of Trade by the Stromberg-Carlson Telephone Manufacturing company of Chicago. It is essential to the successful execution of the important transactions made in this institution that immediate notification be sent from the floor of the Board to the offices of brokers or capitalists interested, and that facilities may be had for directing movements through agents in the pit from the principal's office. The telephone furnishes admirable means for communication in this manner, and it is now generally employed in Chicago for this purpose. Each office in the building is provided with one or more telephones connected on the switchboard system, as well as a number of

is largely used in the offices. All batteries in this system are placed at one point, thus avoiding the inconvenience of local batteries at each instrument. The ringing energy is also furnished from the central, which greatly increases the efficiency of the system, as users are not required to first turn the crank of a generator to signal the central office.

This is one of the most notable equipments furnished by independent manufacturers in Chicago, and as the service is very severe and exacting it is particularly interesting to exchange managers operating systems in competition with the Bell company.

American Electric Telephone Company's New Building.

About July 1st the American Electric Telephone company will move into its new building at 38 to 50 Jackson boulevard, corner Canal street, Chicago. This change in quarters was made necessary by the company's rapidly-increasing business, which has quadrupled during the last year, and has over-

FIG. 1. CHICAGO BOARD OF TRADE TELEPHONE SYSTEM.

instruments in the main corridor, and in the main hall on the trading floor. The system used is the regular public-exchange central-energy apparatus, furnished by the Stromberg-Carlson company.

Fig. 1 shows the switchboard, which has been installed on the third floor. It is equipped with tubular coil, visual signals, which automatically indicate when the station-instrument receiver is taken from the hook, showing the number of the station calling. The signals are controlled entirely from the station instrument, and are electrically restored. After connection has been made, the clearing-out signal is given, when both parties replace their receivers. The board is a very handsomely finished piece of work, and the design and material used indicate the character of the work that can be turned out for independent exchanges.

Fig. 2 shows several of the instruments used in the main hall. These instruments consist of a combination set, transmitter and receiver with hook and bell. They are neat and compact, and especially adapted for this work, as they are kept very busy during the trading hours each day.

Trades are made directly from the floor, and all trades are reported over these instruments to the clearing houses, thus saving considerable time and a large expense of messengers.

Fig. 3 shows the regular wall instrument, which

taxed the capacity of the company's present factory. The new building is a modern eight-story structure, covering half a block. It is being equipped with the very latest automatic machinery throughout, and it is claimed that it will be the largest and most finely appointed telephone manufactory in the world. The entire ground floor will be taken up by the company's general offices.

Mr. P. C. Burns, president of the American company, in speaking of the new building, said: "We have been forced to secure larger quarters in order to take the proper care of our customers. While our present factory is a large one, it is entirely inadequate to the demands made upon it, and it has been impossible to turn out our orders as promptly as desired. We will have a factory modern in every particular, and sufficiently large to meet the requirements of our business. The independent exchanges have multiplied so rapidly that the new quarters will not be any too large to take care of their interests."

Visitors to Chicago during the convention of the Independent Telephone association are especially invited to inspect the new building, although it is not yet completely equipped.

The Hawkeye Telephone company is putting in an exchange at Adair, Ia.

No Compromise.

By JAMES M. THOMAS.

If there is any reason why independent telephone companies should sell out to the Bell companies or contract with them for connection with the Bell system, that reason has not yet been given to the public. But there are a few companies in different parts of the United States which have been induced through some argument or by some means to enter into relations with the Bell companies, and some few have sold to them their properties.

To men who have been through a few years' experience and have learned the policy and methods

place themselves under bondage to the American Bell Telephone company to pay royalties upon inventions after the patents have expired.

The independent long-distance companies will soon extend throughout the entire country, and it is certainly better to wait till the friendly lines of these companies join into a complete new system reaching every local exchange in the country. This will bring greater prosperity to the local companies, whereas, that which is now offered places the control of the property of the local company in the hands of those who will not only absorb all the profits, but will ultimately force the local company to sell at a mere pittance.

If this matter is carefully considered, no company operating an independent exchange will enter into a contract with the Bell companies.

The Bell companies have apparently at last realized that the independents have grown stronger than they. They at least realize that the number of independent exchanges far outnumber their own in the United States, and that they are stronger in the aggregate financially, and that they are better managed and afford better service. It is true that the Bell companies are spending a great deal of money in new equipment, but the independents are even more active in this regard.

The burden of watered stock and the prejudice of the people because of poor service and arbitrary dealings impedes the Bell forces in the race and the independents are fast gaining; in many instances they have already passed the Bell, and in all they shall surely win the race. Why shouldn't they? The people desire to have it so.

It may be that the telephone business is a natural monopoly. We have always doubted it, but if it is, the monopoly will pass to new hands who employ modern business methods.

NEW COMPANIES.

The Delaware Valley Telephone company has been incorporated at Albany, N. Y., with a capital of \$25,000. The general route is from North Sanford to Afton, to Bainbridge, to Masonville, to Sidney, to Cannonsville, to Walton, to Sherman, to Hancock, to China, to Beebe Hill, to Binghamton. The points to be connected include prominent cities and villages in Broome and Delaware counties in New York, and Susquehanna and Wayne counties, Penn. The directors are E. A. Goodsell and Lewis Fredenburg of Afton, Chenango County; V. E. Greg-

Minor Telephone Troubles and How to Correct Them.

By H. P. CLAIBORN.

To those who are familiar with the construction of the simpler pieces of telephone apparatus it is a constant wonder that managers of telephone exchanges are so slow in awakening to the fact that an immense saving of time and money may be effected by equipping a room with a few inexpensive tools, suitable for rewinding an occasional coil or repairing slightly damaged parts of the equipment.

Nothing is more disastrous to good service than to have the "outside men" mingle with the operator. A room should be provided in which the men may store their tools and instruments. Better discipline can be maintained in the operating room, and the men of their own volition will do much that would otherwise be overlooked. Thus, tools will be cleaned, repaired and sharpened and kept in good condition, old bundles of drop wires straightened out, the short pieces being soldered together and retaped ready for future use, and most important of all, damaged parts of the exchange equipment will be gone over, repaired and put in working order.

As a preliminary to a general discussion of telephone repairs, let us first consider what elements enter into the construction of a telephone-exchange system. In the first place, we have the subscriber's station equipment, consisting as a rule of the following essential elements:

- (1) The hackboard, the battery support and cover, the magneto box and the transmitter box.
- (2) The hand telephone, the microphone transmitter, the induction coil and the battery.
- (3) The magneto generator and magneto bell
- (4) Switching appliances.
- (5) Instrument interconnecting circuits.

The first class requires but little treatment, aside from suggesting that if one element gives out—say, the battery cover—it is not a sufficient cause for returning the complete telephone to its maker. Any local cabinet-maker can do the job at a lower figure than the transportation charges would amount to. Adding to this the manufacturer's charges for unpacking, repairing, repacking and the return charges, it is small wonder that managers kick against the cost of so insignificant a job. The manufacturer, of course, receives the blame, but in reality he is a part looser as well, for the amount which he charges for the repairs scarcely covers actual cost, and he would gladly welcome the day when repair work ceases to interfere with his regular production of new goods.

In the second class, however, we find a variety of

FIG. 3 CHICAGO BOARD OF TRADE TELEPHONE SYSTEM.

of the Bell companies, this seems strange, and it is but natural that the mind seeks to know the inducement offered to accomplish this result.

The mere matter of bargain and sale viewed from the standpoint of a cold business transaction, of course, can be explained by the fact that in every instance a great deal more money has been offered than the property is worth—in some instances three or four times the actual value. This is a temptation too great for some men and therefore a sale follows.

But what brings about this condition? Why should the Bell companies offer such excessive prices? We have been told for five years, since the inception of the independent movement, by the entire Bell contingent, from the local manager up to the president of the American Bell Telephone company, that we are infringers of patents and have no right to exist and do business, and their learned lawyers and experts, who claim to be familiar with the state of the art, have been trying to support this view. If they are right, why pay such enormous prices for this property which belongs to their infringers? This is beyond the comprehension of business men, and places those learned in the art in a very embarrassing position, because their opinions are not now consistent with or sustained by the policy of the sub-Bell companies which exist only through the graces of the parent company, the American Bell.

We understand why men who, with the very best intention, start out to fight with a great army for a just cause, desert and join the enemy when dazzled and tempted with sudden wealth and position. It is only the weakness of man tried beyond endurance. And so we understand why a few independent companies sell when sorely tempted. But men should read and remember the histories of those in all walks of life who have been turned away by the glitter and gold which, in the hour of temptation, seems so dear and desirable. Regrets have always followed and we know of no exceptions in this, because the people who have trusted the men to give them cheaper telephone service do not like to have this right turned to financial gain by those men at the expense of those who gave the right to build the property. This is forcibly shown by the fact that in almost every instance the municipality grants another franchise to another local company shortly after the consummation of the sale. It would have been easy to understand in the early days of the independent movement why the local companies might have accepted a reasonable proposition from the Bell company for long-distance service, because the exchanges were isolated and the threats of litigation were loud and persistent; but now the circumstances are so different, the independent companies being so numerous and so strong, controlling at least seven-tenths of the pay business of the communities where the independent companies have entered, that there is no longer reason why a coalition with the Bell is either desirable or advantageous on the part of the local companies, and it shows bad business judgment to enter into any agreement for connection and thus

FIG. 2. CHICAGO BOARD OF TRADE TELEPHONE SYSTEM.

ory, G. L. Reilly, C. A. Philly, A. H. King, W. H. Crawford, F. C. Broad, Barton Springer and C. C. Swart of North Sanford, Broome County; G. C. Vallentine and L. Bielby of Deposit, Broome County; E. E. Crane, Diar Baker and E. L. Garlick of Sanford, Broome County.

Articles of incorporation of the Glen Telephone company of Montgomery County, with a capital of \$10,000, were filed June 20th at Albany, N. Y. Its operations are to be carried on from the town of Glen, and will connect with almost all of the principal cities, towns and villages in the state. The directors are J. S. Glen Edwards, A. Marshall Burt, Andrew A. Turnbull, Jacob W. Shelp, Edward Edwards of Glen, Howard A. De Graff of Fonda and Edward C. Evans of New York.

elements, each of which requires special treatment. In the first place, the hand telephone is subject to several ills. The most common of these is due to the fact that the relative distance between the magnet poles and diaphragm continuously varies. These changes, it is well understood, are due to the manner in which considerable variations of temperature affects the constituent parts of the instrument. Happily, however, this fault is rapidly being overcome by the universal adoption of modern types of receivers, in which the magnet system is supported in such a manner that the adjustment is not affected even by the most extreme variations of temperature.

Another serious fault is observed in the permanent magnet losing its magnetism, which may be due to several causes. Thus if a strong alternat-

ing current is allowed to pass through the magnet coils, the magnetized bars of steel become depolarized, which makes such an instrument almost useless for the purpose required. A direct current, if allowed to flow for an instant through the magnet coil, would tend to depolarize it, provided the current flowed in an opposite direction to the existing polarity. The only way to treat cases of demagnetization is, of course, to recharge the steel bars of which the magnet is constructed. This may be done without removing the magnet from the shell by placing the projecting pole pieces in contact with a comparatively much stronger magnet. The charging may be done by the extended field-pieces of a small dynamo, or better still, an electromagnet may be built and set up in the repair shop. Another method for recharging the magnet system of a hand telephone, whose magnet coils are intact, is to pass a strong current through them for one or two seconds (a 110-volt direct-current lighting main may be connected with a 100-ohm receiver six or eight seconds, without doing any damage. The magnets, however, will have been recharged to normal strength).

Having disposed of demagnetized or weak magnets, we may proceed to consider means for repairing burned-out, open and crossed magnet coils. When a coil is found to have been burned out, remove it from the shell and ascertain whether the spool-head has received any damage, which usually is true if constructed of fiber or hard rubber, in which case it is better to return the complete receiver to the factory for repair. On the other hand, if the spool ends are of a metal, remove all burned wire, and after scraping off the burned insulating paper, reinsulate and rewind the coils. Before restoring the coils to their position be sure that the permanent magnets are of proper strength, as they may have become damaged by the same current which burned the coils. One important feature of rewinding the coils, if there are two coils to a set, is that both coils must be wound in the same direction and have their inside ends connected together.

Open circuits in a receiver usually are found near

FIG. 1. LOUD-SPEAKING TELEPHONE.

one of the outside layers, and may be remedied by merely slacking up on the outside wire and reconnecting, all of which may be done without removing the coils from the magnets, which would destroy the adjustment of the several parts. It rarely occurs that an inside wire is found broken, but when such is the case it is necessary to rewind the damaged coil. The old wire can be used over again, if a little care is exercised in handling.

If on testing it is found that both cores of the magnet refuse to affect a diaphragm, while a generator current (alternating) passes through from one outside terminal to another, it may be that the outer wires are in contact with each other. This can be definitely determined by noting whether the diaphragm is affected when the current is passed from the inside wire to outside coil terminals. If on examination it is found that the cross is not in the wires extending from the coils to the binding posts, a piece of paper slipped between the coils often serves to locate and clear the cross.

The microphone transmitter now in common use consists of few parts, and is not subject to many faults. Chief among them is the liability of breaking diaphragms (if of carbon) and an effect called packing. The former is remedied by installing a new carbon disk, and the latter is made known by a general falling off in efficiency. It becomes necessary to speak louder and to get quite close to the mouthpiece. In some transmitters this effect is much more pronounced than in others, but all of them are more or less subject to it. Taken as a universal remedy it might be suggested that if new granulated carbon is placed in the microphone affected a beneficial result may be observed.

The induction coil, with its primary and secondary winding and its iron wire core, is a comparatively simple piece of apparatus. The part usually damaged is the secondary winding. Sometimes when roughly handled the primary winding is broken or crossed on the side of the core ends, in which case it is necessary to first unwind the secondary in order to repair the primary winding. In rare instances the secondary winding is burned out. When this occurs it may be taken for granted that other parts of the coil have received serious damage, and that it would not be worth while to purchase new wire for the secondary winding, when a new coil could be had for a trifling additional cost. The more com-

mon trouble, and one which can be repaired at practically no expense, is caused by discharges of currents having a very high difference of potential. As a rule the wire will be found broken near the outside, and it can be repaired without requiring specially constructed tools. If it is necessary, however, to unwind the coil, it must first be clamped fast by a pair of chucks or jigs, which fit the spool-heads. One jig should be fastened to a stationary center, and the remaining one to the driven head of a lathe spindle. Under no circumstances is it advisable to remove the core wire for the purpose of sliding the spool on a mandrel, as it is almost impossible to reinsert all of the core wire taken from a coil.

The bell magnets are constructed of an insulated

FIG. 2. LOUD-SPEAKING TELEPHONE.

iron core, with fiber-heads between which a certain quantity of wire is wound. One end of the core is provided with a tapped hole for the reception of a screw fastening into the frame. When it is necessary to repair a faulty ringer, first ascertain where the trouble lies, then, if the coil requires rewinding, remove it from the ringer-frame and screw it fast by means of the threaded hole mentioned to a threaded jig held in place by a chuck on the spindle of a coil-winding machine. The winding of a ringer coil is so simple an operation that it should never be necessary to return one to the factory for repair. In order to avoid delays it is advisable to keep a supply of fiber-coil ends constantly on hand, as a burned-out coil would probably mean a new set of heads. The polarizing magnet of a magnetic ringer is a magnetized bar, and calls for attention only on very rare occasions.

The magnetic generator is a more difficult piece of apparatus to keep in good working condition. The armature bearings wear out in course of time, and can not well be repaired. The gear wheels often are a source of annoyance, especially if the teeth of the larger wheel are very narrow, in which case the smaller wheel or pinion is quickly worn out where the driving gear engages it. Another troublesome point is the wearing off of the armature contact pin, but this wearing may be arrested by a special metal cap placed over the end of the pin. Usually, however, the fault is given no serious consideration until the pin is worn away entirely to the armature frame, when, of course, a new pin is required. This pin is not easily replaced and generally the armature must be returned to the factory for this purpose. The permanent magnets of a generator, if originally made of good material, will require no attention further than remagnetizing after a demagnetizing current accidentally passed through the armature winding. The armature windings of most generators may be taken off and replaced without much trouble, as one limb of the armature is provided with a tapped hole by which it may be fastened to a threaded jig, as was done with the bell coils. In preparing an armature for winding it should be carefully insulated with strips of cloth and paper. Before winding, a strong piece of twine should be laid across the center at right angles to the shaft on both sides of the armature and in such a way that after the wire has been wound on both limbs it may be kept from flying out and against the pole-pieces by tying both ends of the twine together over the wire. While speaking of fastening armatures to a winding chuck the writer failed to mention that recently an armature has been placed on the market wherein the threaded hole is not required, for the armature limbs are so constructed that in order to hold it a specially constructed clamp-

FIGS. 3 AND 4. LOUD-SPEAKING TELEPHONE.

must be secured from the manufacturer of that particular kind of apparatus.

The switching appliance of a subscriber's telephone requires no special treatment, as it can be kept in good working condition by anyone possessing an ordinary degree of mechanical ability.

Telephone In Hawaii.

Mr. John Cassidy, superintendent of the Mutual Telephone company of Honolulu, was in Chicago last week, looking over modern equipments for telephone exchanges. Mr. Cassidy is a native of Albany, N. Y., but he has been a resident of Honolulu 20 years, and is now very much attached to that country and its people. He says that the prospects for improved business conditions in Hawaii are exceedingly bright, and that the country is now enjoy-

ing a large measure of prosperity. Mr. Cassidy has been interested in the electrical development of the country, and was formerly identified with the electric-lighting interests. The telephone has a wide field of usefulness in Hawaii, and it is becoming more generally employed there every year.

Loud-speaking Telephone.

A telephone has been invented by a Frenchman, M. Germain, with which singing and speaking may be heard at a distance of 300 feet from the receiver, and which, when required, registers its message by means of an attached phonograph. The instrument is described by M. Leroy in La Nature, from which the accompanying illustrations have been reproduced.

Fig. 1 shows one of the principal devices adopted. In No. 1 is a general view of the transmitter, and in No. 2 a transverse section. In front there is an opening, in which are the ends of four small tubes that lead from the vibrating disks (A and B). These disks, made of silicate of potash and magnesia, are of special construction and vibrate with great ease. On them are fixed a series of small cylinders enclosing powdered charcoal.

This arrangement is based upon the principle of the microphone, and gives remarkable results with a certain intensity of current. When a person speaks in front of the transmitter there is heard from the receiver a loud and clear voice of good quality, not at all nasal. Even if the voice at the transmitter is very soft, that at the receiver continues to be loud.

The inventor uses also a second receiver (Fig. 2), consisting of a slightly conical tube, over two yards long, which is fixed against the wall and enables one to hear in the garden around his house. In the daytime the outside noises prevent, but in the evening, singing, music and the voice of a speaker can be heard 300 feet away from the receiver. Conversation in an ordinary tone can be heard 50 feet distant.

In the experiments just mentioned the inventor's first model has been used, with four-cell batteries.

FIG. 5. LOUD-SPEAKING TELEPHONE.

There are also other models using six, 10, 15 and more elements, according to the desired intensity. For ordinary conversation the first model is sufficient. When a number of persons wish to hear at once, or to use the instrument in applications like the theatrophone, they may adopt other arrangements and choose higher current-intensities. Figs. 3 and 4 show transmitters that can be utilized in these applications.

M. Germain is also experimenting on a registering apparatus in which a phonograph is combined with the receiver. By this means a message is easily registered in the absence of a correspondent. Fig. 5 shows the chief arrangement. At the right (No. 3) is the transmitter, and at (No. 1) the receiver is shown mounted on the phonograph. As the detail in No. 2 shows, the receiver carries a tube that connects its orifice to the vibrating-plate of the phonograph. These experiments in registration are very interesting, and have succeeded very well. The conversation is heard clearly while it is being registered.

M. Germain's latest instrument, in which the transmitter may be held in the hollow of the hand, was exhibited in Paris, on March 17th, before the French cabinet. "Songs and instrumental music were heard clearly in all parts of the grounds of the Departments of Commerce on the Rue de Grenelle and of Agriculture on the Rue de Varenne, notwithstanding all the noises of the city," it is claimed.

Telephone in the South.

[Special correspondence of the Western Electrician.]

A. J. Cottess is putting in a small exchange at Iuka, Miss.

The citizens of Martin, Tenn., have contracted for a 200-number switchboard and the necessary telephones, in opposition to the Cumberland Telephone and Telegraph company, whose rates proved too high for them.

C. W. Bolton has about completed his lines to Middleton, Tenn. This gives him also one line from Pontotoc, Miss., to Middleton, Tenn., along the line of the Gulf and Chicago railway, with branches to interior towns.

The Arkansas and Tennessee company is extending its lines from Barfield and Osceola, Ark., up the west bank of the Mississippi River to Gayoso, Mo. W. J. R.

Mattoon's New Exchange Equipment.

The Mattoon Telephone company occupies a unique position among the larger independent exchanges of Illinois, in that it has an exclusive territory and has thus far succeeded in keeping the Bell interests out of the field, although it is one of the most important points in the state, and has developed into an excellent city for a telephone system. Dr. J. A. Lumpkin, who organized the company and personally directed its policy since the inception of the movement, has endeavored to make it a model plant, and his efforts have been appreciated by the people of Mattoon and the independent telephone managers of the state. He has developed the business in four years into one of the best independent plants in the state, extending the service and improving the equipment as fast as the demands of patrons warranted. The company is now installing a 500-drop metallic switchboard, manufactured by the Sterling Electric company of Chicago, and illustrated in the accompanying cut. Other improvements in keeping with the character of this equipment are being made. The new service will be given early in July, it is thought.

A brief outline of the company's growth will be interesting at this time, showing, as it does, what can be accomplished in this field by well-directed effort, intelligent and conservative management.

The Mattoon Telephone company was licensed as a corporation with a capital stock of \$10,000, in October, 1894. Construction was begun with a list of 80 subscribers the first of January, 1895, and the plant began operation with 120 subscribers on April 20th, the same year. It was at that time the second

tal stock to \$25,000, to provide for the improvements and extensions demanded by the growth of the business. The present management, which, by the way, is the same as the original organization, comprises the following named officers and directors:

President, Dr. J. A. Lumpkin; vice-president, C. E. Wilson; secretary and manager, John W. Gay; treasurer, Dr. W. C. Lumpkin. Directors, J. A. Lumpkin, W. C. Lumpkin, C. E. Wilson, L. L. Lehman, G. N. Buck and J. W. Bledsoe. Dr. Lumpkin is widely and favorably known in the independent telephone movement. He is president of the Illinois Telephone association and a director from this state in the National association.

The secretary and manager of the company, Mr. Gay, feels proud of the fact that he suggested the idea of the formation of a telephone company at Mattoon, and afterward interested Dr. Lumpkin, and that they have carried through the first company of any size in the state which has neither had financial troubles nor internal dissensions.

The vice-president of the company, Mr. Wilson, is president of the Mattoon National Bank, and among the directors, Mr. L. L. Lehman is president of the First National Bank, and George N. Buck is the leading retail dry goods merchant of that part of the state. It will be appreciated, therefore, that the enterprise has substantial and influential support. As mentioned before, there is no Bell exchange located at Mattoon, but the Bell interests have repeatedly tried to get a franchise. The citizens at Mattoon, however, are thoroughly satisfied with the superiority of the service given by the Mattoon Telephone company, and do not take kindly to the

system to central energy here, making it, of course, depending it borrowed money as far as possible.

Illinois Telephone Association.

Dr. J. A. Lumpkin, the president of the Illinois Telephone association, was in Chicago last week. He said that he expected a large attendance of exchange managers from all parts of the state at the meeting of the Independent Telephone association in Chicago next week, and he hoped that the meeting would help the local organization. He has sent out the following notice to the owners of independent telephone exchanges and toll lines in the state of Illinois:

"The National Independent Telephone association meets in Chicago the 26th, 27th and 28th of this month, at the Auditorium Hotel. The meeting bids fair to be a grand success and a grand good time awaits those who attend. I should like to see a large delegation of Illinois representatives at that meeting. Those who do attend will be called together some time during the meeting to determine whether or not they desire to keep up our state organization or disband. Your presence in Chicago will indicate how you feel in this matter and determine the future of the Illinois State association."

Colonel Astor's Telephone System.

[From the Saturday Evening Post.]

There are many sides to the character of Colonel John Jacob Astor, by all odds the richest soldier in our late war. Since the death of his father he has been indefatigable in his attention to business. Not

MATTOON'S NEW EXCHANGE EQUIPMENT.—500 DROP SWITCHBOARD.

independent plant to be established in the state of Illinois on what was then considered a large scale. The original capacity was for 150 subscribers, which was considered sufficient for all requirements; but the success of the company was so great that, although no solicitation for telephones has been made at any time since the original list was secured, there has been no time since the start that all orders were filled, and at the beginning of the present year the company had 400 telephones in operation.

This constant growth made many changes and additions to the original plant necessary, but it was determined to wait until the maximum demand could be fairly calculated before undertaking a complete installation upon modern lines. The first exchange was a common-return system, and this plan was followed in making the additions necessary in the development and extension of the service.

Now, however, in addition to the new exchange equipment, the company is rebuilding its lines, putting in new cables on the main leads and converting the entire plant into a complete metallic system. The headquarters for the company will be moved into the second floor of the new Demaree building, where three rooms have been arranged especially for this purpose. The new 500-drop switchboard will be installed there by the Sterling company, together with the cable terminals, protective devices and distributing boards furnished by the same company. The Mattoon company recently increased its capi-

interest of the Bell company in their city, and they have rejected all petitions for privileges in that city. It is generally recognized that as long as the company is in control of the present management and the service continues as satisfactory as at present there will be no place for the Bell system in Mattoon.

Telephone War in Lee County.

The Lee County Telephone company of Dixon, Ill., has been engaged in a lively war with the Central Union Telephone company, and thus far the independent company has managed to make material gains upon the Bell forces. L. D. Pitcher, the president and general manager of the Lee County Telephone company, seems to enjoy the excitement. He says:

"I am pleased to say that we have only had two subscribers go back on us and take a 50-cent telephone of the Central Union company in place of ours at the regular \$1.50 rate, and that we have put in about 20 new instruments in the same time—so we don't seem to kill as easy as they expected.

"We are now building a line from Harmon to Stone, and next week will build a line from Paw Paw to Earlville and put in an exchange there with 40 subscribers. We are also now connected with Shabbonie, Somanank and Sycamore, DeKalb County. The Central Union company is changing its

only his large estate, but his outside investments receive his most watchful care. He carries this system into his home life.

Colonel Astor has a splendid estate up the Hudson, called Rhinecliff. It is a model place in a region noted for summer homes. It is cared for by an army of employes, but Colonel Astor is always the commanding officer. Just after his return from Cuba he described to a friend how he conducted it.

"I run it," he said, "on a business basis. Each department has a responsible head. There is a chief dairyman, chief stableman, chief gardener, farm superintendent and general superintendent. I have a report in writing from each division head on my desk every morning. I can tell each day just what has gone on and precisely what is under way. Every month my accounts are balanced, and I know how I stand just as if I ran a grocery store instead of a country place.

"In addition to that, I have a complete telephone system that enables me to communicate within 15 minutes with every man on the place. I have a central office, and branches in all the important buildings. Besides that, I have boxes, like police telephone stations, scattered at regular intervals along my 40 miles of roads.

"Suppose I want to find out at 10 o'clock on a morning just what each gang of road repairers is doing. I ring up the various boxes, and in a quarter of an hour I have a report from every squad."

Western Electrician

EVERY SATURDAY.

PUBLICATION OFFICES:

Suite 510 Marquette Building, CHICAGO.

TELEPHONE, MAIN 1746.

Eastern Office: 148 Times Building, New York.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the entire contents of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION. In advance, postage prepaid, \$3.00 for a full year of 62 numbers; in clubs of four or more, \$2.00, with free extra copy for eight subscriptions; foreign countries, \$5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—the only general electrical paper published in the West—thoroughly covers a territory exclusively for our own. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers desiring western trade will appreciate the UNEQUALLED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

CONVENTIONS AND EXPOSITIONS.

- International Electrical Exposition in Commemoration of Volta, Como, Italy, May 20th to October 25th. (The date of the festival of the centenary of Volta at Como is fixed for September 18th.)
- American Institute of Electrical Engineers, Boston, June 26th to 29th.
- American Society of Civil Engineers, Stockton Hotel, Cape May, N. J., June 27th to 30th.
- Canadian Electrical Association, Hamilton, Ont., June 28th to 30th.
- Southern Telephone Association, Memphis, Tenn., July 5th.
- American Association for the Advancement of Science, Columbus, O., August 21st to 25th.
- International Meteorological Committee, St. Petersburg, August 25th.
- National Association of Municipal Electricians, Wilmington, Del., September 5th and 6th.
- Philadelphia Exposition of American Manufacturers for Export, September 14th to November 30th. (Under the auspices of the Philadelphia Commercial Museum and the Franklin Institute.)
- American Electro-therapeutic Association, Willard's Hotel, Washington, D. C., September 17th to 21st.
- Chicago Exposition of Electrical Arts, Tattersall's, September 25th to October 9th.
- International Exhibition of Motor-vehicles, Berlin, Germany, during September.
- American Street Railway Association, Tattersall's, Chicago, October 17th to 22th.

It is gratifying to note that a fine marble statue of von Helmholtz has been erected in Berlin, the city in which so much of his work was performed. Professor von Helmholtz was a true scientific investigator, and of the first rank. American cities have memorials of Goethe, Schiller, Humboldt, Bismarck and other German celebrities—why not one of the great physicist also?

Chicago park commissioners, after making themselves ridiculous in the eyes of the community by passing a rule prohibiting the operation of automobiles upon the boulevards and in the parks, have finally yielded to public opinion and allowed the objectionable order to be regarded as a dead letter. The commissioners based their objections to the automobiles on the ground that unless they were operated by experienced men they might injure persons using the parks as a pleasure ground, and that they frightened horses.

It is gratifying to find such evidence of the efficiency of the present administration of the Patent Office as that given in the list of patents presented every week. Among the patents issued on June 13th was one for which application was filed on May 1st. It is evident that the provision made by Congress for improving the service and increasing the force of the Patent Office was a wise measure, and that the appropriation has been judiciously expended. We extend our congratulations to Commissioner Duell, and assure him that the inventors of the country appreciate the efforts he is making.

Keeping in mind the criticism of the Western Electrician upon the failure of the makers of automobiles to design original and attractive vehicles, the following excerpt of an editorial in the Chicago Tribune is interesting at this time:

Nothing could be more stiff or ugly than the horseless carriage in its ridiculous aping of the horse carriage. Its lack of individuality represents that loss of creative imagination, and hence that divorce of beauty from utility, which characterizes our industrial age.

It has been announced in the daily newspapers that the company controlling the business in Chicago would put 200 vehicles into service within a short time. This statement is probably exaggerated, but it is a fact, nevertheless, that a serious attempt is being made to get a large number of these conveyances into public use this season. It is to be hoped that some departure will be made from the old styles thus far adhered to, and that some artistic and graceful carriages will be produced.

An effort will be made at the Chicago meeting of the Independent Telephone association to revive interest in the state organizations and secure a more perfect union of local operating companies, in order that they may resist the aggressions of the Bell companies. In Illinois, for example, it has been found difficult to secure co-operation among exchange managers, not because of any lack of harmony, but simply through indifference to the advantages of a strong state organization. A few local operating companies have lately felt the necessity of such an association, and it is quite probable that they will now support the movement earnestly and inspire their neighbors with a wholesome regard for its influence. Dr. Lumpkin, the president of the Illinois association, has urged the members to attend the meeting of the national organization in Chicago next week, and he has suggested a conference of the local interests at the same time, with the view of determining upon a policy for the approaching contest. The experience of other state organizations, which will be represented in the Chicago gathering, has been so beneficial to the industry that it is believed their influence will tend to arouse the Illinois delegation to a realization of the benefits which closer association will bring.

At last steps have been taken to protect foreign inventors and manufacturers who contemplate exhibiting at Paris next year against the industrial pirates who have heretofore taken advantage of the French patent law, which is understood by so few Americans. The Paris correspondent of the Western Electrician furnishes the following interesting statement upon this subject:

M. Paul Delombre, the minister of commerce and

industry, has brought before the French Chambre des Deputes a bill relating to the protection of industrial property, and especially to articles admitted to the exposition of 1900. The law of July, 1844, prohibits under penalty of annulment the introduction into France of patented articles, and also pronounces the penalty of annulment against the patentees who allow two years to pass without exploiting their inventions in France. The same rule holds good to a certain extent in the case of designs. The bill proposed by M. Delombre is to allow the patentee to introduce into France articles to be exhibited, and suspends the obligation to exploit these inventions during the whole period of the exposition. Besides this bill, inventors will be protected by the statute of May, 1868, providing that every person, native or foreigner, who is the originator of a discovery or invention susceptible of being patented may, if he is admitted to one of the government expositions, obtain a certificate describing his invention, which insures him protection from the date of admission until the end of the third month after the exposition, giving him for this space of time the same rights as if he held a patent in due form. By this statute and the bill proposed by M. Delombre, inventors wishing to exhibit in 1900 may be assured of full protection.

Attention has been directed to this subject several times by this journal, and it has been pointed out that Americans who contemplate exploiting their products abroad should learn the requirements of the French and German laws particularly. In both of these countries American inventions have been openly appropriated under technicalities and no redress could be had by the sufferer.

It seems that the theft of electricity is no crime at present in Germany, there being no express law against it. In December last the Provincial Court at Elberfeld sentenced three mechanics each to one day's imprisonment for stealing electricity. The men had secretly attached wires to a circuit in the house where they lodged, and thus got their room lighted by electricity for nothing. The court decided that electricity possessed the essential properties of a movable object, but this was appealed against, and the case has finally reached the Senate of the Supreme Court of the Empire. The Senate holds that the judgment of the Provincial Court must be quashed, for the reason that those properties are wanting in electricity which would be necessary to constitute it a movable object in the sense of the law. In the sentence it is stated that electricity must be reckoned as one of the energies of nature, like sound, light and heat. As the law provides only against theft of movable bodies, it is inapplicable in the case. Damage to property can also not be pleaded, for this requires that the substance of the object must be affected. It cannot again be said that a property has been withdrawn from the wire, for electricity is not one of the properties of copper wire. The Senate came to the unanimous conclusion that, with the law in its present state, tapping an electric current is not theft.

In extending a welcome to the independent telephone men about to assemble in this city, the Western Electrician desires to congratulate them upon the important change they have made in their method of conducting their meetings, and assure them of its earnest support and assistance in making the convention of permanent benefit to the industry. This journal has advocated open meetings of the association, and has repeatedly pointed out the benefits to be derived from arousing public interest in these gatherings. Secret meetings of organizations representing interests depending largely upon public franchises are always dangerous to the associations holding them, as they create and foster distrust in the public mind—a very serious evil of itself and one which contributes largely to the failure of many enterprises of a public nature. The arrangements for entertaining the visitors this year are on a scale commensurate with the character of the industry, and this feature should prove advantageous. There are many points where the association may be improved, so that exchange managers may get some real benefit from it during the year. An active organization or bureau to furnish data to exchange managers who are fighting the Bell system and a systematic canvass for new members are features that might well be introduced during the coming year. The association should broaden out and take an active part in the development of the industry.

Telephone Service at Paris Exposition.

[Special Correspondence of the Western Electrician.]

Paris, June 15.—[Preparations are now being made to provide the necessary telephone service for the exposition which, it is expected, will assume considerable proportions, as the number of subscribers among the exhibitors is estimated at 2,000. A special system will not be installed in the grounds, as at Chicago, but a large central station is to be erected on government property near the grounds, on Avenue de Saxe. This station will not only supply the exposition, but the whole of the surrounding district, being, in fact, one of the numerous stations forming part of the existing system of city distribution, the whole of which is under control of the government. This district is for the present taken care of by two of the neighboring stations, while waiting for the new one to be erected. The minister of commerce, who has the matter in charge, is to push matters as rapidly as possible, in order to have the new station built and equipped in time for the exposition, which will open in the month of May.

It is probable that Paris will shortly have a telephone line to Berlin, by which conversation may be held directly between the two cities, thus doing away with any intermediate connection. This line has been greatly needed, and will doubtless give good service. Its construction has been delayed for some time, owing to the differences between the two governments; but, as the project has now been approved by the German government, there is no doubt that it will also be accepted in France. The line will be of double silicon bronze wire, five millimeters in diameter, and is, in fact, one of the longest lines constructed in Europe up to this time. Another similar line is to extend from Paris to Frankfort, and as Berlin and Frankfort are already connected, the joining of these two lines will give a second connection from Paris to Berlin. These projects will be carried out immediately after the consent of the French government is obtained.

A new system of telephone communication has lately been put in practice, by which a message may be sent from one of the public telephone stations to any address desired. The message is taken down by the employe at one of the other stations nearest the residence of the person to receive it, and is delivered by a special messenger boy, somewhat after the manner of the special-delivery system. This is made easy on account of the large number of telephone stations in Paris, these being installed in the branch postoffices, which are scattered all over the city. To communicate with a subscriber in the ordinary way a ticket, costing five cents, is procured at the telegraph window, and given to the attendant, who calls up the subscriber, after which one enters the telephone box and may hold a three-minute conversation, after which an additional rate is required. The new system recently organized provides for the more numerous cases where the person to be reached is not a subscriber; however, the rate is higher, being ten cents for the delivery of the message to the residence. Besides the telephone communication between the different postoffices, there has existed for a long time the system of "cartes-telegraphes," by which a message written on a special card or letter-sheet is sent from one office to another by pneumatic tube, and delivered at once to the address desired. This system has proved very satisfactory, and is largely used; the rate for an open card is six cents, and for a sealed letter-sheet ten cents. It is expected that this system will be replaced to some extent by the new arrangement for the delivery of telephone messages, as one has the advantage of being able to call the other person to the telephone, if desired. F. P. M.

Bell Interests in Michigan.

The Michigan Telephone company has decided to build a \$10,000 addition to its operating rooms in Detroit. The new building will be used for a warehouse.

Under startling headlines the Detroit Free Press of June 17th announces an opportunity for inventors: "President Charles J. Glidden of the Michigan Telephone company telegraphed the Free Press from Cleveland yesterday concerning a statement recently made, that he will pay \$1,000,000 for a telephone repeater or quadruplex used in connection with a telephone, which will produce, technically speaking, the same results that the telegraph quadruplex does to-day in the workings of the telegraph. Mr. Glidden is president of the Erie telephone system, which operates under the Bell patents, with 82,000 subscribers in Michigan, Wisconsin, Minnesota, North and South Dakota, Cleveland, Texas and Arkansas. The companies included in this system operate a great many long-distance lines, and are now engaged in extending their systems to many new points, as well as doubling the facilities on existing lines. The class of construction work done is of a very high order, and as nothing but copper wire is used, the investment runs into the hundreds of thousands very fast. Up to the present time, no satisfactory quadruplex, or repeater, for telephone purposes has been devised, and not more than one conversation can be held over a pair of wires at one time. The offer of \$1,000,000 for a satisfactory telephone quadruplex will doubtless have the effect of stimulating electrical experts in their work along this line."

The Michigan Telephone company's new long-distance circuits between Detroit and Kalamazoo will be completed within a very short time, it is said, and it is expected that the circuits will be completed as far as Jackson within ten days or two weeks. The lines through to Marshall will be ready by July 1st. In the construction of these new long-distance lines, the Michigan Telephone company is using nothing but first-class material and nothing but copper wire is being strung. The Detroit-Kalamazoo line involves the use of 5,400 poles, 12,400 cross arms, 124,000 pins and 124,600 insulators, and a total of 315,850 pounds of copper wire is used for this line. The Marshall Statesman of June 16th says: "Possibly the telephone company will soon have an exchange list, so that by July 1st subscribers may also be able to know with whom they may talk."

Helmholtz's Monument.

The accompanying illustration represents the statue erected to the memory of von Helmholtz at Berlin, which was unveiled in the University Garden June 6th. It represents the mathematician and physicist in the attitude so familiar to his former pupils, the professor's mantle being thrown over his frock. The likeness is said to be as nearly perfect as the nature of the material permits. White Tyrolense marble was selected by the artist, Ernst Herter, for the statue, and red Franconian marble for the pedestal. The cost of the work amounted to \$25,000, of which the emperor contributed \$4,000.

HELMHOLTZ'S MONUMENT.

The inscription is simply, "Herman von Helmholtz, 1821-1894."

Growth of Telephone Service.

Charles J. Glidden of Lowell, Mass., president of the Erie telephone system, while in New York recently was interviewed by a Tribune reporter and presented some interesting data upon the development of the telephone as a commercial factor.

"The telephone business in the United States," said Mr. Glidden, "is increasing at a rate which exceeds anything in its history. The subscribers of the Erie system alone are increasing 4,000 a month. I know of no other reason for this remarkable growth than the general business revival throughout the country. I have noticed, however, that the greatest development is along the Pacific Coast, in Washington, Oregon and California. Four per cent. of the population there have telephones. In proportion to its size San Francisco has more telephones than any other city in the United States. It has over 14,000 instruments, which is five per cent. of its population. On this basis New York should have 150,000 instruments."

"The long-distance service now reaches to Galveston, Tex., in the Southwest; Grafton, N. D., in the Northwest; New Orleans in the South, and the extreme northeastern sections of Maine. The extreme points have not yet been put into commercial connection with each other, the direct use at present being confined to distances of 1,500 and 1,800 miles. I think the capacity of the No. 8 copper metallic circuits, now in use, is about 2,000. A circuit which would permit of a direct connection between here and San Francisco would require copper wire at least as large as an ordinary broom handle."

"In the present circumstances I cannot see where there is room for any phenomenal developments in the telephone system. Now, if someone would invent a telephone repeater, corresponding to the telegraph repeater, or a telephone quadruplex, corresponding to the telegraph quadruplex, it would revolutionize our business and cut the charges in two for long-distance service. Copper wires would not be necessary then, and the reduction of the cost of maintaining the lines would be enormous. I will give \$1,000,000 for either one of these inventions."

Telephony in New England.

[Special correspondence of the Western Electrician.]

Boston, Mass., June 19.—The readjustment of affairs that is under way in the Bell telephone interests is preparing the public for the transfer of control to the American Telephone and Telegraph company, which has been contemplated, it is understood, for quite a while, under the recent increase of capital stock in the latter corporation from \$25,000,000 to \$75,000,000. Rumors have been current lately in Boston to the effect that the Erie syndicate had bought the New England Telephone company. Nothing of the sort was broached at the annual meeting of the Erie, however, and President Glidden of the Erie and Hudson of the New England could shed no light on the subject. It seems more probable that the real project in prospect is the transfer by the American Bell company of its holdings in dependent companies to the American Telephone and Telegraph company, the better to carry on the growing business of these concerns.

The board of health in Boston has caused a number of telephone transmitters in hotels and public buildings to be examined microscopically by an expert bacteriologist, and resulting in the discovery that they were singularly free from harmful bacilli. Dr. Hill, the examiner, declared that the telephone transmitter cannot be considered a usual or dangerous source of disease. He admitted possibility of infection where a user of the transmitter is affected with diphtheria, tuberculosis or other contagious disease, and where a deposit of saliva is left on the transmitter by coughing or in some other manner. Infection from expired air of breathing he looks upon as hardly probable or even possible. Frequent cleansing of transmitters is recommended, however, for aesthetic reasons, and he suggests washing them with a one per cent. solution of formalin or five per cent. solution of carbolic acid. He asserted that as a rule "there are not in telephone transmitters microbes of any more dangerous nature than are to be found daily in the water we drink or the air we breathe."

The Massachusetts Telephone and Telegraph company (anti-Bell) has just secured franchises in Lawrence, Mass., and Waltham, Mass. Negotiations have also been opened with New Bedford for the right to do business there.

The New England Telephone and Telegraph company has bought an estate on Norman street, Salem, Mass., for a central telephone station, and will raze the old structure, to replace it with an edifice perfectly equipped for the business. The company has been seeking a suitable property for the purpose upward of a year. The company has also secured within a few days an estate in Boston in the North End district, at a cost of upward of \$25,000, most of the valuation being on the land.

At the annual meeting of the Erie Telephone and Telegraph company on June 14th the following board of directors was elected: John C. Burke, Lowell, Mass.; A. B. Chandler, New York; Charles J. Glidden, Lowell, Mass.; Wesley A. Gove, East Boston, Mass.; David S. Greenough, Boston, Mass.; James H. Mills, Lowell, Mass.; James W. C. Pickering, Lowell, Mass.; Asa C. Russell, Lowell, Mass.; Levi Sprague, Lowell, Mass.; H. Fred Stevens, New York; Charles S. Tuckerman, Boston, Mass.; Harvey A. Whiting, Wilton, N. H. The board was organized by the election of Charles J. Glidden, president; George B. Perham, secretary, and Charles A. Grant, treasurer.

Before Judge Colt, in the United States Circuit Court, in this city, the hearing in the final stage on the matter of an accounting from the Bell Telephone company to the Western Union Telegraph company has been in progress, and on June 15th the judge took the papers and documents in the case under advisement, reserving decision to be announced later. This is the big legal contest which has been on since 1883, litigation growing out of the interpretation of the terms of a contract made November 10, 1879, whereby the Western Union Telegraph company ceded the telephone business under its control at that time to the telephone company for certain rentals or royalties. It is set forth by the plaintiffs that after the contract was made the telephone company changed its method of conducting business, so that in addition to specific rentals the defendants received from licensed companies a certain percentage of stock in the licensed corporations, for the use of telephones under its patents. It is 20 per cent. of the stocks so received that the plaintiffs seek to secure. The late Judge Lowell, acting as a master, found for the defendants in the matter, and the Western Union company seeks to have his findings superseded by the court on exceptions. Several millions of dollars are involved in the decision.

From Hartford comes the announcement that on June 13th the lower house of the state Legislature refused by a large majority to grant the petition of the New York and Boston Telephone company for an incorporation in the state. The company made a proposition to give free telephone service to the state and to cities which it entered, and agreed that its rates should not exceed \$50 a year to business houses and \$30 a year to residences. It also agreed to accept amendments to the proposed charter which would prevent its consolidation with any other company, unless the absorbing company should agree to keep the rates as low as \$50 and \$30 a year, and further, that unless all of the capital stock of the company should be paid in within 90

days of incorporation the charter should be null and void.

This action of the Connecticut Legislature was foreshadowed in an adverse report on the petition from the committee to which it was referred. The Massachusetts Telephone and Telegraph company, which has begun to lay its conduits and establish the service for Boston and vicinity to compete with the Bell companies, had hoped to connect with New York via Connecticut, and the New York and Boston Telephone company was to have been the long-distance backbone of the system. The setback is something of a blow to the new enterprise, but work on the Boston and suburban circuits will be pushed just the same. The company has already secured upward of 3,000 subscribers in Boston. J. S. B.

Eureka Electric Company's Factory.

In the accompanying illustration is shown a view of the switchboard department of the Eureka Electric company's factory, which is located at McCordsville, Ind. It is said to be one of the best-equipped telephone manufactories, and contains nothing but the latest high-grade machinery, which enables the Eureka company to turn out only work of the highest degree. The company keeps constantly employed about 100 hands, and at the present time is obliged to keep its force working day and night to meet the demand for the Eureka switchboards and other Eureka products. The Eureka metallic switchboard, like the company's telephone, is in no way behind its competitors. It is said to be rapid in operation, simple in construction, economical in maintenance, while its accessibility is one of its leading features. It is claimed that each drop and jack is self-contained, and can be removed and replaced in less than 30 seconds by anyone without disturbing a single line connection and without the use of a tool. The switchboard, it is claimed, possesses many other points of superiority. The Eureka company says that its apparatus is now in service in over 300 prosperous telephone exchanges, and is said to be giving the best of satisfaction. The company is now equipped to manufacture telephone apparatus to meet any special requirement. The success of the company has been remarkable, due, no doubt, to the untiring efforts of Messrs. Kusel and Stein. The company will exhibit its apparatus during the Independent Telephone association convention, where those who desire to look further into the merits of the Eureka apparatus will be given an excellent opportunity to do so.

Southern Telephone Association.

There will be a meeting of independent telephone men at Memphis, Tenn., on July 4th and 5th. The

was effected, and the following officers elected: President, James D. Randall, Memphis, Tenn.; secretary, C. W. Bolton, Pontotoc, Miss.; treasurer, George W. Scheuing, Memphis, Tenn.

It is proposed that each exchange owner or manager in the South be requested to furnish the association a map of lines and such data so that a map and directory of the telephone business of the South can be made, showing the various telephone lines now built, or under construction, with a view to pointing out all unoccupied territory and gaps which could be filled in to advantage, and give better and more profitable service by operating together. There is much territory which is not now occupied by telegraph or telephone lines, and it is believed that by working together these gaps can be filled in, new lines built and the telephone service in the South greatly improved and a better understanding exist between the several companies.

Carty Patent and Independent Exchanges.

By H. C. DODGE.

The recent decision by the United States Circuit Court of Appeals, upholding the validity of the Carty bridging-bell patent, the full text of which was

FIGS. 1 AND 2. CARTY PATENT AND INDEPENDENT EXCHANGES.

presented in the Western Electrician last week, will not result in precluding the lawful use of bridging-bell telephones in connection with party lines by operators of anti-Bell toll lines in this country, and the decision in question is of no considerable importance to operating telephone companies, inasmuch as they can procure for use in the open market

combination, which Mr. Carty in his deposition admits necessarily involves the permanent bridging of the bell magnets, and does not cover and is not infringed by a device in which the bell magnets are not always in bridge.

The patents urged against the validity of the Carty patent showed that the bell magnets had been permanently bridged, as the Black & Rosebrugh patent described the call-bell magnet as connected by wires to the line and showed it as permanently bridged between two of the binding posts, and the Preece & Maier publication described the bell as "joined between A and B lines respectively at five and four." Mr. Carty himself in his deposition admitted that ringer magnets had been bridged between the two sides of the lines before his invention. It was urged by Mr. Carty's counsel that the permanent bridging of the bell magnets prevented the voice currents from becoming short-circuited by reason of the high resistance of the magnets. This objection was obviated in the Preece & Maier publication by having the electromagnetic inertia of the magnets "choke the circuit across the bridge," which likewise prevented short-circuiting. The electro-

magnetic inertia of the Preece & Maier bell magnets was admitted by the court to be the same thing as the high co-efficient of self-induction of the Carty magnets, each preventing the short-circuiting of the talking currents. Likewise, patents to Mr. Lockwood, the Bell company's well-known expert, and to Mr. Thompson show that it had been the practice to provide devices to block a loop or bridge against rapidly fluctuating voice-currents, while allowing the steady flow of the battery currents. Mr. Thompson says in his patent, by inserting in the loop or bridge "an electromagnet constructed with a large number of turns of wire surrounding an iron core, to insure the required co-efficient of self-induction, will plug the loop with its great electric inertia with respect to the rapidly fluctuating telephonic currents." Thus the very means that Mr. Carty had employed were shown to be old in the art for identically the same purpose, and with these facts admitted upon the record the court was unable to find that Mr. Carty had evolved any new arrangement of parts or discovered any new methods of preventing short-circuiting of the voice-currents, but contented itself with holding that as all of the elements were old and all of their functions were known, the patent could be sustained only on the ground that the bringing together of these various elements as specifically combined by Mr. Carty was sufficient to sustain his patent because, as the court said:

The grant of the patent carries with it the presumption of patentability, and this presumption has been strengthened by the general acceptance of the device, the acquiescence of those skilled in the art, and their willingness to accept licenses thereunder.

The patent was thus given the very limited construction of covering apparatus in which the bells are permanently bridged and as being specifically limited to such apparatus. It is not given a broad construction as covering all apparatus in which the bell magnets are merely normally or temporarily bridged as distinguished from permanently bridged, but is distinctly limited to an apparatus having the bell magnets in permanent bridge.

At the argument of the case Mr. Carty's counsel urged that the effect of the permanent bridging of the bells was to produce electrical balancing of the line, thereby reducing the annoyance of induction to a minimum. It is well known to all electricians that the mere placing of the bell magnets in permanent bridge will not produce this condition. Each wire of the circuit must have as nearly as possible the same resistance, insulation and electrostatic capacity as the other, which means that the two wires of the circuit should be of the same material, diameter and length, and should be carefully insulated and carried on the same poles and even on the same cross-arms. Moreover, not only must the electrical qualities of each wire of a metallic circuit be alike, but the electrical conditions produced by neighboring wires must also affect each wire equally; in other words, the relative exposure of each side of the circuit to sources of induction must be the same. This condition is usually produced by transposing the two wires of a circuit at certain poles along the line, so that for alternate stretches each wire

EUREKA ELECTRIC COMPANY'S FACTORY.

banquet hall of the Peabody Hotel has been secured for holding the business session, and the parlors of the hotel will be available for showing apparatus.

The meeting is to be held under the auspices of the temporary organization formed at Memphis on February 14th, by owners and managers of independent telephone lines and exchanges in the South. At that meeting it was decided to ask all persons interested in the telephone business in the South to co-operate, with a view to holding a convention at some convenient place during the summer, for the purpose of permanently organizing and adopting suitable rules and regulations for the government of the association. The name adopted for the present is the Southern Telephone association.

At the spring meeting a temporary organization

highly efficient non-infringing bridge-type telephones. The claims of the Carty patent in question, which the court has held to be valid, cover all forms of telephones permanently bridged in the line; that is to say, where two or more telephones are in use. The decision of the court upon the patent limits its application to an apparatus in which the bell magnets are permanently bridged. It was urged at the hearing by the counsel for the defendants, Josiah McRoberts, that all of the elements employed by Mr. Carty were old and that their functions were well known. The court concedes the truth of this position and says:

All of the elements of the combination had been used before and the functions of each were well known in the art, but it does not appear that they had ever been similarly specifically combined for effectuating the purpose here accomplished.

Hence, the patent was upheld for the specific com-

takes the place of the other, and so that each wire shall be in turn exposed to the sources of induction. Now, unless this condition exists, the employment of Mr. Carty's permanently bridged bells will not even have a tendency to produce electrical balance of the line, because without this transposition of the two wires of the line only one of the wires will be exposed to the source of induction and affected by it. The fallacy of the assertion that the Carty device of itself produces a balancing of the line is apparent.

The expert who testified that the apparatus of the Millheim Telephone company, which was the defendant, was constructed according to the principles

precipitated by users generally. In making the change from bridging to series remove the shunt coil (A) and change the ringer coils (B), substituting the low-wound series style. For series service the armature is wound for use with series or low-resistance ringers to be employed; for bridging work the armature is wound for use in connection with bridging bells to be used.

When the generator is operated, the disk (D) automatically breaks the shunt circuit at (S) and makes contact with the spring (R), thus causing the electric current to flow through the coil (A), contact (H), and to line through the binding-post (C). The disk (D) and generator (G) are in electrical connection; therefore, while operating the generator, the coil (A) and ringer magnets (B) each conduct a certain amount of the current. In practice the coil (A) conducts about 95 per cent. and the ringer magnets (B) five per cent., which latter quantity is just enough to gently sound the local bells.

Burns Sneak-current Arrester.

The Burns sneak-current arrester, manufactured by the Northwestern Telephone Manufacturing company, is built on entirely new lines, and is both

cut by a weak current and operated by a standard (Fig. 2) with carbon and porcelain contact test for 50 metallic line. The arrester may be mounted on iron cable terminals, complete with carbon arrester, and also singly for the protection of station instruments.

Interior Telephone System.

An interesting equipment for private use was recently installed in the new University Club, Fifth fourth street and Fifth avenue, New York, by the Schmidt & Bruckner Electric company of that city.

The system is of the automatic-signal type. The act of taking the receiver off the hook throws the line drop at the switchboard, and on replacing the clearing-out drop falls. The operator cannot restore the line drop until the plug is inserted in the correct jack or the clearing-out drop until the plug is withdrawn. Central batteries are used for talking and ringing purposes. The induction coils are also centralized. The switchboard is shown in Fig. 1.

At each of the bedrooms and parlors is located a small, white enameled box, on which is mounted a buzzer and a small stationary hook. The telephone

FIG. 1. INTERIOR TELEPHONE SYSTEM.

of the Carty patent, stated that the bell magnets were bridged between the sides of the line. The apparatus furnished to the Millheim company was not permanently bridged, and if the expert's statements are true, it is apparent that this apparatus was changed after it had been installed. None of the apparatus made by the company which furnished the Millheim apparatus is provided with permanently bridged bells, and the only inference to be drawn from the expert's deposition is that he made a misstatement of fact or that the local company had changed the circuits. The Court of Appeals did not go into the question of infringement, but contented itself with following the lower court in this particular, the lower court having accepted the expert's statements without critical examination.

And now comes the opportunity to "toot our own horn" a little in proclaiming to independent telephone users that the Western express No. 2 bridging-bell telephone is absolutely free from claims of the Carty patent, and of all other patents

FIG. 2. INTERIOR TELEPHONE SYSTEM.

controlled by the American Bell Telephone company or others. The accompanying diagram (Fig. 1) shows connections of signaling apparatus of the instrument, which is shown complete in Fig. 2. Not only are the bell magnets not permanently bridged, but the telephone generator, when operated, rings its own bells in series. The ordinary Watson circuit is employed with the exception that the shunt-coil (A) and contact spring (R) are added.

These telephones may be changed from bridging to series type, or vice versa, in a few minutes. The desirability of accomplishing this result will be ap-

Fig. 1.

Fig. 2.

BURNS SNEAK-CURRENT ARRESTER.

cheap and serviceable. Its operation is simple; the heat coil springs out of circuit, leaving a gap of 1/2 inches. In other arresters the coil must break in order to open circuit, requiring an expert to repair them, and even then their usefulness is lessened by arcing.

The Burns arrester is practically indestructible and can be used over and over again indefinitely, thus reducing the cost of maintenance. The illustrations show a heat coil (Fig. 1) in its normal position, also warped after having been forced from cir-

FIG. 1. LIGHTNING ARRESTERS.

used is the company's No. 70 combination microphone, with a clip on the handle, shown in Fig. 2. This clip is pressed down for calling and talking, and springs back when the pressure is removed, thus throwing the clearing-out drop. To the microphone is attached an eight-foot cord, so that the instrument may be laid on a night table by the bed and can be used while reclining. The other sets consist of small compact wall and portable desk telephones, the wood finish being in white enameled and various shades of oak, the metal parts being either of nickel or oxidized copper. The system includes 80 stations, and matches well the magnificent interior of the new club.

The Schmidt & Bruckner Electric company has a number of installations of this class in line, and although a great amount of special work is involved, its manufacturing facilities and experience particularly adapt it to this field.

A novelty in the use of telephone apparatus is the equipment of the elevators of the Park Row building, New York, with telephones connected to switchboards in the engine room. The chief requirement of such a system is telephones that will always work when called upon.

Lightning Arresters.

The question of selecting lightning arresters for the protection of telephone, telegraph and other sensitive instruments is a very important one; in fact, many experts consider it the most important feature of the entire construction of a telephone exchange. In the selection of a lightning arrester, for exchange service, consideration must be given the claims for simplicity of construction, durability and reliability, small space occupied, together with the quality of material used in the construction. It is claimed that all of these advantages are to be found in the arresters manufactured by the Harvard Electric company of Chicago. They are simple and durable in construction, and positive and reliable in action. They are known to the trade as the standard No. 66 and 134 combination porcelain fusible cut-out carbon lightning arresters for common return and metallic circuits. It is claimed that they are in use in every important telephone exchange and telegraph office in this and foreign countries.

The advantage of a combined fuse and carbon

FIG. 2. LIGHTNING ARRESTERS.

lightning arrester may be found in the cost of maintenance, safety, durability and readiness for service at all times.

Fig. 1 shows the standard porcelain double-pole combination fusible cut-out carbon lightning arrester for metallic circuit, and Fig. 2 illustrates a standard 10-circuit fusible cut-out carbon lightning arrester, mounted on a polished oak base, especially adapted for switchboard protection.

Severe tests under all conditions have demonstrated the efficiency of these devices. The fuse links are held in position by metallic clips, and can

be easily and quickly replaced. The spark-gap carbons are held firmly in fixed position, and cannot slide out of place so as to make connection, producing short circuits, and are readily removed for examination. The metal parts are mounted on a substantial porcelain base. All parts are indestructible, with the exception of the fuse links, and the cost of replacing them when burnt out is merely nominal. A fuse arrester used alone does not afford proper protection to sensitive instruments from damage by electric currents, nor does a fuse arrester, when used alone. The combination of these types must be employed to secure such immunity.

Operators of exchanges and toll lines and telephone users generally do not care to take chances in matter of interruption of service, causing a loss of revenue, inconvenience, waste of time and expense resulting from improper protection of apparatus. The Harvard Electric company of Chicago, which makes these arresters, has also a complete line of standard fuses, fusible cut-outs, center-plate and carbon lightning arresters.

Telephone Rates in Chicago.

The question of telephone rates and service in Chicago is one that directly appeals to every business man in the community. At present the Chicago Telephone company is charging rates that are not warranted by its franchise from the city. This condition has been commented on in these columns, and it is still a matter of discussion, provoking many complaints from unwilling patrons of the company. At the last meeting of the Illinois Manufacturers' association, at Chicago, June 16th, Martin B. Madden opened the discussion of the question of telephone rentals and tolls, which was the special order of the evening. He gave the history of the Chicago Telephone company and of the ordinance under which it operates. The rates charged by the company, he said, were much too high, and the service was decidedly inferior. The price of telephones had advanced until now they were as high as \$300 a year. The stock of the company, he said, had been watered until fabulous dividends were paid to the stockholders. He then read the ordinance, which placed a limit on telephone rates of \$125 for business and \$100 for private or house instruments. This section has already been published in the Western Electrician. Mr. Madden continued:

That the charges for telephone service in this city are out of all proportion to what is reasonable to produce a proper return on the cost of the plants required for the service admits of no question whatever. Companies formed in other cities in this union, except perhaps New York, where the price per annum has been raised from \$60 to \$250, furnish a service infinitely better than we receive for less than half what we are called upon to pay. Next to New York the rate in this city is higher than anywhere in the world for the same service.

The City Council should be requested to act in the matter so far as it is at present authorized to do so under the existing ordinance. Failing to accomplish the desired result, the Legislature should be appealed to to grant such authority as will enable the proper city authorities to see that no injustice is done to the telephone-using public.

T. K. Webster of the Webster Manufacturing company also spoke on the evils of the telephone system of Chicago. Among the other speakers were Arthur D. Wheeler of the Chicago Telephone company, W. A. Jackson of the Central Union Telephone company and J. E. Keelyn of the Western Telephone Construction company.

Commenting upon this meeting and the discussion of telephone rates, the Chicago Record says, editorially:

The Illinois Manufacturers' association at its banquet Friday evening discussed the subject of telephone rates. There was particular complaint regarding the rates for communication with other towns in the state.

The ordinance of the Chicago Telephone company, granted in 1889 for a 20-year period, contains this clause: "Said company, during the term for which this ordinance is granted, shall not increase to its present or future subscribers the rates for telephone service now established." Notwithstanding this clause the price of telephone service has been advanced from \$125 to \$175 a year. To be sure, the company furnishes a kind of service for \$125 a year and even less, but the price of its best service has been advanced. The intent of the ordinance of 1889 undoubtedly is that the best service of the company shall be furnished at the rate prevailing when the ordinance was passed. A telephone company, like other public-service corporations, is expected to keep abreast of the times in improvements and not increase its rates with every change for the betterment of the service.

The city government ought to take steps to compel the Chicago Telephone company to lower its charges for good service to \$125 a year, in accordance with the provisions of the franchise under which it operates. It is probable, however, that \$125 is an excessive price for telephone service. If honest legislators at Springfield can be induced to pass laws which shall lead to honest and wise regulation of telephone charges in Chicago and Illinois, the public will be deeply grateful. The curse of "sandbagging bills" and venal legislators is the most serious obstacle in the way of this important reform.

Busy; Please Call Again.

[From Harper's Bazar.]

"Hello, Central!" "What number, please?" "One hundred and two hundred and sixty-four." "I don't catch that." "One thousand two hundred and sixty-four." "Try it once more, please." "Twelve hundred and sixty-four." "Seven hundred and sixty-four." "Not twelve hundred and sixty-four— one thousand two hundred and sixty-four." "I can't give you two numbers at once. Which do you want first?" "I was giving you the same number two different ways." "A little louder, please. I can't quite make you out." "I said I was giving you the same number two different way." "Oh, yes. Well, what number do you want?" "Twelve hundred and sixty-four." "Suppose you give me one, five and separately like one, two, three, for instance." "All right. One, two, three, four, five, six, seven, eight, nine, ten, eleven, twelve. Got that?" "Yes." "One, two, three, four, five, six. Got that?" "Yes." "One, two, three, four. Got that?" "Yes."

You want twelve, six, four, do you?" "Yes; twelve hundred sixty-four. Do you understand now?" "Yes; I understand. Twelve-sixty-four is busy now. Ring off, please."

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The Northwestern Telephone Exchange company is building a line to Princeton, Minn. The Northeastern Minnesota Telephone company of Rush City, Minn., will also build a toll line to Princeton.

The Northwestern Telephone Exchange company will have its new extension between Langdon, N. D., and Park River completed by July 1st.

The Waushara Telephone company of Berlin, Wis., has installed a new switchboard of 100 drops.

The Edgerton Telephone company has been granted a franchise for a local exchange at Edgerton, Wis.

The Badger State Telephone company is arranging to form a local company and install an exchange at Delavan, Wis.

The Minnesota Mutual Telephone and Telegraph company has been granted a franchise at Herman, Minn.

Charles Demorest, formerly manager of the Iowa Telephone company, at Eagle Grove, Ia., has been placed in charge of the company's office at Fort Dodge, Ia.

The Lake Mills (Wis.) Telephone company is extending a toll line northward to Faville Grove.

The Mutual Telephone company of Des Moines, Ia., is making large extensions and improvements to its system. New cables are being put up, sub-exchanges will be built and toll lines extended.

Dr. Chamberlain of Stratford, Ia., is an applicant for a telephone exchange at Webster City, Ia.

The Boone County Telephone company of Boone, Ia., has installed a new and larger switchboard.

The Marquette County Telephone company of Marquette, Mich., is arranging to build a system to cover Houghton, Ontonagon and Keweenaw counties in north Michigan. It proposes an active competition with the Bell interests at all points.

The Sioux Rapids Telephone company has been granted a franchise for a local exchange at Sioux Rapids, Ia.

The franchise granted the American Telephone and Telegraph company by the council of St. Paul has been accepted by the company.

The Zenith City Telephone company has started work on the new exchange to be put in at Duluth, Minn. Work has been started on conduits. This company has purchased the exchange at Ashland, Wis., of the Chequamegon Telephone company, now in course of construction. This will be completed and toll-line connection will be made between Ashland and Duluth.

A local telephone exchange is desired at St. Thomas, N. D., and when the long-distance system reaches St. Thomas an effort will be made to secure one.

The Home Telephone company of Sioux City, Ia., has completed a toll line to Le Mars, Ia.

The Northern Minnesota Telephone company will soon construct its proposed toll line between Menasha, Minn., and Wadena. The company has made a traffic agreement with the Northwestern Telephone Exchange company for connection. A local exchange is projected for Park Rapids also.

The Standard Telephone company has issued a warning to renters of its instruments in Southern Minnesota to the effect that complaint has been made of persons interrupting messages passing over the wire, by shouting and whistling, etc. The company asks for information when it occurs and promises to take out the offending telephone.

A local telephone exchange has been completed at Benson, Minn.

Hewett & Swanson are installing a local exchange in Warren, Minn.

The Nicollet County Telephone company of New Sweden, Minn., put in a line last summer at a cost of \$2,275. The running expenses since August, 1898, according to the annual statement, were \$41.60.

Work has been started on construction for the Lake Park, Minn., and Ulen telephone line. It is expected to be completed by July 1st.

The Minnesota Mutual Telephone company has been granted a franchise for an exchange at Hinckley, Minn.

The local telephone exchange being built in Le Sueur, Minn., will be connected with the Northwestern Telephone Exchange company's toll system.

Competition in the telephone line is in prospect for Austin, Minn.

The Southern Dakota Telephone company of Madison, S. D., is building a toll line from Mitchell to Chamberlain. When this is completed a line will be built to Scotland and other points.

MANUFACTURERS AND DEALERS.

The Sterling Electric company of Chicago has just completed equipments, similar to that installed at Mattoon and illustrated in this issue, for the Rock County Telephone company of Janesville, Wis.; Danville Telephone company of Danville, Ill.; Van Wert Home Telephone company of Van Wert, Ohio, and Wareham and Wood Telephone company of Manhattan, Kan. Many independent telephone companies desire apparatus similar to that used in Bell exchanges, as shown in the prosperity of the Sterling Electric company. During the last

year the company's facilities have been increased three-fold, the working force has been quadrupled, and the company has been forced to run its factory night and day to supply the demand. The Sterling apparatus, consisting of switchboards, cable terminals, distributing boards and protective devices, is accepted as reliable standard goods, similar devices being in use in the most modern Bell exchanges of to-day.

The Ericsson Telephone company of New York will be represented at the convention of the Independent Telephone association in Chicago next week by Messrs. Smith, Wells and Miller of that company's staff. The Ericsson company has been singularly fortunate during the last year in getting many large contracts, and its business has developed much faster than the management expected. As a result of this unusually large and steady demand for Ericsson products, the company has found some difficulty in obtaining goods from Sweden fast enough to fill its orders. The company has recently perfected an arrangement that will permit it to fill its orders much more expeditiously.

The Farr Telephone and Construction Supply company of Chicago has just issued its new catalogue, No. 8, which is also a hand-book of information. It is a neat pamphlet of 84 pages, and contains illustrations of everything used in the construction of telephone exchanges, and directions for those wishing to build a telephone exchange. The hand-book also contains quite a number of diagrams, showing the methods of connecting telephones. The Farr company, as is well known, handles everything in the telephone line, and is always looking out for improvements which will benefit the telephone manager. The company is at present doing three times as much business as it has done at any other time in its history, which speaks well for its products.

Telephones in Rural Districts.

[From the American Farmer.]

We find that the putting up of telephone lines has become very common in many sections, but we hear of no locality in which it has been better managed or proved a greater success than in Geauga County, Ohio. The telephone wires are strung throughout the 16 townships of that county. There are no cities in the county, and but few villages of any size, so their telephone system is essentially a rural one. It is now possible for every citizen of Geauga County to communicate by telephone, either directly or by messenger service, with every other citizen of the county, and by connection service with other lines, with an infinite number of points in surrounding counties.

One of the leading organizations is the Bainbridge Telephone company. It was organized by a company of eight farmers, nearly all of whom reside in the township of Bainbridge. They formed a regular stock company, each one taking a certain number of shares, and they went about the erection of poles and stringing of wires with the positive assurance of only a few patrons except themselves. But they have not been disappointed, as one farmer after another along their lines is asking to have a telephone put into his house, and many that are not along the lines are asking to have them extended so as to take them in. Those who take telephones are pretty sure to keep them, and only an instance or two has yet occurred where telephones have been removed, due to removal of patrons. This company began in the right way about the whole plant, and is a good model to be followed by other neighborhoods contemplating the erection of a system. They did not make the mistake of some other companies of putting up a cheap line. They purchased the best cedar poles, painted cross-arms, bought double-galvanized wire, as good telephones as could be had, and used the metallic circuit. This gave good service from the start, and did not get the patrons out of conceit with them through the line being constantly out of order. Their plant is now as good as any to be found in large cities.

The cost of erecting one mile of this system is approximately as follows:

Table with 2 columns: Item and Cost. Items include poles, cross-arms, insulators, wire, digging holes, and scattering poles. Total cost is \$51.50.

Nearly all the labor of erecting this particular line was done by the stockholders themselves. The president helped to dig holes, the manager did the stringing and stretching the wires, all hands turned in and erected the poles and did nearly all the other work. The poles are the main things to look out for. Those used in Geauga County are stocky, white cedar, 25 feet in length. The manager of the company, who is an intelligent young farmer, is becoming quite an electrical expert, and puts in telephones, makes proper connections, replenishes batteries and repairs them when out of order. The switchboard is located at the intersection of their lines at one of the stockholders' homes, and requires as much attention as a sick baby, but the attendants receive pay for their labor. The patrons are charged \$12 per year, payable in advance, or \$1.25 per month,

also in advance, for the use of their telephones. The company takes entire charge of keeping things in repair, and gives all patrons free use of one other country line almost as extensive; also a line to a neighboring small city, where farmers for miles around go to transact business.

The benefit to farmers of having far-reaching telephone lines are so numerous that they almost suggest themselves without mention. The volume of business that one can do and stay at home will astonish any farmer who tries it a month, and the total for a year is enormous. The telephone is speedily passing from an article of luxury to a thing of necessity. Nothing of importance occurs but one knows it immediately. The current news of the day, such as the ratification of the Spanish treaty, the battle at Manila, and in fact all the important intelligence, may be received by farmers at home or in the field as promptly as the newspaper offices in the cities. You can also, if you want, have the late papers read to you by some one miles away, if you don't want to wait until they arrive by mail. Another feature of great value to farmers is that the weather forecast can be obtained at any hour and enables one to prepare for weather conditions tomorrow. The doctor can be summoned or consulted at any time, though the way be long or the night be dark and stormy. The condition of sick friends may be learned at any time.

The social side of the telephone is especially felt in the country, where it relieves much of the loneliness by bringing distant places near, and renders a farmhouse close neighbor to all others miles away. In fact, the women folks get more comfort and enjoyment out of the telephone than anyone else. To them it comes a boon worth many times its annual cost. They take right hold and enjoy it. The prospect of visitors is known and the good wife rejoices that she can go about the preparation for their reception and escape the housekeeper's terror of being come upon suddenly, especially at meal times. No end of agreeable chats with friends all come within one's own house, though situated far in the country away from the busy scenes of city life. The ceaseless round of domestic duties is much more tiring and monotonous than outdoor work, and to women the telephone comes as a relief to this monotony that is inspiring. It is an antidote to the weariness of household drudgery. The family news items, recipes, the remedies, the congratulations, etc., that go over the line are simply too numerous to mention. The American Farmer's advice to all its hosts of patrons is, if you haven't telephone lines already, hasten to take steps to establish them. The cost is little, and the pleasure and the value derived from them are infinite. Nothing so tends to relieve that great bugbear of farm life, lonesomeness and sameness, as strings of wires connecting every farmhouse with all others for miles around and with the villages or cities in reach.

Telephone Repeater.

James Asher of Dunnville, Ont., has contributed an interesting account of the experiments that have been made in the development of telephone repeaters and a description of an instrument designed by him for special work of this kind to the London Electrical Review:

"Many inventors have tried to devise means by which telephonic messages might be repeated from one circuit into another, in order permit conversation over greater distances than would otherwise be possible. But little success in this regard has hitherto been attained. All telephone repeaters except that about to be described use the diaphragm of a receiving Bell telephone, or its equivalent, to vary the pressure in a microphone transmitter at the end of the second circuit, and so cause a repetition of the message in this circuit. Nearly all the telephone repeaters hitherto invented can be used only in repeating messages from the first circuit into a second. Few or none can repeat from a second into a third circuit, and so on, through an indefinite number of circuits, in a manner similar to repeating through an indefinite number of telegraphic circuits.

Telephone repeaters have usually been unsuccessful, because, although the diaphragm of the transmitter vibrates with considerable amplitude, the diaphragm of the receiver vibrates with an amplitude so small that it is not manifest to the sense of touch. Hence the variation in pressure on the carbon transmitter of a repeater is very small, and, in consequence, the telephonic message in the second circuit, if audible, is very weak even in short circuits.

"In the new telephone repeater a telephone receiver which speaks more loudly than a person is used. This loud-speaking receiver was invented by Mr. Edison more than 20 years ago. It is called the motograph. It consists in a cylinder of plaster-of-paris moistened with a certain solution. Pressed against the face of this cylinder is a strip of platinum, the other end of which is attached to a diaphragm. One wire is connected with the platinum spring and the other with the cylinder. On turning the cylinder steadily by hand, or other motor, the strip is drawn forward by friction on the cylinder, or released, according as a current passes or not, and according as a stronger or a weaker current of electricity passes through the chemical solution between the platinum spring and the cylinder. The sound of the receiver is dynamically caused by the motor which turns the cylinder. It is more difficult to turn the cylinder when receiving a message than when

the line is idle. The electric current merely controls the vibrations of the diaphragm, which throws the atmosphere into acoustic vibrations representing the voice of the sender. This motograph has been little used, because the Bell receiver, which is simpler, speaks in a sufficiently loud tone for common use.

"It recently occurred to the inventor of the new telephone repeater that by using Edison's loud-speaking receiver, or motograph, near the carbon or other suitable transmitter of a second circuit, a message spoken into the first circuit would be repeated with undiminished force into a second circuit. At the end of the second circuit a repeater may be used to forward the message into a third circuit, and so on. The number of repeaters will be one less than the number of circuits. At the end of the last circuit a Bell receiver may be used if desirable. By a suitable duplication of transmitting and receiving parts in each repeater telephonic messages may be sent in either direction automatically. A small electric motor will be suitable for driving the cylinder of each repeater during hours of business.

"The invention is automatic, and all parts of one or more continents would be brought within speaking distance. The reproduction of a speaker's voice, even at the opposite side of a continent, would be louder than the voice itself, because the voice at each repeater is dynamically due to the motive power which turns the cylinder. The reproduction of the voice at the end of a dozen circuits would be as loud as that at the end of the first circuit.

"Nothing would now prevent us from recording a phonogram, even at a distance of thousands of miles. At the end of the last circuit a phonograph may be set before the motograph receiver, and since this will speak as loudly as the person sending the message, the phonogram may be impressed as deeply on the wax cylinder as if the speaker were present. The phonogram tube may be detached from the phonograph and sent to the person addressed, who may, at his leisure, place it on his own phonograph and listen to the message. This phonogram may be saved and it may be caused to reproduce the voice of the correspondent at any future time."

Long-distance Transmission of Speech.

By J. H. WINFIELD.

Long-distance work is every day becoming a more important factor in the telephone business, and toll lines, instead of (as a few years ago) being regarded as mere accessories to the city exchanges, are now recognized as absolute necessities. We are talking over longer distances almost every month. A few years ago 500 miles was considered quite a feat; to-day we have conversations carried on over 1,900 miles of wire with perfect ease. In view of this, it may not be amiss to speak of a few of the difficulties that are encountered in the design, construction and operation of these long lines.

The apparatus used in making a toll-line connection may be divided into three parts: (1) the line, (2) the instruments, (3) the switching apparatus. The chief factor in extending the talking limit has been the improvement in the lines. Grounded circuits of iron wire are now practically obsolete, the recognized standard being a metallic circuit of hard-drawn copper wire, generally No. 10 B. & S., weighing 170 pounds to the mile, but sometimes, for short distances, of No. 12, weighing about 104 pounds to the mile. The New York and Chicago line is constructed of wire weighing 435 pounds to the mile, but that is an exceptional case.

In speaking of the line I shall confine myself to the electrical, rather than the mechanical difficulties that have been met with and overcome. Our object is to so construct the line and arrange the apparatus that the sounds at the receiving end shall possess the following characteristics: Loudness or volume, clearness, quality. Of these three clearness is by far the most important, for a faint sound, if clear, is perfectly intelligible, and a change in quality may only have the effect of disguising to some extent the speaker's voice. Volume is affected by any conditions which alter the amplitude of the wave.

Clearness is affected by any conditions which alter the position of the waves in regard to each other. Quality is affected by any conditions which alter the form of the wave. Therefore, the volume is reduced by resistance, leakage, static induction and self-induction, the effect of these properties being to reduce the amplitude of the wave.

Clearness is reduced by static induction and self-induction, these tending to alter the inter-relationships of the waves, static induction causing a rounding off of the top of the wave, thereby involving a loss of sharpness, while both static induction and self-induction produce an unequal retardation of phase for vibrations of different periods, thus causing interference and a resulting deformed wave. In other words, the telephone current, being an alternating current of a frequency varying from 200 to 1,500 periods per second, according to the sound produced, static induction and self-induction produce a greater retardation on the waves of high frequency than on the lower ones, thus mixing up the waves to some extent and rendering the speech muffled.

Quality is changed by all the properties which reduce the clearness, and by self-induction in another sense as well, this effect of self-induction being to reduce the amplitude of the overtone waves to a greater extent than of waves of a longer period.

Evidently, then, in order to accomplish high telephonic transmission of speech, we must take into account the self-induction and electrostatic capacity of the line and apparatus at low potentials, resistance and leakage being of less importance, though, of course, they should not be lost sight of. A small and well distributed leakage is often an advantage, as it allows the static charges to escape, clearing the line and to some extent neutralizing the effect of capacity, the slight loss in volume being more than counter-balanced by the gain in clearness. When iron wire is used there is a much further deformation of the waves than is caused by the increased resistance, due to the fact that the wire is circularly magnetized, and this magnetism has to be reversed twice in every vibration. There is also a considerable increase in self-induction, due to the magnetic properties of the metal.

The self-induction of a copper metallic circuit of No. 10 or 12 wire is very small, but the self-induction of the apparatus which always forms part of a telephone circuit is sometimes very high and has a considerable effect on the current. Long-distance lines would be particularly liable to disturbance from cross-talk if no means were taken to prevent it. There are two cases in which cross-talk will not be produced on a metallic circuit by a neighboring wire. The first is when the disturbing wire is at an equal distance from each of the wires of the metallic circuit. Were it always possible to string wires in this manner, there would be no trouble from cross-talk; but a little consideration will show that this is only possible for two circuits. The second method is known as transposing. The two wires of the metallic circuit are transposed at regular distances, or, in other words, they change places. A changing to the pin B was on and B going to the pin A was on, the effect being to place each wire of the circuit at an average distance from the disturbing wire or wires. As the number of wires on a pole increases, the difficulty of planning the transpositions increases also. With two circuits it is an easy matter; if, however, we have a third and transpose it, the same as we did the second, there will be cross-talk from the second to the third, because their relations to each other are the same as if there had been no transpositions at all. To get over this difficulty we must transpose the third twice as often as we did the second. A fourth circuit may be transposed at the middle points of the third, and so on. It has not been found necessary to transpose each circuit so that the induction currents are exactly balanced, and it is possible to use the same transpositions for every second cross-arm, so that the first, third and fifth are alike, also the second, fourth and sixth. Transpositions are usually placed half a mile or a mile apart.

There has been very little change in the instruments in the past few years. The transmitter usually used is of the "Hunning's" type, and is known as the solid-back. It does its work remarkably well. Some of them require a little attention now and then on account of the packing of the carbon granules, but a judicious tap generally puts matters to rights. The ringer magnets of the call bells should be wound to a resistance of 1,000 ohms on long spools, bringing the wire close to the core, and thus giving them a high coefficient of self-induction, which effectually prevents any shunting of the high-frequency telephone current, while allowing the ringing current to pass freely, the ringers being bridged across the circuit.

In order to connect a metallic circuit to a grounded line, what is known as a repeating coil or transformer must be used, otherwise the balance of the circuit would be destroyed and the line become noisy. This piece of apparatus is nothing more than a specially made induction coil, the metallic circuit being connected to the primary and the grounded line to the secondary, the other end of the secondary being put to ground. In connecting together two metallic circuits through an intermediate office, the connections should be so arranged that the lines are directly connected, and the two transformers cut out; otherwise, as a transformer only has an efficiency of from 85 to 90 per cent., there would be a serious loss in volume.

All apparatus at intermediate stations should be bridged across the lines, and the parts that are permanently in connection should have a high self-induction in order to avoid shunting the telephone current when the line is being used to stations farther on. Ring-off drops should be wound to 1,000 ohms resistance and also bridged. It is a good plan to use a tubular drop, as it not only increases the self-induction, but it also tends to prevent cross-talk between the coils themselves, which is a frequent cause of disturbance and often not suspected.

Long-distance lines should always be well equipped with protective devices. The best form for protection from lightning consists of two carbon blocks separated by a thin sheet of perforated mica, one block being connected to line and the other to ground. These have proved very efficient, and when properly installed generally prevent any damage to instruments or transformers. They also prove useful in another respect, as the static charges seem to find their way across from one plate to the other, clearing the line to a great extent. Many lines could be improved by a judicious use of these protectors at different points, such as the way stations. A fuse is also generally inserted in order to prevent the entrance of heavy currents, which might otherwise do considerable damage, when, as sometimes hap-

pens, an electric-light or power wire comes in contact with the circuit.

In regard to the operation of toll lines, long-distance telephony is much more expensive than telegraphy, as may easily be seen when we consider that a single iron telegraph wire can easily transmit 40 messages per hour, and when duplexed the number is doubled; whereas in the telephone work we have to use two wires, and they must be of copper instead of iron, and even then under the best conditions it is hard to get more than seven or eight messages through in an hour. Add to this the fact that the sender of the message is aware of every minute of delay, and is usually very impatient when he has to wait a few minutes for the line, where, in sending a telegram, he just hands it in at the office and thinks no more about it, even though the message may not be sent for half an hour or longer, and it is easily seen that not only must the telephone message cost more than a telegram, but the lines are apt to be choked with business during a few hours in the middle of the day and comparatively idle the rest of the time. A great deal can be done by keeping the subscribers posted in reference to the hours when the lines are rushed, and very often they can so arrange their business that it will not come in the rush hours. They would thus save themselves the annoyance of having to wait for a connection and the lines would be worked more steadily.

Development of the Telephone.

[From the Boston News Bureau, June 1st.]

Canvassers in 20 cities of the Erie telephone system last week obtained 1,735 new subscribers, the largest number of contracts ever taken during the history of the telephone, except, possibly, in the very early days of the invention.

This systematic canvass is under the supervision of Mr. C. E. Nestor of San Francisco, and clearly demonstrates that there is no trouble in securing new subscribers if the value of the service is properly placed before the people. The Erie system on April 30th numbered 76,851 subscribers, in eight states, namely, North Dakota, South Dakota, Minnesota, Wisconsin, Michigan, Arkansas, Texas and the city of Cleveland, O.

The result of the canvass indicates that the company will have no difficulty in securing 100,000 subscribers before the close of the year. Even with this number, it will fall about one per cent. short of the development of General Sabin's Pacific coast states, Washington, Oregon and California, so there is still to be worked for the Erie management to do in 1900 to overtake the California telephone magnate.

The net gain in a few of the Erie's principal cities since January 1st has been about as follows: Milwaukee, 1,000; St. Paul, 1,200; Detroit, 1,300; Minneapolis, 2,000; Cleveland, 3,000, and in other cities of Michigan and the Southwest the growth has been proportionately as large, the total net increase since January being about 17,000, or 7,000 more than the entire year 1898.

The company is experiencing some difficulty in obtaining material for subscribers, and it is said throughout the Erie system 7,000 subscribers are waiting connection, but the end of June will probably reduce this number to a minimum.

The company has located three new branch offices at Milwaukee, four in Detroit and five in Cleveland, and employs in all departments 5,000 people.

Telephone in Various Countries.

[From the London Financial Times.]

There has just been issued a foreign-office report on the telephone service in various foreign countries which was called for in Parliament in October, 1897, by Mr. Provand, M. P. Twenty-three queries, embracing all matters connected with the telephone service abroad, were put to the consular agents in the different countries. From the replies of these gentlemen it seems that in Austria, Bavaria, Belgium, Germany and Switzerland the telephone system is in the hands of the government; in Italy, of a company; in the Netherlands, of municipalities; in Russia (Helsingfors), of a local company; in Norway and Sweden, of the state and private companies, and in the United States, of a company which has no monopoly to carry on the public telephone service. These concessions are, of course, more or less onerous, involving generally payments or the giving of exceptional facilities to governments or authorities granting the concessions. The New York company alone is exceptional, its concession involving no liability, though, on the other hand, it is not exempt from competition. A number of the systems which now belong to governments were introduced by private companies, whose interest were generally brought out when they began to affect, as they generally did, the government telegraph system.

There is little or no information to be found on the question whether the telephone pays in the hands of the government. The Italian company, however, paid 10 per cent in 1896, the "Allmannia" company, 20 per cent; the Christiania Telephone company 2 1/2 per cent; the Bergen company six and the London and the New York company six per cent. In Amsterdam there was a surplus of £3,987 in 1897, but no consideration was given for the telephone as principal property.

EXTENSIONS AND IMPROVEMENTS.

The Sunset Telephone and Telegraph company is making arrangements to extend its line from Snohomish to Monroe, Wash.

Work has commenced on the telephone line from Aunisville via Shaw to Macleay, where it will connect with the Salem, Ore., line.

The Northwest Telephone and Telegraph company of Huntington, Ore., will build a line through to Pine, Ballards and the Seven Devils.

The Sunset Telephone company of California will extend its long-distance line from Colfax to Reno, Carson and Virginia City this year.

The Mason County Logging company will shortly establish a telephone line between Olympia, Wash., and the company's camp in the Black Hills.

The Sunset Telephone company is extending its lines in Woodland, Cal. Manager Roberts has orders to put in quite a number of new instruments.

Otto Wettstein, Jr., of La Porte City, Ia., has been granted a telephone franchise at Belle Plaine, Iowa, and has secured 110 subscribers. Construction will be commenced at once.

The Lee County (Ill.) Telephone company is building a toll line from Paw Paw, in Lee County, to Earlville, in La Salle County, and an exchange of 50 subscribers in the latter place.

The Inland Telephone company will erect a new building in Spokane, Wash. The office will have a frontage of 25 feet with a depth of 80 feet. When complete the building, with the fixtures, will cost \$80,000.

The Port Steele (B. C.) Prospector says: "A telephone will at once be established between Elko and Tobacco Plains. It is said that the British Columbia Telephone company is the projector of the line."

Twenty linemen of the Detroit Telephone company are on strike for an eight-hour day and a new scale. The men refused to arbitrate and by their sudden withdrawal crippled the service in a portion of the town.

W. H. Dacey, manager of the Salem, Ore., division of the Oregon Telephone and Telegraph company, says that an aluminum wire will be strung between Salem and Albany to be used for local business only.

F. Bell, assistant superintendent of the Sunset Telephone company, has been investigating the question of extending the company's telephone system across the Cascades. The company asks for a guarantee of \$3,000.

The Sunset Telephone company is making arrangements to run its lines to La Honda, via Woodside and Searsville. A new line will be put up, which will establish communication between Redwood City, Cal., and La Honda.

The Jerome Telephone company is negotiating with F. L. Wright of the Prescott (Ariz.) Electric company for telephone connection with the latter system. If successful, the Prescott company will build the line about 10 miles out to meet the Jerome company.

The Home Telephone company of Rochester, N. Y., has commenced the work of developing its exchange. Charles E. Stinson, who for 17 years has been employed by the Bell Telephone company, has been selected for superintendent of the new system.

The Chicago Telephone company has bought 80 feet in Union avenue, east front, north of Root street, Chicago, from John A. Spoor and H. W. Webb, for \$4,800. The ground will be improved at once with a new building, and may be used for exchange purposes.

The Rocky Mountain Bell Telephone company proposes to spend a large amount of money this year extending its lines, especially in Montana. The capital stock of the company was increased from \$500,000 to \$1,000,000, and agents of the company are now in Boston negotiating a loan of \$225,000 for immediate extensions and improvements.

The San Diego (Cal.) Sun says that there is an urgent demand for a telephone at the lighthouse or some equally conspicuous spot on the highest part of Point Loma. The project has been recommended by all the pilots and mariners who have had occasion to enter San Diego harbor. The need of the line is now greater than ever since the advent of the Oriental steamship line.

Within a few weeks Denver will be connected by telephone with Cheyenne, Wyo., and other towns. Workmen will begin at once on the short strip of line between Fort Collins and the Wyoming capital, and will push construction as rapidly as possible. Under the agreement with the American Bell Telephone company, under which the Colorado company operates, the Denver company has only Colorado and New Mexico, and the Denver end will be only as far as the state line, half a dozen miles from Cheyenne, where the wires will connect with the Rocky Mountain Telephone company's circuits, which will give connection with

Cheyenne and Laramie. The Colorado company will rush the construction, taking in Glenwood Springs, Buena Vista and Salida, and will immediately afterward begin on the surveys for the New Mexican line, work on which can be done late in the fall. It is proposed to connect Denver with Santa Fe and Albuquerque, as well as the other large cities and towns in that vicinity.

J. I. Sabin, president of the Pacific States Telephone company, has purchased from the Vernon and Nelson Telephone company the lines connecting Rossland, B. C., with the system in the United States. Additional lines will be built immediately from Rossland to connect with the extra circuits now being built from Northport to Spokane, from Bossburg to Greenwood and from Meyers Falls to Republic.

The principal mines of Tintic and the leading mercantile houses of the mining sections embracing Mammoth, Robinson, Silver City and Diamond are immediately to be given direct telephone communication with Salt Lake City. A. J. Vance, representing the Rocky Mountain Bell Telephone company, has concluded arrangements. The company will erect a building for the exchange in Salt Lake City. The central office will be established in Robinson.

The New Ulm (Minn.) Telephone exchange has made arrangements with the Northwestern Telephone Exchange company to connect with its lines, and the patrons of the former exchange can now reach by telephone all parts of Minnesota, North and South Dakota, Iowa, and, in fact, any stations of the Northwestern company. Quite a number of improvements have been made in the New Ulm exchange, and there are at present over 150 subscribers connected.

The Sunset Telephone and Telegraph company is gradually extending its underground system throughout Los Angeles, Cal., and within the present year expects to have all of its trunk lines under ground. The company has submitted for approval by the council plans for conduit systems on Grand avenue, between Sixth and Seventh streets, First street from Alameda street to Santa Fe avenue, Third street from Los Angeles street to Central avenue, and Figueroa street between Washington and Adams streets. These plans will be approved and the work of putting the wires underground will be commenced at once.

TELEPHONY ABROAD.

The telephone question is still uppermost in the English mind. The Nottingham City Council has passed a resolution strongly objecting to the scheme proposed by the financial secretary to the treasury for dealing with the telephone question, on the grounds that no provision is being made out of imperial funds for the large provincial towns, as is proposed for London; that London subscribers will get the benefit of imperial expenditure, and be freed from the 10 per cent. royalty provincial subscribers have to pay; that the proposal to allow a municipality to compete until 1911 with the National Telephone company, where the company is well established in a town, can only end in a loss and inconvenience to the public, and that, if the competition is to be carried on, it should be by government. The council of the London Chamber of Commerce proposes to urge upon the government that it is undesirable that the postmaster-general should license the councils of county boroughs, as proposed in the telephone bill now awaiting second reading, to provide systems of public telephonic communication, pending the report of the joint committee about to be appointed by the two houses to consider the whole question of municipal trading.

The last annual report of the Oriental Telephone and Electric company, an English corporation doing business in the Far East, shows a credit balance of £10,655 3s. 9d. transferred to profit and loss. Including £964 8s. 3d. brought forward, and after deducting £2,858 8s., the amount of interim dividend paid in November last, there remains £9,061 4s. for disposal. The directors propose to pay a final dividend of 8d. per share, free of tax, making five per cent. for the year, to transfer £2,000 to reserve, and carry forward £1,344 8s. Of the Indian subsidiary companies, the Bombay company has again paid six per cent. for the year, and the Bengal company has paid five per cent., against seven per cent. for the previous year, carrying forward Rs 20,000 as a precautionary measure against possible temporary outlay. The Telephone company of Egypt has declared its usual dividend of six per cent. on its preferred shares. This company has recently entered into an agreement with the government of Egypt to continue the government telephone service for a period of 25 years from January 1st. Its business in general progresses favorably. The China and Japan Telephone company has paid its debenture interest, but its accounts for the last year have not yet been audited. They point, however, to a larger surplus than in previous years. With a view to improving the telephone service at Shanghai, which would have involved a large expenditure of money, the directors approached the council of the Shanghai settlements some years ago to obtain, if possible, a prolonged term of concession so as to justify the outlay. The council has now decided to grant a 30-year concess-

sion, but has invited bids for the privileges by public advertisement. The directors of the China and Japan company have sent in a bid, but the result so far is not known.

Telephone progress is reported in the West of England by the Bristol Chamber of Commerce annual report. Early in the year, the document says, serious complaints reached the council of the chamber of the interruption to communication on the trunk lines between Bristol and Plymouth. Accordingly, representations were made to the General Postoffice authorities upon the subject, and answer was made to the effect that just prior to the date of the complaint several working parties were engaged on the lines, which probably caused the interruption, but now that the lines were in order, the postal authorities hoped that no further difficulty would be experienced. There are, however, the council of the chamber said, on frequent occasions very serious delays, which point to the necessity for the early provision of additional trunk lines between Bristol and the towns in the West of England. Representations were also made to the council of the chamber upon the inefficient trunk-line service between Bristol and London. The secretary to the Chamber of Commerce communicated with the Bristol postmaster and surveyor, and was informed that the department would lose no time in completing and bringing into use a second trunk line between Bristol and London. With reference to the nationalization of the telephone system, the council expressed its views in the following resolution: "That having regard to the disadvantages arising out of the present working of the telephone service under the dual control of government and the National Telephone company, it is the opinion of the council of this chamber that the government should take immediate steps to acquire the undertaking of the telephone company upon just and reasonable terms as between the nation and the company's shareholders."

The latest developments in the telephone situation in Great Britain are outlined in the following cable dispatch to the Chicago Tribune from London on June 21st: "The House of Commons yesterday spent most of its time over the telephone bill. England is in this, as in most other modern inventions, hopelessly behind other countries. The telephone system now in the hands of the National Telephone company is both expensive and gives bad service. In London it is still almost entirely confined to business offices, and its use in private houses is almost unknown. The long-distance service is execrable. The National company, in the first place, is controlled by government red tape, and, secondly, it uses bad wires, and the whole system is made up on the principle that the government will eventually buy up the company at a high price. In the meantime, since the government controls the telegraph system, the telephone company is not allowed to compete with the telegraph. Not only are long-distance rates frightfully expensive, but many absurd restrictions are enforced. As, for instance, the cable company may not accept messages over the telephone lest the telegraph company should lose thereby. Accordingly, even when the telegraph is closed, as is usual in the country after a certain hour, no one desiring to cable could do so by means of the telephone. All these restrictions bring about the result that in England one person uses the telephone where five do so in the United States. The bill now introduced by Mr. Hanbury is to introduce the service all over England, to be offered to all alike at moderate terms. The chief objectors to the bill are, of course, the National Telephone company, which hoped for a government scheme which would mean the buying up of the company at an exorbitant price, and the big manufacturing firms who at present get advantageous terms from the company. The bill is still under discussion, but the general feeling is something must be done to put England on an equal footing with the other countries in this respect."

A California Farm Telephone.

[From the American Agriculturist.]

The Salinas Valley Land company has a telephone system, the line of which consists of the ordinary barbed wire that was already on the fences. It is about 10 miles long. We use a good telephone instrument. All the connections are made very close, and no wire is connected with the ground in any way, either by hanging down or by touching any other wire that does reach the ground.

In crossing roads and gates the preferable way is to have posts high enough to carry an overhead wire, but we took three-eighth-inch iron water pipes and laid them under the gates and most of the roads and then ran a rubber-covered wire through them to connect with the barbed wire on each side, bending the ends of the pipe up at the sides of the gates or roads and then filling the ends up with putty to keep water out.

This character of telephone line will work just as well as any insulated line in dry weather, but not at all when it is raining, because then the current runs in the ground. As soon as the posts have time to dry off after a rain it is all right again. Such lines will work for any reasonable distance, say from one to 100 miles, but in states where it often rains they will not do well.

Telephone Companies Excluded.

At last the Supreme Court of the United States has put to rest the question of the applicability to telephone companies of the act of Congress of 1866, authorizing telegraph companies to construct and operate lines of telegraph over the public domain and post roads of the United States. This it has done in the case of the city of Richmond against the Southern Bell Telephone and Telegraph company.

As the court itself sums up its decision, it is that the act of 1866 and the sections of the Revised Statutes in which the provisions of that act have been preserved have no application to telephone companies whose business is that of electrically transmitting articulate speech between different points. Upon the question of the power of Congress to control the use of streets in the towns and cities of the country, concerning which something was said in argument, the court states that it was not necessary to express any opinion.

Referring to several adjudged cases to which its attention was called, in some of which it was said that communication by telephone was communication by telegraph, the Supreme Court declares that none of those cases involved a construction of the act of Congress, and that the general language employed in some of them cannot be regarded as decisive in respect of the scope and effect of that act, however pertinent it may have been as to the meaning of the particular statutes under examination.

It may be, the Supreme Court goes on to say, that the public policy intended to be promoted by the act of Congress of 1866 would suggest the granting to telephone companies of the rights and privileges accorded to telegraph companies, and it may be that, if the telephone had been known and in use when that act was passed, Congress would have embraced in its provisions companies employing instruments for electrically transmitting articulate speech. But, it explains, the question is not what Congress might have done in 1866, nor what it may or ought now to do, but what was in its mind when enacting the statute in question. Of the different modes now employed to electrically transmit messages between distant points, Congress, in 1866, knew only of the invention then and now popularly called the "telegraph." When, therefore, the act of 1866 speaks of telegraph companies, it could have meant only such companies as employed the means then used or embraced by existing inventions for the purpose of transmitting messages merely by sounds of instruments and by signs or writings.

It is not the function of the judiciary, the court holds, because of discoveries after the act of 1866, to broaden the provisions of that act so that it will include corporations or companies that were not, and could not have been at that time, within the contemplation of Congress. In other words, it insists that it is clear that the courts should not construe an act of Congress relating in terms only to "telegraph" companies as intended to confer upon companies engaged in telephone business any special rights in the streets of cities and towns of the country, unless such intention has been clearly manifested.

The court further says that it is unwilling to rest the construction of an important act of Congress upon implication merely, particularly if that construction might tend to narrow the full control always exercised by the local authorities of the states over streets and alleys within their respective jurisdictions. If Congress desires to extend the provisions of the act of 1866 to companies engaged in the business of electrically transmitting articulate speech—that is, to companies popularly known as "telephone companies," and never otherwise designated in common speech—it says, let it do so in plain words. It will be time enough when such legislation is enacted to consider any questions of constitutional law that may be suggested by it.

Reasonable Care Defined as Great Care.

A countryman, who had driven into town, stopped his horse near a drinking fountain, and in order to remove some wire that lay in the street, between his horse and the fountain, picked it up, and received through it a powerful electric current that inflicted permanent injuries, for which he brought suit against the telephone company whose wire it was, and against the electric-railway company, whose current, it was contended, did the harm.

To begin with, the Court of Errors and Appeals of New Jersey says (New York and New Jersey Telephone company against Bennett), the defendants were each maintaining wires in a public highway, in the exercise of franchise, not of an easement. Hence, each was bound to take reasonable care not to injure other users of the streets. One factor in the measure of reasonable care is the probable result of negligence. In the use of a powerful electric current in the public streets reasonable care is great care.

The question of whether the linemen of the telephone company had been reasonably diligent in discovering the fallen wire, and in preventing probable injury, it holds, was properly left to the jury. Likewise, it maintains that whether the failure of the trolley company to use guard-wires was negligence by which the plaintiff was injured was for the determination of the jury. So, too, the contributory negligence of the plaintiff, the court holds, was a jury question, pure and simple. How much a countryman would know about the danger of picking up a wire in the streets of a town, what inference he ought

to have drawn from what he saw and heard, on the whole, his conduct showed less than reasonable caution, the court continues, were entirely outside the domain of fact.

Last of all, the court held, that if the plaintiff used reasonable care in the selection of a reputable physician to cure his injury, he could not be kept out of damage because with a better physician he would have had better results.

Power of City to Require Removal of Telephone Poles and Wires.

It is held by the United States Circuit Court that a city, being vested by the Legislature with the power of supervision and control of its streets, has the authority to require a telephone company to transfer its poles and wires from in front of, say, two blocks in the city to the alley next adjoining the street, provided it is done in good faith, and can fairly be seen to be directed to a legitimate purpose falling within the purposes of the delegated authority.

This is the practical result of the decision of the court in the recent case of the Michigan Telephone company against the city of Charlotte, wherein it was sought to enjoin the city from enforcing an ordinance of this character, which was passed upon the grounds that the poles to be removed were decayed to such an extent that they had become inadequate to the support of the system of wires they carried, and that the company had accumulated on the poles a great number of wires, which it employed in the conduct of its business, and to such an extent as to endanger the life and safety of the citizens of the city, and others occupying the building on the street or traveling therein.

The power of the Common Council to order such a transfer was denied by the company, which alleged that while its poles were defective, and the system needed repair in that respect, it proposed to substitute new and sufficient poles in place of the old, and in this respect stood ready to comply with the requirement of the ordinance.

Among the more specific points decided by the court is that a federal court has jurisdiction of such a suit for injunction, under that clause of the constitution which forbids the impairment of the obligations of contracts by state Legislatures. But, having taken jurisdiction, the court holds that section 5263 of the United States statutes, authorizing the construction of lines of telegraph over post roads, is permissive merely, and was not intended to arbitrarily disturb or interfere with the exercise of the police powers of the state, and would not sustain the company in its contention in such a case as this. Nor does the court consider that the action of the Common Council of the city in this case constituted an unlawful interference with commerce between the several states, assuming that the interstate commerce rule applies to telephonic communications as means of such commerce. And it does not consider that the ordinance amounted to an impairment of the obligation of the contract between the company and the city, assuming the existence of such a contract, because contracts of this character are subject to such incidental modifications as result from legislation required in the public interest. Moreover, the court denies that the action of the Common Council deprived the company of its property without due process of law, as that would necessitate the assumption that the company had a vested right to occupy this particular street, which the court pronounces untenable.

The New German-American Cable.

[From the New York Tribune.]

The cable-laying steamer *Britannia* Captain Woodcock, which came into port and anchored in the Upper Bay, off Liberty Island yesterday [June 11th], has almost completed the work of surveying for the new submarine cable which will connect Germany with the United States by way of the Azores. The Emperor of Germany is greatly interested in the new cable, and as permission was granted some time ago by the United States government for the landing of the cable on this side, George G. Ward, vice-president and general manager of the Commercial Cable company, went to Europe on short notice by the St. Paul a few weeks ago, and is at present consulting with the emperor on the project. A report of the soundings made in crossing the Atlantic will be given to the officers of the Commercial Cable company. This company has charge of the construction and laying of the cable, and the German Atlantic Telegraph company will operate it.

The proposed cable line will start at Embley, Germany, and touch at Ponta Delgada, Azores, and the final landing place of the American end will most probably be at Coney Island. The line, when completed, will cost nearly \$25,000,000, and the German backers of the enterprise are the firm of Felten & Guillaume of Mulheim-on-the-Rhine, the Schaafhausen Bankverein, the Darmstadter Bank, the Disconto-Gesellschaft, the Dresdner Bank, the Messrs. Bleichroder and the Land and Sea Cable company of Cologne. The Commercial Cable company of this city is reported to have a financial interest in the new ocean telegraph line, and its interest in the German cable will give the American corporation direct wire connection with the chief cities of Southern Europe, including a number on both sides of the Mediterranean.

The longest stretch of the cable, between the

Azores and New York city, will measure 2,279 miles. At present the Azores can be reached from the United States only by way of London and Lisbon, and another point in Portugal. The American companies interested in the new cable scheme have agreed, it is said, to use the line for transmission of their dispatches to and from Germany, and the German postoffice has, it is understood, as a sort of subsidy, guaranteed the transmission annually of a certain number of words. This, it is said, insures the profitable working of the new submarine line. The headquarters of the German branch of the cable syndicate are at Cologne.

The new cable will do away with the complaints made by shipping agents here of the great delay in getting messages between America and the Azores. Disabled passenger vessels as a rule head for St. Michaels, in the Azores, but it sometimes takes days after their safe arrival there to get the news to New York. The submarine line will doubtless be a great stimulus to trade relations between the United States and Germany.

The steamship Britannia left Fayal for this port on May 14. The continuation of the soundings from Emden was taken up at Ponta Delgada. The officers of the cable ship declined to talk about the trip or discoveries made while sounding the bed of the Atlantic along the proposed route until they made their reports to the agents of the Commercial Cable company.

Before sailing for Germany Vice-president Ward said: "Emperor William has expressed the wish that the cable be laid as quickly as possible, believing that it will be the means of promoting good will between the two countries, and I shall expedite the work as much as possible."

The new cable will be laid and in operation by October unless the present plans fall through.

CORRESPONDENCE.

New York Notes.

New York, June 19.—Mr. Vreeland says that the power house of the Metropolitan Street Railway company, which, with its 70,000 horse power, will be the largest in the world, will be completed by fall. The new plant will give all the power necessary for the running of the Broadway, Columbus and Lexington avenue lines. The power houses now in use will be retained in case of emergency. Mr. Vreeland said that work in connection with the proposed electrical equipment of the cable roads was now in progress on all three lines, but that it would be several months before it was completed. Much of the work, it was explained, is being done at night.

Many of the employees of the surface street-railway companies of the city are organizing as assemblies of the Knights of Labor. It is said that the "trippers" on the Metropolitan lines are dissatisfied with their lot, but it is not expected that a strike will be brought about.

The New York and Queens Light and Power company, the Flushing Gas and Electric Light company and the Newtown Light and Power company of the borough of Queens have been merged in one, and it is said the field of operations will be extended whenever it is possible to secure contracts outside of the present territory. The new corporation is known as the New York and Queens Gas and Electric company.

In Orange, N. J., the Common Council is considering the municipal ownership of an electric-light plant. The city counsel has been directed to prepare the necessary resolutions and ordinances.

One of the big rubber tires on an electric cab exploded one night last week at Broadway and Thirty-second street. The excessive heat of the day had caused the pavements to warm up, and they in turn heated the air in the tire, causing it to expand and rupture a weak spot in the rubber. There was no one in the cab at the time. The vehicle careened to an angle of 45 degrees, and the driver was almost thrown off the box. It righted, however, and the driver managed to take it in its damaged condition to the stable. It is said to be the first accident of the kind since the horseless cabs came into use here. M. S.

Canadian Intelligence.

Ottawa, June 19.—The committee of the City Council of Winnipeg, Man., has recommended the acceptance of the tender of the Western Electric company of Chicago for electric-lighting machinery at \$5,320. The same company secures the contract for lamps and globes, supplying 220 at a cost, complete, of \$4,722. The offer of the Winnipeg Street Railway company to operate the lights at 25 cents was rejected.

The Ottawa Electric company has made a proposition to the City Council of Ottawa, Ont., to dispose of its lighting plant to the city. Many of the city aldermen are in favor of the city operating its own electric-light plant. The nature of the proposition, so far as can be learned, is that the company offers to dispose of its plant, good-will, business and personal connections to the city at par, or, in other words, that the corporation take the entire stock at par value. The work amounts to about \$1,000,000. The Electric company agrees to hold the offer open for one year,

on the express condition that the city does not grant, in the meantime, an extension to the franchise of any now competing company (the Metropolitan Electric company, which is seeking a 20-year extension) and does not issue a franchise to any outside company.

The city of Ottawa, Ont., has issued a writ against the Ottawa Electric Street Railway company to secure the specific performance of an agreement to extend its line to the Exhibition grounds and to Ottawa East. The writ asks for \$10,000 damages in default of building the extensions.

The police commissioners of Toronto, Ont., have decided to purchase an electric ambulance. Should this vehicle, after having been subjected to a thorough test, prove satisfactory, as it is claimed it will, all the police patrol wagons of the city will be operated by electric power.

Attention has been called to the fact that the Montreal Street Railway company is using fenders on its cars which are of no practical use as life-savers. Two deaths under car wheels have forced the question upon the consideration of the authorities. The company is under contract with the city to equip its cars with serviceable fenders which, it is alleged, those in use now are not.

A Toronto syndicate is now negotiating with the St. Hyacinthe (Que.) Hydraulic Power company, as well as with the gas-works company of that town, for the purchase of both plants. The offer made is in the neighborhood of \$175,000. The Toronto company proposes to very materially enlarge both plants and thus reduce the present cost of production.

Mr. R. G. Reid of Montreal has just added another to his many enterprises in Newfoundland in the conclusion of arrangements for the immediate construction of an electric railway in the city of St. John's. Contracts have been made with the Messrs. Lariviere of Montreal for cars of improved style, with the Westinghouse people for electrical apparatus, with the Canada Switch company for the necessary trucks, and with the Stilwell-Bierce and Smith-Vaile company of Dayton, O., for water wheels. The power to operate the line will be generated at a point eight miles from St. John's, and it is the intention to have a system first-class in every respect. The first cars are to be delivered in July or August, and the railway will be opened in the early part of next fall.

The Shawinigan Water and Power company of Montreal, whose plans contemplate the largest water-power development in the world, outside of Niagara Falls, is showing that it means business, for it has just let contracts which will involve an expenditure of over \$300,000. This contract, which is only a preliminary, is for the canals, bulkheads, foundations for power houses, etc., required to develop 30,000 horse power, and a railway to connect the Shawinigan Falls with the Great Northern railway, a distance of 4½ miles.

The West Kootenay Power and Light company of Rossland, B. C., has met with such success in its power-transmission project that it has found it necessary to increase its plant to double the present capacity. About a year ago this company commenced supplying current to its customers at Rossland and Trail, a distance of nearly 40 miles from the power house, which is located at Bonington Falls, on the Kootenay River, and to-day has more orders for power that it can supply. The present generating plant consists of two 1,000 horse power, three-phase, revolving-field dynamos, and the company has just placed an order for a 2,000 horse power generator of the same type. The Canadian General Electric company is also supplying a complete equipment of marble-panel switchboards and 3,000 kilowatts' capacity in high-potential step-up and step-down transformers. When this additional installation is completed, the West Kootenay company will have one of the largest power plants in the Dominion, and the distance of transmission is the greatest now in operation in Canada.

The Canadian Motor Syndicate, pioneer of the horseless-carriage movement in Canada, has within the past month established works in Toronto, Ont., and it is said the company is already busy with orders for electric delivery vans and carriages.

The solid masonry of the dam across the Jacques Cartier River, at St. Catharines, Que., has been completed, and four 54-inch water-wheels of the most modern type are to be used to develop power. It is proposed to deliver in Quebec, for electrical purposes, 5,000 horse power. The work will probably be completed by July next, at a cost estimated at about \$275,000.

The B. Greening Wire company of Hamilton, Ont., had installed in its works, about three months ago, a 40 horse power S. K. C. two-phase motor. It receives its current from the Cataract Power company. This has worked so satisfactorily that it has placed an additional order for one 50 horse power, one 30 horse power and one 20 horse power motor of the same type, to work its entire works by electricity. The Gurney-Tilden company of the same city is also having installed in its works one 30 horse power, three 15 horse power and one seven horse power S. K. C. two-phase motors, which are to drive the machinery and elevators in their entire works, altogether replacing steam. At this rate Hamilton will soon be a smokeless city, as the engines of the Hamilton Electric Light and Power company were closed down in March last, and have not been in operation since, everything being driven by the power from De Cew Falls. A. V. W.

PERSONAL.

Silvanus P. Thompson is slated as the next president of the British Institution of Electrical Engineers.

Mr. A. E. Dresser, salesman for the Fort Wayne Electric Works in the state of New York, has established his office at 717 Dillaye building, Syracuse.

The Rumford medal for the practical development of arc lighting has been awarded to Mr. Charles F. Brush by the American Academy of Arts and Sciences.

A. W. Ebeling, for many years connected with the Otto Gas Engine Works, has resigned his position as secretary of that company. He proposes to take a vacation this summer before assuming fresh business burdens.

At Rochester, Minn., June 21st, Miss Elizabeth Genevieve Feeney was married to Professor Jerome J. Green of Notre Dame, Ind. Professor Green has many friends in the electrical fraternity in the West, and especially in educational circles.

A. H. McDonald, a foreman of the Northwestern Telephone Exchange company, while putting in a switchboard at New Ulm, Minn., was taken sick with pneumonia and died after a few days. The remains were taken to Chicago for burial.

G. F. Greenwood, formerly chief engineer and now consulting engineer of the Consolidated Traction company, Pittsburg, Pa., has been appointed engineer in charge of rebuilding the street railroads in Havana. There are at present about 25 miles of track in that city. The New York and Canadian syndicate, which has obtained control, proposes to begin work in the fall on rebuilding and extending the present roads.

H. P. Clausen, the widely known telephone expert, has resigned his position with the Western Telephone Construction company to take charge of the multiple-switchboard work of the American Electric Telephone company of Chicago. Mr. Clausen has had charge of the engineering department of the Western company for the last five years, and during that time has been connected with some of the most difficult pieces of work handled by the Western company. Mr. Clausen is one of the leading telephone engineers in the United States, and is well known as the author of many instructive articles on telephony.

Tom L. Johnson, the street-railway magnate, recently visited Lansing, Mich., to speak before the state Legislature in favor of a bill for single tax. The railway magnate's arguments were so convincing that the senators became somewhat alarmed. But few of them had the necessary information to combat the arguments, and yet did not wish to pass the bill. Johnson was asked why personal property was omitted from the list of taxable goods and chattels. He said: "If you tax the bonds you tax twice. It is like taxing the house and taxing the deed." He declared himself ready to answer any question put to him, but had few suggestions. He reviewed the whole single-tax argument from end to end, speaking with a wealth of illustration for several hours.

ELECTRIC LIGHTING.

Sealed proposals are being invited until July 7th for furnishing and installing an electric-lighting plant at Fort Point, Cal. Information will be furnished upon application to Major Chas. E. L. B. Davis, Flood building, San Francisco, Cal.

The Treasury Department is inviting sealed proposals until June 28th for installing an electric-light and power plant in the United States postoffice and sub-treasury building at Boston, Mass. Specifications and plans can be obtained upon application to the Treasury Department, Washington, D. C., or to the custodian of the building at Boston.

ELECTRIC RAILWAYS.

It is said that one of the American attractions at the Paris Exposition will be a trolley line six miles long from the America landing to the national building down the Seine.

It is reported that the big deal for a combination of interurban electric-railway interests in and about Indianapolis has been completed, and within six months Indianapolis, Anderson, Marion, Muncie, Elwood and Summitville will be in closer connection with each other through the medium of electric lines all operated by one syndicate. The road from Indianapolis to Muncie will be completed before January 1st, if present plans carry. The firm of Campbell, Wild & Co. of Indianapolis is said to be financing the deal, and some big capitalists are interested in the enterprise, including some of the men who belong to the Indianapolis Street Railway company, which recently secured a franchise for 34 years. Ex-Congressman Charles L. Henry, owner of the Anderson road, and George F. McCullough, owner of the Muncie road, are in the new deal. The combined company will probably be called the Union Traction company. It is the intention to charge one cent a mile for passenger traffic. The system, when completed, will control 100 miles of interurban and 50 miles of city lines.

AUTOMOBILES.

The St. James Gazette says that there is no doubt that the old style of London cabman is doomed. Not only has he to contend with the taximeter, but the yellow electric cabs, after a brief interval of retirement, are to burst upon the streets once more to the number of 80. "London is so overdone with cabs," says the Gazette, "that the addition of 80 new ones to the existing total is a serious matter, especially when the four-score are of a novel and attractive kind. These electric hackney carriages are comfortable, and have only two drawbacks—they are (or were) a trifle noisy, and they attract rather too much public attention. The works, we understand, have now been simplified, and as they increase in number and familiarity the occupants will not get stared at quite so unmercifully."

PUBLICATIONS.

Five recent publications of the Westinghouse Electric and Manufacturing company not previously noticed in the Western Electrician are catalogue bulletins relating to "Transformer Fuse Blocks," "Shallenberger Integrating Wattmeters for Alternating-current Circuits," "Single-reduction Railway Motor," "Generators and Rotary Converters for Electrolytic Work" and "Belt-driven Railway Generators." All supersede earlier publications and are sent on request.

TECHNICAL SCHOOLS.

At the recent commencement exercises at Columbia University, New York, 26 students received the degree of electrical engineer. The total number of degrees conferred was 470.

The Bulletin of the College of Engineering of the University of Minnesota was issued recently. It may be had without charge on application to the Registrar, University of Minnesota, Minneapolis, Minn.

The Polytechnic Institute of Brooklyn graduated three bachelors of science in electricity and one electrical engineer on June 13th. At the annual dinner of the alumni association of the institute it was announced by Henry Sanger Snow, who recently was elected to succeed Dr. Cochran as president, that, contrary to the prevailing idea, he had not accepted the place as a permanent office, but only temporarily. Another interesting statement in regard to Mr. Snow's relation with the office was made by Prof. Brainerd D. Kellogg. He said that Mr. Snow had accepted the office on the understanding that he should not receive one cent of salary, as well as that he should remain only temporarily at the head of the faculty.

POWER TRANSMISSION.

An Albany dispatch says that Colonel John N. Partridge, state superintendent of public works, will grant permission to the Hudson River Power Transmission company to erect poles and string wires along the Erie Canal, provided the state is permitted to place telephone and telegraph wires along the poles. The power company, in its letter to the Canal Board, asks permission to string the wires on the state property from the north line of the village of Mechanicsville, south to the end of the Champlain Canal, and thence along the Erie Canal to and into the city of Albany, and as far as the Erie Canal extends.

The Westinghouse Electric and Manufacturing company has received a contract from the Big Creek Power company, Santa Cruz, Cal., for an addition to its plant. The company has already installed generators amounting to 400 horse power, and is now adding a new generator of 250 horse power, as well as four raising and lowering transformers of 400 horse power. This company is a considerable distance from the city of Santa Cruz, and transmits electric current at 10,000 volts to the city, where it is reduced and used for lighting and power purposes. This company has utilized the water power provided by the falls in the neighborhood of the city.

MISCELLANEOUS.

Consul Fowler sends to Washington from Chefoo a letter written by a merchant who has been investigating the alleged deposits of mica in China. A great abundance of the mineral is found in Chu-Cheng, and it is said to be of excellent quality.

The Treasury Department is inviting sealed proposals until June 30th for the installation of a system of conduits and wiring for electric lighting in the United States postoffice building at Brockton, Mass. Plans and specifications can be had upon application to H. A. Taylor, assistant secretary of the treasury, Washington, D. C.

The Treasury Department opened bids for the installation of an electric-light and power plant in the United States postoffice building at Cincinnati, O., of which the following were the lowest: Generators, General Electric company, Schenectady, N. Y., \$3,050; engines, Ridgeway Dynamo and Engine company, Ridgeway, Pa., \$4,125; switchboard and wiring, L. F. Buchanan & Co., Philadelphia, Pa., \$0,760.

TRADE NEWS.

The Western Electric company has furnished the Calumet Printing company, Chicago, a 40 horse-power motor to operate its printing presses. The construction department of the Western Electric company installed the plant.

Announcement is made that the E. L. Powers company of New York has effected an arrangement for the publication of the Electric Railroad List of the World, formerly issued by the Railroad Gazette. The publication will be consolidated with the American Street Railway Directory.

Among the recent sales reported by Gates & Randolph of Chicago are the following: One 150-kilowatt 200-revolution direct-current Triumph machine to Braun & Fitts of Chicago; one 150-kilowatt Warren alternator to the Manistee, Mich., Electric Light company; one 60-kilowatt Warren alternator to the Bayfield Electric Light company, Bayfield, Wis., and one alternating-current Sterling arc machine to Armour & Co. of Chicago.

Col. J. H. Shay, who recently connected himself with the Chicago Belting company, is meeting with well-earned success in his new capacity. During a trip of three weeks' duration Colonel Shay secured orders amounting to over \$9,000. The Chicago Belting company, which manufactures the well-known "Dynamo brand" of belting, states that the demand for its belting has been so great that its capacity has been taxed to the utmost to meet it.

Convincing proof of the general acceptance of the Sturtevant system is presented in the pamphlet just issued, entitled "Twenty-five Hundred Witnesses," and containing the names of public institutions of all classes and commercial enterprises in which apparatus manufactured by the B. F. Sturtevant company is now regularly employed. Some idea of the magnitude of the industry and the high standing of the Sturtevant company can be gained from a perusal of this list of names and the uses to which the apparatus is put.

William Roche, manufacturer of New Standard dry cells, is doing a splendid business in his line. The increasing demand for the cells is remarkable. Mr. Roche started out on his own account and under his own name only a little over a year and a half ago, after building up a reputation for cells made for other concerns. Mr. Roche states emphatically that the number of cells he has made to the present, under his own name, will in a couple of years bring him reputation that will endure and ought to bring him a fortune at the same time. He claims that it is the most durable telephone dry cell ever made.

Trotter's Mona Manufacturing company, limited, of New York, has placed upon the market within the last few months a compound which is fully guaranteed to be a perfect lubricant and spark preventer. Prof. J. W. Trotter, the inventor of this preparation, is a well-known manufacturer of high-grade toilet soaps and perfumes. He has been an engineer for more than 20 years, and is familiar with electrical machinery. His long and practical experience was of invaluable assistance to him in preparing this new compound. He will furnish a sample on application. Messrs. Goldmark & Wallace of 121 Worth street, New York, have accepted the selling agency of this compound.

The Renew Lamp company of 126 State street, Boston, is doing a thriving business throughout the East, renewing burned-out incandescent lamps. Not satisfied with its handsome trade in the home territory, the Renew company is planning a western campaign and proposes to locate a branch office in Chicago just as soon as the proper man to take charge of it has been secured. As the saving effected through the renewal of incandescent lamps by the Renew company is figured to be no less than one-third in the maintenance of a customer's supply, one can readily appreciate that the company can present a proposition that merits the consideration of every central-station and isolated-plant manager interested in making or saving money, and particularly so in this case, as the Renew Lamp company guarantees its product to be equal to any standard new lamp made. Treasurer Henry Hastings or another representative of the Renew Lamp company expects to visit Chicago with the view of establishing an office in this city about the middle of July.

The Westinghouse Electric and Manufacturing company's Chicago office has secured a contract from the Fox River Electric Railway company, Green Bay, Wis., for an addition to its plant. The company is placing in its power house a 135 horse power Westinghouse "engine-type" generator, connected to a new steam engine. This is an addition to the generators already installed. The company is extending its line and putting on new cars between Green Bay and Depere, which presents a very pleasant trip during the summer months. The Westinghouse company has also received a further contract from the San Gabriel Electric company, Azusa, Cal., for an additional rotary converter of 550 horse power. This unique plant, generating electricity by water power and transmitting it at 10,500 volts, is gradually supplying current to the whole of the neighborhood. The new machine is employed to supply electric current to the street railroads of Los Angeles. The San Gabriel plant now consists of one

325 horse power two 300 horse power and two 250 horse power rotary converters. As the demand for electric power are found the necessity of providing to meet the demand.

BUSINESS.

The Burnley Battery at Mansfield, a member of Painesville, O., has the reputation of being the best phone men for its Pioneer dry battery, which is perfected by long experience and is absolutely reliable. The same company makes the Burnley soldering paste.

Gentle zephyrs from electric fan trucks represent luxury on the Monon Route fast train between Chicago at 2:45 a. m. for Indianapolis and Cincinnati. Sleepers are ready for occupancy at Dearborn station at 9:30 p. m. Tickets may be had at the ticket office, 232 Clark street, Chicago.

The Swarts Metal Refining company of Chicago, in addition to buying up old copper wire, supplies the electrical trade with its high-grade Babcock cotton waste, solder, etc. The company has worked up a large trade in these lines, and users may find it to their advantage to communicate with the Swarts company.

The Montauk Multiphase Cable company will soon have ready for issuance a revised price-list. This has been made necessary, owing to the recent advance in metals. All price-lists heretofore issued are subject to this revision. A new book will give data for specifications and plans of buildings showing the installation of the cables; also directions for installing.

Economy of operation, reliability of action and smallest danger element are requisites in electric lighting. The Zeco enclosed direct-current arc lamps are gratifying to central-station people because giving their customers all that modern constant-potential arcs can render in reliable results. The Central Electric company, Chicago, distributes these articles of proven merit.

The Valentine-Clark company of Chicago states that the demand for cedar poles was never as large as it is at present, and that it finds it difficult to fill its orders. The company is one of the best-known pole concerns in the United States, and bears an enviable reputation among users of poles. Its yards at Pinconning, Mich., Green Bay, Wis., and New London, Wis., are said to contain a larger stock of cedar poles than those of any other dealer.

The wonderful endurance of a well-designed and thoroughly constructed fan blower is shown by a recent statement of William Kennedy & Sons, Owen Sound, Can., to this effect: "We have two Sturtevant pressure blowers in use, one of which has run over 32 years steady, and often 24 hours per day, and is apparently as good as when installed, although no one has as yet seen the inside of it. The other has been used for foundry purposes, and has been in use for about 30 years or so."

The demand for telephone and line material during the past spring has been so heavy that it has only been with the greatest difficulty that the large supply houses have been able to keep up with the demand. This has given the Electric Appliance company of 92 and 94 West Van Buren street, Chicago, an opportunity to test the facilities of its new building, and it has been able to handle a business in the line of telephone-construction material that would have been absolutely impossible if its facilities were not of the highest order.

The Mica Insulator company of New York, Chicago and London reports a heavy increase in the volume of business during the last two months. The company's line of insulating material—Mica plates, segments, rings, etc., Empire insulating cloths and papers and M. I. C. compound—is being used extensively by the leading builders of electrical machinery throughout the United States and European countries. The company's Micaite segments are now in use, it is said, by nearly all the large builders of generators and motors. Those having had no experience in the use of Micaite are asked to correspond with the company at New York, Chicago or London.

The Westinghouse Electric and Manufacturing company has received a contract from the St. Louis Dressed Beef company to install a 600 horse power engine-type electric generator to be directly connected to an engine, and to install a millstone switchboard. The St. Louis Dressed Beef company is adding to its electrical plant for the purpose of generating increased light to the cooling rooms. The Rockwell Electric company of Cincinnati has secured from the Westinghouse Electric and Manufacturing company one 150-kilowatt generator. The Philadelphia and West Chester Traction company, Philadelphia, has contracted with the Westinghouse Electric and Manufacturing company for six additional equipments of 35 horse power each. Each of these cars will therefore be driven by four motors aggregating 140 horse power. They are being especially built for the summer months, and are now fully finished, are on exhibition at the pleasure seekers and excursionists. W. H. Taylor & Co. of Worcester, Mass., have ordered a considerable electrical equipments for street railway cars. Each car will have two motors aggregating 100 horse power each.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued June 13, 1899.

626,661. Electric-arc Carbon. Daniel Bacon, New York, N. Y. Application filed January 13, 1898.

An electric arc-lamp carbon having a longitudinal groove or opening extending inwardly as far as the circumferential line of the crater or arc which will be formed during the use of the carbon, but not to the center or axis of the carbon.

626,667. Electric Sign. Charles A. Chase, Chicago, Ill. Application filed March 29, 1899.

An electric sign comprising a base board provided with a series of slots or open spaces, a series of letters comprising electric lights arranged to form the contour of the letter, the letters attached to the face of the board to form the desired sign, suitable electrical conductors attached to the back of the board, and suitable connections extending from the conductors through the slots or open spaces to the letters.

626,670. Electrical Burglar-alarm. Clyde Coleman, Chicago, Ill. Application filed November 10, 1896. Renewed November 28, 1898.

One claim is given: In an electrical burglar-alarm system the combination of a main circuit, a door circuit, means located at the guarded structure and adapted to be operated manually from the outside of the structure for electrically connecting the door circuit with the main circuit, a responsive device electrically connected with the main circuit and adapted to operate upon a disturbance of the door circuit when the latter is connected with the main circuit, automatically operating means for establishing for the current a path other than the door circuit, and means for thereafter preventing a disturbance of the responsive device by a disturbance of the door circuit, the system being without any means at the guarded structure, accessible from the outside thereof, and adapted to be operated manually for thus establishing the path other than the door circuit.

626,684. Electrical Safe-protection System. Henry F. Freed, Harrisburg, Pa. Application filed December 13, 1898.

In an electrical safe-protection system there is the combination with the safe, its biased door and locking bolts, of an electrical circuit having its terminals extending within the safe and in the path of the door electrical alarm mechanism forming a part of the circuit, a knob spindle fixed to the door, a key-operated lock contained within the knob spindle and operatively connected to the locking bolts and adapted to interrupt the circuit.

626,713. Self-regulating Dynamo. Morris Moskowitz, Newark, N. J. Application filed October 4, 1898.

A dynamo-electric machine, subject to variable armature speed, has a self-excited field coil in shunt with its armature, a high-resistance coil wound around the field of the dynamo, fed from a battery in circuit with the high-resistance coil, and a differential-series coil in the main circuit with the armature of the dynamo, the high-resistance coil coacting with the self-excited field coil to maintain or increase the field magnetism of the dynamo.

NO. 626,713.

626,723. Electricians' or Plumbers' Torch. Hiram C. Roberts, Philadelphia, Pa. Application filed April 17, 1899.

An electricians' and plumbers' torch consisting of a body provided with a wick tube, keepers mounted on the body, an air nozzle, the upper end of which is turned and adapted to discharge a blast in the vicinity of the upper end of the wick tube, which nozzle is movably mounted in the keepers, and a spring disposed between the body and nozzle and bearing against the air nozzle.

626,769. Apparatus for Electrically Annealing Wire or Rods. James H. Preston, Joliet, Ill. Application filed October 12, 1898.

Sheave wheels and means for electrically connecting them are arranged so that the means for opening and closing the switch and the sheave wheels are adapted to have electric contact with the wire or rod to be annealed and thus form an electric circuit over the wire flowing in each direction.

626,787. Electrode. William E. Irish, Cleveland, Ohio. Application filed January 3, 1898.

The method described of substituting an incandescent medium for an arc in an arc lamp, consisting in first turning the circuit through the arc, heating by means of an incandescent medium connecting the carbons, and making the medium conductive, when previously partially non-conductive, and finally maintaining the circuit through the medium to the exclusion of the arc, and increasing the incandescence of the medium thereby.

626,809. Coin-controlled Telephone-register. Tobias J. Hock and Emil Happersberger, San Francisco, Cal. Application filed July 20, 1898.

located in a single circuit and means are provided for transmitting electrical impulses through their coils, one arranged to act quickly and the other slowly in response to the impulses, in combination with a series of contact terminals, a movable arm traveling in the path of the contact terminals without touching them, the movement of the arm actuated by the quick magnet, and devices for bringing the arm in contact with the selected terminal actuated by the slow magnet and brought into action by a momentary stoppage of the impulses.

A series of registering disks, a pawl-carrying lever fulcrumed so that by its forward and backward movement it advances the disks to register the movements, a pawl-and-ratchet mechanism by which the lever is prevented from returning until the forward motion is completed, a latching lever by which the lever is retained in its normal position when it has been returned thereto, the latching lever being disengaged when a coin is introduced into the apparatus.

NO. 626,809.

626,826. Telephone Circuit. Percival G. Burgess, Mexico, Mex., and Henry W. Wilder, Springfield, Mass. Application filed March 16, 1899.

In a telephone system the combination of three differently placed telephones, a circuit including two of the telephones in such manner that each may transmit to and receive from the other, and a second circuit formed in part of a portion of the first, including one of the telephones, and in part of an auxiliary conductor joining two equipotential points of the first circuit, and including the third or remaining telephone, the third telephone being thereby adapted to transmit to one of the two telephones of the first circuit but not to the other.

626,832. Electric Meter. Edward S. Halsey, Chicago, Ill. Application filed May 23, 1898.

This is a mercurial meter in which pole-pieces present to each other surfaces widest at their centers, and tapering toward the ends so as to establish in the slot between them a magnetic field broadest at the center and narrowing toward the ends, the pole-pieces being of small area compared to the armature rotating between them and small electrodes centrally located at each end of the pole pieces.

626,833. System of Electric Metering. Edward S. Halsey, Chicago, Ill. Application filed July 1, 1898.

A multiple electric metering system is applied to a three-wire distributing system; at each point of consumption or metering a dial shifter or switch is operated by a current sent from the central station, passing through coils of wire acting upon a polarized element of shifter, the direction of the current through the coils determining the direction of movement of the operation, both operations being performed by the same coils, all of the coils being connected to and branching from a neutral wire of the distributing system.

626,835. Electric Block System for Railways. George Knowles, Milwaukee, Wis. Application filed December 26, 1895.

A main supply conductor and auxiliary conductors and circuit-controlling devices consisting of switch arms connected in pairs by an auxiliary conductor, two contacts associated with each switch arm and connected one with the main conductor and the other with the ground or return, and instruments arranged to be operated by cars passing successively in the same direction or in opposite directions to shift the switch arm of the associated switch alternately from engagement with one contact into engagement with the other.

626,848. Electrical Measuring Instrument. Joseph Wills, Niagara Falls, N. Y. Application filed November 3, 1898.

In an instrument for recording electrical energy there is the combination with the record-making mechanism of a coil traversed by alternating currents and acting magnetically to produce mechanical vibrations of one of the members of the recording mechanism.

626,918. Electrical Switch. Paul Medary, Cynwyd, Pa. Application filed September 2, 1898.

Provision is made for the combination with an insulating block having hollow terminals at the opposite ends of a reciprocating push rod passing through the block and terminals having metallic bushings thereon and an interposed insulating sleeve, each formed with pockets in their outer faces, and spring pressed balls secured in the terminals and arranged to engage in the pockets.

626,919. Electrical Switch. Paul Medary, Cynwyd, Pa. Application filed November 30, 1898.

An insulated block has oppositely arranged terminals secured thereon; a reciprocating push rod has oppositely arranged terminals and an insulated section; a substantially triangular projection carried by the rod and projecting into the block and spring-pressed member in the block are arranged to engage the projection during the movement of the rod.

626,927. Incandescent-lamp Socket. Charles G. Perkins, Hartford, Conn. Application filed February 13, 1899.

A cap, shell, insulating material located within the shell, fastening plates loosely connected with the insulation, fastening screws extending through the cap and shell and the fastening plates, and binding posts and contacts held by the insulation are combined.

626,940. Electric Cable. Willoughby S. Smith, London, England. Application filed November 7, 1898.

The combination of a single solid metallic conductor

and tapes of the same metal as the conductor helically wound on it, and in electrical connection with it, the diameter of the central conductor being largely in excess of the thickness of the tape, or their combined thickness, when two or more layers are used.

626,942. Magnet Clutch for Brakes. Joseph B. Stewart, Haverstraw, N. Y. Application filed November 4, 1897.

An electromagnetic clutch comprising a shaft, supports mounted thereon and carrying a number of bars loosely mounted in the supports and forming a core, a coil surrounding the core and rigidly supported with relation to the shaft, and an armature loosely mounted on the shaft and connected to the brake-operating mechanism.

626,972. Electrolytic Apparatus for Deposition of Metals from Solution. Thomas Craney, Bay City, Mich. Application filed January 3, 1898.

Claim is made for the combination of the outer tank, an overflow pipe therefrom, a hollow open-ended feed pipe in the center of the tank, and an anode and cathodes mechanically combined therewith and forming with it a removable unit of the apparatus.

626,978. Electrical Arm Signal for Railway Crossings. William H. Daniels, Berea, and Aaron E. Flickinger, Elyria, Ohio. Application filed December 31, 1897.

Two normally closed track circuits include electrically insulated track sections at opposite sides, respectively, of the crossing, and electromagnets; a normally open electric circuit includes magnets and an armature that is normally attracted by one magnet and capable of closing the break in the circuit when it is moved away from the magnet; another normally open electric circuit including magnets and an armature that is normally attracted by a magnet and capable of closing the break in the circuit.

626,979. Rail-bond for Electric Railways. Fred H. Daniels, Worcester, Mass. Application filed November 25, 1898.

A rail bond in which the terminals are combined with a flattened wire rope or cable connector enlarged or bulged at a point between its ends so as to spread apart and loosen up the several strands, the enlarged portion being also flattened, with its strands in their spread-apart condition.

626,980. Rail-bond for Electric Railways. Fred H. Daniels, Worcester, Mass. Application filed April 25, 1899.

This improvement in the manufacture of rail bonds or connectors for electric railways consists in forming from strands of copper wire a tubular rope or cable, and then flattening the rope or cable by pressure.

626,983. Automatic Telephone-exchange System. Ward Decker, Owego, N. Y. Application filed August 3, 1896.

In an automatic telephone or other electrical exchange system the combination is claimed of switch-operating electromagnets at a central station, metallic circuits radiating to substations, means for operating the switching magnets at the central station consisting of a motor-driven magneto-electric generator, generating alternating currents at each substation, and controlled by a dial, and a movable plug for controlling the dial.

626,984. Combined Alternating Continuous-current System for Electric Traction. Max Déri, Vienna, Austria-Hungary. Application filed April 27, 1897.

A car carries an alternating-current motor to operate the train and a continuous-current dynamo or motor is also connected mechanically to an axle or wheel of the car or train, with an accumulator battery electrically connected up to the direct-current dynamo or motor, and interrupted line conductors supplying alternating currents to the alternating-current motor.

NO. 626,984.

627,006. Electrical Burglar-alarm System. Henning O. Megaard, Chicago, Ill. Application filed February 1, 1897. Renewed November 28, 1898.

The combination with the structure to be guarded and a curtain for closing the opening thereto of an electrical burglar-alarm system having an electrical barrier disposed upon the curtain, the structure to be guarded being provided with portions which project in front of the curtain so as to overlap and conceal its edges and which project beyond the edges of and overlap the electrical barrier on the curtain.

627,000. Storage Battery and Method of Preparing Electrodes Therefor. Leonard Paget, New York, N. Y. Application filed May 1, 1899.

A storage-battery electrode in which finely divided active material forms the sole conducting connection between the opposite sides of the electrode, the opposite sides of said active material consisting of oxidized and oxidizable material, substantially as described.

627,054. Electrical Burglar-alarm System. Clyde Coleman, Chicago, Ill. Application filed October 18, 1897.

A device for opening and closing a circuit has a rock shaft, mercury cups carried thereby, an armature, an electromagnet for moving the armature in one direction and thereby moving the rock shaft with its cups, and an automatic mechanical device having a trip adapted to move the shaft in the opposite direction.

HARDTMUTH CORED AND SOLID CARBONS

FOR DIRECT CURRENT ARC LAMPS.

WE HAVE IN STOCK THE FOLLOWING SIZES:

CORED CARBONS.

Diameter. Length.
 5-16 in. x 6 in., 6½ in., 7 in., 7½ in. and 8 in.
 3-8 in. x 7 in., 8 in., 9 in., 9½ in., 10 in. and 12 in.
 7-16 in. x 6 in., 7 in., 8 in., 9 in., 9½ in., 10 in. and 12 in.
 1-2 in. x 6 in., 7 in., 7½ in. and 8 in.
 5-8 in. x 12 in.

SOLID CARBONS.

Diameter. Length.
 7-16 in. x 7 in. and 10 in.
 1-2 in. x 6 in., 7½ in. and 12 in.

Having received a large consignment of these Carbons just before the new tariff went into effect, we are prepared to make very low prices. Send for price list.

“THAT’S the Lamp.”

THE “NEW LYNN”

The Lamp of the Century.

This oval anchored filament lamp is the finest type of lamp yet designed, and in the “New Lynn” we have it in perfection.

This lamp is all that good workmanship and the best of material can make it.

Its superior qualities make it THE LEADER.

Large stock. Prompt shipments. Quality guaranteed.

All voltages, bases, candle powers and efficiencies.

Write for our method of maintaining your supply of this very superior new lamp at lowest price of any first-class lamp on the market.

THE LIFE OF A TALLOW DIP
A Tragedy in Five Acts.

—Unsere Gesellschaft.

THE COLUMBIA INCANDESCENT LAMP.

**“UNEQUALED
IN QUALITY.”**

Just a Few Lines of Greeting
for the New Year.

There are now (and more will appear in 1899 without doubt!) so many “tallow dip” incandescent lamps on the market that we call your attention to the fact that a “tallow dip” lamp, like its namesake to the left, gets “sicker” and sicker as it burns until in a short time it looks (and you feel) like this:

and soon “fizzles out” like this:

You’ve tried all sorts of **cheap** lamps—have they satisfied you? NO! We know they have not. Try a good lamp in 1899—our “unequaled in quality” means something.

**Columbia Incandescent Lamp Co.,
ST. LOUIS.**

COMPLETE FILE CHICAGO DAILIES FOR 10 YEARS.
From _____

Automobile order creates "hull," the unprecedented order from Paris to supply a Chicago firm which has been placed with a contract to supply a large number of motor cars for the city. The order is for nearly \$2,000,000 of electric cars of the most modern workmanlike design. It is the largest order of its kind that it was in Paris that the electric motor was first used in a motor car. The firm in question is the Electric Carriage Co. of Paris. The order has been placed, said yesterday, "the reason Paris comes to this country for the electric car is that it is the only one that has not been developed, although it originated there."

Bureau of Press Clippings

Vitogen Vitogen

The attention of Managers and Engineers of Power Plants

is particularly called to this article,
unequaled in cases of

BURNS and SCALDS,

as the following and many
other testimonials will prove.

**No Pain.
No Odor.
No Irritation.**

Dr. Weathers,
NEW ALBANY,
IND.,

Lifted out 2½ lbs.
mass of burned
flesh.

Sloughing fear-
ful.

Vitogen
to the rescue.

"Mr. Harry Rood, electrician in plant which supplies power to New Albany street car, arc and incandescent light lines, by accident brought his back in contact with switchboard of arc line which carried at the time a 4,000 voltage. He was impaled until released by the tissue being burned away in two pits down to the bone structure about 3 inches in diameter. These pits were 10 inches apart. The intervening flesh was roasted so severely that after a few weeks a mass weighing 2½ pounds was lifted out."

"Immediately after the accident I applied equal parts of linseed oil and lime water, pouring the charred cavities full and covering over with absorbent cotton. This continued for some days. Opiates administered to relieve intense pain. The sloughing was something awful—cotton, bandages, clothing and bed were swathed in pus."

"I turned my attention to dry dressing; first used boracic acid and bismuth Sub. Nit., which was conducive of too much pain."

"I then sprinkled Vitogen lightly over surface of wound and over cloth saturated with linseed oil. The effect was marked by quiet and sleep of patient without the aid of opiates. The burn was thereafter dressed with Vitogen generally twice a day. One remarkable feature was that after Vitogen was applied a few times there was no more pus, and on undressing the wound each time no Vitogen powder was visible. This mode of treatment was not departed from until September 1, when patient was discharged."

"My bill shows that I used all told 18 ounces of Vitogen in this case."

"I enclose photographs of patient's back five weeks after accident and at present time. The rib shown in No. 1 was later excised. Please note the healthy granulation shown to good advantage in No. 1. One part, as seen in No. 2, is not entirely closed. There seems to be some dead bone there, which may necessitate a second operation. However, this does not detract from the merits of Vitogen. Indeed, I feel that Vitogen merits all that I have said of it."

Two Ounce Bottle, 50 cents.

SEND FOR OUR BOOKLET ON VITOGEN.

THE G. F. HARVEY CO.

MANUFACTURING CHEMISTS,

Saratoga Springs, N. Y., U. S. A.

THE COST DON'T COUNT

IT'S WHAT A LAMP DOES THAT IS IMPORTANT.

NOTE THESE FIGURES:—

Cost of "FOWLER" Lamp, 20 cts.

" "CHEPE" " 15 "

Suppose they both last 600 hours—then,

Cost of "FOWLER" Lamp per hour— $20 \div 600 = \frac{1}{30}$ cts.

" "CHEPE" " $15 \div 600 = \frac{1}{40}$ "

$\frac{1}{30}$ cts.—Additional First Cost, per hour of life, for "FOWLER."

Suppose current costs 10 cts. per K.-W. hour:

"FOWLER" Lamp (high efficiency) uses $\frac{5}{10}$ cts. per hour.

"CHEPE" " (any old efficiency) averages $\frac{3}{10}$ cts. per hour.

$\frac{2}{40}$ cts.—Loss, in cost of current per hour, with "CHEPE" Lamp.

After a short time, "CHEPE" Lamp gives $\frac{1}{2}$ less light, though it takes as much current as at first— $\frac{1}{2}$ of $\frac{2}{40}$ cts.

$\frac{2}{40}$ cts.—Loss in light per hour with "CHEPE" Lamp.

$\frac{1}{40}$ cts.—TOTAL AMOUNT YOU LOSE EVERY HOUR YOU USE A "CHEPE" LAMP. Multiply $\frac{2}{40}$ cts. by 600=\$2.65—net amount you lose by every "Chepe" Lamp which lasts 600 hours.

BUY FOWLERS AND SAVE MONEY.

THEIR STRONG POINTS:

- High Efficiency,
- Long Life,
- Maintenance of Candle Power,
- Interchangeable Bases,
- Strong Construction,
- Fitness for Use in Damp Places.

OURS is the only lamp made that is not "plastered together." We use no plaster whatever, but our specially shaped globe is securely held by a collar which fits over the head of our globe, and inside of the base, and which is soldered fast, so that we have

A LAMP THAT

Will never work loose in the base, and so short-circuit inleanding wires.

Will not soak up moisture to cbeow off the inleanding wires.

Is worth more after it is burned out, as base is not clogged up with plaster but may be detached and used again.

QUALITY.—It is not possible, in a written description, to show the good qualities of our lamp for light giving, life and efficiency, but we claim that our lamps will give longer average life, and maintain the candle power better than any other lamp using the same current, if used under the same conditions.

SEND TRIAL ORDER IMMEDIATELY.

SAVE YOUR COMMUTATORS

By using the LE VALLEY VITAE CARBON BRUSH.

Adopted by the largest street railroads throughout the United States and Canada after thorough tests. Guaranteed to be the only positively self-lubricating, non-cutting, non-sparking brush made. A trial will prove this. RECORD OF THE BRUSH.—A set of these brushes has been used on a car motor approximately 19,000 miles without wearing the commutator perceptibly.

Among our customers are the following:

BARGAINS IN DYNAMOS, ENGINES.

Write for Price List No. 22.

Direct Current Dynamos, Alternating Current Dynamos, Arc Dynamos, Engines, Boilers, Heaters, Pumps, all sizes. This apparatus has been in use in our own stations, and we therefore know its exact history, and can state that it is in thoroughly good operative condition.

CHICAGO EDISON COMPANY, 139 ADAMS ST., CHICAGO.

TALK ABOUT PRICES.

Having purchased the entire available assets of The Cornman Company, assigned, and of The Cleveland Electric Trading Company, we have now on hand a large amount of alternating and direct current and arc apparatus, as well as a large stock of lamps, station supplies, construction supplies, etc., which we desire to close out at once.

We have bought cheap, and we are willing to sell cheap.

We expect to have on hand, from time to time, considerable apparatus of this sort. It is our purpose, however, to act as contracting engineers and manufacturers' agents, and we are fitted to handle anything in the way of electrical and steam installation. Write us regarding your contemplated improvements.

GET CATALOG.

A PERFECT RINGER.

All of our magneto bells are equipped with our new single-core ringer. You will undoubtedly find that this form of ringer possesses many points of superiority in many respects over all forms and types of double-core ringers. Here are a few of the reasons:

1st. The magnetic joints in the electro-magnetic circuit are absolutely perfect.

2nd. Perfect symmetry in design means perfect symmetry in action.

3rd. Our ringer has the shortest possible length of magnetic circuit, which circuit encloses only one-half the depth of the winding.

The fact that one of our competitors has brought suit against us for infringement on their double-core ringer is an open acknowledgment that our single-core ringer is superior to any and all double-core ringers, because they find that we are cutting into their trade.

MCINTYRE'S

Dry Battery Portable Electric Safety Lamp.

ABSOLUTE SAFETY IS ASSURED ALL USERS.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use.

Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Fitters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur, and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

Open and Enclosed Arc Lamps

FOR SERIES, ALTERNATING AND DIRECT CURRENT.

Dynamos and Motors. Switchboards. Panelboards.

Factory: Ocean Ave. and South St., BROOKLYN HILLS, L. I.

The steady and increasing favor in which any article is received is the best evidence of its merit. This has been the history of our engine during the fifteen years of its existence, and our engines have been our best advertisements. The highest quality of materials and workmanship are used in their construction. They cost less for maintenance, are economical and reliable; embody all modern improvements, and for these reasons deserve and command higher prices than others.

A VALUABLE BOOK FOR ENGINEERS AND FIREMEN NOW READY.

MODERN EXAMINATIONS OF STEAM ENGINEERS or PRACTICAL THEORY EXPLAINED and ILLUSTRATED.

BY W. H. WAKEMAN.

12 mo. Cloth. 272 pages. 53 Chapters.

Containing a complete list of 300 questions such as will be asked of any Engineer when taking examination for U. S. Government or State License, all of which are fully answered in the text.

PRICE, \$2.00

By mail, postpaid, to any part of the world

This book while especially adapted for engineers' examinations, is also intended as a practical guide to Engineers, Firemen, Boiler Makers, Machinists, and others, in daily practice.

The author being a practical steam engineer himself, well knows the wants of the working engineer, and has put into this work such knowledge and information as is best adapted to their use, making it altogether the most complete and comprehensive guide for the busy workers in the engine room, boiler works and machine shops that has ever been published.

As one engineer who has read the book says: "I think there are few engi-

neers that it wouldn't do some good. It seems as if it was a review of all I have ever read, and a lot more besides."

The author has treated of a very great variety of subjects which are of vital importance to all who wish to improve and extend their knowledge of steam engineering, and has explained the rules and formulas given, in the simplest manner possible, and has worked out examples by them, so that all who can read may understand them.

The 300 questions are an important feature of the book, they are entirely separate from the 53 chapters of reading matter, and were written after many years of practical experience and careful research by the author.

His connection with the Boardman Manual Training High School at New Haven, Conn., as Instructor in Steam Engineering, his 12 years of active membership in the N. A. S. E., and his position as Instructor of No. 10 of Conn., a sturdy branch of the National Organization, makes him especially competent in this part of the work.

The many flattering commendations which this book has already received from competent judges and high authorities, speak well for its value.

ELECTRICIAN PUBLISHING COMPANY, - - - Suite 510 Marquette Building, Chicago, Ill.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price \$1.00.

This handbook is a complete treatise on telephony, and a practical book on telephons working and management, based entirely on standard American practices. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennedy, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged, 360 pp., 283 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Huskins. Sixth edition, 16mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition, 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pages, 333 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp., 168 illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages, 169 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages, 23 illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 785 pages, 516 illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages, 3 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 330 pages, 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG. CHICAGO.

Westinghouse

MECHANICAL DRAFT

conditions or flue temperatures. Can give the effect of a two hundred foot chimney. Invaluable in large lighting stations, where on cloudy days the demand for power is liable to be doubled or trebled in a few minutes. We are pioneers in this work, and it is a class of work in which experience counts.

A large slow-moving suction fan performs the office of a chimney, discharging the products of combustion through a short stack extending just above the roof. Generally costs less than a tall chimney with its expensive foundations. Draft is independent of weather

NEW BOOKS.

AUTHORITIES ON SUBJECTS MENTIONED.

The Pocket Electrical Dictionary. Containing all of the words and definitions in the science. A new work. Indispensable to the electrician, student and professor. Over 11,000 words and about 15,000 definitions. By *Edwin J. Houston, A. M., Ph. D.* (Princeton). 1 volume, 32mo, cloth, \$2.50; leather, \$3.00.

Electricity Made Easy. Profusely illustrated. A hand-book for busy people. By *Edwin J. Houston, A. M., Ph. D., and Arthur E. Kennelly, Sc. D.* 1 volume, 12mo, cloth, \$1.50.

Dynamo-Electric Machinery. By *Silvanus P. Thompson, D. Sc., B. A., F. R. S.* Sixth edition, revised and enlarged. Profusely illustrated with new engravings. 19 folding plates. 2 volumes, 8vo, cloth, gilt, \$6.00. The rapid advance of electrical science made it absolutely necessary to revise the last edition, and this is now a new work. It is indispensable to the electrical expert, professor and student of electrotechnics. Students and professors highly appreciate the publication of this extensive work in two volumes.

Polyphase Electric Currents and Alternate Current Motors. By *Silvanus P. Thompson, D. Sc., B. A., F. R. S.* 1 volume, 8vo, cloth, gilt, \$3.50. The most important work on the subject. A companion book to "Dynamo-Electric Machinery." One of the text-books in schools of technology and colleges. Beautifully illustrated with fine engravings. Folding plates. Invaluable to the expert electrician.

Algebra Made Easy. By *Edwin J. Houston, Ph. D., and A. E. Kennelly, Sc. D.* This little work is of special value to readers of Prof. Thompson's Dynamo-Electric Machinery and Polyphase Electric Currents, as the work has been written to explain in a clear and simple manner the equations contained in those works. 1 volume, 16mo, cloth, 75 cents.

The Interpretation of Mathematical Formulae. By *Edwin J. Houston, Ph. D., and A. E. Kennelly, Sc. D.* 1 volume, 12mo, cloth, \$1.25. A most valuable aid to students and electrical workers.

A B C of Electricity. Now approaching its 65th thousand. By *William H. Meadowcroft.* 1 volume, 12mo, cloth, 50 cents. Fully illustrated. This excellent primary book has taken the first place in elementary scientific works. It has received the endorsement of Thomas A. Edison. It is for every person desiring a knowledge of electricity, and is written in simple style so that a child can understand the work. It is what its title indicates, the first flight of steps in electricity.

Scholars' A B C of Electricity. By *William H. Meadowcroft.* 1 volume, 12mo, illustrated, cloth, 50 cents. The author of this work has designed it for the use of teachers and scholars. A large number of simple experiments have been added, with notes relative to the work. It is the primary book for school use.

The X Ray; or Photography of the Invisible and Its Value in Surgery. By *William J. Morton, M. D.* Written in collaboration with *Edwin W. Hammer,* 1 volume, 12mo, cloth and silver, 75 cents; paper, 50 cents.

The work explains in clear and simple style how these extraordinary pictures are taken through solids. Full description is given of the apparatus used, and the text is profusely illustrated with half-tone illustrations giving facsimile copies of the pictures taken from the negatives of the author. The subjects are varied.

The A B C of the X Ray. By *William H. Meadowcroft.* 1 volume, 12mo, cloth and gold, 75 cents. The first primary work on the subject. A book for the people. The author of "A B C of Electricity" showed clearly in that work his ability to explain a technical subject for the laymen who know nothing of scientific terms. He has written this work about the X Ray in his usual clear and simple style, and a wide circulation of this useful book is assured. The text of the author is beautifully embellished with fine engravings, and nothing is omitted that will give the public a clear knowledge of this remarkable discovery of Prof. Röntgen. The public would do well to secure both these important works.

Sent Prepaid on Receipt of Price.

Westinghouse

AMONG THE BIG FELLOWS.

There is nothing strange about the fact that the big plants select Westinghouse Apparatus. Why shouldn't they? Good judgment could hardly direct them elsewhere. Our experience is the broadest of all the electrical concerns that exist. We have built the largest machines, the largest plants and, by reason of all this, possess the widest experience. Thus we could only expect that

“TRANSFORMER

DESIGN AND

OPERATION.”

TYPE "H" TRANSFORMER, WITH SUSPENSION
HOOKS.

“AN ALTERNATING CURRENT CENTRAL STATION COMPANY cannot pay dividends unless it uses transformers having HIGH INSULATION, LOW IRON CORE LOSS, GOOD REGULATION AND LOW TEMPERATURE RISE. The General Electric Company is foremost in the movement to encourage the central station manager to make electrical tests on transformers, and to induce him to purchase only those which can be depended upon to give results in accordance with *Manufacturers' claims*.

“A new standard of excellence was made when the General Electric TYPE H TRANSFORMERS were introduced, and to-day there are no transformers equal to the Type H in the following essentials:

“HIGH INSULATION, which means safety to customers, few burnouts and interruptions in service, low maintenance cost and small depreciation. Type H Transformers are insulated to withstand a 10,000-volt test between the primary and secondary,

“LOW CORE LOSS, resulting in small coal expense for magnetizing iron cores for transformers.

“GOOD REGULATION, permitting the use of high efficiency lamps and giving uniform light, satisfied customers and low cost for lamp renewals.

“LOW TEMPERATURE RISE, preventing ageing or increase of core loss, burnouts due to overheating of transformer, deterioration of insulation and shortening of life.

“Many central stations that are now unable to pay dividends can be made profitable by substituting Type H Transformers for those now in use. The coal expense can in many cases be reduced one-half.”

Send for a copy of the Pamphlet of which the above is the Preface.

HARDTMUTH CORED AND SOLID CARBONS

FOR DIRECT CURRENT ARC LAMPS.

WE HAVE IN STOCK THE FOLLOWING SIZES:

CORED CARBONS.

Diameter. Length.
 5-16 in. x 6 in., 6½ in., 7 in., 7½ in. and 8 in.
 3-8 in. x 7 in., 8 in., 9 in., 9½ in., 10 in. and 12 in.
 7-16 in. x 6 in., 7 in., 8 in., 9 in., 9½ in., 10 in. and 12 in.
 1-2 in. x 6 in., 7 in., 7½ in. and 8 in.
 5-8 in. x 12 in.

SOLID CARBONS.

Diameter. Length.
 7-16 in. x 7 in. and 10 in.
 1-2 in. x 6 in., 7½ in. and 12 in.

Having received a large consignment of these Carbons just before the new tariff went into effect, we are prepared to make very low prices. Send for price list.

CHICAGO EDISON COMPANY,

EDISON BUILDING, 139 ADAMS STREET, CHICAGO.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use. Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Filters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur, and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs., 1½ C. P. Price complete, \$ 4.00. For meter reading only.
 " 2 " 3 " 4 " " " 6.00. For general use.
 " 3 " 12 " 10 " " " 12.00. For sev. persons to work by.

SEND FOR "SPECIALLY FINE" CATALOGUE.

AMONG OTHER THINGS WE GUARANTEE ARE:

That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball bearing axles.

That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.

That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.

That the batteries can be charged when fully discharged in two and one-half hours' time.

That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.

That for the sum of \$50.00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

AVERAGE COST TO RUN PER MILE, 3-4 CENT.

NEW BOOKS.

AUTHORITIES ON SUBJECTS MENTIONED.

The Pocket Electrical Dictionary. Containing all of the words and definitions in the science. A new work. Indispensable to the electrician, student and professor. Over 11,000 words and about 15,000 definitions. By *Edwin J. Houston*, A. M., Ph. D. (Princeton). 1 volume, 32mo, cloth, \$2.50; leather, \$3.00.

Electricity Made Easy. Profusely illustrated. A hand-book for busy people. By *Edwin J. Houston*, A. M., Ph. D., and *Arthur E. Kennelly*, Sc. D. 1 volume, 12mo, cloth, \$1.50.

Dynamo-Electric Machinery. By *Silvanus P. Thompson*, D. Sc., B. A., F. R. S. Sixth edition, revised and enlarged. Profusely illustrated with new engravings. 19 folding plates. 2 volumes, 8vo, cloth, gilt, \$6.00. The rapid advance of electrical science made it absolutely necessary to revise the last edition, and this is now a new work. It is indispensable to the electrical expert, professor and student of electrotechnics. Students and professors highly appreciate the publication of this extensive work in two volumes.

Polyphase Electric Currents and Alternate Current Motors. By *Silvanus P. Thompson*, D. Sc., B. A., F. R. S. 1 volume, 8vo, cloth, gilt, \$3.50. The most important work on the subject. A companion book to "Dynamo-Electric Machinery." One of the text-books in schools of technology and colleges. Beautifully illustrated with fine engravings. Folding plates. Invaluable to the expert electrician.

Algebra Made Easy. By *Edwin J. Houston*, Ph. D., and *A. E. Kennelly*, Sc. D. This little work is of special value to readers of Prof. Thompson's Dynamo-Electric Machinery and Polyphase Electric Currents, as the work has been written to explain in a clear and simple manner the equations contained in those works. 1 volume, 16mo, cloth, 75 cents.

The Interpretation of Mathematical Formulae. By *Edwin J. Houston*, Ph. D., and *A. E. Kennelly*, Sc. D. 1 volume, 12mo, cloth, \$1.25. A most valuable aid to students and electrical workers.

A B C of Electricity. New approaching its 65th thousand. By *William H. Meadowcroft*. 1 volume, 12mo, cloth, 50 cents. Fully illustrated. This excellent primary book has taken the first place in elementary scientific works. It has received the endorsement of Thomas A. Edison. It is for every person desiring a knowledge of electricity, and is written in simple style so that a child can understand the work. It is what its title indicates, the first light of steps in electricity.

Scholars' A B C of Electricity. By *William H. Meadowcroft*. 1 volume, 12mo, illustrated, cloth, 50 cents. The author of this work has designed it for the use of teachers and scholars. A large number of simple experiments have been added, with notes relative to the work. It is the primary book for school use.

The X Ray; or Photography of the Invisible and its Value in Surgery. By *William J. Morton*, M. D. Written in collaboration with *Edwin W. Hammer*. 1 volume, 12mo, cloth and silver, 75 cents; paper, 50 cents. The work explains in clear and simple style how these extraordinary pictures are taken through solids. Full description is given of the apparatus used, and the text is profusely illustrated with half-tone illustrations giving facsimile copies of the pictures taken from the negatives of the author. The subjects are varied.

The A B C of the X Ray. By *William H. Meadowcroft*. 1 volume, 12mo, cloth and gold, 75 cents. The first primary work on the subject. A book for the people. The author of "A B C of Electricity" showed clearly in that work his ability to explain a technical subject for the layman who know nothing of scientific terms. He has written this work about the X Ray in his usual clear and simple style, and a wide circulation of this useful book is assured. The text of the author is beautifully embellished with fine engravings, and nothing is omitted that will give the public a clear knowledge of this remarkable discovery of Prof. Röntgen. The public would do well to secure both these important works.

Sent Prepaid on Receipt of Price.

KNOWLEDGE IS POWER.

Everyone engaged in the electrical business should keep posted on the developments in the art by reading the latest books on the subject. We are headquarters in the West for electrical books and can fill orders for any work published, promptly on receipt of price. We call your special attention to the following standard books:

Allsop, F. C.—Electrical Bell Construction; Treatise on the Construction of Electric Bells, Indicators, and similar apparatus. 177 illustrations.\$1.25

Angell, J.—Elements of Magnetism and Electricity, with Practical Instructions for the Performance of Experiments, and the construction of cheap apparatus. One hundredth thousand. 160 illustrations.\$1.00

Atkinson, Philip.—The Elements of Electric Lighting. Seventh edition, fully revised, and new matter added. 104 illustrations. 260 pages.\$1.60

Atkinson, Philip.—The Elements of Dynamic Electricity and Magnetism. 406 pages and 117 illustrations. Second edition.\$2.00

Ayrton, W. E.—Practical Electricity; a Laboratory and Lecture Course for First year Students of Electrical Engineering, based on the Practical Definitions of the Electrical Units. With numerous illustrations. Sixth edition.\$2.50

Badt, Lieut. F. B.—New Dynamo Tenders' Hand Book. This is, as the name indicates, a New Book, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers, and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 226 pages, 140 illustrations, flexible cloth binding, size of type page 5½x3 inches.\$1.00

Badt, Lieut. F. B.—Incandescent Wiring Hand-book. A timely book containing full illustration for incandescent wiring and complete information concerning methods of running wires, location of safety devices, splices, insulation, testing for faults, wire gauges, general electrical data, calculation of size of wires, wiring fixtures, elevators, buildings, isolated and central station plants. The only book of the kind published. Type page 5½x3 inches, flexible cloth binding. 66 pages, 35 cuts and 5 tables, 3 of which are 12x18 inches.\$1.00

Badt, Lieut. F. B.—Bell Hang rs' Hand-book. Just the book for people engaged in setting, installing or handling electric batteries, electric bells, elevators, house or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat apparatus. 106 pages, 97 illustrations, flexible cloth binding. Type page 5½x3 inches.\$1.00

Badt, Lieut. F. B.—Electric Transmission Hand-book. First edition, three thousand copies. 97 pages, 22 illustrations, 27 original tables.\$1.00

Gives more Practical information on the subject than any work published to date. The book contains all necessary information for Power Producers, Carpenters, Agents, Engineers and Motor Inspectors. With this book anybody may make estimates on the cost of Transmission Plants.

Bedell, Fred'k and Albert C. Crehore.—Alternating Currents; An Analytical and Graphical Treatment for Students and Engineers. Second edition. 112 illustrations.\$2.50

Blekesley, T. H.—Papers on Alternating Currents of Electricity for the use of Students and Engineers. Third edition, enlarged. 12mo, cloth.\$1.50

Bonney, G. E.—Electro-Plater's Hand Book. A Manual for Amateurs and Young Students on Electro-Metallurgy. 60 illustrations. 208 pages. 12mo, cloth.\$1.25

Bottone, S. R.—Electrical Instrument Making for Amateurs. A Practical Hand-book, with 48 illustrations. Fourth edition. Enlarged by a chapter on the Telephone.\$0.50

Bottone, S. R.—The Dynamo, How Made and How Used. A Book for Amateurs. Eighth edition, with additional matter and 39 illustrations.\$1.00

Bottone, S. R.—Electro-Motors. How Made and How Used. A Handbook for Amateurs and Practical Men. Reduced to cloth.\$0.50

Bottone, S. R.—How to Manage the Dynamo. A Hand-book for Ship Engineers, Electric Light Engineers and Electro-Platers.\$0.60

Buckley, W. J.—Electric Lighting Plants, their cost and operation. 275 pages, many illustrations and diagrams. Cloth.\$2.00

Paper.\$1.00

Cox, Frank P.—Continuous Current Dynamos and Motors. An Elementary Treatise for Students and Engineers. Illustrated.\$2.00

Crocker, P. B., and Wheeler, S. S.—The Practical Management of Dynamos and Motors. With a special chapter by H. A. Foster. Illustrated. Second edition, revised and enlarged.\$1.00

Crosby, O. T., and Dr. Louis Bell.—The Electric Railway in Theory and Practice. A Complete Treatise on the Construction and Operation of Electric Railways. Second edition, revised and enlarged. 183 illustrations.\$2.50

Desmond, Chas.—Electricity for Engineers. Part I. Constant Current. A clear and comprehensive treatise on the principles, construction and operation of Dynamos, Motors, Lamps, Indicator and Measuring Instruments; also a full explanation of the electrical terms used in the work. Part II. Alternate Current Apparatus. Containing an explanation of the principles governing the generation of, and a description of the instruments and machinery used in connection with Alternate Electric Currents. Illustrated. Revised edition.\$2.50

Dyer, A.—Induction Coils. How Made and How Used. Third edition. Boards.\$0.50

Fleming, J. A.—Short Lectures to Electrical Artisans. A course of Experimental Lectures delivered to a Practical Audience. Fourth edition. 74 illustrations.\$1.50

Fleming, J. A.—The Alternate Current Transformer in Theory and Practice. Vol. I. The Induction of Electric Currents, 500 pages, fully illustrated and with copious index. Second edition.\$3.00

Synopsis of contents; Chapter I. Introductory. 2. Electro-Magnetic Induction. 3. The Theory of Simple Periodic Currents. 4. Mutual and Self Induction. 5. Dynamical Theory of Current Induction.

Vol. II. The Utilization of Induced Currents. 8vo, cloth. London, 1892.\$5.00

Gore, G.—The Art of Electro-Metallurgy, including all Known Processes of Electro Deposition. Fourth edition.\$2.00

Gordon.—School Electricity. Sources, Currents, Measurement, Telegraphy, Telephony, Lightning, Electrolysis, Induction, etc. 262 pages, with 140 illustrations.\$2.00

Grier, Thos. G.—Wiring for Motor Circuits. A handy little pamphlet containing tables for wiring and for motor service, arranged in convenient form for ready reference.\$1.00

Haskins, C. H.—The Galvanometer and its Uses. A Manual for Electricians and Students. Fourth edition, revised.\$1.50

Haskins.—Transformers. Their Theory, Construction and Application Simplified. 38 illustrations.\$1.25

Hawkins, C. C., and F. Wallis.—The Dynamo, its Theory, Design and Manufacture. 140 illustrations.\$3.00

Hering.—Practical Directions for Winding Magnets and Dynamos. 12mo, cloth, reprint without additions.\$1.25

Hopkins, Geo. M.—Experimental Science. Elementary, Practical and Experimental Physics, 650 illustrations.\$4.00

Hopkinson.—Original Papers on Dynamo Machinery and Allied Subjects. Illustrated.\$1.00

Hopkinson, Dr. John.—Dynamic Electricity; Its Modern Use and Measurement, chiefly in its Application to Electric Lighting and Telegraphy.\$0.50

Hospitaler, E.—Domestic Electricity for Amateurs. Translated from the French. With additions by C. J. Wharton. With illustrations.\$2.50

Houston, Prof. E. J.—A Dictionary of Electrical Words, Terms and Phrases. Third edition, re-written and greatly enlarged. Large 8vo. 562 pages, and 670 illustrations.\$6.00

Kapp, Gisbert.—Electric Transmission of Energy and its Transformation, Subdivision and Distribution. A practical handbook. Tenth edition.\$3.00

Kapp, Gisbert.—Alternate Current Machinery Illustrated. \$0.50 [Vol. 96 Van Nostrand's Science Series.]

Kapp, Gisbert.—Alternating Currents of Electricity, Their Generation, Measurement, Distribution and Application. Authorized American ed. With an introduction by William Stanley, Jr. Illustrated.\$1.00

Kapp, Gisbert.—Dynamoes, Alternators and Transformers. 138 illustrations.\$4.00

Kempe, H. R.—A Handbook of Electrical Testing. Fifth edition. 200 illustrations. 8vo, cloth. London, 1892.\$7.25

In this edition there is a considerable amount of new matter; the old matter has been thoroughly revised.

Kempe, H. R.—The Electrical Engineer's Pocket Book. Modern Rules, Formulae, Tables and Data. 32mo, leather.\$1.75

Lockwood, T. D.—Electricity, Magnetism and Electric Telegraphy. A Practical Guide and Handbook of General Information for Electrical Students, Operators and Inspectors. 376 pages, 152 illustrations.\$2.50

Lockwood, T. D.—Electrical Measurement and the Galvanometer; Its Construction and Use. Second edition.\$1.50

Lockwood, T. D.—Practical Information for Telephonists. 12mo, cloth. N. Y.\$1.00

Meadowcroft, W. H.—The A. B. C. of Electricity. 36 illustrations.\$0.50

Martin, T. C.—Inventions, Researches and Writings of Nikola Tesla. With special reference to his work in polyphase currents and high potential lighting. 500 pp. 390 illustrations, second edition.\$4.00

Martin, T. C. and Wetzler, J.—The Electric Motor and its Applications. Third edition. With an Appendix on the Development of the Electric Motor since 1888. By Dr. L. Bell. 300 illustrations.\$3.00

Mayer, and Davis, M. M.—The Quadruplex. With Chapters on the Dynamo-Electric Machine in Relation to the Quadruplex. The Practical Working of the Duplex Telegraph Repeaters and the Wheatstone Automatic Telegraph. 63 illustrations.\$1.50

McClure, J. B.—Edison and his Inventions, with Full Explanations of the Telephone, Phonograph, Taenometer, Electric Light and all his Principal Discoveries, etc.\$1.00

Niandet, Alfred.—Elementary Treatise on Electric Batteries. Translated from the French by L. M. Fishback. Illustrated.\$2.50

Noll, Augustus.—How to Wire Buildings. A manual of the art of interior wiring. Illustrated.\$1.50

Pope, Franklin Lennard.—Modern Practice of the Electric Telegraph. A technical Hand-book for Electricians, Managers and Operators. 188 illustrations. 14th edition, rewritten and enlarged.\$1.50

Prindle, H. B.—A Popular Treatise on the Electric Railway of to-day. Fully illustrated.\$0.25

Russell, Stuart A.—Electric Light Cables and Distribution of Electricity. 107 illustrations.\$2.25

Salomons, Sir David.—Electric Light Installations. Vol. I. The Management of Accumulators. A Practical Hand-book. 7th edition, revised and enlarged. With illustrations. 12 mo, cl. London, 1893.\$1.50

Sloane, T. O'Connor.—Electricity Simplified. The Practice and Theory of Electricity, including a Popular Review of the Theory of Electricity, with Analogies and Examples of its Practical Application in every-day life. Illustrated.\$1.00

Sloane, T. O'Connor.—The Standard Electrical Dictionary. A Popular Dictionary of Words and Terms used in the practice of Electrical Engineering, 350 illustrations.\$3.00

Sloane, T. O'Connor.—Electric Toy Making for Amateurs, including Batteries, Magnets, Motors, Miscellaneous Toys.\$1.00

Sloane, T. O'Connor.—The Arithmetic of Electricity. A Manual of Electrical Calculations by Arithmetical Methods, including numerous rules, examples and tables in the field of practical electrical engineering and experimenting. Third edition, revised.\$1.00

Tesla, Nikola.—Experiments with Alternate Currents of High Potential and High Frequency. A lecture delivered before the Institution of Electrical Engineers, London. With a portrait and biographical sketch of the Author. Illustrated.\$1.00

Tesla, Nikola.—Lectures on the Electro-Magnet. Illustrated.\$1.00

Thurston, Prof. R. H.—Stationary Steam Engines, especially adapted to Electric Lighting Purposes. Treating of the development of Steam Engines, the Principles of Construction and Economy, with description of Moderate and High Speed Engines. With many folding plates.\$1.50

Thomson, Prof. Elihu.—What is Electricity? Illustrated.\$0.25

Thompson, Sylvanus P.—Dynamo-Electric Machinery. A Series of Lectures, with an introduction by Franklin L. Pope. 16mo. Numerous illustrations, fancy boards (Van Nostrand's Science Series, No. 66).\$0.50

Thompson, Sylvanus P.—Polyphase Electric Currents and Alternate-Current Motors. Mailed to any address in the world on receipt of.\$3.50

Thompson, Sylvanus P.—Recent Progress in Dynamo-Electric Machines, being a Supplement to Dynamo-Electric Machinery. 16mo. (Van Nostrand's Science Series, No. 75).\$0.50

Thompson, Sylvanus P.—Dynamo-Electric Machinery. Fourth edition, revised and rewritten. Numerous illustrations and 23 plates. 1,000 pages.\$6.00

Trevert.—How to Make Electric Batteries at Home. Illustrated.\$0.25

Urbahart.—Electro-Plating. A Practical Hand-book on the Deposition of Copper, Silver, Nickel, Gold, Aluminum, Brass, Platinum, etc. Second edition; carefully revised, with additions.\$2.00

Walker, P.—Practical Dynamo Building for Amateurs. How to wind for any output. With numerous illustrations. 16mo, boards. (Van Nostrand's Science Series, No. 98).\$0.50

Webb, H. L.—A practical Guide to the Testing of Insulated Wires and Cables. Illustrated.\$1.00

Webb, Herbert Laws.—Telephone Hand-book, Illustrated, 12mo, cloth. Chicago, 1895.\$1.00

The only complete work on the Telephone. All possible information for any one interested in Telephones and how to make and operate them.

THE "CLARK" WIRE.

FOR SWITCHBOARD RAILWAY and MOTOR USE.

All sizes of Stranded and Flexible Wire and Cables with Clark's Insulation

Inspector Boston Fire Underwriters' Union says:
"A thoroughly reliable and desirable wire in every respect."

The Clark wire has been before the public and in use for the past ten years, and has met with universal favor. We guarantee our insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class insulated wire. We shall be pleased to mail Catalogues, with terms and discounts for quantities.

ELECTRICIANS' HANDY-BOOK

OF USEFUL INFORMATION.

Edited by A. E. WATSON, A. M., Teacher of Electricity, Brown University,
Providence, R. I.
Compiled by E. T. BUIER, 2d.
ILLUSTRATED.

A Compilation from the works of Sylvanus P. Thompson, Kapp, Allsop, Munroe and Jamieson, Watson, Bottone, Banney, Watt, Poole, Trevert, Haskins, Morrow and Reid, and others.

This book gives a large number of receipts for making Battery Fluids, Battery Pastes, Insulating Materials and Varnishes, Electro-Plating Solutions, etc. Tells how to make Electric Batteries, Bells, Telephone, Motors, Dynamos, Induction Coils, Influence and Static Machines, etc. Gives formulae for winding Dynamos, Motors, Armatures, Field Magnets, Transformers. Contains many Rules, Tables, Data, etc. In fact it is almost a complete cyclopaedia of Electricity. It is neatly bound and of a convenient size to be carried in the pocket for handy reference.

CONTENTS.

<p>PART</p> <ol style="list-style-type: none"> 1. History. 2. Theory. 3. Measurements. (Electric and Magnetic.) 4. Electric Batteries. 5. Electro-Chemistry and Metallurgy. 6. The Telegraph and Telephone. 7. Dynamos and Motors. 8. Management of Dynamos and Motors. 	<p>PART</p> <ol style="list-style-type: none"> 9. Electric Lighting. 10. Transformers. 11. Wiring for Electric Power. 12. Wiring for Bell Fitting and Gas Lighting 13. Electric Railways. 14. Miscellaneous. 15. Useful Tables. 16. Logarithms.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and in industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address:

LUIS JACKSON,

Industrial Commissioner, C. M. & St. P. R'y.

BARAINS IN DYNAMOS, ENGINES.

Write for Price List No. 22.

Direct Current Dynamos, Alternating Current Dynamos, Arc Dynamos, Engines, Boilers, Heaters, Pumps, all sizes. This apparatus has been in use in our own stations, and we therefore know its exact history, and can state that it is in thoroughly good operative condition.

CHICAGO EDISON COMPANY, 139 ADAMS ST., CHICAGO.

TALK ABOUT PRICES.

Having purchased the entire available assets of The Cornman Company, assigned, and of The Cleveland Electric Trading Company, we have now on hand a large amount of alternating and direct current and arc apparatus, as well as a large stock of lamps, station supplies, construction supplies, etc., which we desire to close out at once.

We have bought cheap, and we are willing to sell cheap.

We expect to have on hand, from time to time, considerable apparatus of this sort. It is our purpose, however, to act as contracting engineers and manufacturers' agents, and we are fitted to handle anything in the way of electrical and steam installation. Write us regarding your contemplated improvements.

X-RAYS

FOR EVERYBODY.

By Edward Trevert.

Just off the Press. 93 Pages. 47 Illustrations.

Fully describes in plain terms how to perform experiments with the X-Ray outfit. Tells what electrical apparatus is needed and how to manipulate it. Illustrations show clearly how to connect up the Crookes Tube, the Ruhmkorff Coil, and how to run them, either by batteries or electric light currents. How to make an X-Ray outfit very cheaply, including a Fluoroscope.

Write us at once, enclosing 25 Cents in stamps, postal note, express money order, and get one of these valuable books.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt to meet that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

- | | | |
|--|--|---|
| <p>CHAPTER 1. The Invention of the Telephone.</p> <p>2. Sound Waves. Articulate Speech.</p> <p>3. Electric Telephony. The Bell Telephone.</p> <p>4. The Microphone.</p> <p>5. Current Induction. A PERFECT RINGER.

All of our magneto bells are equipped with our new **single-core ringer**. You will undoubtedly find that this form of ringer possesses **many points** of superiority in **many respects** over all forms and types of double-core ringers. Here are a few of the reasons:

1st. The magnetic joints in the electro-magnetic circuit are absolutely perfect.

2nd. Perfect symmetry in design means perfect symmetry in action.

3rd. Our ringer has the shortest possible length of magnetic circuit, which circuit encloses only one-half the depth of the winding.

The fact that **one** of our competitors has brought suit against us for infringement on their **double-core** ringer is an open acknowledgment that our **single-core** ringer is superior to any and all **double-core** ringers, because they find that we are **cutting into their trade**.

PRACTICAL DYNAMO BUILDING,

With detail drawings and instructions for winding. Giving correct sizes of wire, dimensions of iron, etc. Also diagram for house wiring.

BY L. C. ATWOOD.

Profusely illustrated. Size of page, 10x8 inches. Price, \$3.

"This work is gotten up especially for amateur builders and non-professional men. All measurements and instructions for winding are taken from machines in actual service. Particular attention has been given to every detail of construction, that they may be thoroughly understood. This work will be of great value, not only to those who wish to build dynamos, but to superintendents, engineers and workmen who have the care of established systems."—From Preface.

Pronounced to be a PRACTICAL AND COMPLETE WORK.

Just the Book you want. 450 Pages, over 150 Illustrations. Read the

TABLE OF CONTENTS:

Chapter I, Introduction; Chapter II, History of Electric Lighting; Chapter III, General Units and Measures; Chapter IV, Classification and Selection of Electric Lighting System; Chapter V, The Location and General Arrangement of Electric Lighting Plants; Chapter VI, Buildings for Electric Lighting Plants; Chapter VII, Possible Sources of Electrical Energy; Chapter VIII, The Steam Engine, History and General Principles; Chapter IX, Steam Boilers for Electric Lighting; Chapter X, Steam Engines for Electric Lighting, General Construction; Chapter XI, Typical Forms of Steam Engine for Electric Lighting; Chapter XII, Steam Engines for Electric Lighting, Selection, Installation and Management; Chapter XIII, Gas, Oil and Hot Air Engines; Chapter XIV, Water Wheels and Windmills; Chapter XV, Mechanical Connections between Engines and Dynamos, Direct Coupling, Belting and Shafting; Chapter XVI, Toothed, Friction and Other Gearing; Chapter XVII, Principles, Construction and Management; Chapter XXI, Applications of Accumulators in Electric Lighting; Chapter XXII, Switchboards, Including Switches, Fuses and Circuit-Breakers; Chapter XXIII, Electrical Measuring Instruments; Chapter XXIV, Lightning Arresters.

Every Engineer and Electrician who desires to thoroughly master the Art of Electric Lighting should have a copy of this book. Sent promptly.

ELECTRICIAN PUBLISHING COMPANY, Suite 510 Marquette Building,
CHICAGO.

The steady and increasing favor in which any article is received is the best evidence of its merit. This has been the history of our engine during the fifteen years of its existence, and our engines have been our best advertisements. The highest quality of materials and workmanship are used in their construction. They cost less for maintenance, are economical and reliable; embody all modern improvements, and for these reasons deserve and command higher prices than others.

A VALUABLE BOOK FOR ENGINEERS AND FIREMEN NOW READY.

MODERN EXAMINATIONS OF STEAM ENGINES or PRACTICAL THEORY EXPLAINED and ILLUSTRATED.
BY W. H. WAKEMAN.

12 mo. Cloth. 272 pages. 53 Chapters.

Containing a complete list of 300 questions such as will be asked of any Engineer when taking examination for U. S. Government or State License, all of which are fully answered in the text.

PRICE, \$2.00

By mail, postpaid, to any part of the world

This book while especially adapted for engineers' examinations, is also intended as a practical guide to Engineers, Firemen, Boiler Makers, Machinists, and others, in daily practice.

The author being a practical steam engineer himself, well knows the wants of the working engineer, and has put into this work such knowledge and information as is best adapted to their use, making it altogether the most complete and comprehensive guide for the busy workers in the engine room, boiler works and machine shops that has ever been published.

As one engineer who has read the book says: "I think there are few engi-

neers that it wouldn't do some good. It seems as if it was a review of all I have ever read, and a lot more besides."

The author has treated of a very great variety of subjects which are of vital importance to all who wish to improve and extend their knowledge of steam engineering, and has explained the rules and formulas given, in the simplest manner possible, and has worked out examples by them, so that all who can read may understand them.

The 300 questions are an important feature of the book, they are entirely separate from the 53 chapters of reading matter, and were written after many years of practical experience and careful research by the author.

His connection with the Boardman Manual Training High School at New Haven, Conn., as Instructor in Steam Engineering, his 12 years of active membership in the N. A. S. E., and his position as Instructor of No. 10 of Conn., a sturdy branch of the National Organization, makes him especially competent in this part of the work.

The many flattering commendations which this book has already received from competent judges and high authorities, speak well for its value.

ELECTRICIAN PUBLISHING COMPANY, - - - Suite 510 Marquette Building, Chicago, Ill.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price \$1.00.

This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. D. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 360 pp., 238 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Haslins. Sixth edition. 16mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pages. 333 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp., 168 illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages. 516 illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 3 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 330 pages. 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG. CHICAGO.

WESTERN ELECTRICIAN Contains more news for the busy reader than can be found in any other journal devoted to electricity.

Although large claims of superiority have been made by our contemporaries, it has been **FOUND** that the Western Electrician is far above the other papers in the matter of news, as is evidenced by the following testimonial:

"Although I have taken every electrical journal, there is none I like so well as the Western Electrician." This is the reason the Western Electrician has so large a circulation, even if it was not found at the **NORTH POLE.**

Electric-light plant, all or one-half interest to an electrician or good engineer who can run the plant. Is paying 20 per cent. on cost. For particulars, etc., address **CHANUTE ELECTRIC LIGHT & POWER CO.,** Chanute, Kans.

\$5.00.

100 Edison-Sperry 9-6-10 Amperes Single Carbon Arc Lamps, \$5.00 each, as many as you want. Guaranteed as good as new.

The Home Electric Light & Power Co.,
ELKHART, IND.

FOR SALE.

A No. 4 Edison 110-volt armature, in first-class condition. New commutator.

ELECTRICAL APPLIANCE CO.,

No. 226 W. Eighth St., Cincinnati, O.

FOR SALE.

500 light dynamo; 20 and 50 h. p. engines; 400 h. p. steam pump; at bargains. All sizes new engines.

NEW YORK SAFETY STEAM POWER CO.,
60 S. CANAL ST., CHICAGO.

SLEET PROTECTION.

Send fifty cents for information how to keep are light carbons from freezing together. No swindle. Is worth many times its cost for one night's use.

W. A. PETERS, Abingdon, Ill.

For Sale at Bargain. POWER GENERATORS.

Two M. P. generators, 175 h. p., speed 530 revolutions for 550 volts; also 220 and 110 volts dynamos and motors, switchboards and instruments.

K. A. BAUX,

1002 Chamber of Commerce, Chicago.

NOTICE.

Two Electric Lighting Companies in the City of Beloit, Wis., having been consolidated and converted into a Water Power Plant, the following list of machinery has been thrown out of use and is for sale. None of it is over four years old, some of it used but little, and the best of it, such as the engines, are as good as new.

It will be disposed of cheaply to quick buyers for cash. Inspection and correspondence solicited:

1 60 h. p. horizontal engine, 8x14 in. cylinder, Manufactured by the John T. Noye Mfg. Co., Buffalo.

1 175 h. p. Bates Corliss, 16x42 in. cylinder.
1 220 h. p. Williams Engine, 16½x30 in. cylinder.

TO CONTRACTORS.

Chicago, January 12th, 1899.

Notice is hereby given that the Board of Local Improvements of the Board of West Chicago Park Commissioners will receive sealed bids for 33 electric-light lamps for South Oakley Avenue, between the south line of Washington Boulevard and the northerly line of West Twelfth Street and Ogden Avenue, until the hour of 4 o'clock in the afternoon of the 24th day of January, A. D. 1899.

Such bids will be received at that time for:

33 Electric-Light Lamps, put in place and ready for lighting purposes.

To be done according to the plans and specifications for said improvement to be found and on file in the office of the Engineer of the West Chicago Park Commissioners, in Union Park, Chicago, Illinois.

The contractor for said work and for every part thereof will be paid in bonds, which bonds will be paid out of the special assessment, to be collected in five annual installments, levied for the purpose of paying the cost of the improvement of said South Oakley Avenue, and said bonds will bear interest at the rate of 6 per centum per annum, payable annually.

All proposals or bids shall be delivered to the President of the Board of Local Improvements of the West Chicago Park Commissioners on or before the hour of 4 o'clock in the afternoon of said 24th day of January, A. D. 1899.

All proposals or bids shall be accompanied by a check, certified by a responsible bank, payable to the order of the "President of the Board of Local Improvements of the West Chicago Park Commissioners," for an amount which shall not be less than 10 per cent. of the aggregate of the proposal.

No proposal or bid will be considered unless the same is accompanied by a certified check for not less than 10 per cent. of the total amount of the proposal or bid.

The Board of Local Improvements reserves the right to reject any and all bids.

ANTON PETERSEN,

President Board of Local Improvements of the West Chicago Park Commissioners.
Attest: **ERNEST G. SCHUBERT,**
Secretary.

IN THIS RUSHING AGE MERIT SHOULD BE CAREFULLY CONSIDERED.

A NEW THING. Write for Particulars of Our CENTRAL ENERGY TELEPHONE SYSTEM.

The Victor Metallic Switchboard

Is the Only Switchboard in the World Built with No Connection on Wood.

All connections are mounted on hard rubber and soldered, leaving **no chance for loose connections or cross talk.**

The Victor Metallic Switchboard

5-Drop Section, Front View.

Clearly demonstrates the impracticability of combined and self-contained jacks and drops. The simplicity of construction and fewness of parts of this board afford ample space for heavy insulation and metallic parts, which give assurance of **durability and high efficiency**, with lowest cost of maintenance.

It is built in five jack and drop sections, with entirely **concealed wiring—Tripolar single coil—Low-contact gravity drops**, insuring sensitive positive action. Individual ringing keys.

YOU SHOULD SEE IT. The ease and rapidity with which our board is operated finds favor with all who inspect it.

Using the Victor Transfer System—the simplest and quickest method known for trunking between operators—a board of any capacity is built.

Write for our '99 catalogue, if you have not received it.

The Most Reliable General Telephone Apparatus Manufacturers In the World.....

A NEW THING. Write for Particulars of Our CENTRAL ENERGY TELEPHONE SYSTEM.

Victor Apparatus is

SCIENTIFICALLY CORRECT, MECHANICALLY PERFECT.

The Victor Metallic Switchboard contains many points of merit long sought by the independent field and not found in the **BEST BELL** products. It is the acknowledged superior of any switchboard on the market. It contains fewness, strength and simplicity of parts; compactness, ease and rapidity of operation; durability and economy of maintenance.

Style C.

Victor Telephones, Parts, Appliances and Exchange Sundries

Are equally superior high-grade products, designed with symmetry of proportion and scientific correctness, and contain the finest material, highest finish and most perfect mechanical construction, embodying all the desirable features that go to make perfect apparatus.

Write us when in need of anything for your exchange.

Automatic Telephone

No Hello Girl! Exchange System. No Waiting!

Strictly Private.

A service that is quick and true. To carry on a conversation uninterruptedly. To avoid interference of voices and confusion of wires. To escape from the dependence upon the pleasure of central operator. The same speedy service by night as by day. An investment that is safe and profitable.

USE THE NATIONAL AUTOMATIC TELEPHONE.

Send for Illustrated Circular Showing Instruments.

National Automatic Telephone Co.,
Home Office, Salina, Kansas.

FACTORY AND OFFICE.

71-75 West Jackson Blvd., Chicago, Ill.

A PERFECT RINGER.

All of our magneto bells are equipped with our new **single-core ringer**. You will undoubtedly find that this form of ringer possesses **many points** of superiority in **many respects** over all forms and types of double-core ringers. Here are a few of the reasons:

1st. The magnetic joints in the electro-magnetic circuit are absolutely perfect.

2nd. Perfect symmetry in design means perfect symmetry in action.

3rd. Our ringer has the shortest possible length of magnetic circuit, which circuit encloses only one-half the depth of the winding.

The fact that **one** of our competitors has brought suit against us for infringement on their **double-core ringer** is an open acknowledgment that our **single-core ringer** is superior to any and all **double-core ringers**, because they find that we are **cutting into their trade.**

IT'S ALL RIGHT.

Webb's Telephone Hand-Book. A book for the expert as well as the novice. Price \$1.00.

ELECTRICIAN PUBLISHING CO.,
 510 Marquette Building, Chicago.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 15mo, 159 pp. Price \$1.00.

This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.50.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Webb, A. I. E. E. Second edition, revised and enlarged. 250 pp., 223 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephons working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. O. H. Haskins. Sixth edition. 16mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 222 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 608 pages. 222 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsup. 701 pp., 163 illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 435 pages. 159 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 illustrations. Price \$1.00.

THE ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages. 616 illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 2 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 320 pages. 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG. CHICAGO.

The steady and increasing favor in which any article is received is the best evidence of its merit. This has been the history of our engine during the fifteen years of its existence, and our engines have been our best advertisements. The highest quality of materials and workmanship are used in their construction. They cost less for maintenance, are economical and reliable; embody all modern improvements, and for these reasons deserve and command higher prices than others.

Westinghouse

MECHANICAL DRAFT

Battery of Boilers Equipped with Westinghouse Mechanical Draft.

A large slow-moving suction fan performs the office of a chimney, discharging the products of combustion through a short stack extending just above the roof. Generally costs less than a tall chimney with its expensive foundations. Draft is independent of weather conditions or flue temperatures. Can give the effect of a two hundred foot chimney. Invaluable in large lighting stations, where on cloudy days the demand for power is liable to be doubled or trebled in a few minutes. We are pioneers in this work, and it is a class of work in which experience counts.

JUST WHAT YOU ARE LOOKING FOR!

— A New and Valuable Book —

Electric Lighting Plants, THEIR COST AND OPERATION.

By W. J. Buckley. With numerous illustrations, diagrams, plans, tables, etc. 275 pages. Cloth. Price, \$2.00, postage free. This work gives all necessary data for the erection of an electric light plant of any size. The cost of Arc Lighting. The cost of Incandescent Lighting.

READ THE TABLE OF CONTENTS:

Alternating Arc Lamps, Arc Plants, Belting, Boilers, Boiler Settings, Boiler Efficiencies, Books, Building, Cost of Arc Dynamos and Lamps, Cost of Arc Plants Erected, Cost of Alternating Dynamos, Cost of Alternating Plants Erected, Cost of Belts, Cost of Boilers, Cost of Brick Chimneys, Cost of Copper for Alternating Circuit, Cost of Corliss Engines, Cost of Compound Corliss Engines, Cost of Compound High Speed Engines, Cost of Condensers, Cost of Friction Clutch Pulleys, Cost of Heaters, Cost of High Speed Engines, Cost of Incandescent Dynamos, Cost of Idlers, Cost of Injectors, Cost of Meters, Cost of Motors, Cost of Operating Lamps per hour, Cost of Power Generators. Cost of Poles, Cost of Plain Pulleys, Cost of Pillow Blocks, Cost of Pumps, Cost of Shafting, Cost of Shaft Couplings, Cost of Stacks—iron, Cost of Stacks—brick, Cost of Steam, Cost of Transformers, Cost of Wire, Chimneys, Circuit Loss, Contract Blanks, Current Distribution, Circuits—overhead, Circular Mills of Wire, Depreciation, Direct Connected Apparatus, Dynamos, Dynamo Data, Economy of Condensing, Economy of Covering Steam Pipes, Economy of Heater, Efficiency of Engines, Engines, Equivalent of Current in Horse Power, Equivalent Rates of Lighting, Fuel, Horse Power of Belting, Horse Power of Motors, Horse Power of Shafting, Incandescent Arc Lamps, Instruments, Instructions for Employes, Insulation, Labor, Load Chart, Meter Connections, Municipal Ownership, Natural Gas, N.E.L.A. Standard Rules, Oil, Outcome of Practical Management, Pole Line, Pulleys, Rope Transmission, Resistance of Wire, Rules—Fire Underwriters, Report Com. on Data N. E. L. A., Reports of Cities Owning Plant, Reports of Cities Contracting, Stock Room, Shafting, Transformers, Transformer Curves, Wiring Tables—Primary Wiring, Wiring Tables—Secondary Wiring, Wiring Tables, Motor Wiring, Wire, Wire Formula, Water Power, Wood as Fuel. The only book of its kind in the English Language. Price, \$2.00.

ANNOUNCEMENT:

We are pleased to announce to our friends and patrons an early extension of our manufacturing facilities such as will enable us to more promptly meet your calls upon us. Allow us at the present time to express our cordial appreciation of your past patronage and also to solicit your future favors within our lines of manufacture. Our aim to produce only high grade, reliable apparatus, and to uniformly protect our trade by liberal guarantees, is, we believe, the secret of our success. This policy we propose to continue, trusting to merit thereby not only your full confidence, but a constantly expanding proportion of your trade. We are, with the season's greetings, yours cordially,

EDWARDS & CO., NEW YORK, N. Y., U. S. A.

There May be Others

who vulcanize the rubber upon the wire before it is braided, but they're as scarce as peaches in the Klondike.

Some insulated wire makers may test every coil of their product for forty-eight hours in water at 500 megohms resistance, but they keep mighty quiet about it.

Infatuated

was the expression of one of the largest and most careful buyers in the West—and so will you be, if you have had experience with enclosed arc lamps, when you see and use the ZECO.

Manhattan General Construction Co., 11 BROADWAY, NEW YORK.

ABSOLUTE SAFETY IS ASSURED ALL USERS OF McINTYRE'S Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use.

Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Filers, City Sewer and Underground Cable Inspectors, Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur, and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs., 1 1/2 C. P. Price complete, \$ 4.00. For meter reading only.
" 2 " 3 " 4 " " " " 6.00. For general use.
" 3 " 12 " 10 " " " " 12.00. For sev. persons to work by.

AMONG OTHER THINGS WE GUARANTEE ARE:

- That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball-bearing axles.
- That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.
- That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.
- That the batteries can be charged when fully discharged in two and one-half hours' time.
- That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.
- That for the sum of \$50.00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

If you have any Old Copper Wire of any description to dispose of, it will pay you to communicate with us, as we are at all times in the market for any quantity of Scrap Copper Wire, at the highest market values. We pay cash and send prompt returns. We are also supplying the electrical trade with our high grade Babbitt, Cotton Waste, Solder, Etc. Please communicate with us.

SWARTS METAL REFINING CO., 20 N. Desplaines Street, CHICAGO, ILL.

NOTICE.

Two Electric Lighting Companies in the City of Beloit, Wis., having been consolidated and converted into a Water Power Plant, the following list of machinery has been thrown out of use and is for sale. None of it is over four years old, some of it used but little, and the best of it, such as the engines, are as good as new.

It will be disposed of cheaply to quick buyers for cash. Inspection and correspondence solicited:

- 1 60 h. p. horizontal engine, 8x14 in. cylinder. Manufactured by the John T. Noye Mfg. Co., Buffalo.
- 1 175 h. p. Bates Corliss, 16x42 in. cylinder.
- 1 220 h. p. Williams Engine, 18 1/2 x 30 in. cylinder.
- 1 181 h. p. Corliss Engine, 14x32 in. Manufactured by Hoffman & Billings Mfg. Co.
- 1 Brownell full front boiler, 53 in. x 14 ft., pattern No. 70.
- 1 Root full front boiler, 70 h. p.
- 1 Excelsior Iron Works boiler, 5 ft. 3 in. x 12 ft., full front.
- 1 Taplin, Rice & Co. boiler, 5 ft. 6 in. x 15 ft. full front.

Pumps, injectors, governors, shafting, floor stand, pulleys, belt tighteners, belting, etc.

Apply to the BELOIT ELECTRIC CO., Beloit, Wisconsin.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The company has all its territory distributed in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting track or sidings. The eight states traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address.

LUIS JACKSON,

Industrial Commissioner, C. M. & St. P. Ry., 450 Old Colony Building CHICAGO, ILL.

THE BEST ANSWER TO A QUESTION

On Wiring, can be found in the New Book,

"WIRING TABLES,"

"How They are Made and How to Use Them."

BY THOS. G. CRIER.

Whenever you are asked a question on Wiring, refer the questioner to this book, and he will find what he desires.

THE BOOK CONTAINS: The Law of Resistance, Electromotive Force and Current Fully Explained; How to Calculate the Size of Wires; The Different Methods of Wiring, with Diagrams; How to Apply the Simple Formula; In Calculating the Size of Wires Under all Conditions; Diagrams for Wiring 3 Point, 4 Point, Head Light and Heat Regulating Switches.
27 TABLES ON WIRING AND VALUABLE DATA.

Ohm's law is described in such plain and simple language that one cannot fail to clearly understand it.

The Victor Metallic Switchboard

Is the Only Switchboard in the World Built with No Connection on Wood.

All connections are mounted on hard rubber and soldered, leaving no chance for loose connections or cross talk.

The Victor Metallic Switchboard

5-Drop Section, Front View.

Clearly demonstrates the impracticability of combined and self-contained jacks and drops. The simplicity of construction and fewness of parts of this board afford ample space for heavy insulation and metallic parts, which give assurance of **durability** and **high efficiency**, with lowest cost of maintenance.

It is built in five jack and drop sections, with entirely **concealed wiring**—Tripolar single coil—Low-contact gravity drops, insuring sensitive positive action. Individual ringing keys.

YOU SHOULD SEE IT. The ease and rapidity with which our board is operated finds favor with all who inspect it.

Using the Victor Transfer System—the simplest and quickest method known for trunking between operators—a board of any capacity is built.

Write for our '99 catalogue, if you have not received it.

CORRUGATED ARCHES
 IRON OR STEEL.
 For fire-proofing buildings our Corrugated Curved Sheets are used. These sheets rest on the lower flanges of I beams, the space above being filled with concrete to, or above, the top of beams, as in illustration. Rigidity, strength, and deadening of sound are attained by their use. Send for printed schedule of tests.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use. Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Fitters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur, and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs., 1 1/2 C. P. Price complete, \$ 4.00. For meter reading only.
" 2 " 3 " 4 " " " " 6.00. For general use.
" 3 " 12 " 10 " " " " 12.00. For sov. persons to work by.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receiving Systems.
12. The Siemens, Kotzra, Neumayer and other Receiving Systems.

CHAPTER 13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cutler Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.

CHAPTER 28. Metallic Circuit.
29. Underground Wires.
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines; The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony Appendix.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory.

The company has all its territory districted in relation to resources, adaptability and advantages for manufacturing.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting track or sidings.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price \$1.00.

This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.60.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 350 pp., 233 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 60 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 608 pages. 333 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp., 163 illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 735 pages. 516 illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages, 2 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRINCIPLES OF ELECTRICITY, treating of the telegraph, telephone, etc. By E. J. Houston. 330 pages. 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG. CHICAGO.

WESTERN ELECTRICIAN

Contains more news for the busy reader than can be found in any other journal devoted to electricity. Although large claims of superiority have been made by our contemporaries, it has been above the other papers in the matter

FOUND

that the Western Electrician is far of news, as is evidenced by the following testimonial: "Although I have taken every electrical journal, there is none I like so well as the Western Electrician."

This is the reason the Western Electrician has so large a circulation, even if it was not found at the

NORTH POLE.

The steady and increasing favor in which any article is received is the best evidence of its merit. This has been the history of our engine during the fifteen years of its existence, and our engines have been our best advertisements. The highest quality of materials and workmanship are used in their construction. They cost less for maintenance, are economical and reliable; embody all modern improvements, and for these reasons deserve and command higher prices than others.

ONE DOLLAR EACH.

A VALUABLE BOOK FOR ENGINEERS AND FIREMEN NOW READY.

MODERN EXAMINATIONS OF STEAM ENGINEERS or PRACTICAL THEORY EXPLAINED and ILLUSTRATED.

BY W. H. WAKEMAN.

12 mo. Cloth. 272 pages. 53 Chapters.

Containing a complete list of 300 questions such as will be asked of any Engineer when taking examination for U. S. Government or State License, all of which are fully answered in the text.

PRICE, \$2.00

By mail, postpaid, to any part of the world

This book while especially adapted for engineers' examinations, is also intended as a practical guide to Engineers, Firemen, Boiler Makers, Mechanists, and others, in daily practice.

The author being a practical steam engineer himself, well knows the wants of the working engineer, and has put into this work such knowledge and information as is best adapted to their use, making it altogether the most complete and comprehensive guide for the busy workers in the engine room, boiler works and machine shops that has ever been published.

As one engineer who has read the book says: "I think there are few engi-

neers that it wouldn't do some good. It seems as if it was a review of all I have ever read, and a lot more besides."

The author has treated of a very great variety of subjects which are of vital importance to all who wish to improve and extend their knowledge of steam engineering, and has explained the rules and formulas given, in the simplest manner possible, and has worked out examples by them, so that all who can read may understand them.

The 300 questions are an important feature of the book, they are entirely separate from the 53 chapters of reading matter, and were written after many years of practical experience and careful research by the author.

His connection with the Boardman Manual Training High School at New Haven, Conn., as Instructor in Steam Engineering, his 12 years of active membership in the N. A. S. E., and his position as Instructor of No. 10 of Conn., a sturdy branch of the National Organization, makes him especially competent in this part of the work.

The many flattering commendations which this book has already received from competent judges and high authorities, speak well for its value.

Westinghouse

Battery of Boilers Equipped with Westinghouse Mechanical Draft.

MECHANICAL DRAFT

conditions or flue temperatures. Can give the effect of a two hundred foot chimney. Invaluable in large lighting stations, where on cloudy days the demand for power is liable to be doubled or trebled in a few minutes. We are pioneers in this work, and it is a class of work in which experience counts.

A large slow-moving suction fan performs the office of a chimney, discharging the products of combustion through a short stack extending just above the roof. Generally costs less than a tall chimney with its expensive foundations. Draft is independent of weather

REPAIR SHOPS

In the West. ELECTRICAL REPAIRS AND MACHINE WORK OF EVERY DESCRIPTION. In having your repair work done by a company operating hundreds of dynamos and motors you are sure of good work and get the benefit of our experience.

CHICAGO EDISON COMPANY,
76 MARKET STREET, CHICAGO.

NEW BOOKS.

AUTHORITIES ON SUBJECTS MENTIONED.

The Pocket Electrical Dictionary. Containing all of the words and definitions in the science. A new work. Indispensable to the electrician, student and professor. Over 11,000 words and about 15,000 definitions. By *Edwin J. Houston*, A. M., Ph. D. (Princeton). 1 volume, 32mo, cloth, \$2.50; leather, \$3.00.

Electricity Made Easy. Profusely illustrated. A hand-book for busy people. By *Edwin J. Houston*, A. M., Ph. D., and *Arthur E. Kennelly*, Sc. D. 1 volume, 12mo, cloth, \$1.50.

Dynamo-Electric Machinery. By *Silvanus P. Thompson*, D. Sc., B. A., F. R. S. Sixth edition, revised and enlarged. Profusely illustrated with new engravings. 19 folding plates. 2 volumes, 8vo, cloth, gilt, \$6.00. The rapid advance of electrical science made it absolutely necessary to revise the last edition, and this is now a new work. It is indispensable to the electrical expert, professor and student of electrotechnics. Students and professors highly appreciate the publication of this extensive work in two volumes.

Polyphase Electric Currents and Alternate Current Motors. By *Silvanus P. Thompson*, D. Sc., B. A., F. R. S. 1 volume, 8vo, cloth, gilt, \$3.50. The most important work on the subject. A companion book to "Dynamo-Electric Machinery." One of the text-books in schools of technology and colleges. Beautifully illustrated with fine engravings. Folding plates. Invaluable to the expert electrician.

Algebra Made Easy. By *Edwin J. Houston*, Ph. D., and *A. E. Kennelly*, Sc. D. This little work is of special value to readers of Prof. Thompson's Dynamo-Electric Machinery and Polyphase Electric Currents, as the work has been written to explain in a clear and simple manner the equations contained in those works. 1 volume, 16mo, cloth, 75 cents.

The Interpretation of Mathematical Formulæ. By *Edwin J. Houston*, Ph. D., and *A. E. Kennelly*, Sc. D. 1 volume, 12mo, cloth, \$1.25. A most valuable aid to students and electrical workers.

A B C of Electricity. Now approaching its 65th thousand. By *William H. Meadowcroft*. 1 volume, 12mo, cloth, 50 cents. Fully illustrated. This excellent primary book has taken the first place in elementary scientific works. It has received the endorsement of Thomas A. Edison. It is for every person desiring a knowledge of electricity, and is written in simple style so that a child can understand the work. It is what its title indicates, the first flight of steps in electricity.

Scholars' A B C of Electricity. By *William H. Meadowcroft*. 1 volume, 12mo, illustrated, cloth, 50 cents. The author of this work has designed it for the use of teachers and scholars. A large number of simple experiments have been added, with notes relative to the work. It is the primary book for school use.

The X Ray; or Photography of the Invisible and its Value in Surgery. By *William J. Morton*, M. D. Written in collaboration with *Edwin W. Hammer*. 1 volume, 12mo, cloth and silver, 75 cents; paper, 50 cents.

The work explains in clear and simple style how these extraordinary pictures are taken through solids. Full description is given of the apparatus used, and the text is profusely illustrated with half-tone illustrations giving facsimile copies of the pictures taken from the negatives of the author. The subjects are varied.

The A B C of the X Ray. By *William H. Meadowcroft*. 1 volume, 12mo, cloth and gold, 75 cents.

The first primary work on the subject. A book for the people. The author of "A B C of Electricity" showed clearly in that work his ability to explain a technical subject for the laymen who know nothing of scientific terms. He has written this work about the X Ray in his usual clear and simple style, and a wide circulation of this useful book is assured. The text of the author is beautifully embellished with fine engravings, and nothing is omitted that will give the public a clear knowledge of this remarkable discovery of Prof. Röntgen. The public would do well to secure both these important works.

SEND FOR "SPECIALLY FINE" CATALOGUE.

AMONG OTHER THINGS WE GUARANTEE ARE:

That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball bearing axles.

That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.

That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.

That the batteries can be charged when fully discharged in two and one-half hours' time.

That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.

That for the sum of \$50.00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

AVERAGE COST TO RUN PER MILE, 3-4 CENT.

FISCHER EQUIPMENT CO.,

110-112 EAST TWENTIETH STREET, CHICAGO, ILL., U. S. A.

The "Bull" seems to be enjoying himself "lifting" copper, and many think it is now "up in the air." Maybe it is, but indications are that it will be some time before it comes down. This does not prevent us from making shipments of Weatherproof, Magnet, Office and Annunciator Wire from stock at attractive prices.

The "ELECTRA" Highest Grade Nuernberg Carbons are recognized as standard all the world over.

All genuine "ELECTRA" carbons are put up in packages bearing the label with the trade mark "ELECTRA."

Good carbons mean less cost for current.

All the excellence in dynamos and arc lamps counts for but little where poor carbons are used in lamps.

A VALUABLE BOOK FOR ENGINEERS AND FIREMEN NOW READY.

MODERN EXAMINATIONS OF STEAM ENGINEERS or PRACTICAL THEORY EXPLAINED and ILLUSTRATED.

BY W. H. WAKEMAN.

12 mo. Cloth. 272 pages. 53 Chapters.

Containing a complete list of 300 questions such as will be asked of any Engineer when taking examination for U. S. Government or State License, all of which are fully answered in the text.

PRICE, \$2.00

By mail, postpaid, to any part of the world

This book while especially adapted for engineers' examinations, is also intended as a practical guide to Engineers, Firemen, Boiler Makers, Mechanists, and others, in daily practice.

The author being a practical steam engineer himself, well knows the wants of the working engineer, and has put into this work such knowledge and information as is best adapted to their use, making it altogether the most complete and comprehensive guide for the busy workers in the engine room, boiler works and machine shops that has ever been published.

As one engineer who has read the book says: "I think there are few engi-

neers that it wouldn't do some good. It seems as if it was a review of all I have ever read, and a lot more besides."

The author has treated of a very great variety of subjects which are of vital importance to all who wish to improve and extend their knowledge of steam engineering, and has explained the rules and formulas given, in the simplest manner possible, and has worked out examples by them, so that all who can read may understand them.

The 300 questions are an important feature of the book, they are entirely separate from the 53 chapters of reading matter, and were written after many years of practical experience and careful research by the author.

His connection with the Boardman Manual Training High School at New Haven, Conn., as Instructor in Steam Engineering, his 12 years of active membership in the N. A. S. E., and his position as Instructor of No. 10 of Conn., a sturdy branch of the National Organization, makes him especially competent in this part of the work.

The many flattering commendations which this book has already received from competent judges and high authorities, speak well for its value.

ELECTRICIAN PUBLISHING COMPANY, - - Suite 510 Marquette Building, Chicago, Ill.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so that user has free use of hands. The current can be turned off when not in use.

Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Roller Shops, Oil and Gas Works and Gas Filters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur, and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weights 2 lbs., 1 1/2 C. P. Price complete, \$ 4.00. For motor reading only.
 " 2 " 3 " 4 " " " 4.00. For general use.
 " 3 " 12 " 10 " " " 12.00. For sev. persons to work by.

KNOWLEDGE IS POWER.

Everyone engaged in the electrical business should keep posted on the developments in the art by reading the latest books on the subject. We are headquarters in the West for electrical books and can fill orders for any work published, promptly on receipt of price. We call your special attention to the following standard books:

- Allsop, F. C.—Electrical Bell Construction; Treatise on the Construction of Electric Bells, Indicators, and similar apparatus. 177 illustrations. \$1.25
- Angell, J.—Elements of Magnetism and Electricity, with Practical Instructions for the Performance of Experiments, and the construction of cheap apparatus. One hundredth thousand. 160 illustrations. \$1.00
- Atkinson, Philip.—The Elements of Electric Lighting. Seventh edition, fully revised, and new matter added. 104 illustrations. 260 pages. \$1.50
- Atkinson, Philip.—The Elements of Dynamic Electricity and Magnetism. 406 pages and 117 illustrations. Second edition. \$2.00
- Ayrton, W. E.—Practical Electricity; a Laboratory and Lecture Course for First-year Students of Electrical Engineering, based on the Practical Definitions of the Electrical Units. With numerous illustrations. Sixth edition. \$2.50
- Badt, Lieut. F. B.—New Dynamo Tenders' Hand Book. This is, as the name indicates, a New Book, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers, and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 236 pages, 140 illustrations, flexible cloth binding, size of type page 6 1/2 x 3 inches. \$1.00
- Badt, Lieut. F. B.—Incandescent Wiring Hand-book. A timely book containing full illustrations for incandescent wiring and complete information concerning methods of running wires, location of safety devices, splices, insulation, testing for faults, wire gauges, general electrical data, calculating sizes of wires, wiring fixtures, elevator, buildings, isolated and central station plants. The only book of the kind published. Type page 5 1/2 x 3 inches, flexible cloth binding, 66 pages, 35 cuts and 6 tables, 3 of which are 12 x 18 inches. \$1.00
- Badt, Lieut. F. B.—Bell Hangers' Hand-book. Just the book for people engaged in selling, installing or handling electric batteries, electric bells, elevators, homes or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat apparatus. 106 pages, 97 illustrations, flexible cloth binding. Type page 5 1/2 x 3 inches. \$1.00
- Badt, Lieut. F. B.—Electric Transmission Hand-book. First edition, three thousand copies. 97 pages, 22 illustrations, 27 original tables. \$1.00
Gives more Practical information on the subject than any work published to date. The book contains all necessary information for Power Producers, Capitalists, Agents, Engineers and Motor Inspectors. With this book anybody may make estimates on the cost of Transmission Plants.
- Bedell, Fred'k and Albert C. Crochore.—Alternating Currents; An Analytical and Graphical Treatment for Students and Engineers. Second edition. 112 illustrations. \$2.60
- Blakesley, T. H.—Papers on Alternating Currents of Electricity for the use of Students and Engineers. Third edition, enlarged. 12mo. cloth. \$1.50
- Bonney, G. E.—Electro-Plater's Hand Book. A Manual for Amateurs and Young Students on Electro-Metallurgy. 60 illustrations. 208 pages. 12mo. cloth. \$1.25
- Bottone, S. R.—Electrical Instrument Making for Amateurs. A Practical Hand-book, with 48 illustrations. Fourth edition. Enlarged by a chapter on the Telephone. \$0.60
- Bottone, S. R.—The Dynamo, How Made and How Used. A Book for Amateurs. Eighth edition, with additional matter and 39 illustrations. \$1.00
- Bottone, S. R.—Electro-Motors, How Made and How Used. A Hand-book for Amateurs and Practical Men. Reduced to 1/2 size. \$0.50
- Bottone, S. R.—How to Manage the Dynamo. A Hand-book for Ship Engineers, Electric Light Engineers and Electro-Platers. \$0.60
- Buckley, W. J.—Electric Lighting Plants, their cost and operation. 275 pages, many illustrations and diagrams. Cloth. \$2.00
Paper. \$1.00
- Cox, Frank P.—Continuous Current Dynamos and Motors. An Elementary Treatise for Students and Engineers. Illustrated. \$2.00
- Crocker, F. B., and Wheeler, S. S.—The Practical Management of Dynamos and Motors. With a special chapter by H. A. Foster. Illustrated. Second edition, revised and enlarged. \$1.00
- Crosby, O. T., and Dr. Louis Bell.—The Electric Railway in Theory and Practice. A Complete Treatise on the Construction and Operation of Electric Railways. Second edition, revised and enlarged. 185 illustrations. \$2.50
- Desmond, Chas.—Electricity for Engineers Part I. Constant Current. A clear and comprehensive treatise on the principles, construction and operation of Dynamos, Motors, Lamps Indicator and Measuring Instruments; also a full explanation of the electrical terms used in the work. Part II. Alternate Current Apparatus. Containing an explanation of the principles governing the generation of, and a description of the instruments and machinery used in connection with Alternate Electric Currents. Illustrated. Revised edition. \$2.60
- Dyer, A.—Induction Coils. How Made and How Used. Third edition. Boards. \$0.50
- Fleming, J. A.—Short Lectures to Electrical Artisans. A course of Experimental Lectures delivered to a Practical Audience. Fourth edition. 74 illustrations. \$1.50
- Fleming, J. A.—The Alternate Current Transformer in Theory and Practice. Vol. I. The Induction of Electric Currents, 600 pages, fully illustrated and with copious index. Second edition. \$3.00
Synopsis of contents; Chapter I. Introductory. 2. Electro-Magnetic Induction. 3. The Theory of Simple Periodic Currents. 4. Mutual and Self Induction. 6. Dynamical Theory of Current Induction.
Vol. II. The Utilization of Induced Currents, 8vo. cloth. London, 1892. \$5.00
- Gore, O.—The Art of Electro-Metallurgy, including all Known Processes of Electro Deposition. Fourth edition. \$2.00
- Gordon.—School Electricity. Sources, Currents, Measurement, Telegraphy, Telephony, Lightning, Electrolysis, Induction, etc. 262 pages, with 140 illustrations. \$2.00
- Grier, Thos. G.—Wiring for Motor Circuits. A handy little pamphlet containing tables for wiring and for motor service, arranged in convenient form for ready reference. \$1.00
- Haskins, C. H.—The Galvanometer and its Uses. A Manual for Electricians and Students. Fourth edition, revised. \$1.50
- Haskins.—Transformers. Their Theory, Construction and Application Simplified. 38 illustrations. \$1.25
- Hawkins, C. C. and F. Wallis.—The Dynamo, its Theory, Design and Manufacture. 190 illustrations. \$5.00
- Hering.—Practical Directions for Winding Magnets and Dynamos. 12mo. cloth, reprint without additions. \$1.25
- Hopkins, Geo. M.—Experimental Science. Elementary. Practical and Experimental Physics, 650 illustrations \$4.00
- Hopkins.—Original Papers on Dynamo Machinery and Allied Subjects. Illustrated. \$1.00
- Hopkins, Dr. John.—Dynamic Electricity; Its Modern Use and Measurement, chiefly in its Application to Electric Lighting and Telegraphy. \$0.50
- Hospitalier, E.—Domestic Electricity for Amateurs, Translated from the French. With additions by C. J. Wharton. With illustrations. \$2.50
- Hauston, Prof. E. J.—A Dictionary of Electrical Words, Terms and Phrases. Third edition, re-written and greatly enlarged. Large 8vo. 662 pages, and 670 illustrations. \$5.00
- Kapp, Gisbert.—Electric Transmission of Energy and its Transformation, Subdivision and Distribution. A practical handbook. Third edition. \$3.00
- Kapp, Gisbert.—Alternate Current Machinery Illustrated. \$0.50 [Vol. 96 Van Nostrand's Science Series.]
- Kapp, Gisbert.—Alternating Currents of Electricity. Their Generation, Measurement, Distribution and Application. Authorized American ed. With an introduction by William Stanley, Jr. Illustrated. \$1.00
- Kapp, Gisbert.—Dynamos, Alternators and Transformers. 138 illustrations. \$4.00
- Kempe, H. R.—A Handbook of Electrical Testing. Fifth edition. 200 illustrations. 8vo. cloth. London, 1892. \$7.25
In this edition there is a considerable amount of new matter; the old matter has been thoroughly revised.
- Kempe, H. R.—The Electrical Engineer's Pocket Book. Modern Rules, Formulas, Tables and Data. 32mo. leather. \$1.75
- Lockwood, T. D.—Electricity, Magnetism and Electric Telegraphy. A Practical Guide and Handbook of General Information for Electrical Students, Operators and Inspectors. 376 pages, 152 illustrations. \$2.60
- Lockwood, T. D.—Electrical Measurement and the Galvanometer; its Construction and Use. Second edition. \$1.50
- Lockwood, T. D.—Practical Information for Telephonists. 12mo. cloth. N. Y. \$1.00
- Meadowcroft, W. H.—The A. B. C. of Electricity. 30 illustrations. \$0.50
- Martin, T. C.—Inventions, Researches and Writings of Nikola Tesla. With special reference to his work in polyphase currents and high potential lightning. 500 pp. 340 illustrations, second edition. \$4.00
- Martin, T. C. and Wetzler, J.—The Electric Motor and its Applications. Third edition. With an Appendix on the Development of the Electric Motor since 1888. By Dr. L. Bell. 300 illustrations. \$3.00
- Mayer, and Davis, M. M.—The Quadruplex. With Chapters on the Dynamo-Electric Machine in Relation to the Quadruplex. The Practical Working of the Duplex Telegraph Repeaters and the Wheatstone Automatic Telegraph. 63 illustrations. \$1.60
- McClure, J. B.—Edison and his Inventions, with Full Explanations of the Telephone, Phonograph, Tascometer, Electric Light and all his Principal Discoveries, etc. \$1.00
- Niaudet, Alfred.—Elementary Treatise on Electric Batteries. Translated from the French by L. M. Fishback. Illustrated. \$2.50
- Nail, Augustus.—How to Wire Buildings. A manual of the art of interior wiring. Illustrated. \$1.50
- Pope, Franklin Leonard.—Modern Practice of the Electric Telegraph. A technical Hand-book for Electricians, Managers and Operators. 185 illustrations. 14th edition, rewritten and enlarged. \$1.60
- Prindle, H. B.—A Popular Treatise on the Electric Railway of to-day. Fully illustrated. \$0.25
- Russell, Stuart A.—Electric Light Cables and Distribution of Electricity. 107 illustrations. \$2.25
- Salomons, Sir David.—Electric Light Installations. Vol. I. The Management of Accumulators. A Practical Hand-book. 7th edition, revised and enlarged. With illustrations. 12mo. cl. London, 1893. \$1.60
- Sloane, T. O'Connor.—Electricity Simplified. The Practice and Theory of Electricity, including a Popular Review of the Theory of Electricity, with Analogies and Examples of its Practical Application in every-day life. Illustrated. \$1.00
- Sloane, T. O'Connor.—The Standard Electrical Dictionary. A Popular Dictionary of Words and Terms used in the practice of Electrical Engineering, 350 illustrations. \$3.00
- Sloane, T. O'Connor.—Electric Toy Making for Amateurs, including Batteries, Magnets, Motors, Miscellaneous Toys. \$1.00
- Sloane, T. O'Connor.—The Arithmetic of Electricity. A Manual of Electrical Calculations by Arithmetical Methods, including numerous rules, examples and tables in the field of practical electrical engineering and experimenting. Third edition, revised. \$1.00
- Tesla, Nikola.—Experiments with Alternate Currents of High Potential and High Frequency. A lecture delivered before the Institution of Electrical Engineers, London. With a portrait and biographical sketch of the Author. Illustrated. \$1.00
- Tesla, Nikola.—Lectures on the Electro-Magnet. Illustrated. \$1.00

Standard Electrical Dictionary.

BY PROF. T. O'CONNOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified,"
"Electric Toy Making," Etc.

682 Pages, 393 Illustrations. Handsomely bound in cloth, 8vo, \$3.

An Entirely New Edition, Brought Up to Date
and Greatly Enlarged.

COMPLETE—CONCISE—CONVENIENT.

In publishing the "Standard Electrical Dictionary," the author
has adhered to what the work purports to be, exhausting the
subject of electrical terms, giving each title the clearness of ex-
planation necessary to make the understanding of it complete
without unnecessary elaboration. In this work, every electrical
word, term, or phrase will be found intelligently defined.

A practical handbook of reference, containing definitions of
about 5,200 distinct words, terms and phrases.

The work is absolutely indispensable to all in any way inter-
ested in electrical science, from the higher electrical expert to
the everyday electrical workman. In fact, it should be in the
possession of all who desire to keep abreast with the progress of
this branch of science.

ELECTRICIAN PUBLISHING CO., 510 Marquette Bldg., Chicago.

VACANCIES

should be filled through the TECHNICAL AGENCY, 1345 Broadway Block, Chicago. Our list of available men is selected from the best that the country affords. If you need a Draughtsman, Designer, Electrician or Engineering help of any kind, we will send you a number of competent men to select from and without expense to you. As to our reliability, we refer you to the WESTERN ELECTRICIAN.

POSITION WANTED

In electric light or power plant by a graduate engineer, at present superintendent of lighting plant in town of \$1,000; best of reference, and suitable reason for desiring change. Address "E. F." care the WESTERN ELECTRICIAN, Chicago.

Position Wanted.

As superintendent of an electric light or power plant by one who is a graduate of both mechanics and electricity, and holds papers for the same. Have three years of practical experience in handling men. Address "SUPERINTENDENT" care WESTERN ELECTRICIAN.

WANTED.

A position as foreman of construction with some good telephone company. Reference furnished. Address F. K. H., care WESTERN ELECTRICIAN, 519 Marquette Bldg., Chicago, Ill.

WANTED.

Position as assistant in electric plant by a practical steam engineer. Have a good technical knowledge of both steam and electricity. Will work for moderate wages if there is a good chance for promotion. Strictly temperate. Age 24. Address "W. B. H.," care WESTERN ELECTRICIAN.

WANTED. ARMATURES TO REWIND.

Winders direct from T. H. and Westinghouse shops. Work guaranteed. Ten years experience. Light plants installed complete. Send for prices.

HODGE, WALSH & LORINC, 701 Delaware St., KANSAS CITY, MO.

FOR SALE.

In growing Texas town, an electric plant and water-works, and gin and grist mill; all operated by constant water-power. Granite dam and power house auxiliary steam plant. Price, \$15,000; plus 20 per cent. For particulars address CHAS. SCHWIRTH, San Antonio, Texas.

FOR SALE.

Investment; paying dividends; electric lighting plant located in one of Illinois' most thriving towns, vicinity of Chicago, for sale; modern machinery and equipment; city contract; no debts; no competition; good will of all customers; satisfactory reasons for selling; rare opportunity for young man; price reasonable; full information given. Call or write FOREE BALN, 1657 Monadnock Bldg., Chicago.

FOR SALE.

Electric-light plant, all or one-half interest to an electrician or good engineer who can run the plant. Is paying 20 per cent. on cost. For particulars, etc., address CHANUTE ELECTRIC LIGHT & POWER CO., Chanute, Kans.

FOR SALE.

50-hp. light dynamo; 20 and 50 h. p. engines; 400 h. p. steam pump; at bargains. All sizes new engines.

NEW YORK SAFETY STEAM POWER CO., 60 S. CANAL ST., CHICAGO.

FOR SALE.

An electric-light plant for sale in a Kentucky town, with a paying patronage. For information, apply to GENERAL ELECTRIC COMPANY, Cincinnati, or GRADY & NAVE, Versailles, Ky.

PROPOSALS FOR ARC LIGHT CARBONS.

Chicago, February 2, 1899. Sealed proposals will be received by the West Chicago Park Commissioners, at their office in Union Park, until 4 o'clock p. m. of Tuesday, February 14, A. D. 1899, for furnishing and delivering 300,000 arc light carbons, more or less, according to specifications on file in the office of the Engineer of said Park Commissioners in Union Park. Proposals must be made out on blank forms to be obtained at said office, be addressed to "West Chicago Park Commissioners," indorsed "Carbons," and must be accompanied with 10 per cent. of the total amount of bid, either in currency or a certified check drawn on a responsible bank doing business in the city of Chicago and made payable to the West Chicago Park Commissioners. The contractor to whom this work may be awarded will be required to furnish a bond in a sum equal to one-half the amount of contract, with sureties acceptable to said Park Commissioners. No proposal will be considered unless the party submitting it shall furnish evidence satisfactory to the West Chicago Park Commissioners of his or their ability, and that he or they have the necessary facilities, together with sufficient pecuniary resources, to fulfill the conditions of the contract. The West Chicago Park Commissioners reserve the right to reject any or all bids. JOSEPH W. SUDDARD, President. Attest: ERNEST G. SCHUBERT, Secretary.

The contractor to whom this work may be awarded will be required to furnish a bond in a sum equal to one-half the amount of contract, with sureties acceptable to said Park Commissioners. The West Chicago Park Commissioners reserve the right to reject any or all bids. JOSEPH W. SUDDARD, President. Attest: ERNEST G. SCHUBERT, Secretary.

NOTICE TO BIDDERS.

Sealed proposals will be received at the office of the City Clerk of the city of Vincennes, Indiana, until 3 o'clock p. m., Monday, February 27, 1899, for lighting the streets, alleys, parks, public buildings and public places of the city of Vincennes, for a period of ten years, with, approximately, 175 arc lamps and, approximately, 200 gas lamps.

The electric light service will begin April 29, 1900, and the gas light service will begin December 27, 1900. A 20-year franchise, covering the use of the streets for the placing of the pipes, poles, wires, appliances, etc., for the supply of gas and electricity for light, heat and power purposes to the citizens of the city will be granted to the successful bidder.

Plans and specifications and a copy of franchise ordinance may be secured from the City Clerk at Vincennes, Indiana, or from Bryan & Humphrey, the consulting engineers, at St. Louis, Mo., after Monday, February 13, 1899.

Each bid must be accompanied by a certified check, payable to the City Treasurer, for \$5,000, as a guarantee of good faith, and that the bidder will, if his proposal is accepted, enter into contract and furnish satisfactory bond in the sum of \$20,000 within fifteen days of the acceptance of his proposal for the faithful execution of said contract.

The right is reserved to reject any or all bids or to make such combinations of bids as may be desired. CHAS. LAUGEL, City Clerk.

DOMESTIC Electrical Work.

Concise and Practical Explanations for Plumbers, Tinsners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams. By WILLIAM A. WITTBECKER.

Price in Paper, 25 Cents. Price in Cloth, 50 Cents.

THE growing demand for simple electrical apparatus in dwelling houses, offices and work shops and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down anyone without the slightest knowledge of electricity should be able to do the work described.

Electrician Publishing Co., Suite 510 Marquette Bldg., CHICAGO.

Given Away

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting tracks or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address: LUIS JACKSON, Industrial Commissioner, C. M. & St. P. R'y., 450 Old Colony Building CHICAGO, ILL.

PRACTICAL DYNAMO BUILDING,

With detail drawings and instructions for winding. Giving correct sizes of wire, dimensions of iron, etc. Also diagram for house wiring.

BY **L. C. ATWOOD.**

Profusely illustrated. Size of page, 10x8 inches. Price, \$3.

"This work is gotten up especially for amateur builders and non-professional men. All measurements and instructions for winding are taken from machines in actual service. Particular attention has been given to every detail of construction, that they may be thoroughly understood. This work will be of great value, not only to those who wish to build dynamos, but to superintendents, engineers and workmen who have the care of established systems."—From Preface.

Telephones, Switchboards and Telephone Supplies.

Exchanges constructed under very favorable terms. Our equipment is simplicity itself. Note our Switchboard—no keys are used in its operation. Telephones are a model of completeness. Write for particulars and circular.

IN THIS RUSHING AGE MERIT SHOULD BE CAREFULLY CONSIDERED.

A NEW THING. Write for Particulars of Our CENTRAL ENERGY TELEPHONE SYSTEM.

The Victor Metallic Switchboard

Is the Only Switchboard in the World Built with No Connection on Wood.

All connections are mounted on hard rubber and soldered, leaving no chance for loose connections or cross talk.

The Victor Metallic Switchboard

5-Drop Section, Front View.

Clearly demonstrates the impracticability of combined and self-contained jacks and drops. The simplicity of construction and fewness of parts of this board afford ample space for heavy insulation and metallic parts, which give assurance of durability and high efficiency, with lowest cost of maintenance.

It is built in five jack and drop sections, with entirely concealed wiring—Tripolar single coil—Low-contact gravity drops, insuring sensitive positive action. Individual ringing keys.

YOU SHOULD SEE IT. The ease and rapidity with which our board is operated finds favor with all who inspect it.

Using the Victor Transfer System—the simplest and quickest method known for trunking between operators—a board of any capacity is built.

Write for our '99 catalogue, if you have not received it.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price \$1.00.
This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 320 pp., 233 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManis, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pages. 333 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp., 188 illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages. 516 illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 2 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY. treating on the telegraph, telephone, etc. By E. J. Houston. 330 pages. 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.
ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG. CHICAGO.

WESTERN ELECTRICIAN

Contains more news for the busy reader than can be found in any other journal devoted to electricity. Although large claims of superiority have been made by our contemporaries, it has been above the other papers in the matter of news, as is evidenced by the following testimonial: "Although I have taken every electrical journal, there is none I like so well as the Western Electrician." This is the reason the Western Electrician has so large a circulation, even if it was not found at the

NORTH POLE.

"Chloride Accumulator" "Chloride Accumulator"

ON THE SYSTEM OF
THE SOUTH SIDE ELEVATED RAILROAD COMPANY, CHICAGO.
From the Annual Report of the President, Jan. 26, 1899.

Storage Batteries.
"While the amount of current used per car mile is low, and has produced gratifying results in all tests and comparisons made, the fluctuations of power above the average requirements are large, and the sudden demands on the power house compelled us to prepare promptly for the heavier business of the winter, which, with increased number of cars in service, heat and light loads, would have been beyond the capacity of the power-house. Additional engine capacity could not be obtained in the time at our disposal, would have cost more money, and have been expensive to operate. We accordingly installed two batteries of 750 K. W. each, equidistant from the power-

house, at Twelfth and Fifty-first streets, respectively. These batteries have very greatly reduced the fluctuations and the maximum load at the power-house. While the output at the power-house is the same, the batteries charge at times of light traffic and discharge at times of heavy traffic, thus equalizing the work at the power-house, and relieving the engines and generators. This is certainly an economy, and it is further claimed, with what correctness I am not yet convinced, that they cheapen the cost of production. But I do know that they keep up the voltage at the ends of the line, enable your road to operate more cars, furnish increased facilities to patrons, and prevent damage to power-house machinery in case of sudden demand for increased power.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use. Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Roller Shops, Oil and Gas Works and Gas Fitters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur, and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

OFFICE OF

CHICAGO TELEPHONE COMPANY,

203 WASHINGTON STREET.

To Patrons of the Chicago Telephone Company and Others:

In order to correct apparent misapprehensions in regard to the object and terms of the ordinance recently applied for by this Company, it desires to make the following statement:

The present ordinance of the Company expires Jan. 8, 1909—ten years hence. An extension of twenty years is requested.

WHY?

The telephone business is comparatively a new industry. At its inception the plan was adopted of making an annual charge entitling a subscriber to an unlimited amount of service. Experience demonstrated that this produced inequalities, because the subscriber needing a small amount of service paid the same as another desiring a much greater amount. About four years ago, at different points throughout the world, efforts were made to obviate these inequalities, and what is generally agreed to be the best solution of the problem was found in what is known as "measured service."

Upon this plan the subscriber pays for outgoing calls in proportion to the number he makes. All incoming calls are free to him. The principle of basing the charge for any kind of public service upon the amount and character of service rendered is undoubtedly correct. No one would undertake to make a fixed charge by the year applicable alike to all business houses or to all residences for other kinds of service, such as electric light, gas, telegraph, mail, street car or even for water. No price could be fixed which would be fair to all, and this is equally true of telephone service. At measured rates the cost to the subscriber is based upon the amount and character of the service rendered him.

This measured-rate plan has been received with great favor in New York, Philadelphia, Boston, Buffalo and other cities. It is universally adopted in Switzerland, used largely in Germany, Norway and Sweden, and is just now being introduced in the Exchanges in London and Paris. In New York more than 80 per cent. of the subscribers have chosen to contract upon the measured-rate plan, and the average annual cost of the telephone to the user has been reduced more than 50 per cent. in that city. The result of this equalization of rates wherever introduced has been to increase the number of users because of the reductions offered and to decrease the average annual return to the Company per telephone. This has necessitated large additional investments by the Companies in those cities, in extending their plants, to enable them to place these facilities at the disposal of the increased numbers desiring them.

About three years ago this Company began to make engineering plans which would enable it to offer measured rates to its subscribers. The experience in other cities was ascertained, and lessons have been learned from it, and last April consultations were had with the Chicago city officials on the subject of offering measured rate service to the public. Last September the basis and schedule of these rates were practically decided upon by the Company.

In order to make the necessary extensions and additions to the present plant of the Chicago Telephone Company to enable it to furnish these facilities it has been found by careful estimate, in the light of experience in other cities, that an additional investment of between \$6,000,000 and \$8,000,000 would be required to be made at the rate of about \$1,000,000 a year. In brief, then, these are the reasons why the Company asks for an extension of its ordinance at this time:

First, That it may be enabled to equalize and reduce rates to present subscribers.

Second, That by reason of the reduced rates telephone facilities may be placed at the disposal of many who do not now have them.

Third, That it may be warranted in making large investment necessary to provide these facilities.

RATES.

Under the proposed new basis the Company provides a copper metallic circuit from the Exchange Office to the premises of the subscriber and installs for his use long-distance instruments and equipment of the best design now known. All incoming calls to him are free. All outgoing calls—i. e., those which originate at the subscriber's instrument and result in a communication with the line called for—are recorded. The subscriber may contract for any de-

sired number of calls, and the Company under the ordinance would be compelled to contract to furnish service at rates based upon the differences in amount and character of service at initial prices of \$40, \$60 and \$90 per annum.

At the \$40 rate a four-party line telephone is offered for private residences with the privilege of sending 400 calls to other subscribers in the Chicago Exchange without additional charge. Additional calls, up to 600, would be at the rate of 8 cents each, and from 600 to 2,000 at graded rates running from 6 cents to 3 cents each; all calls over 2,000 being at the latter rate. Incoming calls are free. There are many residences in Chicago where there are now no telephones and whose needs for outgoing communications would be well accommodated by 400 calls. There are to-day more than 500 telephones in private residences which are not used on outgoing calls more than once a day, although they are entitled to unlimited service. The subscribers for these telephones would be able to reduce their rate \$60 a year as compared with the present ordinance rate and would still have all the service they needed.

A telephone on a two-party line is offered for a place of business or private residence at \$60 per annum, with 600 outgoing calls without additional charge, incoming calls to be free. Additional calls to be at rates of 6, 5, 4 and 3 cents, according to the number sent, all calls over 2,000 being at the latter rate. There are very many business places, stores, markets, offices and establishments in almost every line of business whose needs would be served by this two-party line telephone service, and to them this plan offers a yearly reduction of \$65 or more.

At the rate of \$90 per annum an individual metallic circuit with long-distance instruments and equipment is offered with 900 outgoing calls, additional calls being at the rates of 6, 5, 4 and 3 cents, according to the number used, all calls over 2,000 being at the latter rate. A large percentage of the present subscribers for business telephones will be able to obtain a material reduction in their rates by changing to this basis. One hundred such subscribers were recently asked their opinion of this plan and forty-one signified their willingness to accept it and are anxious to change. These subscribers realize that the legitimate needs of their own business would be served by an average of about three outgoing calls per day with their incoming calls free. They do not contemplate furnishing free service for others or that their telephones will be used for frivolous or unimportant calls by employes. There are also some hundreds of present subscribers who now have two or more telephones who could effect an immediate saving without in any way impairing their service by retaining one telephone on the unlimited or flat-rate plan and putting the others on the measured-rate plan, using the latter principally for incoming calls.

We especially emphasize the fact that no present subscriber is expected to change his contract and adopt the measured rate unless he so desires. It is optional with any subscriber to continue his present contract if he so elects. The Company will continue to offer various forms of unlimited service, such as residence party lines, private branch exchanges, direct exchange lines, extension telephones, private lines and private exchange lines, as may be desired from time to time by its patrons.

PUBLIC TELEPHONES.

The Company also obligates itself under the ordinance to maintain no less than 1,200 telephones, distributed in different parts of the city, at which any citizen may make calls free to the city police, fire and health departments in emergencies. Any other local call may be had at a price not exceeding 10 cents. Public telephones in operation on the present plan are a means of affording facilities to many, but for greater public convenience it is proposed that the number of these telephones should be increased and so generally distributed as to be readily accessible to each citizen. There is no other known method by which the user can obtain such satisfactory results at so small a cost to him. This service is cheaper than telegraph or messenger, quicker and more complete than the mail, as cheap as car fare and always a saver of time and money. If the user does not secure the communication for which he asks it costs him nothing.

On the other hand, it is costly and not very remunerative to the Company. The compensation to persons in whose premises these telephones are in-

stalled consumes a large portion of the receipts and also requires a large amount of free service. Experience has shown that about one-third of all the calls from these telephones are free. The cost of operation, maintenance and the mere cost of collection are much more expensive than for any other telephone. The average revenue from them is considerably less than the revenue authorized by the present ordinance. This average will certainly decrease as the number is increased under the proposed ordinance. Many of them would be maintained at an actual loss to the Company, as is now the case, but the public would be benefited by having them available for use when needed by the citizens in their vicinity.

COMPENSATION TO BE MADE TO THE CITY.

It may not be generally understood that the territory of the Chicago Telephone Company embraces not only the city of Chicago and the county of Cook, but also McHenry, Lake, Kane, DuPage, Kendall, Grundy and Will counties in Illinois, and that it operates Exchanges in more than a hundred places outside of Chicago, some of them large and growing cities, such as Aurora, Elgin, Joliet, Evanston, Waukegan, etc., etc. The compensation named in the ordinance is in payment for privileges granted by the city of Chicago. All will admit that there would be no reason or justice in claiming compensation out of receipts from territory beyond that in which the ordinance conferred rights.

The highest sum that has ever been due from the Company to the city as tax on its gross earnings, under the terms of its ordinance, was \$46,907.95. The average annual sum paid since the ordinance went into effect (ten years ago) has been \$33,725.35.

The Company estimates that the measured rates proposed would reduce the earnings from its present subscribers not less than \$200,000 per annum, and probably more. In view of the proposed lower rates and consequent reduced receipts the Company believed that a lump sum of \$50,000 per annum (which is considerably larger than has yet been reached, and in view of all the circumstances possibly larger than would be reached in many years) would be regarded as an advantage to the city, as its revenue from this source would thereby be relieved from any of the uncertainties of business.

It should not be forgotten that in addition to the compensation provided in the present ordinance, which includes a limited amount of free telephone service and the right to string city police and fire alarm wires on the poles of the Company, additional compensation is now offered by largely increasing the amount of free telephone service and in giving conduit and pole line rights, which the city needs for street lighting and other purposes, and which it could not equip itself to supply for less than \$1,000,000. These additions would be worth to the city a net sum of certainly not less than \$50,000 per year. The total compensation offered by the Company in the new ordinance amounts to not less than \$100,000 per annum, and during the term of the ordinance would aggregate \$3,000,000.

CONCLUSION.

The Company asks for these amendments to its ordinance in perfect good faith and believes that they are fair to all parties interested. If the Council shall decide to pass the ordinance asked for and the Mayor shall approve the same the Company will faithfully carry out the increased obligations which it imposes and immediately proceed to extend its plant and to introduce the lower rates. Whatever may be the outcome of the application to the City Council the Company will continue its endeavors to give to the citizens of Chicago the best telephone service possible and will spare no reasonable expense to that end.

Standard Electrical Dictionary.

BY PROF. T. O'CONNOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," "Electric Toy Making," Etc.

682 Pages, 393 Illustrations. Handsomely bound in cloth, 8vo, \$3.

An Entirely New Edition, Brought Up to Date and Greatly Enlarged.

COMPLETE—CONCISE—CONVENIENT.

In publishing the "Standard Electrical Dictionary," the author has adhered to what the world purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete without unnecessary elaboration. In this work, every electrical word, term, or phrase will be found intelligently defined.

A practical handbook of reference, containing definitions of about 5,000 distinct words, terms and phrases.

The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the everyday electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of this branch of science.

NOTICE TO BIDDERS.

Sealed proposals will be received at the office of the City Clerk of the city of Vincennes, Indiana, until 3 o'clock p. m., Monday, February 27, 1899, for lighting the streets, alleys, parks, public buildings and public places of the city of Vincennes, for a period of ten years, with, approximately, 175 inc. lamps and, approximately, 200 gas lamps.

The electric light service will begin April 29, 1900, and the gas light service will begin December 27, 1900.

A 20-year franchise, covering the use of the streets for the placing of the pipes, poles, wires, appliances, etc., for the supply of gas and electricity for light, heat and power purposes to the citizens of the city will be granted to the successful bidder.

Plans and specifications and a copy of franchise ordinance may be secured from the City Clerk at Vincennes, Indiana, or from Bryan & Humphrey, the consulting engineers, in St. Louis, Mo., after Monday, February 13, 1899.

Each bid must be accompanied by a certified check, payable to the City Treasurer, for \$5,000, as a guarantee of good faith, and that the bidder will, if his proposal is accepted, enter into contract and furnish satisfactory bond in the sum of \$20,000 within fifteen days of the acceptance of his proposal for the faithful execution of said contract.

The right is reserved to reject any or all bids or to make such combinations of bids as may be desired.

CHAS. LAUGEL, City Clerk.

STEVENS' MECHANICAL CATECHISM.

Indispensable to all Steam Engineers, Machinists, Ice Machine Men, Electrical Engineers, Pipefitters and Plumbers generally. New and original. All modern machinery fully described and explained. Technical points made clear. Over 150 carefully designed sectional illustrations, and over 900 pages of text. Descriptions alternate with exhaustive sets of Questions and Answers, affording an effective preparation for all Service Examinations. Subjects treated: The Boiler and Engine, Combustion, Safety Valve, Injector, Pumps, Slide Valve (automatic and Converse), Lap and Lead, Link Motion, Lubricator, Indicator, Horse Power, Refrigeration, Machine Shop Practice, Electricity, Dynamoes, Motors, Trolley (underground and third-rail systems). Standard numbers fully explained, also the elements of algebra, hundreds of rules and examples in the simplest English. Silk cloth, red edges, gold stamped, \$1.00. **AGENTS: This is a Money Maker.** Sample copy and terms mailed on application. **LAIRD & LEE,** 263 Wabash Ave., CHICAGO.

EDUCATION

Thousands have been helped to better pay and positions through our system of instruction **BY MAIL**

Buildings erected expressly for this purpose at a cost of **\$225,000.**

Courses of Steam, Electrical, Mechanical or Civil Engineering; Chemistry; Mining; Mechanical and Architectural Drawing; Surveying; Plumbing; Architecture; Metal Pattern Drafting; Prospecting; Bookkeeping; Shorthand; English Branches.

\$2 a Month pays for a College Education at Home. **45,000 Students and Graduates.**

Circular Free. State subject you wish to study.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address:

LUIS JACKSON,

Industrial Commissioner, C. M. & St. P. R'y,
450 Old Colony Building CHICAGO, ILL.

STREET RAILWAY MEN

—And others engaged in electric railway work will be interested in
THE MOTOR ENGINEERS' AND ELECTRICAL WORKERS' HAND-BOOK.
By **WM. LYTERN.**

The Motor Engineers' and Electrical Workers' Hand-Book is compiled with a view of furnishing a book of reference in a simple and convenient form for the use of motor engineers and street railway men. The diagrams of controller connections and combinations will be found of great value in practical work. The methods of testing are both simple and reliable. The writer is indebted to the Westinghouse, General Electric, Walker and Steel Motor companies for information cheerfully furnished.

TABLE OF CONTENTS.
Chapter I.—Elementary Principles. Units, Ohm's Law, Watt, Kilowatt, Ampere, Turn, Hour, etc. Potential, E. M. F., Voltage, Drop of Potential, Resistance (Ohmic), Conductivity, Chapter II.—Magnetism and Electro-Magnetic Induction. Chapter III.—Circuits: Varieties of Circuits, Series, Shunt, Parallel or Multiple Arc, Joint Resistances of Parallel Circuits, Multiple Series, Series Multiple. Chapter IV.—Dynamo Electric Machine. General Principles, Field Windings, (Varieties) Series, Shunt, Compound, etc. Short Shunt, Long Shunt. Chapter V.—Instructions for Operating Generators: Running a Single Generator, To Shut Down a Machine Not Run in Multiple, Sparking, Polarity, Excitation Grounds, Generators in Multiple, Connections, Running Generators in Multiple. To Shut Down a Machine Running in Multiple. Chapter VI.—The Electric Motor: General Principles, Counter Electromotive Force and Mechanical Power, Efficiency. Chapter VII.—Measurements and Tests of Street Railway Motors—Faults, Measurement by Drop of Potential Method (Examples), Insulation Tests, Voltmeter Method, Description of Voltmeter and Ammeter, The Wheatstone Bridge, Instructions for Operating, Drop of Potential in Motor Circuits. Chapter VIII.—Instructions for Operating Car Apparatus: Brushes, Sparking at Brushes, Bearings, Bucking, Fuse, Block, Operating Car, Trolley, etc. Chapter IX.—The Electric Motor Car in Detail. Series, Parallel, Controller, Reverse Switch, Rheostat, Fuse Box, Lighting Arrestor, Heaters. Chapter X.—Definitions of Terms. Chapter XI.—Diagrams of Car Wiring and Controllers, with Written Descriptions and Diagrams of Combinations: Westinghouse System (G. No. 14, No. 28 and 28 A). General Electric (K, with W. P. Machines, K 3; General Electric Series Parallel Controller with Magnetic Brake). Walker System (B 2, E) Steel Motor Co. System. Chapter XII.—General Electrical and Mechanical Information: Belting, Shafting Pulleys and Gears, Melting Point, Specific Gravity and Relative Conductivity, Table Comparing Wire Gauges, Number, Dimensions, Height, Length and Resistance of Pure Copper Wire, Electrical Units and Formulas, Equivalent Carrying Capacity, Proportions of Gear Teeth Notes, Bill of Material for Span Wire Construction (Single Track) (Double Track), Bracket Construction, (Single Track) (Center Pole) (Double Track). 160 pages. Handsomely bound in cloth, \$1.00. Heavy boards, 50c. Sent on receipt of price.

BALLENGINES!

PERFECTION IN ENGINEERING.

BALL ENGINE CO., ERIE, PA.

A VALUABLE BOOK FOR ENGINEERS AND FIREMEN NOW READY.

MODERN EXAMINATIONS OF STEAM ENGINEERS or PRACTICAL THEORY EXPLAINED and ILLUSTRATED.

BY W. H. WAKEMAN.

12 mo. Cloth. 272 pages. 53 Chapters.

Containing a complete list of 300 questions such as will be asked of any Engineer when taking examination for U. S. Government or State License, all of which are fully answered in the text.

PRICE, \$2.00

By mail, postpaid, to any part of the world

This book while especially adapted for engineers' examinations, is also intended as a practical guide to Engineers, Firemen, Boiler Makers, Mechanists, and others, in daily practice.

The author being a practical steam engineer himself, well knows the wants of the working engineer, and has put into this work such knowledge and information as is best adapted to their use, making it altogether the most complete and comprehensive guide for the busy workers in the engine room, boiler works and machine shops that has ever been published.

As one engineer who has read the book says: "I think there are few engi-

neers that it wouldn't do some good. It seems as if it was a review of all I have ever read, and a lot more besides."

The author has treated of a very great variety of subjects which are of vital importance to all who wish to improve and extend their knowledge of steam engineering, and has explained the rules and formulas given, in the simplest manner possible, and has worked out examples by them, so that all who can read may understand them.

The 300 questions are an important feature of the book, they are entirely separate from the 53 chapters of reading matter, and were written after many years of practical experience and careful research by the author.

His connection with the Boardman Manual Training High School at New Haven, Conn., as Instructor in Steam Engineering, his 12 years of active membership in the N. A. S. E., and his position as Instructor of No. 10 of Conn., a sturdy branch of the National Organization, makes him especially competent in this part of the work.

The many flattering commendations which this book has already received from competent judges and high authorities, speak well for its value.

REPAIR SHOPS

In the West. ELECTRICAL REPAIRS AND MACHINE WORK OF EVERY DESCRIPTION. In having your repair work done by a company operating hundreds of dynamos and motors you are sure of good work and get the benefit of our experience.

CHICAGO EDISON COMPANY,

76 MARKET STREET, CHICAGO.

NEW BOOKS.

AUTHORITIES ON SUBJECTS MENTIONED.

The Pocket Electrical Dictionary. Containing all of the words and definitions in the science. A new work. Indispensable to the electrician, student and professor. Over 11,000 words and about 15,000 definitions. By *Edwin J. Houston*, A. M., Ph. D. (Princeton). 1 volume, 32mo, cloth, \$2.50; leather, \$3.00.

Electricity Made Easy. Profusely illustrated. A hand-book for busy people. By *Edwin J. Houston*, A. M., Ph. D., and *Arthur E. Kennelly*, Sc. D. 1 volume, 12mo, cloth, \$1.50.

Dynamo-Electric Machinery. By *Silvanus P. Thompson*, D. Sc., B. A., F. R. S. Sixth edition, revised and enlarged. Profusely illustrated with new engravings. 19 folding plates. 2 volumes, 8vo, cloth, gilt, \$6.00. The rapid advance of electrical science made it absolutely necessary to revise the last edition, and this is now a new work. It is indispensable to the electrical expert, professor and student of electrotechnics. Students and professors highly appreciate the publication of this extensive work in two volumes.

Polyphase Electric Currents and Alternate Current Motors. By *Silvanus P. Thompson*, D. Sc., B. A., F. R. S. 1 volume, 8vo, cloth, gilt, \$3.50. The most important work on the subject. A companion book to "Dynamo-Electric Machinery." One of the text-books in schools of technology and colleges. Beautifully illustrated with fine engravings. Folding plates. Invaluable to the expert electrician.

Algebra Made Easy. By *Edwin J. Houston*, Ph. D., and *A. E. Kennelly*, Sc. D. This little work is of special value to readers of Prof. Thompson's Dynamo-Electric Machinery and Polyphase Electric Currents, as the work has been written to explain in a clear and simple manner the equations contained in those works. 1 volume, 16mo, cloth, 75 cents.

The Interpretation of Mathematical Formulæ. By *Edwin J. Houston*, Ph. D., and *A. E. Kennelly*, Sc. D. 1 volume, 12mo., cloth, \$1.25. A most valuable aid to students and electrical workers.

A B C of Electricity. Now approaching its 65th thousand. By *William H. Meadowcroft*. 1 volume, 12mo, cloth, 50 cents. Fully illustrated. This excellent primary book has taken the first place in elementary scientific works. It has received the endorsement of Thomas A. Edison. It is for every person desiring a knowledge of electricity, and is written in simple style so that a child can understand the work. It is what its title indicates, the first flight of steps in electricity.

Scholars' A B C of Electricity. By *William H. Meadowcroft*. 1 volume, 12mo, illustrated, cloth, 50 cents. The author of this work has designed it for the use of teachers and scholars. A large number of simple experiments have been added, with notes relative to the work. It is the primary book for school use.

The X Ray; or Photography of the Invisible and Its Value in Surgery. By *William J. Morton*, M. D. Written in collaboration with *Edwin W. Hammer*. 1 volume, 12mo, cloth and silver, 75 cents; paper, 50 cents. The work explains in clear and simple style how these extraordinary pictures are taken through solids. Full description is given of the apparatus used, and the text is profusely illustrated with half-tone illustrations giving facsimile copies of the pictures taken from the negatives of the author. The subjects are varied.

The A B C of the X Ray. By *William H. Meadowcroft*. 1 volume, 12mo, cloth and gold, 75 cents. The first primary work on the subject. A book for the people. The author of "A B C of Electricity" showed clearly in that work his ability to explain a technical subject for the laymen who know nothing of scientific terms. He has written this work about the X Ray in his usual clear and simple style, and a wide circulation of this useful book is assured. The text of the author is beautifully embellished with fine engravings, and nothing is omitted that will give the public a clear knowledge of this remarkable discovery of Prof. Röntgen. The public would do well to secure both these important works.

The "ELECTRA" Highest Grade Nuernberg Carbons are recognized as standard all the world over.

All genuine "ELECTRA" carbons are put up in packages bearing the label with the trade mark "ELECTRA."

Good carbons mean less cost for current.

All the excellence in dynamos and arc lamps counts for but little where poor carbons are used in lamps.

A VALUABLE BOOK FOR ENGINEERS AND FIREMEN NOW READY.

MODERN EXAMINATIONS OF STEAM ENGINEERS or PRACTICAL THEORY EXPLAINED and ILLUSTRATED.

BY W. H. WAKEMAN.

12 mo. Cloth. 272 pages. 53 Chapters.

Containing a complete list of 300 questions such as will be asked of any Engineer when taking examination for U. S. Government or State License, all of which are fully answered in the text.

PRICE, \$2.00

By mail, postpaid, to any part of the world

This book while especially adapted for engineers' examinations, is also intended as a practical guide to Engineers, Firemen, Boiler Makers, Machinists, and others, in daily practice.

The author being a practical steam engineer himself, well knows the wants of the working engineer, and has put into this work such knowledge and information as is best adapted to their use, making it altogether the most complete and comprehensive guide for the busy workers in the engine room, boiler works and machine shops that has ever been published.

As one engineer who has read the book says: "I think there are few engi-

neers that it wouldn't do some good. It seems as if it was a review of all I have ever read, and a lot more besides."

The author has treated of a very great variety of subjects which are of vital importance to all who wish to improve and extend their knowledge of steam engineering, and has explained the rules and formulas given, in the simplest manner possible, and has worked out examples by them, so that all who can read may understand them.

The 300 questions are an important feature of the book, they are entirely separate from the 53 chapters of reading matter, and were written after many years of practical experience and careful research by the author.

His connection with the Boardman Manual Training High School at New Haven, Conn., as Instructor in Steam Engineering, his 12 years of active membership in the N. A. S. E., and his position as Instructor of No. 10 of Conn., a sturdy branch of the National Organization, makes him especially competent in this part of the work.

The many flattering commendations which this book has already received from competent judges and high authorities, speak well for its value.

ELECTRICIAN PUBLISHING COMPANY,

Suite 510 Marquette Building, Chicago, Ill.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enameled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use.

Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Bell Shops, Oil and Gas Works and Gas Fitters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs. 1 1/4 C. P. Price complete, \$ 4.00. For meter reading only.
 " 2 " 3 " 4 " " " 6.00. For general use.
 " 3 " 12 " 10 " " " 12.00. For sev. persons to work by.

FOR SALE.

I will sell or exchange for like property in Illinois, Ohio, Indiana or Iowa, a complete Electric Lighting and Ice Plant in a growing Georgia town. Ice sold eight months in the year; and city and county contracts for arc lights; 900 incandescent lights, wired in, all on a paying basis of 20 per cent. net on investment. Exchange for similar property preferred. Good reason for making trade. Correspondence solicited. All machinery new, Corliss engine, Fort Wayne electric machinery, McCarty ice machine. All in fine shape. Address **SIG. NUSSBAUM,** Bainbridge, Ga.

FOR SALE.

Investment; paying dividends; electric lighting plant located in one of Illinois' most thriving towns, vicinity of Chicago, for sale; modern machinery and equipment; city contract; no debts; no competition; good will of all customers; satisfactory reasons for selling; rare opportunity for young man; price reasonable; full information given. Call or write **FOREE BAIN,** 1657 Monadnock Bldg., Chicago.

NOTICE TO BIDDERS.

Sealed proposals will be received at the office of the City Clerk of the city of Vincennes, Indiana, until 3 o'clock p. m., Monday, February 27, 1899, for lighting the streets, alleys, parks, public buildings and public places of the city of Vincennes, for a period of ten years, with approximately, 175 arc lamps and, approximately, 200 gas lamps.

The electric light service will begin April 29, 1900, and the gas light service will begin December 27, 1900.

A 20-year franchise, covering the use of the streets for the placing of the pipes, poles, wires, appliances, etc., for the supply of gas and electricity for light, heat and power purposes to the citizens of the city will be granted to the successful bidder.

Plans and specifications and a copy of franchise ordinance may be secured from the City Clerk at Vincennes, Indiana, or from Bryan & Humphrey, the consulting engineers, at St. Louis, Mo., after Monday, February 13, 1899.

Each bid must be accompanied by a certified check, payable to the City Treasurer, for \$5,000, as a guarantee of good faith, and that the bidder will, if his proposal is accepted, enter into contract and furnish satisfactory bond in the sum of \$20,000 within fifteen days of the acceptance of his proposal for the faithful execution of said contract.

The right is reserved to reject any or all bids or to make such combinations of bids as may be desired.

Manufacturers of the "Peerless," the Standard Gage of the World.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address.

LUIS JACKSON,

Industrial Commissioner, C. M. & St. P. R'y, 450 Old Colony Building CHICAGO, ILL.

STREET RAILWAY MEN

—And others engaged in electric railway work will be interested in
THE MOTOR ENGINEERS' AND ELECTRICAL WORKERS' HAND-BOOK.
By **WM. LUTERN.**

The Motor Engineers' and Electrical Workers' Hand-Book is compiled with a view of furnishing a book of reference in a simple and convenient form for the use of motor engineers and street railway men. The diagrams of controller connections and combinations will be found of great value in practical work. The methods of testing are both simple and reliable. The writer is indebted to the Westinghouse, General Electric, Walker and Steel Motor companies for information cheerfully furnished.

TABLE OF CONTENTS.

Chapter I.—Elementary Principles. Units, Ohm's Law, Watt, Kilowatt, Ampere, Turn, Hour, etc. Potential, E. M. F., Voltage, Drop of Potential, Resistance (Ohmic), Conductivity. **Chapter II.**—Magnetism and Electro-Magnetic Induction. **Chapter III.**—Circuits: Varieties of Circuits, Series, Shunt, Parallel or Multiple Arc, Joint Resistances of Parallel Circuits, Multiple Series, Series Multiple. **Chapter IV.**—Dynamo Electric Machine. General Principles, Field Windings, (Varieties), Series, Shunt, Compound, etc. Short Shunt, Long Shunt. **Chapter V.**—Instructions for Operating Generators: Running a Single Generator, To Shut Down a Machine Not Run in Multiple, Sparking, Polarity, Excitation Grounds, Generators in Multiple, Connections, Running Generators in Multiple. To Shut Down a Machine Running in Multiple. **Chapter VI.**—The Electric Motor: General Principles, Counter Electromotive Force and Mechanical Power, Efficiency. **Chapter VII.**—Measurements and Tests of Street Railway Motors—Faults, Measurement by Drop of Potential Method (Examples), Insulation Tests, Voltmeter Method, Description of Voltmeter and Ammeter, The Wheatstone Bridge, Instructions for Operating, Drop of Potential in Motor Circuits. **Chapter VIII.**—Instructions for Operating Car Apparatus: Brushes, Sparking at Brushes, Bearings, Racking, Fuse, Block, Operating Car, Trolley, etc. **Chapter IX.**—The Electric Motor Car in Detail. Series, Parallel, Controller, Reverse Switch, Rheostat, Fuse Box, Lighting Arresters, Heaters. **Chapter X.**—Definitions of Terms. **Chapter XI.**—Diagrams of Car Wiring and Controllers, with Written Descriptions and Diagrams of Combinations: Westinghouse System (B, No. 14, No. 28 and 28 A), General Electric (K, with W. P. Machines, K 2; General Electric Series Parallel Controller with Magnetic Brake), Walker System (B, E) Steel Motor Co. System. **Chapter XII.**—General Electrical and Mechanical Information. Belting, Shafting, Pulleys and Gears, Melting Point, Specific Gravity and Relative Conductivity, Table Comparing Wire Gauges, Number, Dimensions, Height, Length and Resistance of Pure Copper Wire, Electrical Units and Formulas, Equivalent Carrying Capacity, Proportions of Gear Teeth Notes, Bill of Material for Spine Wire Construction (Single Track) (Double Track), Bracket Construction, (Single Track) (Center Pole) (Double Track). 169 pages. Handsomely bound in cloth, \$1.00. Heavy boards, 50c. Sent on receipt of price.

NON-INFRINGEMENT APPARATUS.

The Western Electric Company has just brought suit on the Carty patent against the multiple or bridging bells of the American Electric Telephone Company (Williams-Abbott type) in use at Hazleton, Pennsylvania, in the United States District Court, Williamsport, Pennsylvania.

MORAL: Don't be misled by false reports of our competitors, but purchase our new No. 2 Western Express bridging telephone, which positively and absolutely is not affected by the Carty patent in any manner.

The recent braggadocio of the P. C. Burns-American Electric Telephone Company is best replied to by the above suit against their apparatus.

A NEW THING. Write for Particulars of Our CENTRAL ENERGY TELEPHONE SYSTEM.

The Victor Metallic Switchboard

Is the Only Switchboard in the World Built with No Connection on Wood.

All connections are mounted on hard rubber and soldered, leaving no chance for loose connections or cross talk.

The Victor Metallic Switchboard

5-Drop Section, Front View.

Clearly demonstrates the impracticability of combined and self-contained jacks and drops. The simplicity of construction and fewness of parts of this board afford ample space for heavy insulation and metallic parts, which give assurance of **durability and high efficiency**, with lowest cost of maintenance.

It is built in five jack and drop sections, with entirely concealed wiring—Tri-polar single coil—Low-contact gravity drops, insuring sensitive positive action. Individual ringing keys.

YOU SHOULD SEE IT. The ease and rapidity with which our board is operated finds favor with all who inspect it.

Using the Victor Transfer System—the simplest and quickest method known for trunking between operators—a board of any capacity is built.

Write for our '99 catalogue, if you have not received it.

LOWEST PRICE ON MARKET!

NO. 30 AMERICAN TRANSMITTER.

This instrument, for volume of voice transmission, distinctness of articulation, exact reproduction of articulate sounds and durable qualities is unequalled.

The Largest Manufacturers of Telephones and Switchboards in the United States.

Five hundred exchanges aggregating over 100,000 telephones in use. Four years' service.

Write for catalogue showing new types and prices.

WE GUARANTEE Workmanship, material and efficiency of our apparatus to be of the *highest grade*, and agree to defend, at our own expense, any action at law which may be brought against our PATRONS on alleged infringement of patents owing to the use of our instruments.

American Electric Telephone Co.,
171-173 S. CANAL ST., CHICAGO.

SUPERIOR BRIDGING BELLS.

Recent tests and developments have proven our bridging bells to be superior to any manufactured for service on long, troublesome toll lines. The **enormously** high coefficient of self-induction of our single-core ringer, in connection with the **high voltage and heavy current** of our bridging generators, is the **secret of the success** of our bridging bells.

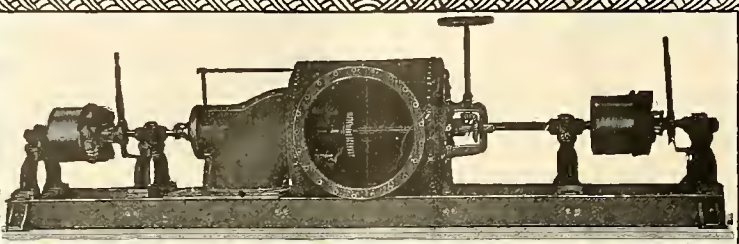

Success and satisfaction with our bells **guaranteed.** Our long distance phone (just out) is without an equal in appearance and general efficiency. Don't fail to place a trial order with us.

THE BEST ANSWER TO A QUESTION

On Wiring, can be found in the New Book,

“WIRING TABLES,”

“How They are Made and How to Use Them.”

BY THOS. G. CRIER.

Whenever you are asked a question on Wiring, refer the questioner to this book, and he will find what he desires.

THE BOOK CONTAINS: The Law of Resistance, Electromotive Force and Current Fully Explained. How to Calculate the Size of Wires. The Different Methods of Wiring, with Diagrams. How to Apply the Simple Formula, in Calculating the Size of Wires Under all Conditions. Diagrams for Wiring 3 Point, 4 Point, Head Light and Heat Regulating Switches.

27 TABLES ON WIRING AND VALUABLE DATA.

Ohm's law is described in such plain and simple language that one cannot fail to clearly understand it.

Bound in Cloth, 80 Pages, Size 5x7½ in. Sent, prepaid, on receipt of price, \$1.00.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 12mo, 120 pp. Price \$1.00.

This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth, handsomely fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Honston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 259 pp., 23 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McLanman, edited by Prof. C. H. Haskins. Sixth edition. 36mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Proce, F. R. S., and A. J. Stubbs. 508 pages. 232 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. O. Allsop. 191 pp., 268 illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 159 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages. 616 illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 2 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 330 pages. 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

Gen'l European Agents, Selig, Sonenthal & Co.,
85 Queen Victoria Street, London, England

The Direct Reading Ohmmeter

WILL ACCURATELY MEASURE RESISTANCE ON A RAPIDLY MOVING ELECTRIC CAR.

No other instrument can do this. A boy can use it. The only one of its kind.

The American Electric Specialty Co.,
123 Liberty St., NEW YORK CITY

ANOTHER VICTORY.

The U. S. Court of Appeals (final) in its February term decided the Roosevelt patent case in favor of the

WESTERN TELEPHONE CONSTRUCTION COMPANY,

Again demonstrating that this company is

SOUND AND RELIABLE.

The Western Telephone Construction Company Owns Patent No. 521,461,

Being the first patent covering all forms of switchboard where the "drop" is automatically restored by the plug.

We claim that the switchboards of the American Electric Telephone Company (P. C. Burns) infringe this patent. We have brought suit against them in the U. S. Court, which is now being vigorously prosecuted. We notify all persons of our confidence that we will stop the use of these infringing switchboards.

WESTERN TELEPHONE CONSTRUCTION COMPANY,

250 S. CLINTON ST., CHICAGO.

NOTE: LARGEST INDEPENDENT MANUFACTURERS OF TELEPHONES AND SWITCHBOARDS IN THE UNITED STATES.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

EXTRACT FROM PREFACE.

This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice, and most of the material, apparatus and methods described are peculiar to or have originated in this country.

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

<p>CHAPTER 1. The Invention of the Telephone.</p> <p>2. Sound Waves. Articulate Speech.</p> <p>3. Electric Telephony. The Bell Telephone.</p> <p>4. The Microphone.</p> <p>5. Current Induction. Electromagnetic Induction.</p> <p>6. The Induction Coil: Its Use in the Telephone Transmitter.</p> <p>7. The Complete Telephone Circuit.</p> <p>8. Magnet Telephones.</p> <p>9. The Bell Telephone Receiver.</p> <p>10. Other forms of Magnet Receivers.</p> <p>11. The Gower, Ader and D'Arsonval Receivers.</p> <p>12. Mercader's Bell Telephone.</p> <p>13. The Siemens, Kolyva, Schumayer and Kellner Receivers.</p>	<p>CHAPTER 13. Carbon Transmitters.</p> <p>14. The Blake Transmitter.</p> <p>15. The Long Distance Transmitter.</p> <p>16. The Solid-back Transmitter.</p> <p>17. The Bellier Transmitter.</p> <p>18. The Cutler's Transmitter.</p> <p>19. Various European Transmitters.</p> <p>20. The Efficiency of Carbon Transmitters.</p> <p>21. Batteries for Telephone Work.</p> <p>22. Open Circuit Batteries.</p> <p>23. Closed Circuit Batteries.</p> <p>24. The Practical Management of Batteries.</p> <p>25. Magneto Bell.</p> <p>26. Automatic Switches.</p> <p>27. Telephone Line Construction.</p>	<p>CHAPTER 28. Metallic Circuit.</p> <p>29. Underground Wires.</p> <p>30. Lightning Arresters.</p> <p>31. Inside Wiring.</p> <p>32. Installation of Telephone Instruments.</p> <p>33. Inspection and Maintenance.</p> <p>34. The Condenser: Its Use in Telephony.</p> <p>35. Electromagnetic Retardation.</p> <p>36. Exchange Working.</p> <p>37. Small Exchanges.</p> <p>38. Party Lines: The Bridging Bell.</p> <p>39. The "Chloride Accumulator"

ON THE SYSTEM OF

THE SOUTH SIDE ELEVATED RAILROAD COMPANY, CHICAGO.

From the Annual Report of the President, Jan. 26, 1899.

Storage Batteries.

"While the amount of current used per car mile is low, and has produced gratifying results in all tests and comparisons made, the fluctuations of power above the average requirements are large, and the sudden demands on the power-house compelled us to prepare promptly for the heavier business of the winter, which, with increased number of cars in service, heat and light loads, would have been beyond the capacity of the power-house. Additional engine capacity could not be obtained in the time at our disposal, would have cost more money, and have been expensive to operate. We accordingly installed two batteries of 750 K. W. each, equidistant from the power-

house, at Twelfth and Sixty-first streets, respectively. These batteries have very greatly reduced the fluctuations and the maximum load at the power-house. While the output at the power-house is the same, the batteries charge at times of light traffic and discharge at times of heavy traffic, thus equalizing the work at the power-house, and relieving the engines and generators. This is certainly an economy, and it is further claimed, with what correctness I am not yet convinced that they cheapen the cost of production. But I do know that they keep up the voltage at the ends of the line, enable your road to operate more cars, furnish increased facilities to patrons, and prevent damage to power-house machinery in case of sudden demand for increased power.

Bulletins describing this and other installations of Chloride Accumulators will be furnished upon request.

CATALOGUES.

Patented February 8, 1898.

Advantages of Buffalo Expansion Circuit Breakers.

- 1st. Simplicity.
- 2d. No fuses to replace.
- 3d. Low cost, little more than knife switch.
- 4th. Better than magnetic circuit breaker for motor work.
- 5th. Better than fuses for overload or short circuit.
- 6th. May be adapted to existing switches and switchboards.
- 7th. Can be placed in junction boxes on various floors where expense of magnetic circuit breakers would be prohibitive.
- 8th. For street railway cut-out boxes saves trouble of conductor replacing fuses.
- 9th. Good for direct or alternating currents.
- 10th. A 100 or 200 ampere switch may be opened on 1/2 ampere by simply changing expansion rod.
- 11th. The loss of energy is no more than with fuses.
- 12th. The switch is operative without any relation to the protective device.

The "BUFFALO" Expansion Circuit Breaker

Manufactured by

McCarthy Bros. & Ford,

45 N. Division Street, BUFFALO, N. Y.

DETACHABLE WINDLASS.

The windlass shown in the accompanying illustration is designed to raise and lower electric lamps for trimming. Only one windlass is required to each trimmer and it can be attached or detached in a second's time. Each lamp pole is provided with an iron socket, which is permanently and securely fastened to the pole by three lag screws, and when the windlass is once attached to the socket it cannot become loosened by accident, making it as safe as if it were bolted direct to the pole. It is very light (weighing only about five pounds), strong and neat, being nickel-plated and enameled, and all parts liable to wear are adjustable.

A MONEY SAVER.

One windlass to each trimmer answers the same purpose as a windlass attached to each lamp pole, and as each windlass is provided with sufficient rope to lower the lamp, only enough rope is required to be attached to the lamp to extend down the pole in easy reach of the trimmer.

Another advantage is that the handling of snowy, icy and muddy ropes is avoided, leaving the trimmer's hands in a condition to handle the lamp and rods without smearing them over with mud, which is difficult to avoid if he must grapple in the snow and mud after a rope.

HARDTMUTH CORED AND SOLID CARBONS

FOR DIRECT CURRENT ARC LAMPS.

WE HAVE IN STOCK THE FOLLOWING SIZES:

CORED CARBONS.

Diameter. Length.
 5-16 in. x 6 in., 6½ in., 7 in., 7½ in. and 8 in.
 3-8 in. x 7 in., 8 in., 9 in., 9½ in., 10 in. and 12 in.
 7-16 in. x 6 in., 7 in., 8 in., 9 in., 9½ in., 10 in. and 12 in.
 1-2 in. x 6 in., 7 in., 7½ in. and 8 in.
 5-8 in. x 12 in.

SOLID CARBONS.

Diameter. Length.
 7-16 in. x 7 in. and 10 in.
 1-2 in. x 6 in., 7½ in. and 12 in.

Having received a large consignment of these Carbons just before the new tariff went into effect, we are prepared to make very low prices. Send for price list.

CHICAGO EDISON COMPANY,

THE PELTON WATER WHEEL CO.

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.
 An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

NINE THOUSAND WHEELS NOW RUNNING
 Aggregating some 700,000 h. p.

ELECTRIC POWER TRANSMISSION
 Pelton Wheels afford the most reliable and efficient power for such service, and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load. Catalogues furnished on application.

Address, **PELTON WATER WHEEL COMPANY,**
 143 Liberty St., New York City, U. S. A. or 121 Main St., San Francisco, Cal., U. S. A.

WATER WHEELS

For all Heads from 3 Ft. to 2000 Ft.
 Especially adapted to all kinds of
ELECTRIC POWER AND LIGHTING PLANTS.

Recent tests at Holyoke enable us to guarantee:
The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency ever realized when running from half to full gate. We guarantee also: A runner of the greatest possible strength. A gate unregulated in quickness and ease of opening and closing. Tests show over 81 per cent. average efficiency with half to full water.

State your Head and send for 124 page pamphlet.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The company has all its territory distributed in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Coincidental inquiries are treated as such. The information furnished a particular industry is reliable. Address.

LUIS JACKSON,
 Industrial Commissioner, C. M. & St. P. Ry.,
 450 Old Colony Building CHICAGO, ILL.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician, but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down anyone without the slightest knowledge of electricity should be able to do the work described.

Gentlemen:--

I recently inserted an advertisement for the sale of an Electric Light Plant in your paper one time, and I also inserted the same "ad" in two of the best Chicago Sunday papers three times each. I received double the number of answers from your "ad" that I did from all the others combined.

Yours truly,
Foree Bain

Westinghouse Standard Engine.

Speed Regulation

It is important that an engine intended for Electric lighting service be especially well governed. Our engine governor is of the "inertia" type, and is capable of being adjusted to maintain a speed regulation of within one per cent. from normal. It is a well-known fact that the life of incandescent lamps is reduced 50 per cent. by a variation in the speed of the dynamo exceeding 2½ per cent. Speed regulation, therefore, is an important factor in electric lighting.

Never Slip Pulley Covering

The greatest power, fuel and money saving ever sold on its merits. No one, No day, No night, No admittance, No delay, No expense, No trouble, No journals, without the use of belts, pulleys, and friction, requiring less power, and increasing the life of both belt and pulley.

Your Never Slip Pulley Covering is all and more than you claim for it. We have no more trouble with slipping belts since we began using this in months ago. The covering we put on them is still on and as good as ever. Springfield, Mass. Lighting Co., H. J. Fox, Supr.

The Pulley Covering we bought of you six months ago is the best investment we've made. Your covering is a success, a saver of fuel and belt leather. Lapeer, Mich. Electric Co.

We have been using Never Slip Pulley Covering in all our plants for more than two years and find it is all you claim for it and the best covering I have ever had anything to do with. N. H. Fulne, Master Mechanic, Heywood Bros. & Wakefield, Chicago.

We have used your Never Slip Pulley Covering on our dynamos, and found it to be just as represented. We had great trouble with our belts previous to using this, but after applying it.

Correspondence solicited; let us send you a trial order.

we have no more slipping belts. St. Louis, Ill. Electric Co., Delafield, Mo. Your Never Slip Pulley Covering we ever used in our factory in all Greenboro, N. C. Your Never Slip Pulley Covering and is used by Colfax Electric Co., Colfax, N. C. An ever slipping belt is a good success. American Electric Co., Kansas City, Mo. We have used your Never Slip Pulley Covering on our dynamos, and found it to be just as represented. We had great trouble with our belts previous to using this, but after applying it. If you have only ONE BELT that slips; is too tight; is oily or greasy; or carries too heavy a load, use

CLING-SURFACE

on it and the increased power ON THIS ONE BELT will pay for all the CLING-SURFACE required throughout the whole plant.

This little belt (12 in.) was our first slack belt - it earned \$640.00 in two years in increased power at a cost of only \$63.00 for CLING-SURFACE for the whole plant. Drop us a line and we will tell you the whole story.

CLING-SURFACE MFG. CO., 177-182 Virginia Street, BUFFALO, N. Y.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

STYLE "D."

Single Battery Box Phone.

VICTOR Ideal Combination Cross-Connecting and Fuse Board.

IMPORTANT

NOTICE TO EXCHANGE MANAGERS.

We wish to announce that we have recently added to our line of apparatus a complete **CENTRAL ENERGY SYSTEM**, overcoming many disadvantages heretofore encountered in systems of this class. **CHEAPEST TO INSTALL. CHEAPEST TO MAINTAIN. ALL POWER FOR SIGNALING AND TALKING SUPPLIED FROM CENTRAL STATION. SUPERVISORY SIGNALING. NO UNRELIABLE BATTERY SIGNALS. NO LISTENING IN ON PART OF OPERATOR NECESSARY. AUTOMATIC CLEAR-OUT DROP.** If you already have a straight metallic system **YOU CAN CHANGE** from your present magneto call to **CENTRAL ENERGY** without the least interruption, at a very slight cost.

Toll line boards may be placed immediately adjacent to central energy switchboard and same plugs used for either, or toll line switchboard may be incorporated in central energy board without change. **THIS SYSTEM HAS MANY OTHER ADVANTAGES THAT ARE PROFIT MAKERS. ALL VICTOR APPARATUS FULLY PROTECTED BY PATENTS. Write us.**

MANUFACTURING CO.,

STREET, CHICAGO, ILL., U. S. A.

THE GREAT TELEPHONE BATTERY

TRADE **GONDA** MARK

The Standard Open Circuit Batteries Of the World.

For more than a quarter of a century the GONDA TRADE MARK CELLS have stood at the head and been recognized as the model in all attempts at rivalry. In all that time the standard has never been lowered and the GONDA TRADE MARK CELLS have never been equaled. The reason is:

- FIRST.** The Exclusive Knowledge of the Only Way to Make Them.
- SECOND.** The Use of the Purest Materials Obtainable.
- THIRD.** The Exercise of the Utmost Care in Workmanship.

BEWARE OF IMITATIONS AND INFRINGEMENTS. THESE ONLY ARE GENUINE.

The Leclanché Battery Co.,

111 TO 117 E. 131ST STREET, NEW YORK.

THE HARRISON Primary Cell No. 1 Open Circuit Cell.

Positive Element: Zinc, Self-Amalgamating. No Local Action.
Negative Element: Lead Peroxide. No Carbon.
E. M. F., 2.45 Volts. Capacity: 40 Amp. Hours. No Creeping Salts.

Thermo Electric Co.,

SOLE AGENTS, TIMES BUILDING, NEW YORK.

The "ELECTRA" Highest Grade Nuernberg Carbons are recognized as standard all the world over.

All genuine "ELECTRA" carbons are put up in packages bearing the label with the trade mark "ELECTRA."

Good carbons mean less cost for current.

All the excellence in dynamos and arc lamps counts for but little where poor carbons are used in lamps.

LIGHTNING

and other high-tension currents cause more loss and annoyance to the Telephone Manager than any other item. We offer you a new device, guaranteed to automatically take care of all this trouble. An

AUTOMATIC LIGHTNING-ARRESTER

installed on your toll line, or in your exchange, will relieve the anxiety always felt by telephone people during severe lightning storms, and, as there are no fuses to burn out, your service will not be interrupted. This alone, in the course of a season, is worth ten times what it costs to install this arrester, for either instrument or switchboard. The magnets together with the nicked parts are mounted on polished hard rubber. Fiber or porcelain base.

Write for prices and additional information.

BUTLER-TAYLOR COMPANY, RAVENNA, OHIO.

"An ounce of prevention is worth a pound of cure."

"DURO"

- Telephone Cords . . .
- Switchboard Cords . .
- Medical Battery Cords.

THE ONLY practical method yet devised to tip a Flexible Conductor using the full strength of the covering is that employed in the

"Duro" Telephone Cord

ALL other devices fail to hold, but that hook is positive! The Conductor, Shell and Pin are all soldered together and therefore cannot come apart. Why not use the Best?

SEND FOR "SPECIALLY FINE" CATALOGUE.

AMONG OTHER THINGS WE GUARANTEE ARE:

- That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball bearing axles.
- That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.
- That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.
- That the batteries can be charged when fully discharged in two and one-half hours' time.
- That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.
- That for the sum of \$50.00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

THE HERCULES BATTERY.

The Acme of Perfection.

In placing the Hercules on the market, it has been our aim to produce a high-grade battery at a moderate cost, and we feel confident that all users will agree that our object has been accomplished.

The Hercules consists of a fluted cylinder, made of selected carbon, filled with a depolarizing compound.

The zinc is cylindrical in form and made of the best rolled zinc and thoroughly amalgamated.

The cover is of porcelain and forms a perfect lid for the jar and prevents evaporation or the climbing of salts.

We can cheerfully recommend the Hercules as being one of the best batteries on the market, and is without an equal for gas lighting and gas engine work, and, in fact, for all open circuit work, where the conditions are most severe.

E. M. F., 1.47 Volts. Internal Resistance, .11 Ohms, and Current on Short Circuit about 13.4 Amperes.

BATES ELECTRIC FANS

Wound for any Voltage
Direct or Alternating

For Ceiling or Desk
A Written Guarantee with each Fan.

D.L. BATES & BRO.
DAYTON, O.

A NEW FAN MOTOR, PEERLESS.

IT'S a beauty and guaranteed 20 per cent. more efficient than any on the market. Think of a 12-inch fan running 1,850 revolutions per minute with only 35 watts. Price is right also. Agencies wanted.

**THE WARREN ELECTRIC
AND SPECIALTY CO.,
WARREN, OHIO,**

MANUFACTURERS OF PEERLESS { INCANDESCENT LAMPS, FAN MOTORS, TRANSFORMERS.

THE STANDARD TELEPHONE COMPANY'S OFFICERS AND CUSTOMERS TAKE A DAY OFF.

THE RESULT

The opportunity to buy first-class Telephone Apparatus at Madison is equally as good as the fishing. A trial order will convince you.

WE CALL ATTENTION TO
 Our New Duplex Switchboard,
 Our New Magneto Generator,
 Our New Cut-Out and Fuse Arrester,
 Our New Desk Portable,
 Our New Standard Dry Battery.

STANDARD
TELEPHONE AND ELECTRIC CO.,
MADISON, WIS.

The Newest!
And Finest!

The Greatest!
Long Distance

READY FOR SHIPMENT MARCH 15, 1899.

TELEPHONE OF THE WORLD.

Concealed or Outside Binding Posts.

Most powerful magneto-generator and bell in the market.

Bi-polar receivers; highest grade. The embodiment of simplicity.

Perfect mechanism; platinum points.

Cast-transmitter caps, (solid).

Cast-transmitter backs, (solid).

For Exchanges—Series No. 1.
Bridged No. 2 for Toll Lines.
Challenges admiration!
Surpasses competition!!
Value unequalled!!!
The grandest telephone ever produced!!!!
Try it.
Order a sample.

The Success of Independent Telephony is Encompassed in These Six Points:

Knowledge of the Art; x x **C**omprehension of its Science **S**
Energy in its Business Development; In the face of Tyranny **Y**
Earnestness in Providing Protection; x x **C**are of Patron **S**
Liberality of Resources; x x x x x x x **W**ithout Limit **T**
Yankeeism in Application and Execution; Beyond Measure **E**
Novelty of Invention and Production; x x x **A**d Libitum **M**

This is the SIXTH YEAR of our incorporation. Each year some mushroom competitor has circulated false stories about us. The files of this paper during these six years will prove that we have survived hundreds of "busted" or "sold-out" competitors; many of them more pretentious and denunciatory than those who villified us last year, or may attempt to this year. It is a safe statement that if the KEELYN SYSTEM had not been able to uphold INDEPENDENT TELEPHONY AND ITSELF, none of its competitors would have survived.

Again for the Sixth Annual time let us remind the public that SIX YEARS HENCE the KEELYN SYSTEM will still be LEADING TO SUCCESS! Notwithstanding that patent pirates and combinations of guerillas who purloin its rights and attempt the theft of its fair name may then be relics of the past. Trade with the most reliable and largest telephone factory in America.

Western Telephone

Note.—Largest Manufacturers of Telephones in the World.

250 So. CLINTON

THE SWITCHBOARD OF A TELEPHONE EXCHANGE

IS LIKE UNTO THE DYNAMO OF AN
ELECTRIC LIGHT PLANT.

IF THE SWITCHBOARD WORKS POORLY THE
TELEPHONES WORK POORLY.

Experienced electric light men will tell you to shun poor, cheap and untried dynamos, although the market is full of them.

Experienced and honest telephone men will advise you to purchase the "highest priced" as the only means of getting satisfaction. If a switchboard is properly built, it cannot be "low priced" in first cost, but is **CHEAPEST AND NECESSARY** in the end.

DON'T BE MISLED!

WRITE TO USERS!

**Why Does the "Western" Succeed?
Why Are its Competitors so Jealous?**

SIMPLY BECAUSE:

- 1st. It is far in advance of all others.
- 2nd. It has kept up-to-date—others have copied from it.
- 3rd. It operates under its own patents; others have found it expedient to pirate its patents—it has several suits in the courts against a number of its competitors.
- 4th. It has succeeded in winning every patent suit it has been engaged in—which has thus far been decided—a large number of them, too.
- 5th. It employs its own patent attorneys and keeps its own patent experts—therefore it is in a position of reasonable certainty, always.
- 6th. Its competitors cannot keep pace with it—they resort to slander and falsehood, which sooner or later prove boomerangs to them.
- 7th. It is honest and fair in its dealings.
- 8th. It, alone, manufactures in its own factory all of its telephones and switchboards.
- 9th. It has the only complete independent telephone engineering department in America.
- 10th. It has the only complete and extensive library of telephone patents outside of the United States government control—a feature absolutely essential to a safe conduct of the telephone manufacturing business.
- 11th. Its officials are the most experienced and progressive men in the business.
- 12th. It has control of over 100 patents upon telephone devices.
- 13th. It produces high-class telephone apparatus of all kinds.
- 14th. It fulfills its agreements.
- 15th. It helps its customers toward success.
- 16th. It has replaced over 10,000 other makes of telephones and has thousands of testimonials of its good results.
- 17th. It manufactures more telephone apparatus than any independent concern in America.
- 18th. It has been manufacturing telephones longer than any independent concern in America.
- 19th. It has been the only concern to successfully litigate against Bell patents.

KESTER TWO-POLE MEDIUM SPEED MOTORS

Were first placed on the market in 1889, and at that early day they never failed to demonstrate in actual service that for efficiency, durability and "ever-readiness" they were in a class by themselves. To day thousands of pleased customers would say that Kester Two-Pole Motors represent all that is best in correctness of design and ease of operation. In appearance they give one a most favorable impression, but it is in the actual "sawing of the wood" where their superiority asserts itself.

For those who desire a motor of 7½ horse power or over we cannot too highly recommend our Four-Pole Type. These motors have ventilated armatures form-wound non-overlapping coils and carbon brushes. They are constructed to be operated for continuous runs of any duration. There is no annoyance from heating, no sparking, and the brushes or any part of the motor requires no attention under any change of load.

Two-Pole Motors, ½ to 10 h. p. Multipolar Motors, 7½ to 100 h. p.

PATRONIZE HOME TRADE.

We manufacture a complete line of Interior and Long-Distance Telephones and Switchboards of the highest grade; sell any parts separate if desired.

OUR TRANSMITTER HAS NO EQUAL IN

EFFICIENCY, DURABILITY and WORKMANSHIP.

All our instruments are sold under guarantee. We make a specialty of Automatic Intercommunicating Telephones. These illustrations show some of our latest designs. Write us for catalogue.

PHILADELPHIA AGENCY,
THE FRANKLIN ELECTRIC SUPPLY HOUSE,
506-508 Cuthbert Street,
H. P. FEISTER, Proprietor.

We Desire to Call the Attention of the Trade

To the fact that all our goods are sold strictly on guarantee, and adapted to meet the requirements of any service demanded. All our Telephone Instruments are equipped with our Granular Transmitter, patented June 14, 1898, the transmitter being thoroughly tested for long distance and general use, and is given the highest of testimonies. A trial will convince anyone of its superiority on either short or long distance work. Sold separately to be used on any system.

We also carry a complete line of instruments intended for inter-communicating system. We make a specialty repairing and re-equipping Telephones.

Dealers and electricians will be protected in their localities in the sale of our goods if we are informed of the territory which they will work.

REASONABLE PRICES. LIBERAL DISCOUNTS.

Correspondence Solicited.

THE RELIABLE ELECTRIC MANUFACTURING CO., Worcester, Mass.

As Lincoln Saw It.

When Lincoln was asked how long a man's legs should be, he showed a pretty clear conception of the situation by replying "just long enough to reach from his body to the ground."

Now, the similarity between a pair of legs and a telephone is striking. A telephone to be of any use must be the connecting link between two points. If it falls short in any particular by refusing to talk, it is of no more use than your legs would be if they stopped half an inch from the ground. There's food for thought in this.

ERICSSON'S SWEDISH TELEPHONES

Are telephones that talk. They are produced by an old-established house, who are leaders in telephony. Every instrument and every part is perfect. They build up a service by doing good work, and build up the profits by keeping the cost for maintenance and repairs at the minimum.

They are the telephones you want—if you want those that are cheapest in the end.

Ask for particulars.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use.

Dry Batteries are used and can be recharged from direct incandescence electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Fitters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs. 1 1/2 C. P. Price complete, \$ 4.00. For meter reading only.
" 2 " 3 " 4 " " " 6.00. For general use.
" 3 " 12 " 10 " " " 12.00. For sev. persons to work by.

DOMESTIC Electrical Work.

Concise and Practical Explanations for Plumbers, Tanners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By **WILLIAM A. WITTEBECKER.**

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

THE growing demand for simple electrical apparatus in dwelling houses, offices and work shops and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician, but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down anyone without the slightest knowledge of electricity should be able to do the work described.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The company has all its territory distributed in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address.

ANNOUNCEMENT.

TO OUR PATRONS AND FRIENDS:

We have just opened our new branch offices in Chicago at 837-838 Marquette Building.

Our manager of Sales Department, Mr. M. E. Baird, will give this office his personal supervision for the present, assisted by a competent engineer from the factory, and will carry a full line of machinery in stock.

He will be pleased to see all his friends at his new quarters.

WINDSOR, CONN.**

The "Chloride Accumulator"

ON THE SYSTEM OF
THE SOUTH SIDE ELEVATED RAILROAD COMPANY, CHICAGO.
From the Annual Report of the President, Jan. 26, 1899.

TRADE MARK:
"Chloride Accumulator"

REGISTERED SEPTEMBER 11, 1894.

SALES OFFICES:

NEW YORK, 20-22 Broad St.
BOSTON, MASS., 69 State St.
CHICAGO, ILL., Marquette Bldg.
CANADA, The Canadian General Electric Co., Limited, Toronto, Ont.
SAN FRANCISCO, CAL., The Parrot Bldg.
BALTIMORE, MD., Equitable Bldg.
CLEVELAND, O., New England Bldg.

Storage Batteries.
"While the amount of current used per car mile is low, and has produced gratifying results in all tests and comparisons made, the fluctuations of power above the average requirements are large, and the sudden demands on the power-house compelled us to prepare promptly for the heavier business of the winter, which, with increased number of cars in service, heat and light loads, would have been beyond the capacity of the power-house. Additional engine capacity could not be obtained in the time at our disposal, would have cost more money, and have been expensive to operate. We accordingly installed two batteries of 750 K. W. each, equidistant from the power-

house, at Twelfth and Sixty-first streets, respectively. These batteries have very greatly reduced the fluctuations and the maximum load at the power-house. While the output at the power-house is the same, the batteries charge at times of light traffic and discharge at times of heavy traffic, thus equalizing the work at the power-house, and relieving the engines and generators. This is certainly an economy, and it is further claimed, with what correctness I am not yet convinced, that they cheapen the cost of production. But I do know that they keep up the voltage at the ends of the line, enable your road to operate more cars, furnish increased facilities to patrons, and prevent damage to power-house machinery in case of sudden demand for increased power.

Bulletins describing this and other installations of Chloride Accumulators will be furnished upon request.

THE ELECTRIC STORAGE BATTERY COMPANY,
Drexel Building, Phila., Pa.

CATALOGUES.

Patented February 8, 1898.

Advantages of Buffalo Expansion Circuit Breakers.

- 1st. Simplicity.
- 2d. No fuses to replace.
- 3d. Low cost, little more than knife switch.
- 4th. Better than magnetic circuit breaker for motor work.
- 5th. Better than fuses for overload or short circuit.
- 6th. May be adapted to existing switches and switchboards.
- 7th. Can be placed in junction boxes on various floors where expense of magnetic circuit breakers would be prohibitive.
- 8th. For street railway cut-out boxes saves trouble of conductor replacing fuses.
- 9th. Good for direct or alternating currents.
- 10th. A 100 or 200 ampere switch may be opened on 1/2 ampere by simply changing expansion rod.
- 11th. The loss of energy is no more than with fuses.
- 12th. The switch is operative without any relation to the protective device.

The "BUFFALO" Expansion Circuit Breaker

Manufactured by

McCarthy Bros. & Ford,

45 N. Division Street, BUFFALO, N. Y.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enameled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use. Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Filters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.
No. 1 Weighs 2 lbs. 1 1/2 C. P. Price complete, \$ 4.00. For meter reading only.
" 2 " 3 " 4 " " " " 6.00. For general use.
" 3 " 12 " 10 " " " " 12.00. For sev. persons to work by.

THE BEST ANSWER TO A QUESTION

On Wiring, can be found in the New Book,

“WIRING TABLES,”

“How They are Made and How to Use Them.”

BY THOS. G. CRIER.

Whenever you are asked a question on Wiring, refer the questioner to this book, and he will find what he desires.

THE BOOK CONTAINS: The Law of Resistance, Electromotive Force and Current Fully Explained. How to Calculate the Size of Wires. The Different Methods of Wiring, with Diagrams. How to Apply the Simple Formula in Calculating the Size of Wires Under all Conditions. Diagrams for Wiring 3 Point, 4 Point, Head Light and Heat Regulating Switches.

27 TABLES ON WIRING AND VALUABLE DATA.

Ohm's law is described in such plain and simple language that one cannot fail to clearly understand it.

Bound in Cloth, 80 Pages, Size 5x7½ in. Sent, prepaid, on receipt of price, \$1.00.

Flickering of lights usually occurs when the station is being crowded. It is self-evident that this flickering is caused by the slipping of belts, and as a belt full of Cling-Surface runs steadily and positively beyond all possibility of slipping, the importance of this fact can be readily seen.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

IN THIS RUSHING AGE MERIT SHOULD BE CAREFULLY CONSIDERED.

A NEW THING. Write for Particulars of Our
CENTRAL ENERGY TELEPHONE SYSTEM.

The Victor Metallic Switchboard

Is the Only Switchboard in the World Built
with No Connection on Wood.

All connections are mounted on hard rubber and soldered, leaving **no chance for loose connections or cross talk.**

The Victor Metallic Switchboard

5-Drop Section, Front View.

Clearly demonstrates the impracticability of combined and self-contained jacks and drops. The simplicity of construction and fewness of parts of this board afford ample space for heavy insulation and metallic parts, which give assurance of **durability** and **high efficiency**, with lowest cost of maintenance.

It is built in five jack and drop sections, with entirely concealed wiring—Tripolar single coil—Low-contact gravity drops, insuring sensitive positive action. Individual ringing keys.

YOU SHOULD SEE IT. The ease and rapidity with which our board is operated finds favor with all who inspect it.

Using the Victor Transfer System—the simplest and quickest method known for trunking between operators—a board of any capacity is built.

Write for our '99 catalogue, if you have not received it.

THE VICTOR TELEPHONE MFG. CO.,

166 TO 174 S. CLINTON STREET, CHICAGO, U. S. A.

TELEPHONE CABLE DISTRIBUTING BOARD.

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers

NINE THOUSAND WHEELS NOW RUNNING

Aggregating some 700,000 h. p.

ELECTRIC POWER TRANSMISSION

Pelton Wheels afford the most reliable and efficient power for such service, and are running the majority of stations of this character in the United States, as well as most foreign countries.

Highest efficiency and absolute regulation guaranteed under the most extreme variations of load. Catalogues furnished on application.

Address, **PELTON WATER WHEEL COMPANY,**

143 Liberty St., New York City, U. S. A. or 121 Main St., San Francisco, Cal., U. S. A.

WATER WHEELS

For all Heads from 3 Ft. to 2000 Ft.

Especially adapted to all kinds of

ELECTRIC POWER AND LIGHTING PLANTS.

Recent tests at Holyoke enable us to guarantee:

The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency ever realized when running from half to full gate. We guarantee also: A runner of the greatest possible strength. A gate unequalled in quickness and ease of opening and closing. Tests show over 81 per cent. average efficiency with half to full water.

State your Head and send for 124 page pamphlet.

DOMESTIC Electrical Work.

Concise and Practical Explanations for Plumbers, Tanners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By WILLIAM A. WITTEBECKER.

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

THE growing demand for simple electrical apparatus in dwelling houses, offices and work shops and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician, but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down anyone without the slightest knowledge of electricity should be able to do the work described.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is rollable. Address.

LUIS JACKSON,

Industrial Commissioner, C. M. & ST. P. Ry.,

Gentlemen:--

I recently inserted an advertisement for the sale of an Electric Light Plant in your paper one time, and I also inserted the same "ad" in two of the best Chicago Sunday papers three times each. I received double the number of answers from your "ad" that I did from all the others combined.

Yours truly,
Foree Bain

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price \$1.00.
 This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 360 pp., 258 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManus, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 60 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stebbins. 503 pages. 333 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp., 168 illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 736 pages. 616 illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 2 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 330 pages. 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG. CHICAGO.

Westinghouse

IN BUYING Electrical Equipment for Your Factory

DO NOT FORGET

That in the hundreds of examples of electrically driven machinery in successful operation to-day, and including every important line of manufacture,

THE WESTINGHOUSE TYPE "C" MOTOR

has clearly demonstrated its superiority. The reason is readily explained by the fact that the simplicity of its construction

....IS IDEAL....

It has no commutator or collector, which is the principal seat of motor trouble.

Read what some of the users have to say of

Never Slip Pulley Covering

The greatest power, fuel and money saver ever invented. Sold on its merits. "No Cure, No Pay." 30 days test. Will admit the running of machinery with sagging belts and cool journals, without the use of lifters or tighteners, saving lost motion, requiring less power and only about half the oil; also increasing the life of both belt and machinery fully one-third.

Your Never Slip Pulley Covering is all and more than you can get for it. We have no more trouble with sagging belts since we began using this covering. The covering we put on them is all and as good as ever. Springfield, Mo., Lighting Co., H. J. Fox, Mgr.

The Never Slip Pulley Covering we bought of you six months ago is still the best we ever made. Your covering is a real saver of fuel and best ever. Lapeer, Mich., Electric Co.

We have been using your Never Slip Pulley Covering for a couple of years and find it all you claim for it and the best covering I have ever had a chance to try. M. H. Paine, Master Mechanic, Heywood Bros. & Wakefield, Chicago.

We have used your Never Slip Pulley Covering on our dynamo and found it to be a real saver of power and best ever. It is all you claim to be. Chicago, Ill., Electric Co., H. J. Fox, Mgr.

We have no more, still using the same greasy belts. St. Louis, Electric Light and Power Co., Deibel, Mgr.

Your Never Slip Covering is the best covering we ever used. Our belts are running more satisfactory than they have for years. Greensboro, Gas and Electric Light Co., Greensboro, N. C.

Your Never Slip Pulley Covering does the business and is all you claim for it. Colfax Electric Co., Colfax, Wash.

Your Never Slip Pulley Covering is giving good satisfaction. Send us another gallon at once. American Elec. Lt. Co., Kan. City, Mo.

We have given your Never Slip Covering a thorough trial and we find it all that you recommend it to be. Petaluma Electric Light & Power Co., Petaluma, Cal.

Your never slip covering is the best we have ever used. Denton Elec. Light Co., Denton, Tex.

REPAIR SHOPS

In the West. ELECTRICAL REPAIRS AND MACHINE WORK OF EVERY DESCRIPTION. In having your repair work done by a company operating hundreds of dynamos and motors you are sure of good work and get the benefit of our experience.

CHICAGO EDISON COMPANY,

76 MARKET STREET, CHICAGO.

General Incandescent Arc Light Co.

MANUFACTURERS OF THE

Bergmann Enclosed Arc Lamps, Switches,
And Other High-Grade Electrical Specialties.

General Offices and Factory:

572-4-6-8 First Ave., Between 33d
and 34th Sts., New York.

CHICAGO:

MARTIN J. INSULL Co.,
1012-1013 Monadnock Block.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

Fort Wayne Electric Corporation,

FORT WAYNE, IND.

Apparatus for

Arc, Direct Current and Alternating
Incandescent Lighting and
Power Transmission.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use.

Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Filters, City Sewer and Underground Cable Inspectors, Powder Mills and Warehouses where explosive materials are manufactured and stored, exploring cellars and trenches where leaks occur and investigating pipe connections where it is possible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs. 1½ C. P. Price complete, \$ 4.00. For meter reading only.
" 2 " 3 " 4 " " " 6.00. For general use.
" 3 " 12 " 10 " " " 12.00. For sev. persons to work by.

WOOD'S MOTO-VEHICLES.

THE WOOD ELECTRIC MOTO-VEHICLES.

SEND FOR "SPECIALLY FINE" CATALOGUE.

AMONG OTHER THINGS WE GUARANTEE ARE:

That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball bearing axles.

That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.

That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.

That the batteries can be charged when fully discharged in two and one-half hours' time.

That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.

That for the sum of \$50.00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

AVERAGE COST TO RUN PER MILE, 3-4 CENT.

FISCHER EQUIPMENT CO.,

Eastern Agents for Emerson Alternating Fans and Power Motors.

Flickering of lights usually occurs when the station is being crowded. It is self-evident that this flickering is caused by the slipping of belts, and as a belt full of Cling-Surface runs steadily and positively beyond all possibility of slipping, the importance of this fact can be readily seen.

CLING-SURFACE MFG. CO., 177-182 VIRGINIA ST., BUFFALO, N. Y.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

North Woolwich, E.

ANTWERP,
33 Rue Boudewyns.

PARIS,
45 Avenue de Breteuil.

The lighting of gas by an electric spark has long passed the experimental state. The expense and trouble of wiring a house, putting in the system heretofore used, has been a source of reluctance on the part of most people in using this great convenience. To overcome this we have put on the market a system in which all of these difficulties have been obliterated. No one now need hesitate in fitting up one or more FIXTURES, for in this system each fixture is entirely independent of all others. The source of electric supply is entirely contained on the fixture in the small drum as shown in the cut. This avoids wiring a room or house as in the old way.

REMEMBER this system can be attached to your fixtures NOW IN USE in a few minutes without any special preparation, and at a very moderate expense. The advantages we claim for this system are as follows: 1st. SIMPLICITY. No outside wiring, easily attached to any fixture now in use. 2d. ECONOMY. It does not cost anything like the old system. 3d. It is an ornament to any fixture. 4th. Each fixture is independent; if one should get out of order it does not affect any other. Made in all colors of metal to match fixture. See it and you will surely like it. For sale by **ADVANCE SPECIALTY CO.,** Tel. Main 3359. Room 68, 119 La Salle St., Chicago, And Electric Supply Houses Everywhere.

HASKINS' NEW CATECHISM OF ELECTRICITY.

A PRACTICAL TREATISE
TESTIMONIAL. Chas. M. Weir, Chief Engineer U. S. Projectile Works, Brooklyn, N. Y.: "It is one of the most practical and concise works on the subject I ever saw. It is just the right thing in the right place, and I most cheerfully recommend it to all who desire a practical knowledge of Electricity."

This is a book of 250 pp., full of up-to-date information, 300 illustrations. Handsomely bound in red leather, pocketbook form, size 4 1/2 x 6 1/2, with titles and edges in gold. Price, \$2.00, postpaid. 100 page descriptive catalogue of electrical books free on request.

ELECTRICIAN PUBLISHING COMPANY,
510 Marquette Building, Chicago

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

EXTRACT FROM PREFACE

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

<p>CHAPTER 1. The Invention of the Telephone. 2. Sound Waves. Articulate Speech. 3. Electric Telegraphy. The Bell Telephone. 4. The Microphone. 5. Current Induction. Electromagnetic Induction. 6. The Induction Coil: Its Use in the Telephone Transmitter. 7. The Complete Telephone Circuit. 8. Magnet Telephones. 9. The Bell Telephone Receiver. 10. Other Forms of Magnet Telephones. 11. The Gower, Ader and D'Arsonval Receivers. Mercader's Et-Telephone. 12. The Siemens, Kolyta, Nougat and other Receivers.</p>	<p>CHAPTER 13. Carbon Transmitters. 14. The Blake Transmitter. 15. The Long Distance Transmitter. 16. The Solid-back Transmitter. 17. The Berlin Transmitter. 18. The Cuttiss Transmitter. 19. Various European Transmitters. 20. The Efficiency of Carbon Transmitters. 21. Batteries for Telephone Work. 22. Open Circuit Batteries. 23. Closed Circuit Batteries. 24. The Practical Management of Batteries. 25. Magneto Bell. 26. Automatic Switches. 27. Telephone Line Construction.</p>	<p>CHAPTER 28. Metallic Circuit. 29. Underground Wires. 30. Lightning Arresters. 31. Inside Wiring. 32. Installation of Telephone Instruments. 33. Inspection and Maintenance. 34. The Condenser: Its Use in Telephony. 35. Electromagnetic Retardation. 36. Exchange Working. 37. Small Exchanges. 38. Party Lines: The Bridget Bell. 39. Long Distance Telephony. 40. Duplex Telephony. 41. Simultaneous Telegraphy and Telephony Appendix.</p>

Recent tests at Holyoke enable us to guarantee:

The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency ever realized when running from half to full gate. We guarantee also: A runner of the greatest possible strength. A gate unequalled in quickness and ease of opening and closing. Tests show over 81 per cent. average efficiency with half to full water.

State your Head and send for 124 page pamphlet.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railroad, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address:

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 15mo, 150 pp. Price \$1.00.

This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 350 pp., 238 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

THE TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Haskins. Sixth edition. 36mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pages. 333 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allison. 191 pp., 168 illustrations. Price \$2.00.

TELEPHONE SYSTEMS OF THE CONTINENT OF EUROPE. By Bennett. 436 pages, 169 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages, 23 illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 756 pages, 516 illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 132 pages, 3 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 330 pages, 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

Gentlemen:--

I recently inserted an advertisement for the sale of an Electric Light Plant in your paper one time, and I also inserted the same "ad" in two of the best Chicago Sunday papers three times each. I received double the number of answers from your "ad" than I did from all the others combined.

Yours truly,

Foree Bain

Advantages of Buffalo Expansion Circuit Breakers.

- 1st. Simplicity
- 2d. No fuses to replace.
- 3d. Low cost, little more than knife switch.
- 4th. Better than magnetic circuit breaker for motor work.
- 5th. Better than fuses for overload or short circuit.
- 6th. May be adapted to existing switches and switchboards.
- 7th. Can be placed in junction boxes on various floors where expense of magnetic circuit breakers would be prohibitive.
- 8th. For street railway cut-out boxes saves trouble of conductor replacing fuses.
- 9th. Good for direct or alternating currents.
- 10th. A 100 or 200 ampere switch may be opened on 1/2 ampere by simply changing expansion rod.
- 11th. The loss of energy is no more than with fuses.
- 12th. The switch is operative without any relation to the protective device.

The "BUFFALO"

Expansion Circuit Breaker

Manufactured by

McCarthy Bros. & Ford,

45 N. Division Street, - BUFFALO, N. Y.

NEW YORK: GENERAL INCANDESCENT ARC LIGHT CO., 39-41 Cortlandt St.

Flickering of lights usually occurs when the station is being crowded. It is self-evident that this flickering is caused by the slipping of belts, and as a belt full of Cling-Surface runs steadily and positively beyond all possibility of slipping, the importance of this fact can be readily seen.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

MAIN OFFICE AND WORKS:

ELIZABETHPORT, N. J.

No Matches, No Smoke, No Smell,
No Profanity, Always Ready.

The lighting of gas by an electric spark has long passed the experimental state. The expense and trouble of wiring a house, putting in the system heretofore used, has been a source of reluctance on the part of most people in using this great convenience. To overcome this we have put on the market a system in which all of these difficulties have been obliterated. No one now need hesitate in fitting up one or more FIXTURES, for in this system each fixture is entirely independent of all others. The source of electric supply is entirely contained on the fixture in the small drum as shown in the cut. This avoids wiring a room or house as in the old way.

REMEMBER this system can be attached to your fixtures now in use in a few minutes without any special preparation, and at a very moderate expense. The advantages we claim for this system are as follows: 1st. SIMPLICITY. No outside wiring, easily attached to any fixture now in use. 2d. ECONOMY. It does not cost anything like the old system. 3d. It is an ornament to any fixture. 4th. Each fixture is independent; if one should get out of order it does not affect any other. Made in all colors of metal to match fixture. See it and you will surely like it. For sale by **ADVANCE SPECIALTY CO.,** Tel. Main 3359. Room 68, 119 La Salle St., Chicago, And Electric Supply Houses Every where.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use.

Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Filters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs. 1 1/2 C. P. Price complete, \$ 4.00. For meter reading only.
" 2 " 3 " 4 " " " 6.00. For general use.
" 3 " 12 " 10 " " " 12.00. For sev. persons to work by.

A NEW THING. Write for Particulars of Our CENTRAL ENERGY TELEPHONE SYSTEM.

The Victor Metallic Switchboard

Is the Only Switchboard in the World Built with No Connection on Wood.

All connections are mounted on hard rubber and soldered, leaving no chance for loose connections or cross talk.

The Victor Metallic Switchboard

5-Drop Section, Front View.

Clearly demonstrates the impracticability of combined and self-contained jacks and drops. The simplicity of construction and fewness of parts of this board afford ample space for heavy insulation and metallic parts, which give assurance of durability and high efficiency, with lowest cost of maintenance.

It is built in five jack and drop sections, with entirely concealed wiring—Tripolar single coil—Low-contact gravity drops, insuring sensitive positive action. Individual ringing keys.

YOU SHOULD SEE IT. The ease and rapidity with which our board is operated finds favor with all who inspect it.

Using the Victor Transfer System—the simplest and quickest method known for trunking between operators—a board of any capacity is built.

Write for our '99 catalogue, if you have not received it.

Locations for Industries.

The name of the Chicago, Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.
 The company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.
 Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.
 The Chicago, Milwaukee & St. Paul Railway Company owns 6,150 miles of railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of the territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.
 A number of new factories and industries have been induced to locate—largely through the instrumentality of this company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address:
LUIS JACKSON,
 Industrial Commissioner, C., M. & St. P. Ry.,
 450 Old Colony Building CHICAGO, ILL.

DOMESTIC Electrical Work.

Concise and Practical Explanations for Plumbers, Tanners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators and for Gas Lighting from Batteries.
 Illustrated with Twenty-two Diagrams.
 By **WILLIAM A. WITTEBECKER.**
 Price in Paper, 25 Cents.
 Price in Cloth, 50 Cents.

THE growing demand for simple electrical apparatus in dwelling houses, offices and work shops and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down anyone without the slightest knowledge of electricity should be able to do the work described.

 Are the only standard portable instruments of the type deserving this name. Write for circular and price lists 8 and 9.

Weston Standard Portable Direct Reading Voltmeters and Wattmeters

The Only Fire Detective Cable in the World.

Every Fractional Part of which is continuously Thermostatic, and designed for all Interior Electric Wiring Adaptations. It lights the gas! Rings the door bells! It automatically notifies of fire and indicates that burglars are at work, all in one installation.

Why use dormant wires? The Montauk Automatic Thermostatic Electric Cables are as sensitive to heat or fire as the nervous system of a human being is to the touch of flame.

Write for descriptive matter. Call and see cables operated.

MONTAUK MULTIPHASE CABLE CO.,
 Telephone 4031 Cortlandt. 100 Broadway, NEW YORK.

THE WOOD ELECTRIC MOTO-VEHICLES.

SEND FOR "SPECIALLY FINE" CATALOGUE.

AMONG OTHER THINGS WE GUARANTEE ARE:

That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball bearing axles.

That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.

That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.

That the batteries can be charged when fully discharged in two and one-half hours' time.

That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.

That for the sum of \$50 00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

AVERAGE COST TO RUN PER MILE, 3-4 CENT.

MAIN FACTORY BUILDING

Now in course of erection, which doubles our manufacturing capacity.

TO OUR FRIENDS:-

We attribute our growth from a capitalization of \$25,000.00 in 1892 to \$500,000.00 in 1899 to YOUR cordial appreciation of OUR continuous endeavor to BUILD only high-grade apparatus at PRICES justifying your consideration.

Soliciting your continued inquiries, we are

Yours very truly,

WAGNER ELEC. MFG. CO.,

ST. LOUIS, U. S. A.

Flickering of lights usually occurs when the station is being crowded. It is self-evident that this flickering is caused by the slipping of belts, and as a belt full of Cling-Surface runs steadily and positively beyond all possibility of slipping, the importance of this fact can be readily seen.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

The lighting of gas by an electric spark has long passed the experimental state. The expense and trouble of wiring a house, putting in the system heretofore used, has been a source of reluctance on the part of most people in using this great convenience. To overcome this we have put on the market a system in which all of these difficulties have been obviated. No one now need hesitate in fitting up ONE OR MORE FIXTURES, for in this system each fixture is entirely independent of all others. The source of electric supply is entirely confined on the fixture to the small drum as shown in the cut. This avoids wiring a room or house as in the old way.

REMEMBER this system can be attached to your fixtures NOW IN USE in a few minutes without any special preparation, and at a very moderate expense. The advantages we claim for this system are as follows: 1st. **SIMPLICITY.** No outside wiring, easily attached to any fixture now in use. 2d. **ECONOMY.** It does not cost anything like the old system. 3d. It is an ornament to any fixture. 4th. Each fixture is independent; if one should get out of order it does not affect any other. Made of all colors of metal to match fixture. See it and you will surely like it. For sale by **ADVANCE SPECIALTY CO.,** Tel. Main 3359. Room 68, 1191 a Salle St., Chicago, And Electric Supply Houses Everywhere.

DISTRICT COURT OF THE UNITED STATES, DISTRICT OF INDIANA.

IN THE MATTER OF THE FORT WAYNE ELECTRIC CORPORATION. No. 7 IN BANKRUPTCY.

Notice is hereby given that, pursuant to an order made and entered on the 30th day of March, 1899, in the above proceedings, the undersigned, as Receivers, will, on the 18th day of April, 1899, between the hours of 10:00 a. m. and 4:00 p. m. of said date, sell at public auction for not less than two-thirds of the appraised value thereof, all the following described property of said bankrupt, to-wit:

The real estate, plant, property, business and good will of said Fort Wayne Electric Corporation, said real estate being more particularly described as follows:

Commencing at a point fifty (50) feet south of the center line of right of way of the Pittsburg, Fort Wayne and Chicago Railway Company, on the east line of the west half northwest quarter section eleven (11), Township thirty (30), Range twelve (12), thence west along the south line of said right of way three hundred and twenty-three and four-tenths (223.4) feet to the east line of Broadway; thence south thirty-one degrees thirty minutes (31°, 30') west along said east line of Broadway, sixty (60) feet; thence south fifty-eight degrees forty-five minutes (58°, 45'), east one hundred and fifty-two (152) feet; thence south thirty-one degrees thirty minutes (31°, 30'), west two hundred and forty (240) feet; thence south fifty-eight degrees forty-five minutes (58°, 45'), east eighty (80) feet; thence south thirty-one degrees thirty minutes (31°, 30'), west thirty (30) feet to the Cemetery line; thence south fifty-eight degrees forty-five minutes (58°, 45'), east one hundred and sixty (160) feet; thence south five degrees thirty minutes (5°, 30'), east one hundred and eleven (111) feet; thence north forty-eight degrees (48°), east three hundred and thirty-four (334) feet; thence north five degrees thirty minutes (5°, 30'), west three hundred and ninety (390) feet to the place of beginning, and containing three and fifteen hundredths (3.15) acres in the City of Fort Wayne, Allen County, State of Indiana.

Also the following described real estate situate in Morrow County, State of Ohio, to-wit:

Commencing at the southwest corner of the depot grounds on the west side of the Cleveland, Cincinnati, Chicago & St. Louis Railroad; thence westerly on said railroad line thirty (30) feet; thence northerly fifty (50) feet; thence easterly thirty (30) feet to the line of the depot grounds; thence southerly along the line of the depot grounds fifty (50) feet to the place of beginning, said land being a part of the land deeded to John McNamara by John Gregory and Louise Gregory on the sixth day of August, 1866, situate in the town or city of Cardington, State of Ohio, Morrow County.

And also all the books, prints, patterns, pictures, blue-prints, drawings and designs used in the buildings on the aforesaid real estate in Indiana and used in connection with the business of said Fort Wayne Electric Corporation, including all the fixtures, machinery, tools, merchandise and personal property of every kind and description, books, papers, contracts and contract records, and interests in patents and inventions, except books of account in the book-keeping department, and notes, bills and accounts receivable, located in the offices and buildings of said Fort Wayne Electric Corporation, together with all property of every kind and description, on consignment or otherwise, situate in any of the towns or cities in the United States, and all property and papers of every kind and description in the branch offices of said Fort Wayne Electric Corporation in the following cities, to-wit:

- Boston, Mass.
New York, N. Y.
Pittsburg, Pa.
Philadelphia, Pa.
Syracuse, N. Y.
St. Paul, Minn.
Chicago, Ill.
St. Louis, Mo.
Cincinnati, O.
San Francisco, Cal.

Free of liens, such sale to be held at the office of the Fort Wayne Electric Corporation, corner of Broadway and the Pittsburg, Fort Wayne & Chicago Railroad in the City of Fort Wayne, Allen County, Indiana; such sale to be continued from day to day at the same place and between the same hours until completed.

TERMS OF SALE.

Twenty (20) per cent. in cash of the purchase price shall be paid at the time of purchase and the balance upon the approval of the sale by the Court. In cash, or at the option of the purchaser in four equal installments, such deferred payments to be payable in three, six, nine and twelve months from the date of sale, with five per cent. interest per annum thereon, and evidenced by notes of the purchaser; the title, however, to the property so sold by the undersigned to be and remain in the control of said District Court of the United States for the District of Indiana until said deferred payments with interest are fully paid, with the right reserved and vested in said Court to retake said property and resell the same upon default in the payment of any such deferred payments, such condition to be inserted in the notes executed by the purchaser and also in the deed to be delivered on the order of the Court.

Notice is further given that, by the order of said Court the mortgage of the General Electric Company on a portion of the aforesaid real estate is assigned to me a first and valid lien upon the aforesaid real estate in Indiana, the buildings thereon and all machinery, tools, patterns, drawings, furniture and fixtures situated in or about the aforesaid buildings and offices on July 16, 1897, and which belonged on that date to the Fort Wayne Electric Light Company to the amount of One Hundred and Eighty-Five Thousand Dollars (\$185,000), with the power to said General Electric Company, in case of its selling a purchaser at such sale of said property in payment of its purchase the balance of said indebtedness, and secured by said mortgage to the extent of One Hundred and Eighty-Five Thousand Dollars (\$185,000).

AMEL L. MORRIS, H. W. WARREN, Receivers.

VACANCIES

Should be filled through the TECHNICAL AGENCY, 1865 Monadnock Block, Chicago. Our list of available men is selected from the best that the country affords. If you need a Draughtsman, Designer, Electrician or Engineering help of any kind, we will send you a number of competent men to select from and without expense to you. As to our reliability, we refer you to the WESTERN ELECTRICIAN.

WANTED.

Good salary or commission will be paid salesman, if ability is demonstrated; must be acquainted with the electrical supply business, know the trade in eastern and middle states and be capable of getting business at reasonable expense. Apply, stating age, years of experience, line have sold, where best acquainted. "Manufacturer," care Western Electrician, 510 Marquette Building, Chicago.

WANTED.

RELIABLE AGENTS to sell our line of DIRECT-CURRENT DYNAMOS and MOTORS. Address, for full information, Eagle Electric Works, Peoria, Ill.

WANTED.

An experienced armature winder and general electrical machinery repair man. Must be familiar with alternating and direct current apparatus, and be able to rewind motor and generator armatures of all common makes; also rewinding transformers and repairing arc lamps. None but experienced men need apply. State age, where employed at present, and number of years actually engaged in electrical repair work. Address "M," care Western Electrician, 510 Marquette Building, Chicago.

SMITH-VAILE TRIPLEX PUMPS.

OPERATED BY ELECTRIC MOTOR. SINGLE AND DOUBLE ACTING.

REPAIRING.

PRACTICAL DYNAMO BUILDING,

With detail drawings and instructions for winding. Giving correct sizes of wire, dimensions of iron, etc. Also diagram for house wiring.

BY L. C. ATWOOD.

Profusely illustrated. Size of page, 10x8 inches. Price, \$3.

"This work is gotten up especially for amateur builders and non-professional men. All measurements and instructions for winding are taken from machines in actual service. Particular attention has been given to every detail of construction, that they may be thoroughly understood. This work will be of great value, not only to those who wish to build dynamos, but to superintendents, engineers and workmen who have the care of established systems."—From Preface.

Pronounced to be a **PRACTICAL AND COMPLETE WORK.**

Sent postpaid on receipt of price.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 15mo, 150 pp. Price \$1.00.
This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. (Each book fully illustrated.) Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Jr. D., and A. E. Kennelly, Sc. D.; 15mo, cloth, 422 pp., 142 illustrations. Price \$1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanism, and the switchboard apparatus at the central station. It is written by two well-known electricians, and was the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By James Peck, A. I. E. C. Second edition, revised and enlarged. 200 pp., 22 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Harkins. Sixth edition. 16mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preese, P. R. S., and A. J. Stubbs. 508 pages, 223 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.50.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. O. Allison. 191 pp., 168 illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages, 169 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages, 23 illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages, 516 illustrations. Price \$4.00.

PHILIP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages, 2 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY. treating on the telegraph, telephone, etc. By E. J. Houston. 230 pages, 88 illustrations. Price \$1.00.

Standard Electrical Dictionary.
 BY PROF. T. O'CONNOR SLOANE.
 Author of "Arithmetic of Electricity," "Electricity Simplified," "Electric Toy Making," Etc.
 682 Pages, 393 Illustrations. Handsomely bound in cloth, 8vo, \$3.
 An Entirely New Edition, Brought Up to Date and Greatly Enlarged.
 COMPLETE—CONCISE—CONVENIENT.
 In publishing the "Standard Electrical Dictionary," the author has adhered to what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete without unnecessary elaboration. In this work, every electrical word, term, or phrase will be found intelligently defined.
 A practical handbook of reference, containing definitions of about 5,000 distinct words, terms and phrases.
 The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the everyday electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of this branch of science.

THE TELEPHONE HAND-BOOK
 BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."
146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.
 EXTRACT FROM PREFACE.
 "This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to, or have originated in this country."
 No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.	CHAPTER 13. Carbon Transmitters.	CHAPTER 28. Metallic Circuit.
2. Sound Waves, Articulate Speech.	14. The Blake Transmitter.	29. Underground Wires.
3. Electric Telephony. The Bell Telephone.	15. The Long Distance Transmitter.	30. Lightning Arresters.
4. The Microphone.	16. The Solid-back Transmitter.	31. Inside Wiring.
5. Current Induction. Electromagnetic Induction.	17. The Berliner Transmitter.	32. Installation of Telephone Instruments.
6. The Induction Coil: Its Use in the Telephone Transmitter.	18. The Cottrell Transmitter.	33. Inspection and Maintenance.
7. The Complete Telephone Circuit.	19. Various European Transmitters.	34. The Condenser: Its Use in Telephony.
8. Magnet Telephones.	20. The Efficiency of Carbon Transmitters.	35. Electromagnetic Retardation.
9. The Bell Telephone Receiver.	21. Batteries for Telephone Work.	36. Exchange Working.
10. Other forms of Magnet Telephones.	22. Open Circuit Batteries.	37. Small Exchanges.
11. The Gower, Ader and D'Arsonval Receivers. Mercadier's Bi-Telephone.	23. Closed Circuit Batteries.	38. Party Lines: The Bridging Bell.
12. The Siemens Kofyra Neumayer and Söthner Receivers.	24. The Practical Management of Batteries.	39. Long Distance Telephony.
	25. Magneto Bell.	40. Duplex Telephony.
	26. Automatic Switches.	41. Simultaneous Telegraphy and Telephony.
	27. Telephone Line Construction.	Appendix

National Electric Light Association

And **THIRD ELECTRICAL and Kindred Industries EXHIBITION**, at
MADISON SQUARE GARDEN during the month of May.

Other meetings and conventions every day during the show. Schedule in advance. Register of participants free to exhibitors. All exhibits to be in the amphitheater. Very little space still to be sold. Send application early.

350 Exhibitors.
50,000 Buyers.
700,000 Visitors at the former shows.
The Exhibitors are the foremost
people in their respective lines.

Special exhibition of patents and in-
ventions.
An economical arrangement whereby
inventors may be able to show their
models to investors at very little cost.

Electrical Exhibition Company,

MARCUS NATHAN, General Manager.

Madison Square Garden, New York City.

THE
General Electric Company's
FAN MOTORS

are made in styles suitable for portable use, for brackets, or for ceilings.

Fans are kept in stock to suit either direct or alternating current for any voltage or periodicity, and with either solid or trunnion bases.

Each fan motor is made to run at either a high or low rate of speed, and is equipped with highly polished, four-bladed brass fans and heavy brass guards.

The new single-speed noiseless, highly finished fan is specially adapted for sleeping rooms in hotels and private residences.

These fans are constructed to give the highest efficiency with the smallest consumption of current.

GENERAL ELECTRIC COMPANY,

A TOTAL LOSS.

Who would ride on a lumbering stage coach when he can go by the "Limited?" Of all the mediums for conveying and delivering heat through long lines of pipe, steam is and must remain supreme. Why? Because under moderate pressure it travels like lightning and gets there. Steam or hot water, which? The boiler pressure is all the power required to deliver steam throughout a city to heat its residences, stores, offices, churches and public buildings. Nothing could be more simple. When it reaches its destination it does its work, and resolves itself back to its original element, water. This is the Holly System, "The Limited," which reaches the end of its journey while the stage coach is lumbering its slow and laborious way along.

Can we heat by water through long lines of pipe (the lumbering stage coach)? Yes, but at what expense? We must have two lines of pipe, and hot-water pipes are proven short-lived. We must have large and expensive tanks for heating the return water. We must have pumps and power to force hot water to the tops of high buildings. Everybody knows that it costs to pump against a head. In cities, a large proportion of the buildings are already fitted for steam. Water heating would require refitting of these throughout, and 50 per cent. more additional radiation at increased cost. Electric heating is still in the dim future on account of its great expense.

The electric companies know this, and to get back 85 to 90 per cent. of efficiency, which they cannot secure in engine work, they are putting in the Holly System of heating, which accomplishes this object.

We can give many references to cities and villages that have this system in practical and successful operation. Inquire of the

CHAS. A. COOPER & CO., 608 Roe Bldg., St. Louis.

BUCKEYE

INCANDESCENT LAMPS.

Monadnock Building, Chicago.

QUALITY UNEQUALED. FACTORY PRODUCTION TRIPLED.

THE BUCKEYE ELECTRIC CO., Cleveland, Ohio.

Truitt Regulating Lamp.

**EFFICIENT and
ECONOMICAL.**

No waste of current by resistance or induction.

Simply turning lamp in socket will produce 1, 8, 16 or 24 candle power illumination, as may be desired.

Nothing unsightly, for it is precisely the same size as an ordinary socket and 16 c. p. lamp.

Works equally as well on direct and alternating currents.

**PRICE BUT LITTLE
IN EXCESS OF
ORDINARY LAMP AND
SOCKET.**

Central Electric Company,

264-266-268-270 FIFTH AVENUE,

...CHICAGO...

Patented February 8, 1898.

Advantages of Buffalo Expansion Circuit Breakers.

- 1st. Simplicity
- 2d. No fuses to replace
- 3d. Low cost, little more than knife switch
- 4th. Better than magnetic circuit breaker for motor work.
- 5th. Better than fuses for overload or short circuit.
- 6th. May be adapted to existing switches and switchboards.
- 7th. Can be placed in junction boxes on various floors where expense of magnetic circuit breakers would be prohibitive
- 8th. For street railway cut-out boxes saves trouble of conductor replacing fuses.
- 9th. Good for direct or alternating currents.
- 10th. A 100 or 200 ampere switch may be opened on 1/2 ampere by simply changing expansion rod
- 11th. The loss of energy is no more than with fuses.
- 12th. The switch is operative without any relation to the protective device.

Flickering of lights usually occurs when the station is being crowded. It is self-evident that this flickering is caused by the slipping of belts, and as a belt full of Cling-Surface runs steadily and positively beyond all possibility of slipping, the importance of this fact can be readily seen.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

MAIN OFFICE AND WORKS:

ELIZABETHPORT, N. J.

No Matches, No Smoke, No Smell,
No Profanity, Always Ready.

The lighting of gas by an electric spark has long passed the experimental state. The expense and trouble of wiring a house, putting in the system heretofore used, has been a source of reluctance on the part of most people in using this great convenience. To overcome this we have put on the market a system in which all of these difficulties have been eliminated. No one now need hesitate to fitting up one or more fixtures, for in this system each fixture is entirely independent of all others. The source of electric supply is entirely contained on the fixture in the small drum as shown in the cut. This avoids wiring a room or house as in the old way.

REMEMBER this system can be attached to your fixtures now in use in a few minutes without any special preparation, and at a very moderate expense. The advantages we claim for this system are as follows: 1st. SIMPLICITY. No outside wiring, easily attached to any fixture now in use. 2d. ECONOMY. It does not cost anything like the old system. 3d. It is an ornament to any fixture. 4th. Each fixture is independent; if one should get out of order it does not affect any other. Made in all colors of metal to match fixture. See it and you will surely like it. For sale by **ADVANCE SPECIALTY CO.,** Tel. Main 3359. Room 68, 119 La Salle St., Chicago, and Electric Supply Houses Everywhere.

A 40-PAGE FAN Motor Catalogue mailed to any address upon request.

1899 CONSTRUCTION. ABOUT SPOKES.

There are 64 spokes in the two wheels of a Columbia bicycle. They represent 64 points of superiority over any other wheel.

Since we adopted the Columbia Stud Hub and direct tangent spoke over 7,500,000 of these spokes have been in use. We have yet to hear of one breaking from any cause except collision or other violent accident. The stud hubs obviate all bending and twisting of the spokes.

When you compare Columbia, Hartford and Vedette bicycles part for part with other wheels you find good reason for their recognized superiority.

PRICES, \$75 TO \$25.

NEW BOOKS.

AUTHORITIES ON SUBJECTS MENTIONED.

The Pocket Electrical Dictionary. Containing all of the words and definitions in the science. A new work. Indispensable to the electrician, student and professor. Over 11,000 words and about 15,000 definitions. By Edwin J. Houston, A. M., Ph. D. (Princeton). 1 volume, 32mo, cloth, \$2.50; leather, \$3.00.

Electricity Made Easy. Profusely illustrated. A hand-book for busy people. By Edwin J. Houston, A. M., Ph. D., and Arthur E. Kennelly, Sc. D. 1 volume, 12mo, cloth, \$1.50.

Dynamo-Electric Machinery. By Silvanus P. Thompson, D. Sc., B. A., F. R. S. Sixth edition, revised and enlarged. Profusely illustrated with new engravings. 19 folding plates. 2 volumes, 8vo, cloth, gilt, \$6.00. The rapid advance of electrical science made it absolutely necessary to revise the last edition, and this is now a new work. It is indispensable to the electrical expert, professor and student of electrotechnics. Students and professors highly appreciate the publication of this extensive work in two volumes.

Polyphase Electric Currents and Alternate Current Motors. By Silvanus P. Thompson, D. Sc., B. A., F. R. S. 1 volume, 8vo, cloth, gilt, \$3.50. The most important work on the subject. A companion book to "Dynamo-Electric Machinery." One of the text-books in schools of technology and colleges. Beautifully illustrated with fine engravings. Folding plates. Invaluable to the expert electrician.

Algebra Made Easy. By Edwin J. Houston, Ph. D., and A. E. Kennelly, Sc. D. This little work is of special value to readers of Prof. Thompson's Dynamo-Electric Machinery and Polyphase Electric Currents, as the work has been written to explain in a clear and simple manner the equations contained in those works. 1 volume, 16mo, cloth, 75 cents.

The Interpretation of Mathematical Formulae. By Edwin J. Houston, Ph. D., and A. E. Kennelly, Sc. D. 1 volume, 12mo, cloth, \$1.25. A most valuable aid to students and electrical workers.

A B C of Electricity. Now approaching its 65th thousand. By William H. Meadowcroft. 1 volume, 12mo, cloth, 50 cents. Fully illustrated. This excellent primary book has taken the first place in elementary scientific works. It has received the endorsement of Thomas A. Edison. It is for every person desiring a knowledge of electricity, and is written in simple style so that a child can understand the work. It is what its title indicates, the first flight of steps in electricity.

Scholars' A B C of Electricity. By William H. Meadowcroft. 1 volume, 12mo, illustrated, cloth, 50 cents. The author of this work has designed it for the use of teachers and scholars. A large number of simple experiments have been added, with notes relative to the work. It is the primary book for school use.

The X Ray; or Photography of the Invisible and its Value in Surgery. By William J. Morton, M. D. Written in collaboration with Edwin W. Hammer, 1 volume, 12mo, cloth and silver, 75 cents; paper, 50 cents.

The work explains in clear and simple style how these extraordinary pictures are taken through solids. Full description is given of the apparatus used, and the text is profusely illustrated with half-tone illustrations giving facsimile copies of the pictures taken from the negatives of the author. The subjects are varied.

The A B C of the X Ray. By William H. Meadowcroft. 1 volume, 12mo, cloth and gold, 75 cents. The first primary work on the subject. A book for the people. The author of "A B C of Electricity" showed clearly in that work his ability to explain a technical subject for the laymen who know nothing of scientific terms. He has written this work about the X Ray in his usual clear and simple style, and a wide circulation of this useful book is assured. The text of the author is beautifully embellished with fine engravings, and nothing is omitted that will give the public a clear knowledge of this remarkable discovery of Prof. Röntgen. The public would do well to secure both these important works.

VACANCIES

Should be filled through the **TECHNICAL AGENCY**, 1965 Monadnock Block, Chicago. Our list of available men is selected from the best that the country affords. If you need a Draughtsman, Designer, Electrician or Engineering help of any kind, we will send you a number of competent men to select from and without expense to you. As to our reliability, we refer you to the **WESTERN ELECTRICIAN**.

WANTED.

Good salary or commission will be paid salesman, if ability is demonstrated; must be acquainted with the electrical supply business. Know the trade in eastern and middle states and be capable of getting business at reasonable expense. Apply, stating age, years of experience, line have sold, where best acquainted. "Manufacturer," care Western Electrician, 510 Marquette Building, Chicago.

WANTED.

Armature winder. Must be a thoroughly competent winder and accustomed to general electrical repair work. References required.

F. BISSELL & CO., Toledo, Ohio.

WANTED.

Electrician. Must be thoroughly familiar with repairs for incandescent wiring, bells, annunciators and telephones. No contracting, repair work only. References required.

F. BISSELL & CO., Toledo, Ohio.

WANTED.

An experienced armature winder and general electrical machinery repair man. Must be familiar with alternating and direct current apparatus, and be able to rewind motor and generator armatures of all common makes; also rewinding transformers and repairing arc lamps. None but experienced men need apply. State age, where employed at present, and number of years actually engaged in electrical repair work. Address "M," care Western Electrician, 510 Marquette Building, Chicago.

POSITION WANTED

As manager of telephone exchange, by one who has had fifteen years' practical experience with the Bell Telephone Co. I thoroughly understand the telephone business in all its branches. Have good reason for making a change. Address A. B. C. care **WESTERN ELECTRICIAN**, 510 Marquette Bldg., Chicago, Ill.

POSITION WANTED

As manager, superintendent or electrician of an independent telephone exchange. Will take charge of an exchange now non-paying and guarantee results. Five years' experience, partly with the Bell Telephone Co. Address "B," care Western Electrician, 510 Marquette Building, Chicago.

POSITION WANTED.

As superintendent, manager or electrician of an independent telephone company. Twelve years' (eight years with Bell Companies) practical experience in all branches of telephone work. Am posted in construction, testing switchboard, instrument and office work. Have built several exchanges. At present am engaged; good reasons for making a change. A No. 1 references as to ability, character, habits, etc. Address "BUSINESS," care Western Electrician, 510 Marquette Building, Chicago.

THE LAST—THE BEST! THE DOUBLE DIAPHRAGM

We herewith illustrate our NEW LONG DISTANCE TELEPHONE, which we are just placing in the market.

It is not only handsome in appearance, but has many novel features that greatly add to its efficiency and general reliability.

Everyone knows the high quality of the Williams Magneto.

Our Receiver and Microphone are no less perfect.

Do not fail to place a trial order with us and convince yourself that our 'Phone is the best.

THE WILLIAMS ELECTRIC CO.,

84-86 SENECA ST., CLEVELAND, O.

of the Wilhelm Transmitter secures a double compression of the carbon granules in the pocket between them, greatly increasing the volume, distinctness and carrying value of the voice. Will not "pack" under any circumstance, and cannot be injured by rough handling or pencil jabbing.

Recognized by experts as containing features that place it far ahead of all others

WILHELM TELEPHONE MFG. CO.,

Caxton Building, Buffalo, N. Y.

IN THIS RUSHING AGE MERIT SHOULD BE CAREFULLY CONSIDERED.

A NEW THING. Write for Particulars of Our CENTRAL ENERGY TELEPHONE SYSTEM.

The Victor Metallic Switchboard

Is the Only Switchboard in the World Built with No Connection on Wood.

All connections are mounted on hard rubber and soldered, leaving **no chance** for loose connections or cross talk.

The Victor Metallic Switchboard

5-Drop Section, Front View.

Clearly demonstrates the impracticability of combined and self-contained jacks and drops. The simplicity of construction and fewness of parts of this board afford ample space for heavy insulation and metallic parts, which give assurance of **durability** and **high efficiency**, with lowest cost of maintenance.

It is built in five jack and drop sections, with entirely concealed wiring—Tripolar single coil—Low-contact gravity drops, insuring sensitive positive action. Individual ringing keys.

YOU SHOULD SEE IT. The ease and rapidity with which our board is operated finds favor with all who inspect it.

Using the Victor Transfer System—the simplest and quickest method known for trunking between operators—a board of any capacity is built.

Write for our '99 catalogue, if you have not received it.

THE TELEPHONE HANDBOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HANDBOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

<p>CHAPTER 1. The Invention of the Telephone.</p> <p>2. Sound Waves. Articulate Speech.</p> <p>3. Electric Telephony. The Bell Telephone.</p> <p>4. The Microphone.</p> <p>5. Current Induction. Electromagnetic Induction.</p> <p>6. The Induction Coil. Its Use in the Telephone Transmitter.</p> <p>7. The Complete Telephone Circuit.</p> <p>8. Magnet Telephones.</p> <p>9. The Bell Telephone Receiver.</p> <p>10. Other forms of Magnet Telephones.</p> <p>11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.</p> <p>12. The Siemens Kolyra, Neumayer and Mitchell Receivers.</p>	<p>CHAPTER 13. Carbon Transmitters.</p> <p>14. The Blake Transmitter.</p> <p>15. The Long Distance Transmitter.</p> <p>16. The Solid-back Transmitter.</p> <p>17. The Berliner Transmitter.</p> <p>18. The Gutless Transmitter.</p> <p>19. Various European Transmitters.</p> <p>20. The Efficiency of Carbon Transmitters.</p> <p>21. Batteries for Telephone Work.</p> <p>22. Open Circuit Batteries.</p> <p>23. Closed Circuit Batteries.</p> <p>24. The Practical Management of Batteries.</p> <p>25. Magneto Bell.</p> <p>26. Automatic Switches.</p> <p>27. Telephone Line Construction.</p>	<p>CHAPTER 28. Metallic Circuit.</p> <p>29. Underground Wires.</p> <p>30. Lightning Arresters.</p> <p>31. Inside Wiring.</p> <p>32. Installation of Telephone Instruments.</p> <p>33. Inspection and Maintenance.</p> <p>34. The Condenser; Its Use in Telephony.</p> <p>35. Electromagnetic Retardation.</p> <p>36. Exchange Working.</p> <p>37. Small Exchanges.</p> <p>38. Party Lines; The Bridging Bell.</p> <p>39. Long Distance Telephony.</p> <p>40. Duplex Telephony.</p> <p>41. Simultaneous Telegraphy and Telephony Appendix.</p>

Published and for sale by **ELECTRICIAN PUBLISHING CO., 510 Marquette Building, Chicago.**

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 146 pp. Price \$1.00.
This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 Illustrations. Price \$1.50.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanism, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 200 pp., 22 Illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McMinnan, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preese, F. R. S., and A. J. Stubbs. 508 pages, 222 Illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. O. Allsop. 191 pp., 168 Illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 Illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 Illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages. 616 Illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages, 2 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRINCIPLES OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 330 pages. 88 Illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

76 Cortlandt Street, Cor. Washington, NEW YORK.

Western Electrician

\$3 per Annum. Copyright, 1899, by Electrician Publishing Company, Chicago. EVERY SATURDAY. Entered at Chicago Postoffice as mail matter of the second class. 10 cents per Copy. Vol. XXIV. CHICAGO, APRIL 22, 1899. No. 16

SIMPLEX INSULATED WIRES AND CABLES. RUBBER COVERED, WEATHERPROOF, UNDERGROUND AND SUBMARINE. WESTERN SELLING AGENT: **Simplex Electrical Company**, H. R. HIXSON, 1137 Monodnock Block, CHICAGO. 75-81 Cornhill, BOSTON, MASS.

—NOVELTY IN PORCELAIN—

NEW PERU FUSE PLUG. TRY IT—YOU'LL BUY IT.

New Catalogue Out. Send for It. **PERU ELECTRIC MFG. CO., PERU, IND.**

1889—Paris Exposition, Medal for Rubber Insulation. 1893—World's Fair, Medal for Rubber Insulation.

THE STANDARD FOR RUBBER INSULATION.

Sole Manufacturers of

Okonite Wires, Okonite Tape, Manson Tape, Candee Weather-proof Wires.

THE OKONITE CO., LTD.

Harold L. Candee, Managers. 253 Broadway, New York. Geo. T. Manson, Gen'l Supt. W. H. Hodgins, Secy.

NAME PLATES

FOR MOTORS, ELECTRICAL APPARATUS, TELEPHONES, SWITCHBOARDS, DYNAMOS ETC.

Write for Estimates. **BESTER NAME PLATE COMPANY**, 34 Oliver St., Boston, Mass.

National India Rubber Co's

RUBBER COVERED Wires and Cables. OFFICE AND FACTORY: BRISTOL, R. I.

The Fibre-Graphite Commutator Brush.

(U. S. and Foreign Patents.)

No Sparking Under Varying Load. No Wear on Commutator. No Shifting of Quadrant. 80 per cent. Pure Graphite.

For Sample Order, and Prices, write to

Holmes Fibre-Graphite Mfg. Co., Station Z, Philadelphia.

WESTON Electrical Instrument Co.,

114-120 William St., NEWARK, N. J., U. S. A.

Illuminated Dial Station Instruments.

These instruments are based upon the same general principle and are just as accurate as our regular Standard Portable Direct Current Voltmeters and Ammeters, but are much larger, and the working parts are inclosed in a gently designed, dust-proof cast-iron case which effectively shields the instruments from disturbing influences of external magnetic fields.

Weston Standard Illuminated Dial Station Ammeter, Style B.

Weston Standard

Portable Direct Reading Voltmeters and Millivoltmeters. Ammeters and Milliammeters. Wattmeters and Voltmeters, for Alternating and Direct Current Circuits.

Our portable instruments are recognized as standards throughout the civilized world.

Our Semi-Portable Laboratory Standard Voltmeters and Ammeters are still better.

They are the most reliable, absolute standards for Laboratory use.

Mention the WESTERN Electrician when writing for catalogues.

The Only Fire Detective Cable in the World.

Every Fractional Part of which is continuously Thermostatic, and designed for all Interior Electric Wiring Adaptations. It lights the gas! Rings the door bells! It automatically notifies of fire and indicates that burglars are at work, all in one installation.

Fusible Core running throughout the cable is immediately short-circuited on any interruption by Fire or Theft, Accident or Intention.

Why use dormant wires? The Montauk Automatic Thermostatic Electric Cables are as sensitive to heat or fire as the nervous system of a human being is to the touch of flame.

Write for descriptive matter.

Call and see cables operated.

MONTAUK MULTIPHASE CABLE CO.,

Telephone 4031 Cortlandt. 100 Broadway, NEW YORK.

INSULATE ARMATURES WITH PAINT OR VARNISH ACCORDING TO CHEMICAL LAW INSTEAD OF BY HABIT. NOWHERE ARE EXPERIMENTS OR ARCHAIC METHODS SO WASTEFUL. **MASSACHUSETTS CHEMICAL CO. U.S.A.**

The Brady Mast Arms. T. H. Brady, New Britain, Conn., U. S. A. Manufacturer of Mast Arms, Pole and Banging Hoods, House Brackets and other Specialties for Construction Work. Catalogues and Prices furnished on application.

GENUINE ERICSSON SWEDISH COAL-GRAIN MICROPHONE. THE PERFECT TRANSMITTER AS PRACTICED BY ARNOLD, IN THE ORIGINAL. ALSO COMPLETE LINE LONG DISTANCE TELEPHONES. **ERICSSON TELEPHONE CO.** 20 WARREN ST. NEW YORK.

Queen & Co., 1012 Chestnut St., PHILADELPHIA.

Acme Testing Sets, Queen-Wirt Switchboard Instruments, X-Ray Focus Tubes, Induction Coils.

Foré Bain, Consulting Engineer, Electricity, Mechanics, Solicitor of Patents. Expert in patent causes. Suite 1657-59 Monodnock Bldg., Chicago.

ERICSSON SWEDISH BI-POLAR RECEIVER. A MODERN FOR ALL METAL RECEIVERS. NEEDS NO ADJUSTING. IS PERFECT IN EVERY PARTICULAR. IT IS THE BEST WHY NOT HAVE IT? **ERICSSON TELEPHONE CO.**

30% TO 50% SAVED!

Why not make this big saving in your lamp bills? Write us for full particulars, prices and circulars.

LYNN INCANDESCENT LAMP CO., LYNN, MASS.

The Direct Reading Ohmmeter

WILL ACCURATELY MEASURE RESISTANCE ON A RAPIDLY MOVING ELECTRIC CAR.

No other instrument can meet such difficulties of stray magnetism and vibration. A boy can use it. The brains are in the box.

The American Electric Specialty Co., 123 Liberty St., NEW YORK CITY.

SAVE YOUR EYES BY USING

The KINSMAN DESK LAMP

Which is the only fixture made that will properly light a roll-top desk and at the same time shield the eyes. Beware of the numerous cheap imitations in the market.

McLEOD, WARD & CO.,

Send for Descriptive Catalogue and Latest Quotations. 27 Thomas Street, NEW YORK.

WESTERN ELECTRICAL SUPPLY CO.,

REPAIR SHOPS

In the West. ELECTRICAL REPAIRS AND MACHINE WORK OF EVERY DESCRIPTION. In having your repair work done by a company operating hundreds of dynamos and motors you are sure of good work and get the benefit of our experience.

CHICAGO EDISON COMPANY,

76 MARKET STREET, CHICAGO.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use.

Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Fitters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs. 1 1/2 C. P. Price complete, \$ 4.00. For meter reading only.
" 2 " 3 " 4 " " " 6.00. For general use.
" 3 " 12 " 10 " " " 12.00. For sev. persons to work by.

ELMER E. McINTYRE,

PITTSBURG, PA., U. S. A.

A HEARTY WELCOME!

Paillard Non-Magnetic Watches are Dynamo Proof.

"SEEING IS BELIEVING."—These words mean much, but to see the new PAILLARD NON-MAGNETIC WATCHES will impress the truth more forcibly. The choicest selections of the most renowned makes reveal nothing finer. The watches which received the first prizes and medals at the Government Observatory in Geneva and the Marine Chronometers supplied the Admiralty of Great Britain and France contained PAILLARD NON-MAGNETIC HAIR SPRING AND COMPENSATION BALANCES.

PAILLARD NON-MAGNETIC watches are the finest timekeepers made. They possess all the merits of other makes, with the additional advantage of being absolutely non-magnetic.

Sold by all leading jewelers. Write for pamphlets.

A. G. BECKEN, Manufacturer, 103 State Street, Chicago, Ill.

WOOD'S MOTO-VEHICLES.

THE WOOD ELECTRIC MOTO-VEHICLES.

SEND FOR "SPECIALLY FINE" CATALOGUE.

AMONG OTHER THINGS WE GUARANTEE ARE:

That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball bearing axles.

That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.

That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.

That the batteries can be charged when fully discharged in two and one-half hours' time.

That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.

That for the sum of \$50.00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

AVERAGE COST TO RUN PER MILE, 3.4 CENT.

FISCHER EQUIPMENT CO.,

110-112 EAST TWENTIETH STREET, CHICAGO, ILL., U. S. A.

Flickering of lights usually occurs when the station is being crowded. It is self-evident that this flickering is caused by the slipping of belts, and as a belt full of Cling-Surface runs steadily and positively beyond all possibility of slipping, the importance of this fact can be readily seen.

CLING-SURFACE MFG. CO., 177-182 VIRGINIA ST., BUFFALO, N. Y.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

Winders direct from T.-H. and Westinghouse shops. Work guaranteed. Ten years' experience. Light plants installed complete. Send for prices.

HOOGE-WALSH ELECTRICAL ENGINEERING CO.
701 Delaware St., KANSAS CITY, MO.

Notice to Bidders.

Sealed proposals will be received at the office of the city clerk of the city of Vincennes, Indiana, until 7 o'clock p. m., Monday, 22d day of May, 1899, for lighting the streets, alleys, parks, public buildings and public places of the city of Vincennes for a period of ten years, with approximately 165 arc lamps and approximately 175 gas lamps.

The electric arc lamps shall be those known as nominal 2,000 candle power lamps, consuming approximately 450 watts of energy.

The gas lamps shall be those known as the Welsbach, or equal thereto, having a candle power of not less than seventy candles.

Said street lamps shall burn each and every night from one-half hour after sunset until one-half hour before sunrise. The electric light service shall begin April 25th, 1899, and the gas light service shall begin December 25th, 1899.

A 15 years' franchise, covering the use of the streets, alleys, parks and public places of said city for the lighting of pipes, appliances and appurtenances, poles, etc., for the supply of gas and for the supply of electricity for light, heat and power purposes to the citizens of the city and private consumers will be granted to the successful bidder, according to the plans and specifications on file in the clerk's office of said city, and adopted by the Common Council of said city, which will be furnished to all on request of any party.

The successful bidder will be required to provide and maintain the proper and reliable operation of said plants and the furnishing of said service.

The plan of estimate will be made only by an order made covering the proposition accepted. Each bid must be accompanied by a certified check payable to the city treasurer, for \$1,000, as a guarantee of good faith and that the bidder will if his proposal is accepted, enter into contract and furnish satisfactory bond in the sum of \$20,000 within fifteen days of the acceptance of his proposal for the faithful execution of said contract.

It is reserved to reject any and all bids or to make such combinations of bids as may be desired. No bids are to be opened, unless by order of and at a regular meeting of the Common Council of said city.

CHARLES LAUGEL,
City Clerk, City of Vincennes.

POSITION WANTED

As manager of telephone exchange, by one who has had fifteen years' practical experience with the Bell Telephone Co. I thoroughly understand the telephone business in all its branches. Have good reason for making a change. Address A. B. C., care **WESTERN ELECTRICIAN**, 510 Marquette Bldg., Chicago, Ill.

POSITION WANTED

As manager, superintendent or electrician of an independent telephone exchange. Will take charge of an exchange now non-paying and guarantee results. Five years' experience, partly with the Bell Telephone Co. Address "B." care **WESTERN ELECTRICIAN**, 510 Marquette Building, Chicago.

POSITION WANTED.

As superintendent, manager or electrician of an independent telephone company. Twelve years' (eight years with Bell Companies) practical experience in all branches of telephone work. Am posted in construction, testing switchboard, instrument and office work. Have built several exchanges. At present am engaged; good reasons for making a change. A No. 1 references as to ability, character, habits, etc. Address "BUSINESS," care **WESTERN ELECTRICIAN**, 510 Marquette Building, Chicago.

WESTERN ELECTRICIAN

Contains more news for the busy reader than can be found in any

other journal devoted to electricity.

Although large claims of superiority have been made by our contemporaries, it has been above the other papers in the matter

FOUND

that the Western Electrician is far of news, as is evidenced by the follow-

ing testimonial: "Although I have taken every electrical journal, there is none I like so well as the Western Electrician." This is the reason the Western Electrician has so large a circulation, even if it was not found at the

NORTH POLE.

THE TELEPHONE HANDBOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HANDBOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

- CHAPTER 1.** The Invention of the Telephone.
 2. Sound Waves. Articulate Speech.
 3. Electric Telephony. The Bell Telephone.
 4. The Microphone.
 5. Current Induction. Electromagnetic Induction.
 6. The Induction Coil: Its Use in the Telephone Transmitter.
 7. The Complete Telephone Circuit.
 8. Magnet Telephones.
 9. The Bell Telephone Receiver.
 10. Other forms of Magnet Telephones.
 11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
 12. The Siemens Kotyra Nourmayr and
 Withner Receivers

- CHAPTER 13.** Carbon Transmitters.
 14. The Blake Transmitter.
 15. The Long Distance Transmitter.
 16. The Solid-back Transmitter.
 17. The Berliner Transmitter.
 18. The Cuttriss Transmitter.
 19. Various European Transmitters.
 20. The Efficiency of Carbon Transmitters.
 21. Batteries for Telephone Work.
 22. Open Circuit Batteries.
 23. Closed Circuit Batteries.
 24. The Practical Management of Batteries.
 25. Magneto Bell.
 26. Automatic Switches.
 27. Telephone Line Construction.

- CHAPTER 28.** Metallic Circuit.
 29. Underground Wires
 30. Lightning Arresters.
 31. Inside Wiring.
 32. Installation of Telephone Instruments.
 33. Inspection and Maintenance.
 34. The Condenser: Its Use in Telephony.
 35. Electromagnetic Retardation.
 36. Exchange Working.
 37. Small Exchanges.
 38. Party Lines: The Bridging Bell.
 39. Long Distance Telephony.
 40. Duplex Telephony.
 41. Simultaneous Telegraphy and Telephony
 Appendix

Published and for sale by **ELECTRICIAN PUBLISHING CO., 510 Marquette Building, Chicago.**

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price \$1.00.
 This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.
PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.
THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennedy, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.50.
 This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.
THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 229 pp. 22 illustrations. Price \$1.50.
 In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.
TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McMaoman, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 69 pp. Price 25 cents.
 This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.
TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.
A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 608 pages. 223 illustrations. Price \$4.50.
HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.
TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 291 pp., 138 illustrations. Price \$2.00.
TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 illustrations. Price \$4.50.
TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.
MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 60 pages. 23 illustrations. Price \$1.00.
BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages. 516 illustrations. Price \$4.00.
PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 2 plates and 43 engravings. Price \$3.00.
ELECTRIC TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY. treating on the telegraph, telephone, etc. By E. J. Houston. 230 pages. 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

THE PELTON WATER WHEEL CO.

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

NINE THOUSAND WHEELS NOW RUNNING Aggregating some 700,000 h. p.

ELECTRIC POWER TRANSMISSION

Pelton Wheels afford the most reliable and efficient power for such service, and are running the majority of stations of this character in the United States, as well as most foreign countries.

Highest efficiency and absolute regulation guaranteed under the most extreme variations of load. Catalogues furnished on application.

Address, **PELTON WATER WHEEL COMPANY,**

143 Liberty St., New York City, U. S. A. or 121 Main St., San Francisco, Cal., U. S. A.

WATER WHEELS

For all Heads from 3 Ft. to 2000 Ft.

Especially adapted to all kinds of

ELECTRIC POWER AND LIGHTING PLANTS.

Recent tests at Holyoke enable us to guarantee:

The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency ever realized when running from half to full gate. We guarantee also: A runner of the greatest possible strength. A gate unequalled in quickness and ease of opening and closing. Tests show over 81 per cent. average efficiency with half to full water.

State your Head and send for 124 page pamphlet.

NEW BOOKS.

AUTHORITIES ON SUBJECTS MENTIONED.

The Pocket Electrical Dictionary. Containing all of the words and definitions indispensable to the electrician, student and professor. Over 11,000 words and about 15,000 definitions. By *Edwin J. Houston, A. M., Ph. D. (Princeton)*. 1 volume, 32mo, cloth, \$2.50; leather, \$3.00.

Electricity Made Easy. Profusely illustrated. A hand-book for busy people. By *Edwin J. Houston, A. M., Ph. D., and Arthur E. Kennelly, Sc. D.* 1 volume, 12mo, cloth, \$1.50.

Dynamo-Electric Machinery. By *Silvanus P. Thompson, D. Sc., B. A., F. R. S.* Sixth edition, revised and enlarged. Profusely illustrated with new engravings. 19 folding plates. 2 volumes, 8vo, cloth, gilt, \$6.00. The rapid advance of electrical science made it absolutely necessary to revise the last edition, and this is now a new work. It is indispensable to the electrical expert, professor and student of electrotechnics. Students and professors highly appreciate the publication of this extensive work in two volumes.

Polyphase Electric Currents and Alternate Current Motors. By *Silvanus P. Thompson, D. Sc., B. A., F. R. S.* 1 volume, 8vo, cloth, gilt, \$3.50.

The most important work on the subject. A companion book to "Dynamo-Electric Machinery." One of the text-books in schools of technology and colleges. Beautifully illustrated with fine engravings. Folding plates. Invaluable to the expert electrician.

Algebra Made Easy. By *Edwin J. Houston, Ph. D., and A. E. Kennelly, Sc. D.* This little work is of special value to readers of Prof. Thompson's Dynamo-Electric Machinery and Polyphase Electric Currents, as the work has been written to explain in a clear and simple manner the equations contained in those works. 1 volume, 16mo, cloth, 75 cents.

The Interpretation of Mathematical Formulae. By *Edwin J. Houston, Ph. D., and A. E. Kennelly, Sc. D.* 1 volume, 12mo, cloth, \$1.25. A most valuable aid to students and electrical workers.

A B C of Electricity. Now approaching its 65th thousand. By *William H. Meadowcroft.* 1 volume, 12mo, cloth, 50 cents. Fully illustrated. This excellent primary book has taken the first place in elementary scientific works. It has received the endorsement of Thomas A. Edison. It is for every person desiring a knowledge of electricity, and is written in simple style so that a child can understand the work. It is what its title indicates, the first flight of steps in electricity.

Scholars' A B C of Electricity. By *William H. Meadowcroft.* 1 volume, 12mo, illustrated, cloth, 50 cents. The author of this work has designed it for the use of teachers and scholars. A large number of simple experiments have been added, with notes relative to the work. It is the primary book for school use.

The X Ray; or Photography of the Invisible and Its Value in Surgery. By *William J. Morton, M. D.* Written in collaboration with *Edwin W. Hanner,* 1 volume, 12mo, cloth and silver, 75 cents; paper, 50 cents. The work explains in clear and simple style how these extraordinary pictures are taken through solids. Full description is given of the apparatus used, and the text is profusely illustrated with half-tone illustrations giving facsimile copies of the pictures taken from the negatives of the author. The subjects are varied.

The A B C of the X Ray. By *William H. Meadowcroft.* 1 volume, 12mo, cloth and gold, 75 cents. The first primary work on the subject. A book for the people. The author of "A B C of Electricity" showed clearly in that work his ability to explain a technical subject for the layman who knows nothing of scientific terms. He has written this work about the X Ray in his usual clear and simple style, and a wide circulation of this useful book is assured. The text of the author is beautifully embellished with fine engravings, and nothing is omitted that will give the public a clear knowledge of this remarkable discovery of Prof. Röntgen. The public would do well to secure both these important works.

Sent Prepaid on Receipt of Price.

ELECTRICIAN PUBLISHING CO., 510 Marquette Bldg., CHICAGO.

THE BEST ANSWER TO A QUESTION

On Wiring, can be found in the New Book,

"WIRING TABLES,"

"How They are Made and How to Use Them."

BY THOS. C. CRIER.

Whenever you are asked a question on Wiring, refer the questioner to this book, and he will find what he desires.

THE BOOK CONTAINS: The Law of Resistance, Electromotive Force and Current Fully Explained, How to Calculate the Size of Wires, The Different Methods of Wiring, with Diagrams, How to Apply the Simple Formula, in Calculating the Size of Wires Under all Conditions, Diagrams for Wiring 5 Point, 4 Point, Head Light and Heat Regulating Switches.

27 TABLES ON WIRING AND VALUABLE DATA. Ohm's law is described in such plain and simple language that one cannot fail to clearly understand it.

Bound in Cloth, 80 Pages, Size 5x7½ in. Sent, prepaid, on receipt of price, \$1.00.

THE General Electric Company's FAN MOTORS

are made in styles suitable for portable use, for brackets, or for ceilings.

Fans are kept in stock to suit either direct or alternating current for any voltage or periodicity, and with either solid or trunnion bases.

Each fan motor is made to run at either a high or low rate of speed, and is equipped with highly polished, four-bladed brass fans and heavy brass guards.

The new single-speed noiseless, highly finished fan is specially adapted for sleeping rooms in hotels and private residences.

These fans are constructed to give the highest efficiency with the smallest consumption of current.

THE SHELBY ELECTRIC CO.
 SHELBY, OHIO.

WESTON Electrical Instrument Co.,
 114-120 William St., NEWARK, N. J., U. S. A.
Illuminated Dial Station Instruments.
Weston Standard
 Portable Direct Reading Voltmeters and Millivoltmeters, Ammeters and Milliammeters, Wattmeters and Voltmeters, for Alternating and Direct Current Circuits.
 Our portable instruments are recognized as standard throughout the civilized world.
 Our Semi-Portable Laboratory Standard Voltmeters and Ammeters are still better.
 They are the most reliable, absolute standards for Laboratory use.
Weston Standard Illuminated Dial Potential Indicator, Style B. "Flush Type."
 Mention the WESTERN ELECTRICIAN when writing for catalogues.

ESTABLISHED 1873
COMBINATION OF Stow Flexible Shaft AND IRON CLAD ELECTRIC MOTOR.
 Practically dust and water proof. For Portable Drilling, Tapping, Reaming, Emery Grinding, etc. Write for Catalogue and Prices.
STOW MFG. CO., Binghamton, N. Y.
 Gen'l European Agents, Selig, Sonnenthal & Co., 85 Queen Victoria Street, London, England.
The Direct Reading Ohmmeter
 WILL ACCURATELY MEASURE RESISTANCE ON A RAPIDLY MOVING ELECTRIC CAR.
 No other instrument can do such delicate work so rapidly.
 A boy can use it. The truth is in the box.
The American Electric Specialty Co.,
 123 Liberty St., NEW YORK CITY.

May 20th May 27th

These are the dates of the WESTERN ELECTRICIAN'S two special Convention-Exhibition numbers; the first will be distributed everywhere at the Convention and Electrical Exhibition, and the second will contain a full account of the Convention.

If you have something worth saying about your business, this is the time to tell it to all the electrical people through a large display advertisement in these editions.

Please send us your order for space as soon as possible.

Vitogen

Cures Electrical Burns Quickly.

NO ELECTRICIAN

can possibly afford to be without a bottle of **Vitogen** for a single day. You don't know when the burn is coming, but you do know **Vitogen** will prevent serious complications from developing and will also effect a rapid cure. Write for free book, "Vitogen in Practice" (52 pages).

Sold by druggists or mailed on receipt of price—2 oz., 50c.; 4 oz., \$1.00. Canadian price—2 oz., 60c.; 4 oz., \$1.20.

Manufacturing Chemists, **THE G. F. HARVEY CO.,** Saratoga Springs, N. Y., U. S. A.
Canadian Branch, Mille Roches, Ont., KEZAR & BENNETT, Agents.

HERE IT IS! A PERFECT CLUTCH

THE **KNUTSON CARBON ROD GRAVITY CLUTCH FOR T-H ARC LAMPS**

POINTS OF SUPERIORITY: CHEAPEST AND BEST.

Has only one pivotal hinge Has no lost motion. Has a sure grip and is more sensitive to feeding than all others. Will not pit a rod. Will take up the full arc instantly after feeding. Prolongs the life of the lamp. Prevents rod from binding.

Can be taken out and put in place without tearing the lamp to pieces. Coils cannot burn where this clutch is used. Saves users hundreds of dollars in lamp repairs; overcomes troubles of the trimmer. Send for FREE SAMPLE and prices.

GET FULL PARTICULARS **A.W. KNUTSON & CO.** GALESBURG, ILL.

ESTABLISHED 1878.

J. H. BUNNELL & CO.,

76 CORTLANDT STREET, CORNER WASHINGTON STREET, NEW YORK.

We Are Here to Fill Orders for Everything Electrical at Right Prices.

Prompt attention given to all inquiries and orders. We shall continue to deserve the honored distinction of being the makers of the **BEST TELEGRAPH INSTRUMENTS ON EARTH.** They are the acknowledged Standard of the World. We have just issued a new Telephone Catalogue and Manual of Telegraphy. Send for a copy, and mention this paper.

15366

is the number of the car bringing the first car-lot consignment of our

Central Fan Motors.

We receive them in **carloads**, so you can rely as heretofore on our making prompt shipments. Each Fan Motor is packed in a separate box with Fan and Guard attached, which makes the outfit ready for connection with your circuit.

We've sold Fan Motors before—perhaps you know we have. We've sold as many as all other dealers combined—perhaps you know that also. We never sold or offered a better Fan Motor than the

Central 1899.

We know what it costs to make a good Fan Motor; we know what we and others have sold them for. We can sell the Central's 1899 at prices that will prove attractive.

We have them in Desk, Bracket, Duplex and Ceiling Types. Send for Catalogue.

CENTRAL ELECTRIC COMPANY,

264-266-268-270 FIFTH AVENUE,

...CHICAGO...

Flickering of lights usually occurs when the station is being crowded. It is self-evident that this flickering is caused by the slipping of belts, and as a belt full of Cling-Surface runs steadily and positively beyond all possibility of slipping, the importance of this fact can be readily seen.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

have distinctive merits.

This is because they are Enclosed Arc Lamps.

The Morris Enclosed Arc Lamps

have characteristic as well as distinctive ones.

You can learn of each by addressing

THE MORRIS ARC LAMP CO.,

CHESTER, PA.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use. Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Fitters, City Power and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur and investigating pipe connections where it is in possible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

REPAIRING.

THE DOUBLE DIAPHRAGM

of the Wilhelm Transmitter secures a double compression of the carbon granules in the pocket between them, greatly increasing the volume, distinctness and carrying value of the voice.

Will not "pack" under any circumstance, and cannot be injured by rough handling or pencil jabbing.

Recognized by experts as containing features that place it far ahead of all others

WILHELM TELEPHONE MFG. CO.,

Caxton Building, Buffalo, N. Y.

IN THIS RUSHING AGE MERIT SHOULD BE CAREFULLY CONSIDERED.

A NEW THING. Write for Particulars of Our CENTRAL ENERGY TELEPHONE SYSTEM.

The Victor Metallic Switchboard

Is the Only Switchboard in the World Built with No Connection on Wood.

All connections are mounted on hard rubber and soldered, leaving no chance for loose connections or cross talk.

The Victor Metallic Switchboard

Clearly demonstrates the impracticability of combined and self-contained jacks and drops. The simplicity of construction and fewness of parts of this board afford ample space for heavy insulation and metallic parts, which give assurance of durability and high efficiency, with lowest cost of maintenance.

It is built in five jack and drop sections, with entirely concealed wiring—Tripolar single coil—Low-contact gravity drops, insuring sensitive positive action. Individual ringing keys.

YOU SHOULD SEE IT. The ease and rapidity with which our board is operated finds favor with all who inspect it.

Using the Victor Transfer System—the simplest and quickest method known for trunking between operators—a board of any capacity is built.

Write for our '99 catalogue, if you have not received it.

5-Drop Section, Front View.

THE PELTON WATER WHEEL CO.

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.
 An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

NINE THOUSAND WHEELS NOW RUNNING Aggregating some 700,000 h. p.

ELECTRIC POWER TRANSMISSION
 Pelton Wheels afford the most reliable and efficient power for such service, and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load. Catalogues furnished on application.

Address, **PELTON WATER WHEEL COMPANY,**
 142 Liberty St., New York City, U. S. A. or 121 Main St., San Francisco, Cal., U. S. A.

WATER WHEELS

For all Heads from 3 Ft. to 2000 Ft.

Especially adapted to all kinds of

ELECTRIC POWER AND LIGHTING PLANTS.

Recent tests at Holyoke enable us to guarantee:

The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency ever realized when running from half to full gate. We guarantee also: A runner of the greatest possible strength. A gate unequalled in quickness and ease of opening and closing. Tests show over 81 per cent. average efficiency with half to full water.

State your Head and send for 124 page pamphlet.

Incandescent Lamps.

NO BETTER guarantee of the merits of the SAWYER-MAN LAMP could be offered than the fact that it was a pioneer in its field and has successfully withstood the competition of innumerable cheap and inferior-grade lamps that

have been offered. The well-known high-grade qualities are features of the SAWYER-MAN LAMPS.

And all Principal Supply Houses.

SAWYER-MAN ELECTRIC CO., Allegheny, Pa.

THE
General Electric Company's
FAN MOTORS

are made in styles suitable for portable use, for brackets, or for ceilings.

Fans are kept in stock to suit either direct or alternating current for any voltage or periodicity, and with either solid or trunnion bases.

Each fan motor is made to run at either a high or low rate of speed, and is equipped with highly polished, four-bladed brass fans and heavy brass guards.

The new single-speed noiseless, highly finished fan is specially adapted for sleeping rooms in hotels and private residences.

These fans are constructed to give the highest efficiency with the smallest consumption of current.

SPokane: First and Howard Sts.
SAN FRANCISCO: 409 Market St.

YOKOHAMA, JAPAN: Bagnall & Hiles
LONDON, ENG.: C. E. Heap.
TORONTO, CAN.: W. A. Johnson.

Flickering of lights usually occurs when the station is being crowded. It is self-evident that this flickering is caused by the slipping of belts, and as a belt full of Cling-Surface runs steadily and positively beyond all possibility of slipping, the importance of this fact can be readily seen.

CLING-SURFACE MFG. CO., 177-182 VIRGINIA ST., BUFFALO, N. Y.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use. Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Boiler Shops, Oil and Gas Works and Gas Fitters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploding cellars and trenches where leaks occur and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs. 1 1/2 C. P. Price complete, \$ 1.00. For meter reading only.
" 2 " 3 " 1 " " " 6.00. For general use.
" 3 " 12 " 10 " " " 12.00. For sev. persons to work by.

THE "CLARK" WIRE.

FOR SWITCHBOARD, RAILWAY and MOTOR USE.

All sizes of Stranded and Flexible Wire and Cables with Clark's Insulation

Inspector Boston Fire Underwriters' Union says:
"A thoroughly reliable and desirable wire in every respect."

The Clark wire has been before the public and in use for the past ten years, and has met with universal favor. We guarantee our insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class insulated wire. We shall be pleased to mail Catalogues, with terms and discounts for quantities.

THE TELEPHONE HAND-BOOK
 BY HERBERT LAWS WEBB.
Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."
146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.
 EXTRACT FROM PREFACE.
 "This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a need for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."
 No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

<p>CHAPTER 1. The Invention of the Telephone. 2. Sound Waves. Articulate Speech. 3. Electric Telephony. The Bell Telephone. 4. The Microphone. 5. Current Induction. Electromagnetic Induction. 6. THE
General Electric Company's
FAN MOTORS

are made in styles suitable for portable use, for brackets, or for ceilings.

Fans are kept in stock to suit either direct or alternating current for any voltage or periodicity, and with either solid or trunnion bases.

Each fan motor is made to run at either a high or low rate of speed, and is equipped with highly polished, four-bladed brass fans and heavy brass guards.

The new single-speed noiseless, highly finished fan is specially adapted for sleeping rooms in hotels and private residences.

These fans are constructed to give the highest efficiency with the smallest consumption of current.

DO YOU WANT A LIFE INCOME OF \$125 PER MONTH?

The Safest and Most Profitable Investment in the World.

PAYMENTS.

Table with 2 columns: Year, Amount. Rows: FIRST YEAR \$12.50 MONTH \$150 00, SECOND YEAR DEDUCTING DIVIDEND 135 00, THIRD 93 00, FOURTH 20 40, FIFTH 36 30, TOTAL CASH INVESTED \$434 70.

This statement shows the actual cost each year of carrying five acres to maturity in the Mexican Plantation Association, and means that, at the end of the third year, the investor has practically paid for his land, and at the end of the contract the money invested has been returned, together with a profit of \$1,000.00.

Our Plan—No Chance to Freeze Out.

The association has 6,000 acres and is planting rubber, chocolate, coffee, tobacco, etc. Its officers, who have had ten years' successful experience in developing large plantations, contract for \$350 an acre to cultivate the land for seven years and bring it to full maturity.

Benefits of Co-operation.

This is not a stock company, but a co-operative association and a share represents an acre, but an acre in the form of an undivided interest, the plan being to conduct the entire plantation jointly forever.

Chicago Title and Trust Co., Trustee.

The land has been deeded this strong financial institution for practically 93 years, and the money paid by the investors is deposited with the Trust Company, which transfers it to the management only upon evidence that the development contract is being faithfully carried out.

A Guarantee Bond of \$100,000

Has now been approved by and deposited with the Chicago Title and Trust Company, and is for the purpose of indemnifying the members. If the association falls in any of its agreements, and positively assures the scientific development of the land—obviously the pivotal point.

First Dividend, 10 per cent., May, 1899.

This will come from a crop of tobacco now nearly matured and very promising. Thereafter steady increasing dividends will be paid in cash by the Trust Company in May each year, and reduce the investor's net cash outlay as shown in the table above.

Excursions to the Plantation

Will be conducted by the association every few months, and inspectors elected annually by the members to visit the land and make an exhaustive report. The first one will be elected within six weeks. The work of clearing the land and erecting buildings is now going on under the supervision of expert tropical horticulturists.

DIVIDENDS.—Over and Above Payments.

Table with 2 columns: Year, Amount. Rows: SIXTH YEAR \$ 450 00, SEVENTH YEAR 1,075 00, PROFIT 1,525 00, 434 70, NET SURPLUS \$1,090 30, Eighth to Fiftieth Year, Annual Income \$1,000 to \$1,500.

Some Objections Answered.

We do not go to the capitalist with this proposition, for the excellent reason that the capitalist can do alone what we are doing co-operatively, and some of them are doing it and getting big returns. The originators of this association expect to make a profit of \$100 an acre out of the \$350. The capitalist, by doing the work himself, can save our profit. Do you think that we promise too much? If so, go to the public library and read up on tropical horticulture; go to the document department and get the consular reports.

Some of Our Members,

H. C. Fuller, auditor of the Crane Co. Mr. Titus, local treasurer, Ill. Cent. Ry. W. S. Pinney, chief travelling auditor, Ill. Cent. Ry. G. W. Halfer, purchasing agent, Ill. Cent. Ry. Arthur Woodcock, lawyer, and formerly manager of the Trust Development, American Trust & Savings Bank. A. B. Stone, manager fuel oil dept., Standard Oil Co. J. W. Howell, attorney, 1015 153 La Salle St. Rev. M. J. Hayes, pastor, Belden Ave. Baptist Church. Dr. J. H. Prothero, N. W. Dental College, J. Charles Smith, cashier, City Treasurer's office. B. Bailey, assistant superintendent, Calumet Terminal Ry. John A. Wleferth, Corn Exchange National Bank. Harry Manning, Deputy U. S. Appraiser, 259 La Salle Avenue. Rev. E. J. Haines, assistant pastor Plymouth Congregational Church. Lawrence Henselroth, druggist, 170 E. Chicago Ave.

Over 1,600 Members—70 per cent. of Shares Sold.

Included in this number are 25 Chicago school principals and about 100 teachers, not to mention many well-known business and professional men, who have thoroughly investigated our proposition.

Your Last Opportunity—All Will be Sold by May 30.

The shares are selling rapidly, and it now seems certain that all will be taken and the books closed by May 30. If you can possibly spare \$12.50 per month, take five acres, which will give you an independent life income. If you can't carry five, take less. Fill out the blank application below and mail it at once. It is the opinion of everybody connected with the association that within a year the shares will bring a premium, which will increase annually for ten years. This insures the ready sale of your shares at a profit, if unable to keep up your payments.

If you want to investigate further, our literature will be sent upon application, or I or one of my assistants will call at your home, if you will make an appointment. Call at the office Saturday and talk it over.

APPLICATION FOR CONTRACT.

Form with fields for Mexican Plantation Association, Gentlemen, I hereby make application for... Shares in the MEXICAN PLANTATION ASSOCIATION. Said shares to be paid for in 84 monthly installments, as provided in the Association's Development Contract. E. E. CALKINS, Agent. ADDRESS

Mail this to E. E. CALKINS, 1603, 100 Washington Street, Chicago, Ill.

Address the special agent, E. E. CALKINS, 1603, 100 Washington Street, Chicago, Ill.

HELLO!

WHAT'S THE MATTER WITH CHICAGO?

SHE WILL HOLD A

NATIONAL EXPOSITION OF ELECTRICAL ARTS

FROM

September 25 to October 9, 1899.

1,000,000 PEOPLE WILL VISIT CHICAGO DURING THOSE DATES TO WITNESS THE BIG FALL FESTIVITIES.

Space now in active demand. Send in your application for particulars at once.

200,000 people will be there to see exhibits and displays.

Here's a chance to show the public the latest novelties in all branches of the electrical and allied industries.

TO BE HELD IN THE TATTERSALL'S BUILDING.

(DIMENSIONS 148 X 265 FEET.)

NATIONAL EXPOSITION OF ELECTRICAL ARTS CO.

INCORPORATED UNDER THE LAWS OF ILLINOIS. CAPITAL, \$50,000.

W. E. BURNHAM, Mgr., 412 New York Life Building, Chicago, Ill.

CURVES FROM THE STATION OF THE BARRE-MONTPELIER TRACTION CO., MONTPELIER, VT.,

EQUIPPED WITH

Chloride Accumulators.

Maximum load on the line.....300 Amperes.
 " " " generator...125 "
 The Battery supplies the excess...175 "
 Variation of load on the line.....290 "

Vitogen

Cures Electrical Burns Quickly.

No ELECTRICIAN can possibly afford to be without a bottle of **Vitogen** for a single day. You don't know when the burn is coming, but you do know **Vitogen** will prevent serious complications from developing and will also effect a rapid cure. Write for free book, "Vitogen in Practice" (52 pages).

Sold by druggists or mailed on receipt of price—2 oz., 50c.; 4 oz., \$1.00. Canadian price—2 oz., 60c.; 4 oz., \$1.20.

Manufacturing Chemists, **THE G. F. HARVEY CO.**, Saratoga Springs, N. Y., U. S. A.
 Canadian Branch, Mille Roches, Ont., KEZAR & BENNETT, Agents.

How about your T.-H. lamps?

Don't Study Over this Matter Any Longer.

You will be perfectly safe to speculate on this deal; it is a **sure winner**. Besides being the cheapest clutch on the market it is the simplest and best. Overcomes troubles of the trimmer. Will save you hundreds of dollars in lamp repairs. A trial order will settle this matter. You will be pleased, as others are. We don't ask you to send for 100 or 1,000 just to get your money; get a few to start with, we know we will get to sell you more.

A. W. Knutson & Co.,
 Galesburg, Ill.

BUY THE VESTA PORTABLE STORAGE BATTERY.

Light Your Bicycle or Carriage with Electricity.

Bicycle, 12 hours' light costs 5c.
 Buggy, 36 hours' light costs 15c.

TO ELECTRICAL MEN EVERYWHERE.

We call your attention to the fact that the Vesta Portable Storage Battery is **Portable** and will stand the jar and usage necessary to light a Bicycle or Carriage. Ask and we will give you full information.

Vesta Accumulator Co.,

D. P. PERRY, Prest. 53 Dearborn Street, CHICAGO.

KNAPP FAN MOTOR OUTFITS WITH GORDON PRIMARY CELLS

The hot spell of summer is approaching and to those who wish to seek comfort at home or in the office, professional or mercantile, we desire to call attention to these celebrated outfits.

We guarantee the highest speed at the lowest cost for primary cells.

These fan motor outfits are manufactured in two sizes, as follows:

Type C, 8-inch Fan, with 3 No. 1A Gordon Cells.

Type E, 10-inch Fan, with 4 No. 1A Gordon Cells.

These outfits will give a life of over 150 hours without recharging, at a speed of at least 750 revolutions per minute.

For full particulars, price list, etc., address

May 20th May 27th

These are the dates of the WESTERN ELECTRICIAN'S two special Convention-Exhibition numbers; the first will be distributed everywhere at the Convention and Electrical Exhibition, and the second will contain a full account of the Convention.

If you have something worth saying about your business, this is the time to tell it to all the electrical people through a large display advertisement in these editions.

Please send us your order for space as soon as possible.

Copy and order for issue May 20th should be sent in immediately.

WESTERN ELECTRICIAN,

510 MARQUETTE BLDG., CHICAGO.

Flickering of lights usually occurs when the station is being crowded. It is self-evident that this flickering is caused by the slipping of belts, and as a belt full of Cling-Surface runs steadily and positively beyond all possibility of slipping, the importance of this fact can be readily seen.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

NOTICE.

It has been brought to our attention that certain parties are making and selling imitations of the celebrated GONDA BATTERY ZINC. The reputation of this zinc is so great that a desire to imitate it—as far as possible—is natural. We desire therefore to state that it is protected by patents, and we warn all persons against making, selling, buying or using such zincs, unless manufactured by this company. Persons so doing render themselves liable to suit for infringement and damages and will be prosecuted to the full extent of the law.

ABSOLUTE SAFETY

IS ASSURED ALL USERS OF

McINTYRE'S

Portable Electric Safety Lamp.

This is an Electric Lamp set in a White Enamelled Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket, so the user has free use of hands. The current can be turned off when not in use. Dry Batteries are used and can be recharged from direct incandescent electric current. Charger and full directions go with each lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Roller Shops, Oil and Gas Works and Gas Fitters, City Sewer and Underground Cable Inspectors; Powder Mills and Warehouses where explosive materials are manufactured and stored; exploring cellars and trenches where leaks occur and investigating pipe connections where it is impossible to carry an oil lamp or candle for fear of explosion—and all parties requiring a safe, portable light. The whole outfit is neat and compact.

No. 1 Weighs 2 lbs. 1 C. P. Price complete, \$ 4.00. For meter reading only.
" 2 " 3 " 4 " " " 6.00. For general use.
" 3 " 12 " 10 " " " 12.00. For sev. persons to work by.

CHICAGO, ILL.

IN THIS RUSHING AGE MERIT SHOULD BE CAREFULLY CONSIDERED.

A NEW THING. Write for Particulars of Our CENTRAL ENERGY TELEPHONE SYSTEM.

The Victor Metallic Switchboard

Is the Only Switchboard in the World Built with No Connection on Wood.

All connections are mounted on hard rubber and soldered, leaving no chance for loose connections or cross talk.

The Victor Metallic Switchboard

5-Drop Section, Front View.

Clearly demonstrates the impracticability of combined and self-contained jacks and drops. The simplicity of construction and fewness of parts of this board afford ample space for heavy insulation and metallic parts, which give assurance of durability and high efficiency, with lowest cost of maintenance.

It is built in five jack and drop sections, with entirely concealed wiring—Tripolar single coil—Low-contact gravity drops, insuring sensitive positive action. Individual ringing keys.

YOU SHOULD SEE IT. The ease and rapidity with which our board is operated finds favor with all who inspect it.

Using the Victor Transfer System—the simplest and quickest method known for trunking between operators—a board of any capacity is built.

Write for our '99 catalogue, if you have not received it.

THE TELEPHONE HANDBOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

EXTRACT FROM PREFACE.

This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HANDBOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country.

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it anything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

<p>CHAPTER 1. The Invention of the Telephone.</p> <p>2. Sound Waves, Articulate Speech.</p> <p>3. Electric Telephony. The Bell Telephone.</p> <p>4. The Microphone.</p> <p>5. Current Induction. Electromagnetic Induction.</p> <p>6. The Induction Coil; its Use in the Telephone Transmitter.</p> <p>7. The Complete Telephone Circuit.</p> <p>8. Magnet Telephones.</p> <p>9. The Bell Telephone Receiver.</p> <p>10. Other forms of Magnet Telephones.</p> <p>11. The Gower, Ader and D'Arsonval Receivers.</p> <p>12. Mercader's Bi-Telephone.</p> <p>13. The Siemens Kotyra Newmayer and Ritchie Receivers.</p>	<p>CHAPTER 13. Carbon Transmitters.</p> <p>14. The Blake Transmitter.</p> <p>15. The Long Distance Transmitter.</p> <p>16. The Solid-back Transmitter.</p> <p>17. The Berliner Transmitter.</p> <p>18. The Cuttriss Transmitter.</p> <p>19. Various European Transmitters.</p> <p>20. The Efficiency of Carbon Transmitters.</p> <p>21. Batteries for Telephone Work.</p> <p>22. Open Circuit Batteries.</p> <p>23. Closed Circuit Batteries.</p> <p>24. The Practical Management of Batteries.</p> <p>25. Magneto Bell.</p> <p>26. Automatic Switches.</p> <p>27. Telephone Line Construction.</p>	<p>CHAPTER 28. Metallic Circuit.</p> <p>29. KNAPP FAN MOTOR OUTFITS WITH GORDON PRIMARY CELLS

The hot spell of summer is approaching and to those who wish to seek comfort at home or in the office, professional or mercantile, we desire to call attention to these celebrated outfits

We guarantee the highest speed at the lowest cost for primary cells.

These fan motor outfits are manufactured in two sizes, as follows:

Type C, 8-inch Fan, with 3 No. 1A Gordon Cells.
Type E, 10-inch Fan, with 4 No. 1A Gordon Cells.

These outfits will give a life of over 150 hours without recharging, at a speed of at least 750 revolutions per minute.

For full particulars, price list, etc., address

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

Good Second-Hand Weatherproof Wire, all sizes from 4-0 to 10, excepting Nos. 3 and 8.

LOW PRICE.

10, 20, 40, 80 and 120 Amp. Recording Ampere Hour Meters. **GOOD AS NEW.**

All of the above material is the property of the Missouri-Edison Electric Co., of this city, who have discontinued use of same for the following reasons:

THEY HAVE CONSOLIDATED SEVERAL STATIONS INTO TWO LARGE ONES;
CHANGED THEIR CIRCUITS FROM OVERHEAD TO UNDERGROUND;
CHANGED FROM CONSTANT CURRENT TO ALTERNATING ARC;
ARE SUBSTITUTING SMALLER UNITS FOR LARGE ONES.

All of the material is consequently in splendid condition, having been the best to begin with.

Any little repairs necessary to machinery will be made and satisfactory guarantees furnished. Must be sold early as possible. Terms cash.

Some Comments

On New York Telephone Service.

A Physician said:

"I would as soon think of taking off the door-bell as of doing without the telephone service."

A Business Man said:

"For economy's sake I had done without the telephone service until lately. I had it put in less than a year ago. Now I would not give it up for Five Hundred Dollars a Year." (HE PAYS) \$75.

The Head of a Large Firm said:

"The telephone service is the cheapest thing we have in our office."

Whether used on a large scale or on a small scale, the telephone service, weighed by its performance, is the cheapest thing in modern life.

MESSAGE RATES make the cost of telephone service in New York very moderate.

STANDARD EQUIPMENT for all subscribers. The rate varies with the amount of use.

ADDRESS-NEW YORK

The "ELECTRA" Highest Grade Nuernberg Carbons are recognized as standard all the world over.

All genuine "ELECTRA" carbons are put up in packages bearing the label with the trade mark "ELECTRA."

Good carbons mean less cost for current.

All the excellence in dynamos and arc lamps counts for but little where poor carbons are used in lamps.

CONVINCING TESTIMONY

Scores of Such Letters as the Following Are Being Received by Us. They Surely Are Convincing.

Montreal,
February 20th, 1899.

The Wagner Electric Mfg. Co.
St. Louis, Mo.

Gentlemen,

Replying to your inquiry concerning the action of the 3 H.P. Single Phase Induction Motor supplied me sometime since for tests, I beg to say I made full and complete tests of the motor as to power factor, efficiency, temperature, regulation, and starting torque and current:

I am forwarding you results of the tests.

Without entering into details, I beg to say I consider the motor a thoroughly commercial and practical machine.

Very truly yours

Sic. P. S. C.

No Matches. No Smoke. No Soot.
No Profanity. Always Ready.

The lighting of gas by an electric spark has long passed the experimental state. The expense and trouble of wiring a house, putting in the system heretofore used, has been a source of reluctance on the part of most people in using this great convenience. To overcome this we have put on the market a system in which all of these difficulties have been obviated. No one now need hesitate in fitting up one or more fixtures, for in this system each fixture is entirely independent of all others. The source of electric supply is entirely contained on the fixture in the small drum as shown in the cut. This avoids wiring a room or house as in the old way.

REMEMBER this system can be attached to your fixtures now in use in a few minutes without any special preparation, and at a very moderate expense.

The advantages we claim for this system are as follows: 1st. **SIMPLICITY.** No outside wiring, easily attached to any fixture now in use. 2d. **ECONOMY.** It does not cost anything like the old system. 3d. It is an ornament to any fixture. 4th. Each fixture is independent; if one should get out of order it does not affect any other. Made in all colors of metal to match fixture.

See it and you will surely like it. For sale by

A HEARTY WELCOME!

Paillard Non-Magnetic Watches are Dynamo Proof.

"SEEING IS BELIEVING."—These words mean much, but to see the new **PAILLARD NON-MAGNETIC WATCHES** will impress the truth more forcibly. The choicest selections of the most renowned makes reveal nothing finer. The watches which received the first prizes and medals at the Government Observatory in Geneva and the Marine Chronometers supplied the Admiralty of Great Britain and France contained **PAILLARD NON-MAGNETIC HAIR SPRING AND COMPENSATION BALANCES.**

PAILLARD NON-MAGNETIC watches are the finest timekeepers made. They possess all the merits of other makes, with the additional advantage of being absolutely non-magnetic.

Sold by all leading jewelers. Write for pamphlets.

Draft Without a Chimney.

Mechanical Draft

What It Is and What It Does.

Good Draft

Is essential to success with any boiler plant.

Better Draft

Can be produced by a fan at less first cost and running expense than by a chimney.

Best Draft

Is, therefore, Mechanical Draft, by which these results can be secured.

It is draft mechanically produced by means of a fan, and may be introduced either as forced draft, by which the air under pressure is delivered to the ash pits, or as induced draft, arranged to draw the gases through the fan and to maintain a partial vacuum within the furnace. The method to be adopted must of necessity depend upon the existing conditions.

It does what an ordinary chimney is incapable of doing. Its cost is from 20 to 40 per cent. of that of a chimney; its intensity permits of the burning of finely divided or low-grade fuel; it makes possible the utilization of the heat of the flue gases which a chimney wastes in producing draft; it is independent of the weather; is automatically regulated to maintain constant steam pressure, prevents smoke, increases the capacity of an existing plant, and serves as an auxiliary to a chimney already overburdened; it saves space and is portable.

This is the size of the chimney and This is the size of the fan required for the same boiler capacity. COMPLET IS UNNECESSARY.

Detailed Information Regarding

MECHANICAL DRAFT

WANTED

ENGINEERING SALESMAN.

A large manufacturing company, with an established office in Chicago, proposes to increase their force. An opportunity is offered to an experienced man who is a capable salesman and a well-posted engineer. The position is a permanent one for the right man. The applicant must be a successful business man, about thirty-five years of age, technically educated as a mechanical and electrical engineer; a man who has made an undoubted success of his present position, and feels that he is capable of undertaking work of greater importance. A man who is competent to make a good record in the near future is sought.

Applicants in their first letter must state their experience, the salary they believe they can earn, and should give not less than four references to men of prominence, whose names will probably be known to the company.

Address "ENGINEERING," care Western Electrician, 510 Marquette Building, Chicago.

ROSE POLYTECHNIC INSTITUTE.

A College of Engineering. Mechanical, Electrical, Civil Engineering; Chemical Courses; Architecture. Extensive shops. Modernly equipped laboratories in all departments. Expenses low. 17th year. For catalog address **C. L. MEES**, President, Terre Haute, Ind.

WANTED.

A second-hand compound engine of about 350 to 400 h. p., Corliss preferred.

PEOPLE'S ELECTRIC LIGHT CO.,

Flint, Mich.

WANTED.

Six good city linemen at once.

A VALUABLE NEW WORK.

ELECTRICIANS' HANDY-BOOK

OF USEFUL INFORMATION.

Edited by A. E. WATSON, A. M., Teacher of Electricity, Brown University,
Providence, R. I.

Compiled by E. T. BUIER, 2d.
ILLUSTRATED.

A Compilation from the works of Sylvanus P. Thompson, Kapp, Allsop, Munroe and Jamieson,
Watson, Bottone, Bonney, Watt, Poole, Trevert, Haskins,
Norrow and Reid, and others.

This book gives a large number of receipts for making Battery Fluids, Battery Pastes, Insulating Materials and Varnishes, Electro-Plating Solutions, etc. Tells how to make Electric Batteries, Bells, Telephone, Motors, Dynamos, Induction Coils, Influence and Static Machines, etc. Gives formulae for winding Dynamos, Motors, Armatures, Field Magnets, Transformers. Contains many Rules, Tables, Data, etc. In fact it is almost a complete cyclopaedia of Electricity. It is neatly bound and of a convenient size to be carried in the pocket for handy reference.

CONTENTS.

PART

1. History.
2. Theory.
3. Measurements. (Electric and Magnetic.)
4. Electric Batteries.
5. Electro-Chemistry and Metallurgy.
6. The Telegraph and Telephone.
7. Dynamos and Motors.
8. Management of Dynamos and Motors.

Contains over four hundred and fifty pages and many illustrations.

PRICE, CLOTH, ONLY \$2.50; POSTPAID.

ELECTRICIAN PUBLISHING CO., 510 Marquette Bldg., CHICAGO.

PART

9. Electric Lighting.
10. Transformers.
11. Wiring for Electric Power.
12. Wiring for Bell Fitting and Gas Lighting.
13. Electric Railways.
14. Miscellaneous.
15. Useful Tables.
16. Logarithms.

THE BEST ANSWER TO A QUESTION

On Wiring, can be found in the New Book,

"WIRING TABLES,"

"How They are Made and How to Use Them."

BY THOS. G. CRIER.

Whenever you are asked a question on Wiring, refer the questioner to this book, and he will find what he desires.

THE BOOK CONTAINS: The Law of Resistance, Electromotive Force and Current Fully Explained. How to Calculate the Size of Wires. The Different Methods of Wiring, with Diagrams. How to Apply the Simple Formula, in Calculating the Size of Wires Under all Conditions. Diagrams for Wiring 3 Point, 4 Point, Head Light and Heat Regulating Switches.

27 TABLES ON WIRING AND VALUABLE DATA.

Ohm's law is described in such plain and simple language that one cannot fail to clearly understand it.

Bound in Cloth, 80 Pages, Size 5x7½ In. Sent, prepaid, on receipt of price, \$1.00.

ELECTRICIAN PUBLISHING CO., 510 Marquette Building, CHICAGO.

THE WOOD ELECTRIC MOTO-VEHICLES.

SEND FOR "SPECIALLY FINE" CATALOGUE.

AMONG OTHER THINGS WE GUARANTEE ARE:

That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball bearing axles.

That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.

That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.

That the batteries can be charged when fully discharged in two and one-half hours' time.

That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.

That for the sum of \$50.00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

AVERAGE COST TO RUN PER MILE, 3-4 CENT.

KNOWLEDGE IS POWER.

Everyone engaged in the electrical business should keep posted on the developments in the art by reading the latest books on the subject. We are headquarters in the West for electrical books and can fill orders for any work published, promptly on receipt of price. We call your special attention to the following standard books:

- Allsop, F. C.—Electrical Bell Construction; Treatise on the Construction of Electric Bells, Indicators, and similar apparatus. 177 illustrations. \$1.25
- Angell, J.—Elements of Magnetism and Electricity, with Practical Instructions for the Performance of Experiments, and the construction of cheap apparatus. One hundredth thousand. 160 illustrations. \$1.00
- Atkinson, Philip.—The Elements of Electric Lighting. Seventh edition, fully revised, and new matter added. 104 illustrations. 260 pages. \$1.50
- Atkinson, Philip.—The Elements of Dynamic Electricity and Magnetism. 406 pages and 117 illustrations. Second edition. \$2.00
- Ayrton, W. E.—Practical Electricity; a Laboratory and Lecture Course for First-year Students of Electrical Engineering, based on the Practical Definitions of the Electrical Units. With numerous illustrations. Sixth edition. \$2.50
- Badt, Lieut. F. B.—New Dynamo Tenders' Hand Book. This is, as the name indicates, a New Book, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Licenses, Stationary Engineers, and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 226 pages, 140 illustrations, flexible cloth binding, size of type page 6 1/2 x 3 inches. \$1.00
- Badt, Lieut. F. B.—Incandescent Wiring Hand-book. A timely book containing full illustrations for incandescent wiring and complete information concerning methods of running wires, location of safety devices, splices, insulation, testing for faults, wire gauges, general electrical data, calculating sizes of wires, wiring fixtures, elevator buildings, isolated and central station plants. The only book of the kind published. Type page 6 1/2 x 3 inches, flexible cloth binding, 66 pages, 35 cuts and 5 tables, 3 of which are 12x18 inches. \$1.00
- Badt, Lieut. F. B.—Bell Hangers' Hand-book. Just the book for people engaged in selling, installing or handling electric batteries, electric bells, elevators, house or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat apparatus. 106 pages, 97 illustrations, flexible cloth binding. Type page 6 1/2 x 3 inches. \$1.00
- Badt, Lieut. F. B.—Electric Transmission Hand-book. First edition, three thousand copies. 97 pages, 22 illustrations, 27 original tables. \$1.00
Gives more Practical information on the subject than any work published to date. The book contains all necessary information for Power Producers, Capitalists, Agents, Engineers and Motor Inspectors. With this book anybody may make estimates on the cost of Transmission Plants.
- Bedell, Fred'k and Albert C. Crehore.—Alternating Currents; An Analytical and Graphical Treatment for Students and Engineers. Second edition. 112 illustrations. \$2.50
- Blakesley, T. H.—Papers on Alternating Currents of Electricity for the use of Students and Engineers. Third edition, enlarged. 12mo. cloth. \$1.50
- Bonney, G. E.—Electro-Plater's Hand Book. A Manual for Amateurs and Young Students on Electro-Metallurgy. 60 illustrations. 208 pages. 12mo. cloth. \$1.25
- Bottonne, S. R.—Electrical Instrument Making for Amateurs. A Practical Hand-book with 48 illustrations. Fourth edition. Enlarged by a chapter on the Telephone. \$0.90

JUST WHAT YOU ARE LOOKING FOR!

A VALUABLE BOOK

Electric Lighting Plants, THEIR COST AND OPERATION.

By W. J. Buckley. With numerous illustrations, diagrams, plans, tables, etc. 275 pages. Cloth. Price, \$2.00, postage free. This work gives all necessary data for the erection of an electric light plant of any size. The cost of Arc Lighting. The cost of Incandescent Lighting.

READ THE TABLE OF CONTENTS:

Alternating Arc Lamps, Arc Plants, Belting, Boilers, Boiler Settings, Boiler Efficiencies, Books, Building, Cost of Arc Dynamos and Lamps, Cost of Arc Plants Erected, Cost of Alternating Dynamos, Cost of Alternating Plants Erected, Cost of Belts, Cost of Boilers, Cost of Brick Chimneys, Cost of Copper for Alternating Circuit, Cost of Corliss Engines, Cost of Compound Corliss Engines, Cost of Compound High Speed Engines, Cost of Condensers, Cost of Friction Clutch Pulleys, Cost of Heaters, Cost of High Speed Engines, Cost of Incandescent Dynamos, Cost of Idlers, Cost of Injectors, Cost of Meters, Cost of Motors, Cost of Operating Lamps per hour, Cost of Power Generators. Cost of Poles, Cost of Plain Pulleys, Cost of Pillow Blocks, Cost of Pumps, Cost of Shafting, Cost of Shaft Couplings, Cost of Stacks—iron, Cost of Stacks—brick, Cost of Steam, Cost of Transformers, Cost of Wire, Chimneys, Circuit Loss, Contract Blanks, Current Distribution, Circuits—overhead, Circular Mills of Wire, Depreciation, Direct Connected Apparatus, Dynamos, Dynamo Data, Economy of Condensing, Economy of Covering Steam Pipes, Economy of Heater, Efficiency of Engines, Engines, Equivalent of Current in Horse Power, Equivalent Rates of Lighting, Fuel, Horse Power of Belting, Horse Power of Motors, Horse Power of Shafting, Incandescent Arc Lamps, Instruments, Instructions for Employes, Insulation, Labor, Load Chart, Meter Connections, Municipal Ownership, Natural Gas, N.E.L.A. Standard Rules, Oil, Outcome of Practical Management, Pole Line, Pulleys, Rope Transmission, Resistance of Wire, Rules—Fire Underwriters, Report Com. on Data N. E. L. A., Reports of Cities Owning Plant, Reports of Cities Contracting, Stock Room, Shafting, Transformers, Transformer Curves, Wiring Tables—Primary Wiring, Wiring Tables—Secondary Wiring, Wiring Tables, Motor Wiring, Wire, Wire Formula, Water Power, Wood as Fuel. The only book of its kind in the English Language. Price, \$2.00.

ELECTRICIAN PUBLISHING COMPANY,

PAPER COVER, PRICE \$1.00.

THE LATEST BOOK.

“ELECTRIC LIGHTING,”

A PRACTICAL EXPOSITION OF THE ART FOR THE USE OF

Engineers, Students and Others Interested in the Installation or Operation of Electrical Plants.

BY FRANCIS B. CROCKER,

Professor of Electrical Engineering, Columbia University, New York.

Price \$3, Prepaid. - Practical and Up-to-Date.

Just the Book you want. 450 Pages, over 150 Illustrations. Read the

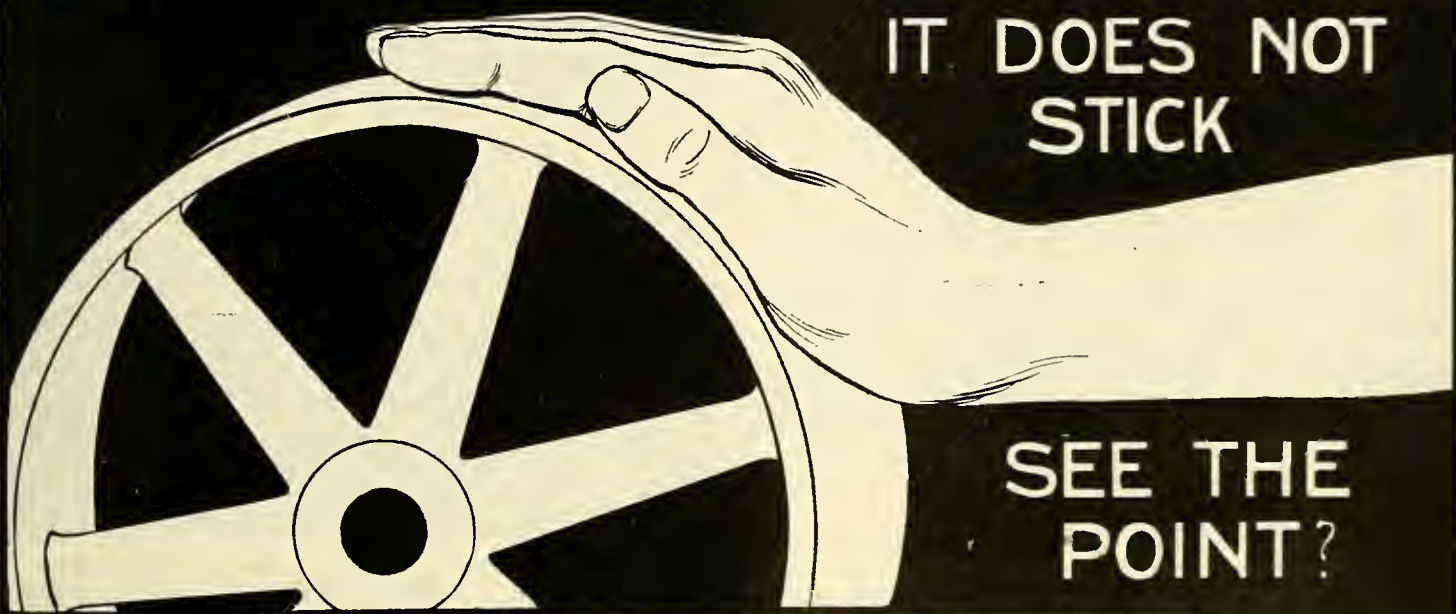

TABLE OF CONTENTS:

Chapter I, Introduction; Chapter II, History of Electric Lighting; Chapter III, General Units and Measures; Chapter IV, Classification and Selection of Electric Lighting System; Chapter V, The Location and General Arrangement of Electric Lighting Plants; Chapter VI, Buildings for Electric Lighting Plants; Chapter VII, Possible Sources of Electrical Energy; Chapter VIII, The Steam Engine, History and General Principles; Chapter IX, Steam Boilers for Electric Lighting; Chapter X, Steam Engines for Electric Lighting, General Construction; Chapter XI, Typical Forms of Steam Engine for Electric Lighting; Chapter XII, Steam Engines for Electric Lighting, Selection, Installation and Management; Chapter XIII, Gas, Oil and Hot Air Engines; Chapter XIV, Water Wheels and Windmills; Chapter XV, Mechanical Connections between Engines and Dynamos, Direct Coupling, Belting and Shafting; Chapter XVI, Toothed, Friction and Other Gearing; Chapter XVII, Principles, Construction and Management; Chapter XXI, Applications of Accumulators in Electric Lighting; Chapter XXII, Switchboards, Including Switches, Fuses and Circuit-Breakers; Chapter XXIII, Electrical Measuring Instruments; Chapter XXIV, Lightning Arresters.

Every Engineer and Electrician who desires to thoroughly master the Art of Electric Lighting should have a copy of this book. Sent promptly.

ELECTRICIAN PUBLISHING COMPANY, Suite 510 Marquette Building,

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 150 pp. Price \$1.00.
This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONE. A Review of the Patents Pertaining to Telephones and Telephone Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 Illustrations. Price \$1.75.
This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 291 pp., 223 Illustrations. Price \$1.25.
In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManoan, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 50 pp. Price 25 cents.
This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pages. 223 Illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp., 168 Illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 Illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 Illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages. 516 Illustrations. Price \$4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 2 plates and 43 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 230 pages. 88 Illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

THE PELTON WATER WHEEL CO.

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.
 An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

NINE THOUSAND WHEELS NOW RUNNING Aggregating some 700,000 h. p.
ELECTRIC POWER TRANSMISSION

Pelton Wheels afford the most reliable and efficient power for such service, and are running the majority of stations of this character in the United States, as well as most foreign countries.
 Highest efficiency and absolute regulation guaranteed under the most extreme variations of load. Catalogues furnished on application.

Address, **PELTON WATER WHEEL COMPANY,**
 143 Liberty St., New York City, U. S. A. or 121 Main St., San Francisco, Cal., U. S. A.

WATER WHEELS

For all Heads from 3 Ft. to 2000 Ft.
 Especially adapted to all kinds of

ELECTRIC POWER AND LIGHTING PLANTS.

Recent tests at Holyoke enable us to guarantee:
The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency ever realized when running from half to full gate. We guarantee also: A runner of the greatest possible strength. A gate unequalled in quickness and ease of opening and closing. Tests show over 81 per cent. average efficiency with half to full water.

State your Head and send for 124 page pamphlet.

HOW DO WE KNOW

That the present year will present an UNPARALLELED RECORD?

THE OUTPUTS OF Westinghouse Self-Cooling Transformers

For seven years—total 146,540 h. p.

A recent order placed by the Niagara Falls Power Co. is for seven 2,500 h. p. Westinghouse Transformers of our Standard Water-Cooled Type.

Considering the circumstances under which this contract was awarded—the disadvantage of changing from one type of transformer to another, and the fact that they are the largest units ever constructed—it is the most weighty endorsement ever given a manufacturer of transformers.

Cut showing outputs of our SELF-COOLING Transformers, exclusive of our other types.

Table showing payments over five years: FIRST YEAR \$12.50 MONTH... \$150 00; SECOND YEAR DEDUCTING DIVIDEND... 185 00; THIRD... 93 00; FOURTH... 20 40; FIFTH... 36 30; TOTAL CASH INVESTED... \$434 70

DIVIDENDS.—Over and Above Payments.

Table showing dividends: SIXTH YEAR... \$ 450 00; SEVENTH YEAR... 1,075 00; PROFIT... \$1,525 00; 434 70; NET SURPLUS... \$1,090 30; Eighth to Fiftieth Year, Annual Income... \$1,000 to \$1,500.

This statement shows the actual cost each year of carrying five acres to maturity in the Mexican Plantation Association, and means that, at the end of the third year, the investor has practically paid for his land, and at the end of the contract the money invested has been returned, together with a profit of \$1,000.00.

Our Plan—No Chance to Freeze Out.

The association has 6,000 acres and is planting rubber, chocolate, coffee, tobacco, etc. Its officers, who have had ten years' successful experience in developing large plantations, contract for \$350 an acre to cultivate the land for seven years and bring it to full maturity.

Benefits of Co-operation.

This is not a stock company, but a co-operative association and a share represents an acre, but an acre in the form of an undivided interest, the plan being to conduct the entire plantation jointly forever. The interest of one is the interest of all.

Chicago Title and Trust Co., Trustee.

The land has been deeded to this strong financial institution for practically 20 years, and the money paid by the investors is deposited with the Trust Company, which transfers it to the management only upon evidence that the development contract is being faithfully carried out.

A Guarantee Bond of \$100,000

Has now been approved by and deposited with the Chicago Title and Trust Company, and is for the purpose of indemnifying the members, if the association falls in any of its agreements, and positively assures the scientific development of the land—obviously the pivotal point.

First Dividend, 10 per cent., May, 1899.

This will come from a crop of tobacco now nearly matured and very promising. Thereafter steadily increasing dividends will be paid in cash by the Trust Company in May each year, and reduce the investor's net cash outlay as shown in the table above.

Excursions to the Plantation

Will be conducted by the association every few months, and inspectors elected annually by the members to visit the land and make an exhaustive report. The first one will be started within six weeks. The work of clearing the land and erecting buildings is now going on under the supervision of expert tropical horticulturists.

Some Objections Answered.

We do not go to the capitalist with this proposition, for the excellent reason that the capitalist can do alone what we are doing co-operatively, and some of them are doing it and getting big returns. The originators of this association expect to make a profit of \$100 an acre out of the \$350. The capitalist, by doing the work himself, can save our profit. Do you think that we promise too much? If so, go to the public library and read up on tropical horticulture; go to the document department and get the consular reports.

Some of Our Members.

H. C. Fuller, auditor of the Crane Co. Mr. Titus, local treasurer, Ill. Cent. Ry. W. S. Pinney, chief traveling auditor, Ill. Cent. Ry. G. W. Halter, purchasing agent, Ill. Cent. Ry. Arthur Woodcock, lawyer, and formerly manager of the Trust Department, American Trust & Savings Bank. A. B. Stone, manager fuel oil dept., Standard Oil Co. J. W. Howell, attorney, 1015 1/2 La Salle St. Rev. M. J. Hayes, pastor, Belden Ave. Baptist Church. Dr. J. H. Prothero, N. W. Dental College, J. Charles Smith, cashier, City Treasurer's office. B. Bailey, assistant superintendent, Calumet Terminal Ry. John A. Wierth, Corn Exchange National Bank. Harry Manning, Deputy U. S. Appraiser, 259 La Salle Avenue. Rev. D. J. Haines, assistant pastor Plymouth Congregational Church. Lawrence Hesselroth, druggist, 170 E. Chicago Ave.

Over 1,600 Members—70 per cent. of Shares Sold.

Included in this number are 25 Chicago school principals and about 100 teachers, not to mention many well-known business and professional men, who have thoroughly investigated our proposition.

Your Last Opportunity—All Will be Sold by May 30.

The shares are selling rapidly, and it now seems certain that all will be taken and the books closed by May 30. If you can possibly spare \$12.50 per month, take five acres, which will give you an independent life income. If you can't carry five, take less. Fill out the blank application below and mail it at once. It is the opinion of everybody connected with the association that within a year the shares will bring a premium, which will increase annually for ten years. This insures the ready sale of your shares at a profit, if unable to keep up your payments.

If you want to investigate further, our literature will be sent upon application, or I or one of my assistants will call at your home, if you will make an appointment. Call on the office Saturday and talk it over.

APPLICATION FOR CONTRACT.

Application form for Mexican Plantation Association. Includes fields for name, address, and signature of E. E. Calkins, Agent.

Mail this to E. E. CALKINS, 1603, 100 Washington Street, Chicago.

Address the special agent, E. E. CALKINS, 1603, 100 Washington Street, Chicago, Ill.

COMBINATION FAN AND ARC LAMP

for direct currents, is the work of genius and practical application, uniting in one artistic chandelier an excellent light and a perfect ceiling fan.

By means of the switch either one, or both the lamp and fan, may be operated, and at a marked saving for user of individual ceiling fans and lamps.

We also manufacture ceiling, desk, bracket, column fans and long-burning arc lamps. Fans for all circuits except alternating.

Ceiling fans with and without chandelier lights. Ball bearings. Small consumption. Prices low. This fan will suit you. Send for catalogue, prices and description.

The Interstate Electric Company,

34 South Water Street,

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

SEND FOR CATALOGUE.

We also Manufacture Water Motors, Woven Wire Brushes, Coffee Mills with Electric and Water Motor Attachment.

Branches: Boston, New York, Chicago, St. Louis, Minneapolis, Milwaukee, Toledo, Denver, San Francisco.

...DUNCAN...

INTEGRATING WATTMETERS FOR ALTERNATING CURRENTS

Will measure accurately the real energy or true watts consumed by both inductive and non-inductive translating devices, such as arc lamps, induction and commutated motors, incandescent lamps, and circuits employing choke coils or dimmers. They will also register on a load that is less than one per cent. of their rated capacity, thereby making it possible to furnish energy to small consumers at a profit.

THE H. B. CAMP CO.'S VITRIFIED CLAY CONDUIT.

For Underground Telephone, Telegraph and Electric Light Wires and Underground Trolley System for Electric Street Railways.

MANUFACTURED BY **THE H. B. CAMP CO.,** AULTMAN, OHIO.

Our conduit is made of specially prepared clays, is thoroughly vitreous and glazed, making it acid, gas and water proof, and is not affected by electrolysis. Standard size is 3-inch internal diameter. However, we can make any size or multiple duct. Our patent mandrel used in laying our conduits prevents the possibility of shoulders, and insures good alignment of bore. We claim for strength, economy, durability, cheapness and perfect insulation it is the best, and is used by the most prominent companies. Any information promptly given. Write for catalogue.

TEN TO ONE

That if you burn out in the next storm you'll blame the

LIGHTNING ARRESTERS,

and a way down in your heart you know that you have not over half as many in use as you should.

GARTON LIGHTNING ARRESTERS

lead others in point of small air-gap. They will not ground your circuit, and a complete equipment will not cost as much as the repairs following one storm. Prompt shipments from stock or your supply dealer.

BARGAINS IN DYNAMOS, ENGINES.

Write for Price List No. 22.

Direct Current Dynamos, Alternating Current Dynamos, Arc Dynamos, Engines, Boilers, Heaters, Pumps, all sizes. This apparatus has been in use in our own stations, and we therefore know its exact history, and can state that it is in thoroughly good operative condition.

CHICAGO EDISON COMPANY, 139 ADAMS ST., CHICAGO.

"AS GOOD AS NEW."

THE STORY of the consolidation of the various electrical interests of Washington, D. C., is now a fact—they have been merged into one concern. This means the operation of greater units—that a large portion of the apparatus heretofore operated in the several different plants will now be replaced by machinery of greater capacity.

WE OFFER ALL THE OLD MACHINERY FOR SALE.

It consists of ENGINES—100 to 500 h. p., New York Safety and Ide-Harrisburg High-Speed, Green, Wright and Frick Corliss. GENERATORS of the best-known manufacture, 60 to 100 k. w. capacity. BOILERS of the best makes and standard sizes. BESIDES shafting, pipe, pumps, belting, etc., all in first-class condition.

Further information cheerfully furnished. Send for our new catalog.

BUY

Your Electrical Books of the Electrician Publishing Co., Suite 510 Marquette Bldg., Chicago. You will save TIME and MONEY by doing so.

No Matches. No Smoke. No Soot.
No Profanity. Always Ready.

HELLO! EVERYBODY.

The lighting of gas by an electric spark has long passed the experimental state. The expense and trouble of wiring a house, putting in the system heretofore used, has been a source of reluctance on the part of most people in using this great convenience. To overcome this we have put on the market a system in which all of these difficulties have been obviated. No one now need hesitate in fitting up ONE OR MORE FIXTURES, for in this system each fixture is entirely independent of all others. The source of electric supply is entirely contained on the fixture in the small drum as shown in the cut. This avoids wiring a room or house as in the old way.

REMEMBER this system can be attached to your fixtures NOW IN USE in a few minutes without any special preparation, and at a very moderate expense.

The advantages we claim for this system are as follows: 1st. **SIMPLICITY.** No outside wiring, easily attached to any fixture now in use. 2d. **Economy.** It does not cost anything like the old system. 3d. It is an ornament to any fixture. 4th. Each fixture is independent; if one should get out of order it does not affect any other. Made in all colors of metal to match fixture.

See it and you will surely like it. For sale by
ADVANCE SPECIALTY CO.,

Has opened a
**Telephone
Supply House**

On the Missouri River and carries nothing but High-Grade Telephones and Switchboards, Holtzer-Cabot Magneto Bells, Transmitters and Receivers, National Carbon Co.'s Batteries, and, in fact, everything in the telephone line, and can fill all orders promptly?

It will pay you to communicate with us.

PRACTICAL DYNAMO BUILDING,

With detail drawings and instructions for winding.
Giving correct sizes of wire, dimensions of iron, etc.
Also diagram for house wiring.

BY L. C. ATWOOD.

Profusely illustrated. Size of page, 10x8 inches. Price, 83.

"This work is gotten up especially for amateur builders and non-professional men. All measurements and instructions for winding are taken from machines in actual service. Particular attention has been given to every detail of construction, that they may be thoroughly understood. This work will be of great value, not only to those who wish to build dynamos, but to superintendents, engineers and workmen who have the care of established systems."—From Preface.

Pronounced to be a **PRACTICAL AND COMPLETE WORK.**

Sent postpaid on receipt of price.

Some Comments On New York Telephone Service.

A Physician said:

"I would as soon think of taking off the door-bell as of doing without the telephone service."

A Business Man said:

"For economy's sake I had done without the telephone service until lately. I had it put in less than a year ago. Now I would not give it up for Five Hundred Dollars a Year." (HE PAYS) \$75.

The Head of a Large Firm said:

"The telephone service is the cheapest thing we have in our office."

Whether used on a large scale or on a small scale, the telephone service, weighed by its performance, is the cheapest thing in modern life.

MESSAGE RATES make the cost of telephone service in New York very moderate.

STANDARD EQUIPMENT for all subscribers. The rate varies with the amount of use.

KESTER ELECTRIC CO., Terre Haute, Indiana.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

"No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity."

CONTENTS.

<p>CHAPTER 1. The Invention of the Telephone. 2. Sound Waves. Articulate Speech. 3. Electric Telephony. The Bell Telephone. 4. The Microphone. 5. Current Induction. Electromagnetic Induction. 6. The Induction Coil: Its Use in the Telephone Transmitter. 7. The Complete Telephone Circuit. 8. Magnet Telephones. 9. The Bell Telephone Receiver. 10. Other forms of Magnet Telephones. 11. The Direct Reading Ohmmeter

WILL ACCURATELY MEASURE RESISTANCE
ON A RAPIDLY MOVING
ELECTRIC CAR.

No other instrument can meet such difficulties of stray magnetism and vibration.
A boy can use it. The brass are in the box.

The American Electric Specialty Co.,
123 Liberty St., NEW YORK CITY.

How about your T.-H. lumps?

Don't Study Over this Matter Any
Longer.

You will be perfectly safe to speculate on
this deal; it is a **sure winner**. Besides being
the cheapest clutch on the market it is the sim-
plest and best. Overcomes troubles of the trim-
mer. Will save you hundreds of dollars in lamp
repairs. A trial order will settle this matter.
You will be pleased, as others are. We don't
ask you to send for 100 or 1,000 just to get
your money; get a few to start with, we know
we will get to sell you more.

A. W. Knutson & Co.,

Galesburg, Ill.

HELLO!

WHAT'S THE MATTER WITH CHICAGO?

SHE WILL HOLD A

NATIONAL EXPOSITION OF ELECTRICAL ARTS

—FROM—

September 25 to October 9, 1899.

1,000,000 PEOPLE WILL VISIT CHICAGO DURING THOSE DATES TO WITNESS THE BIG FALL FESTIVITIES.

Space now in active demand. Send in your application for particulars at once.

200,000 people will be there to see exhibits and displays.

Here's a chance to show the public the latest novelties in all branches of the electrical and allied industries.

TO BE HELD IN THE TATTERSALL'S BUILDING.

(DIMENSIONS 148 X 265 FEET.)

NATIONAL EXPOSITION OF ELECTRICAL ARTS CO.

INCORPORATED UNDER THE LAWS OF ILLINOIS. CAPITAL, \$50,000.

W. E. BURNHAM, Mgr., 412 New York Life Building, Chicago, Ill.

COMBINATION FAN AND ARC LAMP

for direct currents, is the work of genius and practical application, uniting in one artistic chandelier an excellent light and a perfect ceiling fan.

By means of the switch either one, or both the lamp and fan, may be operated, and at a marked saving for user of individual ceiling fans and lamps.

We also manufacture ceiling, desk, bracket, column fans and long-burning arc lamps. Fans for all circuits except alternating.

Ceiling fans with and without chandelier lights. Ball bearings. Small consumption. Prices low. This fan will suit you. Send for catalogue, prices and description.

KNAPP FAN MOTOR OUTFITS WITH GORDON PRIMARY CELLS

The hot spell of summer is approaching and to those who wish to seek comfort at home or in the office, professional or mercantile, we desire to call attention to these celebrated outfits.

We guarantee the highest speed at the lowest cost for primary cells.

These fan motor outfits are manufactured in two sizes, as follows:

Type C, 8-inch Fan, with 3 No. 1A Gordon Cells.

Type E, 10-inch Fan, with 4 No. 1A Gordon Cells.

These outfits will give a life of over 150 hours without recharging, at a speed of at least 750 revolutions per minute.

For full particulars, price list, etc., address

To Telephone and Telegraph Without Wire

Is a fact in lighthouse communication, laboratory practice and convention entertainment. However, there has been neither a drop in prices nor a market surplus of copper and iron wire as a result of lessened demand.

Only with the greatest difficulty do we maintain full lines of **OKONITE**, **BANNER WEATHERPOOF**, **BARE COPPER AND IRON WIRE**, and we give due credit (as also do our customers) to our happy faculty of discounting the market and trade conditions.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

GET OUR PRICES.

The "ELECTRA" Highest Grade Nuernberg Carbons are recognized as standard all the world over.

All genuine "ELECTRA" carbons are put up in packages bearing the label with the trade mark "ELECTRA."

Good carbons mean less cost for current.

All the excellence in dynamos and arc lamps counts for but little where poor carbons are used in lamps.

THE WOOD ELECTRIC MOTO-VEHICLES.

SEND FOR "SPECIALLY FINE" CATALOGUE.

AMONG OTHER THINGS WE GUARANTEE ARE:

- That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball bearing axles.
- That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.
- That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.
- That the batteries can be charged when fully discharged in two and one-half hours' time.
- That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.
- That for the sum of \$50.00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

AVERAGE COST TO RUN PER MILE, 3-4 CENT.

WANTED.

Expert transformer man wanted, one familiar with the construction and testing of core type transformers. Experience and references, and also state salary expected and how soon would be at liberty to accept a position. Address "TRANSFORMER," care Western Electrician, 510 Marquette Building, Chicago.

POSITION WANTED.

Superintendency or general management of electric plant, by electrical engineer who held similar position in plant three years, and from which company he has excellent recommendations. Address "B," care Western Electrician, 510 Marquette Building Chicago.

WANTED,

By well-known company, manufacturing generators and motors, 2 foremen for the machine shop; one who has had experience in similar work preferred. State experience and salary expected. Address "FOREMAN," care Western Electrician, 510 Marquette Building, Chicago.

WANTED—SITUATION,

By an experienced engineer and electrician, fourteen years' experience in electrical work and steam. I understand the installing and maintenance of electric lighting throughout; have license and good references; plant out of city preferable. Address "H. B.," care of Western Electrician, 510 Marquette Building, Chicago, Ill.

WANTED.

Expert armature winder and repair man. One preferred who, after satisfactory trial, could take few hundred dollars' interest in business. Address, giving particulars and references, ELECTRO-DYNAMIC, care Western Electrician, 510 Marquette Building, Chicago.

WANTED.

100 or 125 h. p. high-speed engine and a 45, 50, 60, or 75 k. w. direct-current 250-volt dynamo. Both must be in first-class condition. Give guaranteed description and spot cash quotation. Emmetsburg Electric Light & Power Co., Emmetsburg, Iowa.

WANTED.

After June 15, position as manager with a progressive independent telephone company. Twelve (12) years (eight with Bell Companies) practical experience as exchange and district manager. Am posted in modern exchange and toll-line construction, switchboards and instruments. Familiar with office work and electrical testing. Good references. Address "F. C. B.," care Western Electrician, 510 Marquette Bldg., Chicago, Ill.

PROPOSAL FOR BIDS FOR ELECTRIC LIGHT PLANT.

The city of Falls City, Nebraska, will receive bids on the following apparatus at their city hall, on June 12, 1899, at 7:30 p. m.

One 75 k. w. alternator, sixty cycle, direct-connected type, speed not more than 300 revolutions.

Also switchboard of marble, with iron frame of suitable size, with following instruments mounted and ready to set up:

- One ammeter.
- One voltmeter.
- One switchboard transformer with fuse block.
- One exciter switch.

Four high tension knife-blade switches, double pole

Eight high-tension single-pole or four high-tension double-pole fuse boxes, exciter and alternator rheostats mounted on rear of board with hand wheels in front.

The various manufacturers of apparatus to bid on their nearest standard size of apparatus.

All apparatus to be delivered F. O. B. at Falls City, Neb., and engineer to superintend erection free of charge. Also to state time of delivery.

Also separate proposals for one high-grade automatic engine of suitable size to direct connect to a 75 k. w. generator, steam pressure 100 pounds, delivered as above.

Bidders must specify their apparatus in detail.

All bids must be directed to the City Clerk of Falls City, Nebraska.

The council reserves the right to reject any and all bids.

WANTED.

ARMATURES TO REWIND.

Winders direct from T-H. and Westinghouse shops Work guaranteed. Ten years' experience. Light plants installed complete. Send for prices.

HODGE-WALSH ELECTRICAL ENGINEERING CO. 701 Delaware St., KANSAS CITY, MO.

WANTED.

The Twin City Electric Company of Grand Rapids, Wis., are in the market for new or good second-hand apparatus for their proposed lighting plant, to consist of the following machinery and apparatus:

One 150 to 200 k. w. two-phase alternator, with exciter and switchboard instruments.

Fifty alternating-current arc lamps, 350 watts each, to be run on a series circuit controlled by a step-up transformer at switchboard.

Necessary transformer and controlling apparatus for arc lamps, 1,500 lights capacity, of new style transformers, 1,000 or 2,000 volts; primary 100 to 200 volts; secondary from 100 to 200 lights each.

Some second-hand weatherproof wire, No. 4 to No. 8.

Line and arc lamp suspension appliances.

One engine, 200 to 300 h. p. Corliss (or four valve, equal in economy); compound with condenser preferred.

250 h. p. capacity of boilers, capable of carrying 115 lbs. safe working pressure at least.

All necessary pumps, condenser, heaters, valves, piping, smokestack, belts and appliances required with the above. (About 75 wattmeters, 10 to 30 lights each; one steam engine indicator; one portable voltmeter for direct or alternating current.)

We are ready to receive bids on any or all of this material, new or second-hand. All material to be delivered F. O. B. cars at Centralia, Wis., with substantial guarantee as to condition.

Send full description, with size of pulleys, speed, etc. We would be pleased to have your lowest figures on anything you may have to offer.

"AS GOOD AS NEW."

THE STORY of the consolidation of the various electrical interests of Washington, D. C., is now a fact—they have been merged into one concern. This means the operation of greater units—that a large portion of the apparatus heretofore operated in the several different plants will now be replaced by machinery of greater capacity.

WE OFFER ALL THE OLD MACHINERY FOR SALE.

It consists of **ENGINES**—100 to 500 h. p., New York Safety and Ide-Harrisburg High-Speed, Green, Wright and Frick Corliss. **GENERATORS** of the best-known manufacture, 60 to 100 k. w. capacity. **BOILERS** of the best makes and standard sizes. **BESIDES** shafting, pipe, pumps, belting, etc., all in first-class condition.

Further information cheerfully furnished. Send for our new catalog.

THE PELTON WATER WHEEL CO.

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.
 An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

NINE THOUSAND WHEELS NOW RUNNING Aggregating some 700,000 h. p.

ELECTRIC POWER TRANSMISSION
 Pelton Wheels afford the most reliable and efficient power for such service, and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load. Catalogues furnished on application.

Address, **PELTON WATER WHEEL COMPANY,**
 143 Liberty St., New York City, U. S. A. or 121 Main St., San Francisco, Cal., U. S. A.

WATER WHEELS

For all Heads from 3 Ft. to 2000 Ft.
 Especially adapted to all kinds of

ELECTRIC POWER AND LIGHTING PLANTS.

Recent tests at Holyoke enable us to guarantee:
The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency ever realized when running from half to full gate. We guarantee also: A runner of the greatest possible strength. A gate unequalled in quickness and ease of opening and closing. Tests show over 51 per cent. average efficiency with half to full water.

State your Head and send for 124 page pamphlet.

ONE DOLLAR EACH.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.	CHAPTER 13. Carbon Transmitters.	CHAPTER 28. Metallic Circuit.
2. Sound Waves, Articulate Speech.	14. The Blake Transmitter.	29. Underground Wires.
3. Electric Telephony. The Bell Telephone.	15. The Long Distance Transmitter.	30. Lightning Arresters.
4. The Microphone.	16. The Solid-back Transmitter.	31. Inside Wiring.
5. Current Induction. Electromagnetic Induction.	17. The Berliner Transmitter.	32. Installation of Telephone Instruments.
6. The Induction Coil; Its Use in the Telephone Transmitter.	18. The Cuttriss Transmitter.	33. Inspection and Maintenance.
7. The Complete Telephone Circuit.	19. Various European Transmitters.	34. The Condenser; Its Use in Telephony.
8. Magnet Telephones.	20. The Efficiency of Carbon Transmitters.	35. Electromagnetic Retardation.
9. The Bell Telephone Receiver.	21. Batteries for Telephone Work.	36. Exchange Working.
10. Other forms of Magnet Telephones.	22. Open Circuit Batteries.	37. Small Exchanges.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.	23. Closed Circuit Batteries.	38. Party Lines; The Bridging Bell.
12. The Siemens Kolyba, Neumayer and Bletcher's Repeater.	24. The Practical Management of Batteries.	39. Long Distance Telephony.
	25. Magneto Bell.	40. Duplex Telephony.
	26. Automatic Switches.	41. Simultaneous Telegraphy and Telephony.
	27. Telephone Line Construction.	Appendix.

DO YOU WANT A LIFE INCOME OF \$125 PER MONTH?

The Safest and Most Profitable Investment in the World.

Table with 2 columns: PAYMENTS. and Amount. Rows include First Year (\$125.00), Second Year (185.00), Third (93.00), Fourth (20.40), Fifth (36.30), and Total Cash Invested (\$434.70).

This statement shows the actual cost each year of carrying five acres to maturity in the Mexican Plantation Association, and means that, at the end of the third year, the investor has practically paid for his land, and at the end of the contract the money invested has been returned, together with a profit of \$1,030.00.

Our Plan—No Chance to Freeze Out.

The association has 6,000 acres and is planting rubber, chocolate, coffee, tobacco, etc. Its officers, who have had ten years' successful experience in developing large plantations, contract for \$350 an acre to cultivate the land for seven years and bring it to full maturity. The \$350 is paid in 54 installments—\$2.50 per month for 48 months, \$5.00 for 26 months and \$10.00 for 10 months.

Benefits of Co-operation.

This is not a stock company, but a co-operative association and a share represents an acre, but an acre in the form of an undivided interest, the plan being to conduct the entire plantation jointly forever. The interest of one is the interest of all. It is more and more evident each year to the acute observer and the close student of economics and sociology, viewing the daily formation of trusts and combinations of capital, that the only way for people of limited means, unaided people who can save something from their income, to get good returns from their investments, is to unite their capital in a profitable business, under capable management and adequate legal protection.

Chicago Title and Trust Co., Trustee.

The land has been deeded this strong financial institution for practically 23 years, and the money paid by the investors is deposited with the Trust Company, which transfers it to the management only upon evidence that the development contract is being faithfully carried out.

A Guarantee Bond of \$100,000

Has now been approved by and deposited with the Chicago Title and Trust Company, and is for the purpose of indemnifying the members, if the association fails in any of its agreements, and possible 7 assures the scientific development of the land—obviously the pivotal point.

First Dividend, 10 per cent., May, 1899.

This will come from a crop of tobacco now nearly matured and very promising. Thereafter steadily increasing dividends will be paid in cash by the Trust Company in May each year, and will be the investor's net cash or they as shown in the table above.

Excursions to the Plantation

Will be conducted by the association every few months, and inspectors selected monthly by the members to visit the land and make an exhaustive report. The first one will be selected within a week. The work of clearing the land and erecting buildings is now going on, and will be supervised by a team of expert tropical horticulturists.

Table with 2 columns: DIVIDENDS.—Over and Above Payments. Rows include Sixth Year (\$450.00), Seventh Year (\$1,075.00), Profit (\$1,525.00), Net Surplus (\$1,090.30), and Eighth to Fiftieth Year Annual Income (\$1,000 to \$1,500).

Some Objections Answered.

We do not go to the capitalist with this proposition, for the excellent reason that the capitalist can do alone what we are doing co-operatively, and some of them are doing it and getting big returns. The originators of this association expect to make a profit of \$100 an acre out of the \$350. The capitalist, by doing the work himself, can save our profit. Do you think that we promise too much? If so, go to the public library and read up on tropical horticulture; go to the document department and get the consular reports.

Some of Our Members.

H. C. Fuller, auditor of the Crane Co. Mr. Titus, local treasurer, Ill. Cent. Ry. W. S. Pluney, chief traveling auditor, Ill. Cent. Ry. G. W. Hsiter, purchasing agent, Ill. Cent. Ry. Arthur Woodcock, lawyer, and formerly manager of the Trust Department, American Trust & Savings Bank. A. B. Sloan, manager fuel oil dept., Standard Oil Co. J. W. Howell, attorney, 1015 153 La Salle St. Rev. M. J. Haynes, pastor, Belden Ave. Baptist Church. Dr. J. H. Prothero, N. W. Dental College, J. Charles Smith, cashier, City Treasurer's office. B. Bailey, assistant superintendent, Grant Terminal Ry. John A. Wleferth, Corn Exchange National Bank. Harry Manning, Deputy U. S. Appraiser, 250 La Salle Avenue. Rev. E. J. Hulnes, assistant pastor Plymouth Congregational Church. Lawrence Hesselroth, druggist, 170 E. Chicago Ave.

Over 1,600 Members—70 per cent. of Shares Sold.

Included in this number are 25 Chicago school principals and about 100 teachers, not to mention many well-known business and professional men, who have thoroughly investigated our proposition.

Your Last Opportunity—All Will be Sold by May 30.

The shares are selling rapidly, and it now seems certain that all will be taken and the books closed by May 30. If you can possibly spare \$12.50 per month, take five acres, which will give you an independent life income. If you can't carry five, take less. Fill out the blank application below and mail it at once. It is the opinion of everybody connected with the association that within a year the shares will bring a premium, which will increase annually for ten years. This insures the ready sale of your shares at a profit, if unable to keep up your payments.

If you want to investigate further, our literature will be sent upon application, or I or one of my assistants will call at your home, if you will make an appointment. Call at the office Saturday and talk it over.

APPLICATION FOR CONTRACT.

From the Chicago Chronicle, Friday Morning, May 26, 1899.

PLAN AN ELECTRICAL SHOW

Promoters Wish to Hold It at Autumn Festival Time.

Corporation Is Formed to Forward the Proposed Exhibition.

Tattersall's to Be the Scene of the Varied Displays.

Several Big Concerns Have Already Promised to Take Space.

It is now an assured fact that Chicago is to have an electrical exposition on a large scale next fall. The extensive show is to be held under the auspices of the National Exposition of Electrical Arts Company, which has been incorporated in this state with a capital of \$50,000. The officers of the company are: President, N. J. Heinbach; secretary, T. Carrabine; treasurer and manager, W. E. Burnham. It is confidently expected that the exposition, which is to be held at Tattersall's, will prove as great a success as similar ones have in Madison Square garden, New York, during the last two or three seasons.

According to the plans now under consideration the show is to be held from Sept. 25 to Oct. 9, and will be followed by the exhibits to be shown in connection with the annual convention of the American Street Railway association, which is to open Oct. 17 and continue until the 20th of the same month. The autumnal carnival, to be held in connection with the laying of the corner stone of the new postoffice will be in progress on the date set for the opening of the electrical exposition, and the managers of the latter have decided to illuminate the vicinity of Tattersall's with festoons of incandescent lamps in honor of the occasion.

Displays Will Be Practical.

It is the intention of the promoters of the electrical exposition to give a general electrical exhibition, devoting especial attention to household uses of electricity and displaying at the same time the latest advancement of the electrical and allied arts. Ever since the plan of an electrical exhibit was tested and found successful in New York several Chicagoans have been anxious to adopt the scheme in this city. In addition to the household devices it is expected that there will be demonstrations of liquid air, wireless telegraphy, the electrolytic lamp, X-ray phenomena and kindred devices and inventions.

It will be the aim of the promoters of the exposition to conduct these demonstrations in such a manner as to interest and instruct the general public. Thousands of people will be attracted to Chicago during the autumn festival and the promoters of the electrical show count on a large patronage. The illumination of the exposition hall will be made one of the features of the show.

Big Concerns Are Interested.

Among the concerns that have already signified a determination to take part in the exposition are the Chicago Edison Company, Chicago Telephone Company, Postal Telegraph Cable Company, Woods Motovehicle Company and the American Electric Vehicle Company. It is probable that gold medals will be awarded for excellence of exhibits. The exhibition of motor applications of many kinds, heating and cooking by electricity, electric vehicles, new telephone apparatus and improved methods of telegraphy will be made features.

The Chicago Edison company will furnish power in addition to the output of the electric plant in the building. The vicinity of the big building will be illuminated by thousands of incandescent lamps and band concerts will be given daily. Space will be leased to intending exhibitors at rates varying according to space, this work being in charge of W. E. Burnham, who is to manage the exposition. There are 149 exhibit spaces, ranging from 100 to 400 square feet, and in case of extensive exhibits two or more sections may be combined.

How about your T.-H. lamps?

Don't Study Over this Matter Any Longer.

You will be perfectly safe to speculate on this deal; it is a **sure winner**. Besides being the cheapest clutch on the market it is the simplest and best. Overcomes troubles of the trimmer. Will save you hundreds of dollars in lamp repairs. A trial order will settle this matter. You will be pleased, as others are. We don't ask you to send for 100 or 1,000 just to get your money; get a few to start with, we know we will sell you more.

Agents wanted.

KNAPP FAN MOTOR OUTFITS WITH GORDON PRIMARY CELLS

The hot spell of summer is approaching and to those who wish to seek comfort at home or in the office, professional or mercantile, we desire to call attention to these celebrated outfits.

We guarantee the highest speed at the lowest cost for primary cells.

These fan motor outfits are manufactured in two sizes, as follows:

Type C, 8-inch Fan, with 3 No. 1A Gordon Cells.

Type E, 10-inch Fan, with 4 No. 1A Gordon Cells.

These outfits will give a life of over 150 hours without recharging, at a speed of at least 750 revolutions per minute.

For full particulars, price list, etc., address

Sultry Summer Season Simmers Superintendents?

What also will be the summer effect on electric-light consumers, and would they not welcome relief? Does not this heat offer a chance to get current into a house or office for attachment to electric fans and thus gain new patrons for light? Doubtless your night load can be increased, but isn't a day circuit most unsatisfactory for lighting only? How thoroughly have you canvassed your city for Central Fan Motors? Can you not advertise locally and use our cuts? Will you not distribute good advertising matter if sent free? This offer applies to Central Lighting and Power Stations, also to Dealers. Write us on the topic of Central 1899 Fan Motors. Our Motors are in Stock: Quality the Best; Prices are Consistent.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

Our PHOENIX No. 1 Battery.

Protected by Letters Patent 500,284.

The Best Cell That Can be Made.

Low prices to the trade in round lots.

2d.

Our PROGRESS Dry Battery.

PRINCIPLE NEW. A trial order will convince the trade that the PROGRESS is the BEST DRY BATTERY that can be made, and the only Dry Battery ever constructed that can be renewed at a NOMINAL COST.

3d.

Our PERFECTION Battery

Or Electric Generator, for closed or open circuit work, fan motors, signal service and long distance telephone.

The longest life and the least cost for renewals of any battery in the market to-day. This battery will give three hundred ampere hours, E. M. F. 2 volts, current 12 amperes, and can be renewed at a cost of 25 cents per cell.

We are determined to stand at the head in Battery Manufacture. Our products are the result of invention, application and construction, and we will prosecute to the utmost all infringers and imitators.

Will take pleasure in giving information, or in sending samples to the TRADE.

PHOENIX BATTERY MFG. CO.,

ST. LOUIS, MO.

S. C. BOOKER, Superintendent.

Standard Fort Wayne Duncan Meters

INTEGRATING LAMP AND AMPERE-HOUR METER.

Have been made in our factory without interruption for five years, and we are still making them. For extreme simplicity the lamp or ampere-hour meter has no equal and it does its work well. The adjustable friction compensator is a device peculiar to our watt-hour meters—they start on one-half of one per cent. of full load. If you do not know all about the **Standard Fort Wayne Duncan Meters** and just where and how they are made, drop us a postal for our new pamphlet. Don't forget the name.

INTEGRATING WATT-HOUR METER.

10,000 New Rubber Storage Battery Jars for sale cheap. Old electrical material bought and sold. WALSH'S SONS & CO., NEWARK, N. J.

WANTED.

The Twin City Electric Company of Grand Rapids, Wis., are in the market for new or good second-hand apparatus for their proposed lighting plant, to consist of the following machinery and apparatus:

One 150 to 200 k. w. two-phase alternator, with exciter and switchboard instruments.

Fifty alternating current arc lamps, 350 watts each, to be run on a series circuit controlled by a step-up transformer at switchboard.

Necessary transformer and controlling apparatus for arc lamps, 1,500 lights capacity, of new style transformers, 1,000 or 2,000 volts; primary 100 to 200 volts; secondary from 100 to 200 lights each.

Some second-hand weatherproof wire. No. 4 to No. 8.

Line and arc lamp suspension appliances. One engine, 200 to 300 h. p. Corliss (or four valve, equal in economy); compound with condenser preferred.

250 h. p. capacity of boilers, capable of carrying 115 lbs. safe working pressure at least.

All necessary pumps, condensers, heaters, valves, piping, smokestack, belts and appliances required with the above. (About 75 wattmeters, 10 to 40 lights each; one steam engine indicator, one portable voltmeter for direct or alternating current.)

We are ready to receive bids on any or all of this material, new or second hand. All material to be delivered F. O. B. cars at Centralia, Wis., with substantial guarantee as to condition.

Send full description, with size of pulleys, speed, etc. We would be pleased to have your lowest figures on anything you may have to offer.

“AS GOOD AS NEW.”

THE STORY of the consolidation of the various electrical interests of Washington, D. C., is now a fact—they have been merged into one concern. This means the operation of greater units—that a large portion of the apparatus heretofore operated in the several different plants will now be replaced by machinery of greater capacity.

WE OFFER ALL THE OLD MACHINERY FOR SALE.

It consists of **ENGINES**—100 to 500 h. p., New York Safety and Ide-Harrisburg High-Speed, Green, Wright and Frick Corliss. **GENERATORS** of the best-known manufacture, 60 to 100 k. w. capacity. **BOILERS** of the best makes and standard sizes. **BESIDES** shafting, pipe, pumps, belting, etc., all in first-class condition.

Further information cheerfully furnished. Send for our new catalog.

From the Chicago Chronicle, Friday Morning, May 26, 1899.

PLAN AN ELECTRICAL SHOW

Promoters Wish to Hold It at Autumn Festival Time.

Corporation Is Formed to Forward the Proposed Exhibition.

Tattersall's to Be the Scene of the Varied Displays.

Several Big Concerns Have Already Promised to Take Space.

It is now an assured fact that Chicago is to have an electrical exposition on a large scale next fall. The extensive show is to be held under the auspices of the National Exposition of Electrical Arts Company, which has been incorporated in this state with a capital of \$50,000. The officers of the company are: President, N. J. Heinbach; secretary, T. Carrabine; treasurer and manager, W. E. Burnham. It is confidently expected that the exposition, which is to be held at Tattersall's, will prove as great a success as similar ones have in Madison Square garden, New York, during the last two or three seasons.

According to the plans now under consideration the show is to be held from Sept. 25 to Oct. 9, and will be followed by the exhibits to be shown in connection with the annual convention of the American Street Railway association, which is to open Oct. 17 and continue until the 20th of the same month. The autumnal carnival, to be held in connection with the laying of the corner stone of the new postoffice will be in progress on the date set for the opening of the electrical exposition, and the managers of the latter have decided to illuminate the vicinity of Tattersall's with festoons of incandescent lamps in honor of the occasion.

Displays Will Be Practical.

It is the intention of the promoters of the electrical exposition to give a general electrical exhibition, devoting especial attention to household uses of electricity and displaying at the same time the latest advancement of the electrical and allied arts. Ever since the plan of an electrical exhibit was tested and found successful in New York several Chicagoans have been anxious to adopt the scheme in this city. In addition to the household devices it is expected that there will be demonstrations of liquid air, wireless telegraphy, the electrolytic lamp, X-ray phenomena and kindred devices and inventions.

It will be the aim of the promoters of the exposition to conduct these demonstrations in such a manner as to interest and instruct the general public. Thousands of people will be attracted to Chicago during the autumn festival and the promoters of the electrical show count on a large patronage. The illumination of the exposition hall will be made one of the features of the show.

Big Concerns Are Interested.

Among the concerns that have already signified a determination to take part in the exposition are the Chicago Edison Company, Chicago Telephone Company, Postal Telegraph Cable Company, Woods Motorcycle Company and the American Electric Vehicle Company. It is probable that gold medals will be awarded for excellence of exhibits. The exhibition of motor applications of many kinds, heating and cooking by electricity, electric vehicles, new telephone apparatus and improved methods of telegraphy will be made features.

The Chicago Edison company will furnish power in addition to the output of the electric plant in the building. The vicinity of the big building will be illuminated by thousands of incandescent lamps and hand concerts will be given daily. Space will be leased to intending exhibitors at rates varying according to space, this work being in charge of W. E. Burnham, who is to manage the exposition. There are 140 exhibit spaces, ranging from 100 to 400 square feet, and in case of extensive exhibits two or more sections may be combined.

From
SEPTEMBER 25
TO
OCTOBER 9, 1899.

AT TATTERSALL'S,
The largest convention hall in Chicago.

DISTINGUISHED GUESTS,
Viz:

President McKinley and Cabinet, Dewey, Bryan, President Diaz of Mexico, and Governor Roosevelt and his "Rough Riders" will be in attendance.

OFFICE, 410 NEW YORK LIFE BUILDING, CHICAGO, ILL.

The "ELECTRA" Highest Grade Nuernberg Carbons are recognized as standard all the world over.

All genuine "ELECTRA" carbons are put up in packages bearing the label with the trade mark "ELECTRA."

Good carbons mean less cost for current.

All the excellence in dynamos and arc lamps counts for but little where poor carbons are used in lamps.

TROTTER'S COMMUTATOR COMPOUND. GOLDMARK & WALLACE. 121 WORTH ST. NEW YORK. AGENTS FOR KOCH WOVEN WIRE DYNAMO BRUSHES.

All Careful Engineers use MONA COMMUTATOR COMPOUND, A perfect lubricator and spark preventer. Prepared only by TROTTER'S MONA MANUFACTURING CO., Limited, 65 West Broadway, New York City.

The Direct Reading Ohmmeter

WILL ACCURATELY MEASURE RESISTANCE ON A RAPIDLY MOVING ELECTRIC CAR.

No other instrument can meet such difficulties of stray magnetism and vibration. A boy can use it. The brains are in the box.

The American Electric Specialty Co., 123 Liberty St., NEW YORK CITY.

The Fibre-Graphite Commutator Brush.

(U. S. and Foreign Patents.)

No Sparking Under Varying Load. No Wear on Commutator. No Shifting of Quadrant. 80 per cent. Pure Graphite.

For Sample Order, and Prices, write to

Holmes Fibre-Graphite Mfg. Co., Station Z, Philadelphia.

KNAPP FAN MOTOR OUTFITS WITH GORDON PRIMARY CELLS

The hot spell of summer is approaching and to those who wish to seek comfort at home or in the office, professional or mercantile, we desire to call attention to these celebrated outfits

We guarantee the highest speed at the lowest cost for primary cells.

These fan motor outfits are manufactured in two sizes, as follows:

Type C, 8-inch Fan, with 3 No. 1A Gordon Cells.

Type E, 10-inch Fan, with 4 No. 1A Gordon Cells.

These outfits will give a life of over 150 hours without recharging, at a speed of at least 750 revolutions per minute.

For full particulars, price list, etc., address

Auto=Auto=Auto.

There Are Automobiles, Automomists and Autocrats.
Our Autographs are never framed and we are partial to seeing those of our customers.

Science is a good thing, but we don't care to further it by furnishing the subject for an Autopsy, when prevention is sold by the watt or on a flat rate.

Have You Been Stricken

BY THE

Automatic Weather Bureau Reports?

Just like an Automaton in repeating Southerly Winds, Light Showers, Sultry Indications, Hot Waves, Scorchers and Broilers?

Personally do you seek relief, commercially have you not current for sale, and if a dealer, isn't an article most salable during the proper season?

Central Duplex Fan Motors

are in three speeds and AUTOMATICALLY deliver balmy two-directioned consolation, or a spicy suggestion of seaside breezes, or a wild, exhilarating swirl of rejuvenated atmosphere.

Made only in 12-inch Fan, but in amply strong proportion of field and armature to render duplex duty.

The price is not AUTOCRATIC, but simply is half again as much as the single desk type, hence in results the cost is divided and the output doubled.

Our Catalogue of 1899 Fan Motors is free to the trade and our quotations are as prompt as our shipments.

Central Electric Company,

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

Standard Fort Wayne Duncan Meters

INTEGRATING LAMP AND AMPERE-HOUR METER.

Have been made in our factory without interruption for five years, and we are still making them. For extreme simplicity the lamp or ampere-hour meter has no equal and it does its work well. The adjustable friction compensator is a device peculiar to our watt-hour meters—they start on one-half of one per cent. of full load. If you do not know all about the **Standard Fort Wayne Duncan Meters** and just where and how they are made, drop us a postal for our new pamphlet. Don't forget the name.

"AS GOOD AS NEW."

THE STORY of the consolidation of the various electrical interests of Washington, D. C., is now a fact—they have been merged into one concern. This means the operation of greater units—that a large portion of the apparatus heretofore operated in the several different plants will now be replaced by machinery of greater capacity.

WE OFFER ALL THE OLD MACHINERY FOR SALE.

It consists of **ENGINES**—100 to 500 h. p., New York Safety and Ide-Harrisburg High-Speed, Green, Wright and Frick Corliss. **GENERATORS** of the best-known manufacture, 60 to 100 k. w. capacity. **BOILERS** of the best makes and standard sizes. **BESIDES** shafting, pipe, pumps, belting, etc., all in first-class condition.

Further information cheerfully furnished. Send for our new catalog.

THE TELEPHONE HAND-BOOK

NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables," Joint Author of "Electricity in Daily Life."

160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

Extract from Preface.—This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country.

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS

- CHAPTER 1. The Invention of the Telephone.
- 2. Sound Waves, Articulate Speech.
- 3. Electric Telephony, The Bell Telephone.
- 4. The Microphone.
- 5. Current Induction, Electromagnetic Induction.
- 6. The Induction Coil; Its Use in the Telephone Transmitter.
- 7. The Complete Telephone Circuit.
- 8. Magnet Telephones.
- 9. The Bell Telephone Receiver.
- 10. Other forms of Magnet Telephones.
- 11. The Gower, Ader and D'Arsonval Receivers; Merz's and B. Telephone.
- 12. The Siemens, Kitzka, Neumayer and Bimcher Receivers.

- CHAPTER 13. Carbon Transmitters.
- 14. The Blake Transmitter.
- 15. The Long Distance Transmitter.
- 16. The Solid-back Transmitter.
- 17. The Berliner Transmitter.
- 18. The Cutlipis Transmitter.
- 19. Various European Transmitters.
- 20. The Efficiency of Carbon Transmitters.
- 21. Batteries for Telephone Work.
- 22. Open Circuit Batteries.
- 23. Closed Circuit Batteries.
- 24. The Practical Management of Batteries.
- 25. Magneto Bell.
- 26. Automatic Switches.
- 27. Telephone Line Construction.

- CHAPTER 28. Metallic Circuit.
- 29. Underground Wires.
- 30. Lightning Arresters.
- 31. Inside Wiring.
- 32. Installation of Telephone Instruments.
- 33. Inspection and Maintenance.
- 34. The Condenser; Its Use in Telephony.
- 35. Electromagnetic Retardation.
- 36. Exchange Working.
- 37. Small Exchanges.
- 38. Party Lines; The Bridging Bell.
- 39. Long Distance Telephony.
- 40. Duplex Telephony.
- 41. Simultaneous Telegraphy and Telephony.
- 42. Recent Progress. Appendix.

SEND FOR "SPECIALLY FINE" CATALOGUE.
AMONG OTHER THINGS WE GUARANTEE ARE:

- That the material and workmanship in the vehicle shall be of the very best, including rubber tires and ball bearing axles.
- That for a period of one year the Company will replace, free of charge, any broken parts due to defective material or faulty shop construction.
- That the vehicle shall have, on a level hard roadway, a mileage capacity in one charge of the batteries that will carry its given load twenty-five miles at an average speed of twelve and one-half miles per hour, two hours.
- That the batteries can be charged when fully discharged in two and one-half hours' time.
- That the vehicle shall be capable of climbing a six per cent. grade with given load when batteries are reasonably well charged.
- That for the sum of \$50.00 per annum, the Company will furnish all parts for keeping batteries in perfect repairs for a period of five (5) years, leaving them at the end of the five years in good condition for operation during the ensuing year.

Draft Without a Chimney.

Mechanical Draft

What It Is and What It Does.

Good Draft

Is essential to success with any boiler plant.

Better Draft

Can be produced by a fan at less first cost and running expense than by a chimney.

Best Draft

Is, therefore, Mechanical Draft, by which these results can be secured.

It is draft mechanically produced by means of a fan, and may be introduced either as forced draft, by which the air under pressure is delivered to the ash pits, or as induced draft, arranged to draw the gases through the fan and to maintain a partial vacuum within the furnace. The method to be adopted must of necessity depend upon the existing conditions.

It does what an ordinary chimney is incapable of doing. Its cost is from 20 to 40 per cent. of that of a chimney; its intensity permits of the burning of finely divided or low-grade fuel; it makes possible the utilization of the heat of the flue gases which a chimney wastes in producing draft; it is independent of the weather; is automatically regulated to maintain constant steam pressure, prevents smoke, increases the capacity of an existing plant, and serves as an auxiliary to a chimney already overburdened; it saves space and is portable.

This is the size of the chimney and This is the size of the fan required for the same boiler capacity. COMMENT IS UNNECESSARY.

Detailed Information Regarding

MECHANICAL DRAFT

Will be cheerfully furnished by

KNAPP FAN MOTOR OUTFITS WITH GORDON PRIMARY CELLS

The hot spell of summer is approaching and to those who wish to seek comfort at home or in the office, professional or mercantile, we desire to call attention to these celebrated outfits.

We guarantee the highest speed at the lowest cost for primary cells.

These fan motor outfits are manufactured in two sizes, as follows:

Type C, 8-inch Fan, with 3 No. 1A Gordon Cells.

Type E, 10-inch Fan, with 4 No. 1A Gordon Cells.

These outfits will give a life of over 150 hours without recharging, at a speed of at least 750 revolutions per minute.

For full particulars, price list, etc., address

GORDON BATTERY COMPANY,

594 Broadway, New York.

Western Representative, GEORGE W. PATTERSON, 1539 Marquette Bldg., Chicago, Ill.

DOES

Your Electric Light or
Street Railway Plant Pay
Satisfactory Dividends?

If not, why don't you remodel
and put it on a paying basis?
That's a specialty of our business.

DIEHL ELECTRIC FANS,

FOR ALL CIRCUITS, EXCEPT ALTERNATING.

Our line of Electric Fans for ALL purposes for the present season is the most complete that we have ever placed in the market, and the high standard of our product has been strictly upheld.

Our fans are the cheapest because they are absolutely the best made: wear longest, require less outlay for repairs and show a higher efficiency than any other fan. This statement is fully sustained by the past record of our fans. Our place has always been in the lead and we intend to maintain that position.

THE PEERLESS.—Victor Exchange and Long-Distance Wall Set.

STYLE C.

The Victor Telephone Mfg. Co.'s Telephones are the Most Reliable in the World.

We are prepared to fill your orders promptly on Telephones and Telephone Parts.

...TEN REASONS...

Why you should have the instrument illustrated here in your exchange.

1. It has a guaranteed 12,000-ohm generator with noiseless wide gear and durable automatic shunt.
2. The ringers have a centrally pivoted armature, are very sensitive and easily adjusted.
3. The receiver is of the double-pole, bell-flare type, with hard rubber shell, and adjusted to heat and cold.
4. The transmitter head is made of heavily finished castings, is absolutely moisture proof, with a screw adjustment on the back electrode to give it any degree of sensitiveness; it can be removed in an instant and has no false vibrations.
5. The transmitter arm is hollow, containing cord; it has no exposed cords to be broken.
6. The induction coil is wound in even layers to a standard 500-ohm resistance with silk insulated wire.
7. The long lever switch has German-silver springs and Platinum contacts.
8. The cabinet is substantial, neat in design and well finished.
9. All connections are soldered and can give no trouble.
10. Because the instrument, taken as a whole, is durable, simple and efficient.

VICTOR SWITCHBOARDS.

Our metallic switchboard Apparatus is new, scientifically correct, mechanically perfect, up to date on all labor-saving and rapid switching devices.

CENTRAL ENERGY SYSTEM.

The Victor Central Energy System overcomes many disadvantages heretofore encountered in this system. It is correct, cheap to install, economical to maintain. All power for signaling and talking supplied from central station. No listening on part of operator necessary. Automatic clearing-out drops. All Victor Apparatus fully protected by patents.

THE VICTOR TELEPHONE MFG. CO., 166 S. CLINTON STREET, CHICAGO.

Telephone Men and All Users of MAGNET COILS—

Have Your MAGNET COILS Wound BY MACHINERY.

HERE'S THE OBJECT LESSON— A PLAIN FACT.

The 2 1/2-lb. spools (9 1/2 lbs. total) of No. 36 single silk-covered wire will cost you \$243 net at 50, 10, 10, 5 off list; and there is sufficient wire on these 2 1/2 spools to wind 1,000 500-ohm bridging-bell magnets. Your winding labor will cost you at least \$5 additional, making a total cost of your own 1,000 magnets finished at factory, \$248.

The above box contains 1,000 "Duplex" magnet windings. Each winding is made up of No. 36 wire, 500 ohms per winding, and each winding has 12 per cent. more turns than there are in the ordinary wound magnet. Price, \$218 70 net. This is 10 per cent. less than your wire bill and we charge nothing for winding.

THE VARLEY DUPLEX MAGNET CO.,

138 7TH ST., JERSEY CITY, N. J.,

DOES IT BY MACHINERY.

We can Save You CONSIDERABLE Money.

Standard Fort Wayne Duncan Meters

INTEGRATING LAMP AND AMPERE-HOUR METER.

Have been made in our factory without interruption for five years, and we are still making them. For extreme simplicity the lamp or ampere-hour meter has no equal and it does its work well. The adjustable friction compensator is a device peculiar to our watt-hour meters—they start on one-half of one per cent. of full load. If you do not know all about the **Standard Fort Wayne Duncan Meters** and just where and how they are made, drop us a postal for our new pamphlet. Don't forget the name.

CABLE POLE HOUSE.

Made with double doors for convenience and to insure an absolutely dry interior. The distributing board is screwed to back of inside box. Cable pot-head enters from below and runs through to it. Tight joints are easily made in several ways. Spider wires also enter from below and run between the two boxes and turn in to board through holes already bored. The house is carefully made, all doors closing against a shoulder, painted white, with locks or crossbars as customer orders, and is a permanent fixture. Price, without board, \$7.50, for 200 lines or less.

□ We also make Cable Distributing Boards and Cross-Connecting Boards. Write for prices.

"AS GOOD AS NEW."

THE STORY of the consolidation of the various electrical interests of Washington, D. C., is now a fact—they have been merged into one concern. This means the operation of greater units—that a large portion of the apparatus heretofore operated in the several different plants will now be replaced by machinery of greater capacity.

WE OFFER ALL THE OLD MACHINERY FOR SALE.

It consists of **ENGINES**—100 to 500 h. p., New York Safety and Ide-Harrisburg High-Speed, Green, Wright and Frick Corliss. **GENERATORS** of the best-known manufacture, 60 to 100 k. w. capacity. **BOILERS** of the best makes and standard sizes. **BESIDES** shafting, pipe, pumps, belting, etc., all in first-class condition. Further information cheerfully furnished. Send for our new catalog.

AMERICAN ELECTRIC TELEPHONE CO.

Largest Manufacturers of Telephones, Switchboards
and Accessories in the World.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Lawa Webb. 16mo, 150 pp. Price \$1.00.

This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONE. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price \$1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price \$1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 350 pp., 233 illustrations. Price \$1.50.

In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, sad detailing, as far as space will allow, the most

recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price \$1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pages. 233 illustrations. Price \$4.50.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price \$1.00.

TELEPHONES, THEIR CONSTRUCTION AND FIT-

TING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. O. Allsop. 191 pp., 188 illustrations. Price \$2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 illustrations. Price \$4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 illustrations. Price \$1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages. 516 illustrations. Price \$4.00.

PHILIP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 3 plates and 48 engravings. Price \$3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, resting on the telegraph, telephone, etc. By E. J. Houston. 330 pages. 88 illustrations. Price \$1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

TO INDEPENDENT TELEPHONE USERS.

Perspective view of Western Express Switchboard equipped with one hundred combined removable jacks, drops and coils.

THERE are in the United States over 2,000 independent telephone companies operating telephone exchanges in opposition to the American Bell Telephone Company. These independent companies are operating from 50 to 6,000 telephones in each exchange. Exchanges are connected by thousands upon thousands of miles of toll lines. **There are upward of thirty millions of dollars invested in the independent telephone business. The independent plants have come to stay.** The vast tidal wave of reform in telephone service has swept through the length and breadth of the land. Their promotion has proven one of the greatest boons of the century to the public at large. **The truth must prevail. The Monopoly "cannot fool all of the people all of the time,"** and the number that it can fool part of the time is rapidly diminishing in number. That a high grade of telephone service can be secured at prices which are within the reach of the majority has been demonstrated. Influential and conservative business men, leaders of enterprises in their respective sections, tending to promote the general welfare of the people, have built up the independent telephone business and are interested in independent exchanges which afford service to their patrons at rates less than those formerly charged by the monopoly, and at the same time independent plants properly built and equipped, even though rates for service are moderate, have opened the way for the most remunerative investment of capital of any legitimate enterprise which has been offered during the present century. In view of the above facts it is evident that the independent companies should in-trench themselves by the installation of first-class plants, constructed in such a manner that operating expenses and maintenance are reduced to a minimum and highly efficient service assured, equipped with apparatus of high-grade construction,

adapted to withstand years of wear and tear of service, the adoption of which will enable the users to successfully compete with the best service the Bell Company can provide for its patrons. Such apparatus can be procured from the pioneer independent manufacturers, the Western Telephone Construction Company, 250-254 South Clinton Street, Chicago, manufacturers of high-grade exchange and toll-line equipment, switchboards, combined lightning arrester, distributing and test boards, Series and Bridging Bell Telephones, portable and cabinet desk sets, magneto bells, repeating coils, receivers and transmitters, all of new and improved type.

**? Have you seen our latest production, the Western Express Switchboard ?
and Western Express Telephones?**

A long experience in the manufacture of telephone appliances has enabled us to build the Western Express switchboard, which represents the highest and latest production of the designers' art. Same is adapted for use in exchanges of any size. Is generally conceded by experts who have made comparative tests and critical examinations as by far the best board procurable for use by operators of independent exchanges in this country. Has replaced other makes in numerous sections. We have in operation at the present time

Express boards employing an aggregate of upward of 15,000 drops, and have yet to register the first complaint from any user thereof relative to inefficiency or development of inherent defects of any nature whatsoever. The following claims for this board are substantiated by all users: Perfection of details both electrically and mechanically, ease and rapidity of operation, ease of access of parts for purposes of inspection and repairs, freedom from infringement of all valid patents not controlled by us, freedom from defects causing cross-talk and induction disturbances, great durability, and the highest general efficiency of any board in use. Write for detailed description.

The above cut shows Combined Removable Spring Jack, Drop and Coil of our Western Express Switchboard. Any Jack, drop or coil can be easily taken out by removing the two thumb nuts, Nos. 1 and 2, in rear, without disconnecting any line or other wires.

MERIT WINS.

Our exchange and combined exchange and toll line switchboards beat the world. Our apparatus is in use in upwards of 1,200 prosperous exchanges in the Navy and War Departments, by Railroad Companies and other large corporations, aggregating over 300,000 instruments, and its adoption assures the highest quality of service both for local exchange and long-distance lines. We guarantee workmanship, material and efficiency of our apparatus to be of the highest grade, and agree to defend at our own cost and expense any action at law which may be brought against our patrons on alleged infringement of patents owing to the use of our appliances.

THE TELEPHONE HAND-BOOK

NEW AND REVISED EDITION, WITH A NEW CHAPTER ON "RECENT PROGRESS," BRINGING THE BOOK UP TO DATE.

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables," Joint Author of "Electricity in Daily Life."

160 Pages, 133 Illustrations, Cloth, Hand-Book Size, Price \$1.00.

Extract from Preface.—This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice, and most of the material, apparatus and methods described are peculiar to or have originated in this country.

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS

- CHAPTER 1. The Invention of the Telephone.
- 2. Sonal Waves, Articulate Speech.
- 3. Electric Telephony, The Bell Telephone.
- 4. The Microphone.
- 5. Current Induction. Electromagnetic Induction.
- 6. The Induction Coil: Its Use in the Telephone Transmitter.
- 7. The Complete Telephone Circuit.
- 8. Magnet Telephones.
- 9. The Bell Telephone Receiver.
- 10. Other forms of Magnet Telephones.
- 11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
- 12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.

- CHAPTER 13. Carbon Transmitters.
- 14. The Blake Transmitter.
- 15. The Long Distance Transmitter.
- 16. The Solid Back Transmitter.
- 17. The Berlioz Transmitter.
- 18. The Cutler's Transmitter.
- 19. Various European Transmitters.
- 20. The Efficiency of Carbon Transmitters.
- 21. Batteries for Telephone Work.
- 22. Open Circuit Batteries.

Incandescent Lamps.

NO BETTER guarantee of the merits of the SAWYER-MAN LAMP could be offered than the fact that it was a pioneer in its field and has successfully withstood the competition of innumerable cheap and inferior grade lamps that have been offered. The well-known high-grade qualities are features of the SAWYER-MAN LAMPS.

And all Principal Supply Houses. SAWYER-MAN ELECTRIC CO., Allegheny, Pa.

General Electric Company's

EDISON

SOCKETS

With characteristic screw base embody in their design and manufacture all the elements of simplicity, durability and reliability.

The General Electric Plug and Link Cut-Outs, Ceiling Rosettes, Punch Clip Knife Switches, Porcelain Cleats and Porcelain Knobs are absolutely uniform in quality and stand the severest tests.
